ribs having one vittæ each, but the outer ones have 2-3 vittæ; carpophore undivided. Seed gibbously convex, flattish in front. —Herbs, having the roots thickish at the neck. Stems furrowed, branched. Leaves pinnate; leaflets cuneiform, cut. Umbels axillary on the branchlets, and nearly sessile at the top of the stem. Involucra and involucels wanting. Flowers white or greenish.

Sect. I. Eua'pium (from *eu*, well, and *apium*, celery; this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 101. Point of petals closely involute.

1 A. grave'olens (Lin. spec. 379.) plant glabrous; leaves pinnate: upper ones ternate; leaflets cuneated, cut and toothed at the apex. ♂. H. Native nearly throughout the whole of Europe, even to Caucasus, in ditches; and also of Chili, near Mendoza, and of the Falkland Islands. D'Urv. fl. mal. p. 457. In Britain it is a common weed by the sides of ditches, brooks of water, and marshy ground, especially towards the sea. Smith, engl. bot. t. 1210. Schultes, syst. 6. p. 429. Hayn. arz. gew. 7. t. 24. Fl. dan. t. 790. Plench, icon. t. 217. Séseli gravèolens, Scop. carn. no. 360. Sium A'pium, Roth, germ. 1. p. 128. Sium gravèolens, Vest. man. bot. p. 517. Celery is known in Britain in its wild state under the name of smallage. The seeds and whole plant in its native ditches are acrid and dangerous, with a peculiar rank coarse taste and smell, and the effects of cultivation in producing from it the mild sweet stalks of celery are not a little remarkable; for which, and its name, we are indebted to the Italians, and which has now supplanted our native Alexanders (*Smýrnium Olusàtrum*).

Use.—The blanched leaf-stalks are used raw as a salad from August till March; they are also stewed, and put in soups. In Italy the unblanched leaves are used for soups, and when neither blanched nor the green leaves can be had, the seeds bruised form a good substitute. The root only of the variety called the *celeriac*, is used, and is excellent in soups, in which, whether white or brown, slices of it are used as ingredients, and readily impart their flavour. With the Germans it is also a common salad, for which the roots are prepared by boiling, until a fork will pass easily through them; after they are boiled and become cold, they are eaten with oil and vinegar. They are also sometimes served up at table, stewed with rich sauces. In all cases before they are boiled, the coat and the fibres of the roots, which are very strong, are cut away, and the root is put in cold water on the fire, not in water previously boiling. The varieties are as follow:—

Var. β, *dúlce* (D. C. prod. 4. p. 101.) leaves erect; petioles very long; leaflets 5-lobed, serrated. A'pium dúlce, Mill. dict. no. 5. A'pium Celleri, Gærtn. fruct. 1. t. 22. *Celery* of the English; *celeri* or *ache* of the French; *æppich* of the Germans; and *appio* of the Italians. There are several sorts of the common or sweet celery, viz. 1 Common upright Italian. 2 Large hollow upright. 3 Solid stalked upright. 4 Large red stalked upright.

Var. γ, *rapàceum* (D. C. l. c.) leaves spreading; petioles short; segments of leaves 5, serrated; root roundish. A'pium rapàceum, Mill. dict. no. 5. *Celeriac* of the English; *celeri-rave* of the French; and *knott-cellerie* of the Germans. There are 2 or 3 sorts of celeriac, viz. 1 Common celeriac or turnip-rooted celery. 2 Celeri-rave of the French; and 3 Knott-cellerie of the Germans. This last is hardier than the other kinds, and will continue longer in spring. It is grown to a large size in the neighbourhood of Hamburgh, and is sometimes imported for the London market.

Var. δ, *Lusitánicum* (D. C. l. c.) radical leaves 3-lobed; cauline ones 5-lobed, crenated. A'pium Lusitánicum, Mill. dict. no. 7.

Estimate of sorts.—The first three sorts of var. β are preferable for general culture. The red variety is rather coarse for salads, but is hardy to stand the winter, and well adapted for soups and stews. The sorts of var. γ are cultivated for their roots, under the name of celeriac, which are fit for use in September and October, and may be preserved in sand through the winter. Celery may be grown to 10lbs. weight, and averaging 6lbs. each head. A head of celery, we are informed (Cal. mem. vol. 2. p. 297.), was dug up on the 4th of October, 1815, at Longford, near Manchester, which weighed 9lbs. when washed, with the roots and leaves still attached to it, and measured 4 feet 6 inches in height. It was the red sort, perfectly solid, crisp, and firm, and remarkably well flavoured.

Propagation.—All the sorts are raised from seed; and half an ounce is reckoned sufficient for a seed-bed 4 feet and a half wide by 10 feet in length, of the upright sorts; but for celeriac, a quarter of an ounce will be enough for a bed 4 feet square.

Soil.—Celery delights in a soil rather moist, rich in vegetable mould, but not rank from new unrotted dung.

Times of sowing.—The most forward crop is slightly forced, Any of the varieties may be sown in the spring in the open garden, at 2 or 3 different times, from the 21st of March until the first week of May; but the principal sowing should be made in the first fortnight of April.

Early crop.—For early summer and autumn celery, sow a small portion towards the end of February, in a moderate hot-bed. When the young plants are about 2 inches high, put out some into a warm border, 2 or 3 inches apart, or rather into a second slight hot-bed, if before the 21st of March, as well to protect the plants, as to expedite their growth for final planting. As soon as the leaves are 6 inches high, in May or June transplant them into trenches for blanching, as directed below for the main crops. But as these early sown plants will not continue long in full growth before many of them will pipe or run, you should plant only a moderate crop, for a temporary supply; when they are advanced in the trenches from 8 to 12 inches in growth, begin to earth them up several inches on both sides of each row; continue earthing up by degrees as they rise higher, till they are whitened from 6 to 12 inches in length; when they may be dug up as wanted.

Main crop.—To raise the main crops for summer, autumn, and winter, make a considerable sowing at the commencement of April. Sow in beds of light mellow earth, and rake in the seed lightly and regularly. In very dry weather give moderate waterings, both before and after the plants come up. When they are 2-3 or 4 inches high, thin the seed-bed, and prick out a quantity at successive times into intermediate beds, 3-4 inches asunder. Water those removed, and till they have struck fresh root. D. Judd sows about the middle of January in a warm situation, on very rich ground, protecting it by mats at night. When the plants are from 2-3 inches high, he pricks them out into a nursery-bed, immersing the plants, as he draws them, in water, so as they may remain moist while out of ground. The plants remain in the nursery-bed until they become very strong. John Walker, a gardener near Manchester, grows the red celery; sows for the early crop about the 1st of March, and for the late crop about the 1st of April. "The seed-bed is formed of fresh dark loamy soil, mixed with old rotten dung, half and half, and placed on a hot-bed. The nursery or transplanting bed is formed with old hot-bed dung, very well broken, laid 6 or 7 inches thick, on a piece of ground which has lain some time undisturbed, or has been made hard by compression. The situation should be sunny. The plants are set 6 inches apart in the dung, without soil, and covered with hand-glasses. They are watered well when planted, and frequently afterwards. By hardening the soil under the dung in which the plants are set,

the root is formed into a brush of fibres; and by thus preventing the pushing of a tap-root, the plant never runs to seed before the following spring."—Cal. hort. mem. vol. 2.

Transplanting into trenches.—When either the plants left in the seed-bed, or those removed, are from 6 to 12 inches high, or when the latter have acquired a stalky growth, by 4 or 5 weeks' nurture in the intermediate bed, transplant them into trenches for blanching. For this purpose allot an open compartment. Mark out the trenches a foot wide, and from 3 feet to 3½ distant; dig out each trench lengthwise, a spade in width, and a light spit deep, that is, 6 or 8 inches, or even a foot. Lay the excavated earth smoothly in the intervals, making the edges of the trenches equally full and straight; also loosen the bottom moderately, in a level order, to receive the plants. Before inserting them, it would essentially strengthen the soil, to apply some good rotten dung in each trench 3 inches thick, and let it be dug into the bottom regularly a moderate depth. Then having lifted the plants, just thin any long straggling tops of the leaves and fibres of the roots; also slip off side shoots; plant a single row along the bottom of each trench, 4 or 5 inches apart. Give a good watering directly, and occasionally after, if the weather be dry, till the plants take root, and show renewed growth. Continue planting out a monthly succession in June, July, August, and September; thus providing for a supply from July and August of the present summer throughout the course of autumn and winter, till May in the following spring. Judd prepares his ground for transplanting by trenching in 2 spades deep, mixing with it in the operation a good dressing of well-reduced dung from the old forcing beds. He says, "I give it a second trenching in order that the dung may be better incorporated with the mould, and then leave it in as rough a state as possible, till my plants are ready to be put out." In the ground thus prepared, he forms trenches 20 inches deep, and 6 feet distant from each other, measuring from the centre of each trench. Before planting he reduces the depth of the trenches to 3 inches, by digging in sufficient dung to fill them so much up. At the time of planting, if the weather be dry, the trenches are well watered in the morning, and the plants are put in, 6 inches apart in a row, in the evening, care being taken by the mode above mentioned, to keep the fibres quite wet whilst out of ground; as they are drawn from the nursery-bed, the plants are dressed for planting, and then laid regularly in the garden pan. The trenches, in which his rows of celery are planted, being so very shallow, the roots of the plants grow nearly on a level with the surface of the ground: this he considers particularly advantageous; for as considerable cavities are necessarily formed on each side when the moulding takes place, all injury from stagnant water or excess of moisture is prevented. The trenches when planted are watered, as may be required. He prepares his ground for celery during the winter, and avoids putting much of a crop in the space between the trenches, especially one that grows tall, as he finds celery does best when it grows as open as possible. Walker makes his trenches at 4 feet distance, and 18 inches wide, 12 deep, and filled 9 inches with a compound of fresh strong soil, and well-rotted dung; three-fourths dung, and one-fourth soil. Old hot-bed dung is the best. The plants should be taken up with as much soil as will conveniently adhere to the roots, and the side-shoots are removed from the stems; they are then set with the hand at 9 or 10 inches apart, in the centre of each trench; it is necessary to water well until they are ready to be earthed, but not afterwards.

Landing or earthing up.—As the plants in trenches rise from 10 to 15 inches high, Abercrombie begins to land-up for blanching, observing "to trim in the earth gently when first raised to the stems, with a hoe or spade, but mostly the latter. When the plants are of a more advanced growth, earth them up equally on both sides each row, 3-4 or 5 inches, according to the strength and height of the different crops. Repeat this once a week or fortnight, till by degrees they are landed-up from 12 inches to 2 feet, in order to blanch them of some considerable length. Continue thus landing-up the different crops from July till February. As the autumnal and main winter crops attain full growth, give them a final landing-up near the tops, which will increase the length of the blanched part, and also protect the later crops more effectually during the winter." In landing-up celery, Judd does "not think it well to load the plants with too much mould at first. The two first mouldings, therefore, are done very sparingly, and only with a common draw-hoe, forming a ridge on each side of the row, and leaving the plants in a hollow, to receive the full benefit of the rain and the waterings. When the plants are strong enough to bear 6 inches high of mould, the moulding is done with the spade, taking care to leave bases enough to support the masses of mould, which will ultimately be used in the ridge, and still keeping for some time the plants in a hollow, as before directed. The process of moulding is continued through the autumn, gradually diminishing the breadth of the top, until at last it is drawn to as sharp a ridge as possible to stand the winter. In the operation it is necessary, in order to prevent the earth from falling into the hearts of the plants, to keep the outer leaves as close together as possible; for this purpose, before I begin the moulding I take long bands of bass matting, tied together till of sufficient length to answer for an entire row, and I fasten this string to the first plant in the row, then pass it to the next plant, giving it one twist round the leaves, and so on till I reach the other, where it is again fastened; when the moulding is finished, the string is easily unravelled, by beginning to untwist it at the end where it was last fastened." Walker, having removed the lateral shoots, the leaves of each plant being held together with one hand, the soil pulverized, is drawn round with the other, taking care not to earth up too high at once, nor too close. The heart should always be left quite free. This may be repeated about once a fortnight until the plants are ready for use.

Late crop.—For late spring celery to stand till the end of May in the returning spring, without running considerably, it is expedient to make a small late sowing at the commencement of May. The plants when 6 weeks old may be pricked on intermediate beds, 6 inches by 3 asunder; to remain till September or October, then transplant them into moderate trenches; as they advance in growth, earth them up a little in winter, and finally in the spring in February and March.

Occasional shelter.—On the approach of frost take up a part of the crop, and lay it by under dry sand for winter use. To preserve the plants left in the bed, lay some long dry litter over the tops, which remove in every interval of mild weather. It is a common complaint, that very fine looking celery is often found to be rotten at the base of the leaf-stalks; the fact being, that when it is full grown, and the blanching completed, it begins to decay, and will not keep good in the ground for more than a month at most. Some, therefore, take up and preserve in dry sand, but in that situation it soon becomes tough and dry. The best mode seems to be that of forming successive plantations.

Taking the crop.—It is best to begin at one end of the row, and dig clean down to the roots, which then loosen with a spade, that they may be drawn up entire without breaking the stalks.

Cultivation of celeriac.—The times of sowing are the same as that for other sorts of celery. The plants require a rich well-manured soil, and according to an account communicated by Lord Stanhope to Mr. Sabine, the plants are reared on a hot-bed under glass, and transplanted when 2 or 3 inches high to another hot-bed, and set an inch and a half apart. In the be-

ginning or middle of June they are transplanted into flat beds in the open air, at the distance of 15 inches from each other, and not in trenches like other celery. They must be abundantly watered as soon as they are set out, and the watering must be repeated every other day, or, if the weather should be warm, every day. As they increase in size they will require a greater quantity of water, and they must be occasionally hoed. The roots will be fit for use in September or October. Mr. Sabine states that he has been informed, that the plan of giving excess of water is peculiar, and that the vigorous growth of the plant is more dependent on richness of soil than on any other cause. Abercrombie directs to earth up the bulbs 4 or 5 inches to blanch them, when they are full grown.

To save seed.—Either leave some established plants in the spring where growing; or in February or March dig up a competent number, cut down the top leaves, and set the plants in the ground full 2 feet asunder. They will produce seed in autumn. Walker grows only red celery, and in preparing plants for seed, chooses the most solid, of the reddest colour, and the smallest size. When taken out of the transplanting bed, the lateral shoots being removed, they should be planted in a dry warm situation, where the seed will ripen well.

Strong-scented Apium, Smallage, Celery, and Celeriac. Fl. June, Aug. Britain. Shrub 3 to 4 feet.

2 A. Chile'nse (Hook. et Arn. in bot. misc. 3. p. 353,) plant glabrous; stem nearly terete, hardly angular; leaves spreading, bipinnate: lobes cuneated, somewhat trifidly cut, quite entire; petals involute at the apex. ♂. H. Native about Valparaiso. The plant is much stouter than *A. gravèolens*, and the stem is not deeply furrowed. The leaves resemble those of common parsley, but are much smaller, and more flaccid. The peduncles or short lateral branches are stout and firm. Fruit much larger than that of *A. gravèolens*. Involucrum and involucels wanting.

Chili Celery. Pl. 2 feet.

Sect. II. Oreoscia'dium (*ορος ορεος, oros oreos*, a mountain, *σκιαδιον, skiadion*, an umbel; habitat of plants). D. C. prod. 4. p. 101. Petals denticulated, with an inflexed point.

3 A. monta'num (H. B. et Kunth, nov. gen. amer. 5. p. 17.) leaves ternate; leaflets obovate-cuneated, trifid: lobes acute, quite entire. ♃. F. Native of New Granada, in Paramo de Almaguer, at the height of 9,300 feet. Ligústicum ternàtum, Schlecht. in Schultes, syst. 6. p. 555.

Mountain Celery. Pl. 2 to 3 feet.

4 A. ranunculifòlium (H. B. et Kunth, l. c. p. 18. t. 421.) leaves somewhat ternate; leaflets obovate-cuneated: lateral ones 5-lobed: intermediate one 3-parted; segments 2-3-lobed. ♃. F. Growing along with the preceding, of which it is probably only a variety.

Crowfoot-leaved Celery. Pl. 2 to 3 feet.

5 A. glauce'scens (H. B. et Kunth, l. c.) leaves subternate; leaflets obovate-cuneated, tripartite; lobes bifid or trifid. ♃. F. Growing along with the two preceding species, of which it is perhaps only a variety.

Glaucescent Celery. Pl. 2 to 3 feet.

6 A. Commersònii (D. C. prod. 4. p. 101.) leaves pinnate; leaflets multifid: lobes linear. ♃. F. Native of South America. Styles a little longer and more divaricate than any other of the species. It is very nearly allied to *A. ranunculifòlium*, but the segments of the leaves are narrower and more acute, and the lower leaves are pinnate.

Commerson's Celery. Pl. 2 to 3 feet.

† *Species not sufficiently known.*

7 A. fractophy'llum (Horn. hort. hafn. suppl. p. 128.) segments of radical leaves cordate, and truncate at the base, and trifid at the apex. ♂. H. Native country unknown. The fruit is very like that of *A. gravèolens.*

Broken-leaved Celery. Fl. June, July. Clt. 1826. Pl. 1 to 2 feet.

8 A. austra'le (Pet. Th. fl. hist. d'ac. p. 43.) leaves bipinnate: segments cuneiform; branches whorled; umbels sessile, crowded. ♂. F. Native of the Island of Tristan da Cunha. Carm. descr. p. 34. Flowers white. Petals not described. Perhaps the same as *A. Commersònii.*

Southern Celery. Pl. 1 foot.

Cult. The species will grow in any common soil, and are increased by seeds.

XXXVIII. PETROSELI'NUM (from *πετρος, petros*, a rock, and *σελινον, selinon,* parsley; habitat of the species). Hoffm. umb. 1. p. 78. t. 1. f. 7. Lag. am. nat. 2. p. 102. Koch. umb. p. 127. D. C. prod. 4. p. 102.—A'pium species of Lin. Spreng. and others.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals roundish, incurved, entire, hardly emarginate, with an inflexed point. Stylopodium short, conical, rather crenulated. Styles diverging. Fruit ovate, contracted from the sides, somewhat didymous; mericarps with 5 equal filiform ribs: lateral ribs marginal; having the furrows between the ribs furnished with one vitta each, and the commissure with 2. Carpophore bipartite. Seed gibbously convex, flattish in front.—Branched glabrous herbs. Leaves decompound, with cuneated segments. Involucra few-leaved; involucels many-leaved. Flowers white or greenish, uniform: those in the disk of the umbel frequently sterile. Stamens longer than the corolla.

1 P. sati'vum (Hoffm. et Koch, l. c.) stem erect, angular; leaves decompound, shining; lower leaflets ovate-cuneated, trifidly toothed: superior ones lanceolate, nearly entire; leaves of involucel filiform. ♂. H. Native of Sardinia, Greece, Archipelago, Turkey, Chili about Conception, &c. on shaded rocks; and now cultivated in every culinary garden. Nees. off. pflanz. 16. t. 21. A'pium Petroselìnum, Lin. spec. 379. Hayn. arz. gew. 7. t. 23. A'pium vulgàre, Lam. fl. fr. 3. p. 1027. A'pium tenuifòlium, Riv. pent. irr. with a figure. The Parsley is called *Persil* in French, *Petersilie* in German, and *Petroselino* in Italian. It is a hardy biennial; introduced to England in 1548 from Sardinia. It is now so common as to be naturalised in several places both in England and Scotland. The root leaves are much curled in some varieties. The flowers are yellow, and appear in June; they have usually one leaf at the origin of the universal umbel; and the involucel often of from 6 to 8 short small leaves, fine almost as hairs to the partial umbels.

"It may be right to notice, that the poisonous plant called fools-parsley (*Æthùsa Cynàpium*), a common weed in rich garden soils, has sometimes been mistaken for common parsley. They are very easily distinguished: the leaves of fools-parsley are darker green, of a different shape, and, instead of the peculiar parsley smell, have when bruised a disagreeable odour. When the flower-stem of the fool's-parsley appears, the plant is at once distinguished by what is vulgarly called its beard, the 3 long pendant leaves of the involucrum. The timid may shun all risk of mistake by cultivating only the curled variety. This last it may be remarked, makes the prettiest garnish." Neill.

Varieties.—There are:

1. The *common plain leaved*, which is the true species, is seldom cultivated.

2 The *curled-leaved.* This is the most esteemed variety. A'pium crìspum, Mill. dict. no. 2. P. satìvum β crìspum, D. C. prod. 4. p. 102.

3 The *broad-leaved* or *large-rooted Hamburgh*, which is cultivated for its carrot-shaped roots. A'pium latifòlium, Mill. dict.

no. 3. but not of Poir. P. satìvum γ latifòlium, D. C. prod. 4. p. 102.

Use.—The leaves of the two first varieties are used as pot-herbs at all seasons of the year; also as a garnish. The third kind is esteemed for its large white carrot-shaped roots, drawn in winter like parsnips for the table; and occasionally to be used in medicine, being a good remedy for the gravel.

Culture of the pot-herb kinds.—"One sowing in spring will mostly furnish young leaves all the year, though to answer a constant demand, many persons make successive sowings from February to May. Some also sow early in autumn for young parsley in winter and spring; but such a supply is better provided by cutting down established plants. Sow in a single drill along the edge of any compartment, or occasionally in rows 9 or 12 inches asunder. Draw small drills, something less than an inch deep, in which drop the seed moderately thick, and cover a little above half an inch. The plants will come up in 3 or 4 weeks, and when 2 or 3 inches high, may be gathered as wanted all the summer, winter, and following spring till May, when they will go to seed. Have always a young crop sown timely in the spring, to succeed the declining old plants. In gathering pot-herb parsley, cut close and regular. In summer, when the plants grow rank, yielding more leaves than can be used, cut them in close to the bottom, and they will shoot up stocky in a regular close growth. Observe also to do the same in autumn, about the end of September, that the plants may form heads of fresh young leaves before winter. On the approach of frosty weather protect them with haulm or reed-pannels, laid upon branches of birch or other light supports."

Culture of Hamburgh parsley.—"To obtain large roots allot a compartment where the soil is deep, and has been well dug. Any common mould will suit, if dry and not too rank. Sow in February, March, or early in April, in one or more beds; either in drills 9 inches asunder, or broad-cast, and rake it. The plants should be thinned to 9 inches distance, to give room for proper growth in the roots, for use in August, September, October, and thence till the following spring. On the approach of frost take up some roots, and preserve them in sand. A sowing may be made in the third week in June, when young roots are wanted in winter."

To save seed.—"Permit some old plants to run to stalks in May; they will produce plenty of seed, ripening in July or August." Abercrombie.

Cultivated or Common Parsley. Fl. June, July. Clt. 1548. Pl. 2 feet.

2 P. PEREGRI'NUM (Lag. am. nat. 2. p. 100. Koch, umb. 128.) stem erect, stiff, rather angular; petioles sheathing, scarious; leaves shining; leaflets on long petioles, cuneated, deeply serrated; leaves of both the involucrum and involucel linear. ♂. H. Native of Spain? Portugal? and on the mountains of Peru according to Hænk. herb. A'mmi petroselinoìdes, Presl, mss. Ligústicum peregrìnum, Lin. spec. p. 368. Jacq. hort. vind. 3. t. 18. Sìson peregrìnus, Spreng. in Schultes, syst. 6. p. 409. A'pium latifòlium, Poir. dict. 4. p. 369. but not of Mill. Bupleùrum petroselinoìdes, Spreng. umb. prod. p. 39. and perhaps A'pium Romànum, Zucc. cent. p. 57. Petals white, entire.

Foreign Parsley. Fl. June, July. Clt. 1633. Pl. 2 feet.

3 P. SELINOI'DES (D. C. prod. 4. p. 102.) stem striated; radical leaves tripinnate: cauline ones bipinnate; leaflets pinnatifid: lobes linear-lanceolate, acute, entire, or tripartite; umbels drooping a little; involucrum almost absent. ♃. H. Native country unknown. Selìnum peregrìnum, Willd. enum. p. 306. This plant differs from *Gnìdium apioìdes*, to which it is joined by Sprengel, in the segments of the leaves being much larger, in the petals being cream coloured, not white, and in being entire, not obcordate.

Selinum-like Parsley. Pl. 2 feet.

4 P. PROSTRA'TUM (D. C. prod. 4. p. 102.) stem procumbent, flexuous; leaves pinnate; leaflets petiolate, pinnatifid: lobes 5-7-lanceolate: ultimate ones trifid at the apex; umbels nearly sessile, opposite the leaves; involucrum usually of one leaf. ♃. F. Native of Van Diemen's Land. A'pium prostràtum, Labill. nov. holl. 1. p. 76. t. 103. Vent. malm. t. 81. Schultes, syst. 6. p. 430. Herb edible.

Prostrate Parsley. Pl. prostrate.

5 P. SE'GETUM (Koch, umb. p. 128.) stem erect, twiggy, nearly naked; leaves pinnate; leaflets nearly sessile, roundish-ovate, pinnatifidly cut, mucronately toothed: upper lobes linear; involucrum 2-3-leaved; rays of umbel very unequal. ⊙. H. Native of Britain, France, Caucasus, and Switzerland, in cornfields, vineyards, and gardens. In Britain in a chalky rather moist soil, but not very common; as about Mapledurham, Hants; at Binham, Norfolk; near Kelmarsh, Northamptonshire; at Walthamstow, Essex; and in the island of Tirèe, Scotland. Sìson ségetum, Lin. spec. 362. Jacq. hort. vind. t. 134. Smith, engl. bot. 228. Sìum ségetum, Lam. dict. 1. p. 406.—Mor. hist. 3. p. 283. sect. 9. t. 5. f. 6. Flowers and fruit agreeing with the rest of the genus *Petroselìnum*, but the habit is that of *Pimpinélla*. Flowers all fertile, white or even reddish. Teeth of calyx rather conspicuous. Perhaps Sìson arvénsis, Brot. fl. lus. 1. p. 424. and Schultes, syst. 6. p. 418. is not distinct from this. The whole account of this herb by that accurate observer Goodyer, with the origin of honewort, from its curing a swelling in the cheek, called a hone, &c. is a model of precise information.

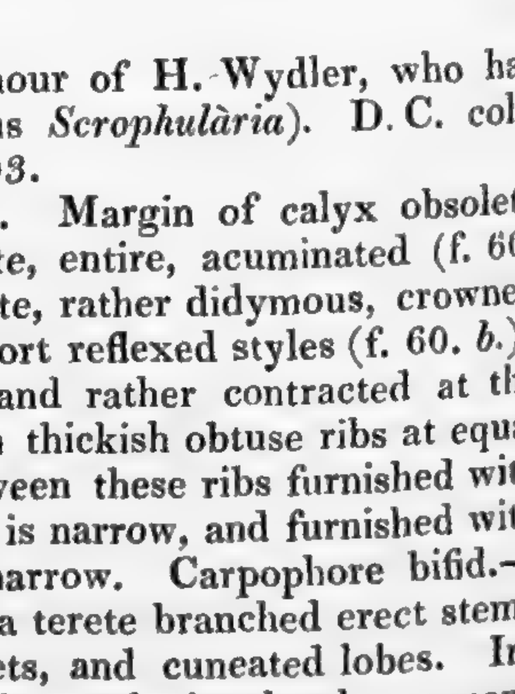
Corn Honewort. Fl. July, Aug. Britain. Pl. 1 to 1½ feet.

Cult. The species will grow in any soil, and they are only to be propagated by seed.

XXXIX. WYDLERIA (in honour of H. Wydler, who has written a monograph of the genus *Scrophulària*). D. C. coll. mem. v. p. 36. t. 7. prod. 4. p. 103.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx obsolete (f. 60. *a.*). Petals ovate-lanceolate, entire, acuminated (f. 60. *c.*); acumen incurved. Fruit ovate, rather didymous, crowned by the short stylopodium, and short reflexed styles (f. 60. *b.*); mericarps somewhat semi-terete, and rather contracted at the margins; furnished with 5 filiform thickish obtuse ribs at equal distances; having the furrows between these ribs furnished with one vitta each, but the commissure is narrow, and furnished with 2 vittæ; all the vittæ are very narrow. Carpophore bifid.—A smooth West Indian herb, with a terete branched erect stem; ternate leaves, with multifid leaflets, and cuneated lobes. Involucrum none or only of one leaf, but the involucels are many leaved. Flowers white, not sufficiently known. This genus, according to Koch, is allied to *Petroselìnum*, but differs both from it and *Fœnículum*, in the petals ending in long taper points. It is also to be distinguished from *Cnìdium*, in the fruit being somewhat contracted at the sides, and in the ribs not being winged; from *Séseli*, in the calyx being toothless, and from both these last genera in the petals being entire.

FIG. 60.



1 W. PORTORICE'NSIS (D.C. l. c.) ⊙. F. Native of Porto Rico, on the west coast, where it is cultivated along with *Mùsa paradisiàca* and *Lepídium Virgínicum*. Plant a foot high and more.

Leaves rather stiff. Umbels numerous, 12-14-rayed. (fig. 60.)

Porto-Rico Wydleria. Pl. 1 foot.

Cult. A plant of easy culture, and only to be propagated by seeds.

XL. TRI'NIA (in honour of Dr. Trinuus, a celebrated Russian botanist, who has written on Gramineæ). Hoffm. umb. gen. p. 92. Bieb. suppl. 244. Koch, umb. p. 127. D. C. prod. 4. p. 103.—Pimpinélla species of Lin. Spreng. Lag.—Apinélla, Neck. elem. no. 325.—Spielmánnia, Cuss. mss. ex Juss. dict. sc. nat. 55. p. 328.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx obsolete. Flowers usually dioecious from abortion, rarely monoecious. Petals of the male flowers lanceolate, ending in an involute segment; those of the female or hermaphrodite flowers ovate, and ending in a short inflexed point each. Fruit ovate, compressed from the sides; mericarps furnished with 5 filiform, rather prominent equal ribs: lateral ones marginal; having the furrows between the ribs either without vittæ, or with one in each furrow; carpophore flat, bipartite from the base. Seed gibbously convex, flattish in front.—Much branched biennial herbs. Stems angular. Leaves bipinnate; leaflets triternate; lobes linear, pale or glaucescent. Umbels numerous, of many rays, without any involucrum, either disposed in a thyrse or panicle. Umbellules usually naked, seldom furnished with an involucel, sometimes proliferous or somewhat racemose. Flowers white, dioecious or polygamous.

1 T. KITAIBE'LII (Bieb. suppl. p. 246. Koch, umb. 127.) plant glabrous; involucels 4-5-leaved; ribs of fruit obtuse. ♂. H. Native of Tauria and the south of Russia, Volhynia, &c. Pimpinélla glaúca, Hoffm. umb. 18. Waldst. et Kit. pl. rar. hung. 1. t. 72. Séseli pùmilum, Lin. spec. p. 378. Pimpinélla dichótoma, Lin. syst. p. 291. Spreng. syst. 1. p. 883.? Flowers white.

Kitaibel's Trinia. Fl. July, Aug. Clt. 1800. Pl. 1 foot.

2 T. VULGA'RIS (D. C. prod. 4. p. 103.) plant glabrous; involucels wanting or of one leaf; ribs of fruit obtuse; lobes of leaves linear, setaceous, very long. ♂. H. Native of Europe and Caucasus, in exposed places. T. Henníngii, Koch, umb. p. 127. Bieb. suppl. 245. Séseli montànum var. γ. Lapeyr. abr. pyr. Pimpinélla dioíca, Bess. journ. galic. Pimpinélla glaúca, Lin. spec. p. 378. Pimpinélla multicaúlis, Poir. suppl. 1. p. 684. Séseli pùmilum, Gouan. ill. 15. Flowers white.

Common Trinia. Fl. June, Aug. Clt. 1803. Pl. 1 foot.

3 T. GLABE'RRIMA (Hoffm. umb. p. 93.) plant glabrous; involucels wanting or of one leaf; ribs of fruit obtuse; leaflets linear-lanceolate, short, equal. ♂. H. Native of Western and Central Europe, frequent. In England, on St. Vincent's rock near Bristol, and at Uphill in Somersetshire. In Ireland near the church at Athboy, county of Meath, in great quantities. Pimpinélla dioíca, Lin. mant. p. 354. Smith, engl. bot. t. 1209. Séseli glaúcum, Lam. fl. fr. 3. p. 436. Séseli pùmilum, Lin. spec. 373. All. fl. pedem. Pimpinélla glaúca, Spreng. syst. 1. p. 883. Pimpinélla pùmila, Jacq. hort. vind. t. 227. aust. 1. t. 28. Peucédanum mìnus, Huds. angl. ed. 8. p. 101. Trínia vulgàris β, Jacquìni, D. C. prod. 4. p. 103. Root tapering, fleshy. Herb glaucous. Umbels panicled. Flowers cream-coloured.

Var. β, *Dalechámpii* (D. C. prod. 4. p. 104. under *T. vulgàris,*) lobes of leaves linear, short; stem a finger in height; umbels numerous, many flowered. ♂. H. Native of the kingdom of Naples, and other parts of the south of Europe, in sterile fields. Mèum Dalechámpii, Ten. prod. fl. neap. p. xix.—Dalech. hist. 1. p. 749.

Quite-glabrous Trinia. Fl. June, July. Britain. Pl. ½ to 1 ft.

4 T. RAMOSÍSSIMA (Fisch. ex Koch, in nov. act. bonn. 12. p. 127.) germens glabrous; ribs of mericarps very blunt, rounded; umbellules few flowered, furnished with involucels; fruit bearing pedicels much longer than the cremocarps. ♂. H. Native of Altaia, in plains at the river Irtysh near Krasnojarsk, and elsewhere; and about Buchtorminsk. It differs from *T. Kitaibèlii*, in the involucels being present, and in the pedicels being more slender and elongated.

Much-branched Trinia. Pl. ½ foot.

5 T. HOFFMA'NNI (Bieb. suppl. p. 244.) plant glabrous; involucels wanting or of one leaf; ribs of fruit, especially the carinal ones, acute. ♂. H. Native of Russia and Tauria. Trínia glabérrima var. Hoffm. umb. 93. Flowers whitish.

Hoffmann's Trinia. Fl. June, July. Pl. ½ to 1 foot.

6 T. HI'SPIDA (Hoffm. umb. 94.) stem, leaves, and fruit puberulous from short scattered down; involucrum none, but when present of only one leaf; ribs of fruit acute. ♂. H. Native of the south of Russia and Tauria, in dry desert places. T. Hoffmánni var. β, Bieb. suppl. p. 245. Pimpinélla dioíca Róssica, Fisch. hort. gorenk. 1812. Pimpinélla dioíca, D'Urv. enum. pl. orient. p. 34. Perhaps only a variety of the preceding. Flowers white.

Hispid Trinia. Pl. 1 foot.

7 T. DUFOU'RII (D. C. prod. 4. p. 104.) stem and leaves smoothish; involucels almost wanting; fruit puberulous, roundish, with obtuse ribs. ♂. H. Native of Spain, near Tudela. Séseli dioícum, Dufour in litt. Pedicels after flowering time very short, hardly longer than the fruit. The species of this genus are very variable, and by no means easily distinguished.

Dufour's Trinia. Pl. 1 foot.

Cult. A light sandy soil suits the species, in which the seeds should be sown in spring.

XLI. HELOSCIA'DIUM (from ἕλος, *helos,* a marsh, and σκιαδιον, *skiadion,* an umbel; meaning an umbelliferous plant inhabiting marshes). Koch, umb. p. 125. D. C. coll. mem. 5. p. 37. D. C. prod. 4. p. 104.—Sìum, Adans. fam. 2. p. 97.—Sìum species of Lin.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx 5-toothed, or obsolete. Petals ovate, entire, with a straight or inflexed apex. Styles short. Fruit compressed from the sides, ovate or oblong; mericarps furnished with 5 equal, rather prominent filiform ribs, lateral ribs marginating: having the furrows between the ribs furnished with one vitta each; carpophore entire, distinct. Seeds gibbously or teretely convex, flattish in front.—Herbs. Umbels compound. Flowers white. Involucra variable in the different sections, which are probably genera.

SECT. I. MAUCHA'RTIA (in honour of Burc. Dav. Mauchart, author of Dissertationis Butyrum Cacao, 4to. Tubingen, 1735). D. C. prod. 4. p. 104.—Neck. elem. no. 286.? Common involucra composed of from 1 to 3 leaves, rarely wanting; involucels of 5-6 leaves.—Procumbent or creeping aquatic herbs, with pinnate leaves.

1 H. CRA'SSIPES (Koch, l. c.) stems creeping at the base, ascending; leaves pinnate: upper ones ternate; leaflets obovate, deeply toothed at the apex; umbels 3-5-cleft, without any involucra; pedicels of umbellules stiff, a little thickened at the base, and rather connate. ♃. H. Native of Corsica, in watery places about Bonifacio and Porto Vecchio; and of Sardinia. Reich. icon. bot. 3. p. 16. no. 365. t. 218. Sìum limòsum, Moris. in herb. Balb. Sìum crássipes, Spreng. Lois. Flowers white.

Thick-pedicelled Helosciadium. Pl. creeping 1 foot.

2 H. NODIFLÒRUM (Koch, umb. p. 126.) stem rooting, procumbent, striated; leaves pinnate; leaflets oblong, equally serrated; umbels opposite the leaves, sessile or on short peduncles; involucra wanting or few-leaved, deciduous. ♃. W. H. Native

of many parts of Europe, in ditches and rivulets; plentiful in some parts of Britain. Sium nodiflòrum, Lin. spec. 361. Woodv. med. bot. 3. t. 182. Smith, engl. bot. t. 639. but not of the Flora Danica. Sison nodiflòrum, Brot. fl. lus. 1. p. 423. Séseli nodiflòrum, Scop. carn. 2. p. 353. Flowers white. There is a dwarf variety of this mentioned in D. C. fl. fr. 4. p. 300. which is hardly a finger in height; and a large variety, which grows even $1\frac{1}{2}$ foot high. This plant was formerly admitted into the London Pharmacopœia, in the character of an antiscorbutic, or rather as a corrector of acrid humours, especially when manifested by cutaneous eruptions, and tumours in the lymphatic system. The best proofs of its efficacy are from Dr. Withering. A young lady was cured of a most obstinate cutaneous eruption by taking three large tea-spoonfuls of the juice twice a day; and he has repeatedly given to adults 3 or 4 ounces every morning, in similar complaints, with the greatest success. It is not nauseous, and children take it readily if mixed with milk. In the dose he has given it, it neither affects the head, the stomach, nor the bowels. This plant, therefore, if it should be eaten for water-cresses, does not seem to be very dangerous, or to require all that caution which Miller prescribes, to distinguish it from water-cresses.

Var. β, ochreàtum (D. C. prod. 4. p. 104.) stems rather creeping; petioles membranous, and dilated at the base; umbels on rather longer peduncles than those of the species; involucrum permanent. ♃. W. H. Native of ditches and rivulets about Lugdun. Sium rèpens β, D. C. fl. fr. 4. p. 300. This variety is said to be intermediate between *H. nodiflòrum* and *H. rèpens*.

Var. γ? radiàtum (D. C. prod. 4. p. 105.) involucrum of one foliaceous, somewhat trifid leaf; leaves of involucel exceeding the flowers. ♃. W. H. Native of the north of Africa. Sium radiàtum, Viv. fl. lyb. 1. p. 16. t. 9. f. 2. Tordýlium Cyrenàicum, Spreng. syst. 1. p. 895.

Knot-flowered Helosciadium. Fl. July, Aug. Britain. Pl. $\frac{1}{2}$ to 1 foot.

3 H. re'pens (Koch, l. c.) stem prostrate, rooting; leaves pinnate; leaflets roundish, deeply toothed; umbels on long peduncles, opposite to the leaves; involucrum of 2-4 ovate-lanceolate permanent leaves. ♃. W. H. Native of France, Denmark, and Germany. In Britain in boggy meadows, or on watery commons; on Bullington Green and Cowley Bottom, near Oxford; on Coldham Common, Cambridgeshire; on Goldington Green and Stevington bogs; at Fisher Row and on Guillon Links, near Edinburgh; and in ditches near Forfar. Sium rèpens, Lin. fil. suppl. 181. Fl. dan. 1514. Jacq. aust. 3. t. 260. Smith, engl. bot. t. 1431. Peduncles of umbels equal to the naked part of the petioles, which are in *H. nodiflòrum* much shorter. Flowers white.

Creeping Helosciadium. Fl. June, July. Britain. Pl. cr.

4 H. inunda'tum (Koch, l. c.) stems creeping; leaves pinnate: leaflets of the submersed leaves capillaceously multifid: those of the emersed ones cuneiform and deeply trifid; umbels opposite the leaves; peduncles bearing 2 rays or umbels, without an involucrum; umbellules 5-flowered. ♃. W. H. Native of Europe, in marshes, bogs, ditches, pools, and wet ground over-flowed in winter; plentiful in some parts of Britain. Sium inundàtum, Wigger's, Holsat. p. 24. Hydrocótyle inundàtum, Smith, fl. brit. 1. p. 290. Engl. bot. t. 227. Fl. dan. t. 89. Sison inundàtum, Willd. Mèum inundàtum, Spreng. umb. spec. 115.—Pluk. alm. t. 61. f. 3. Flowers white.

Var. β, capillàceum (D. C. prod. 4. p. 105.) stems erect; leaves all capillaceously multifid. Schum. zeel. 1. p. 90. ex Schultes, syst. 6. p. 435.

Inundated Helosciadium. Fl. May, June. Britain. Pl. cr.

5 H. interme'dium (D. C. prod. 4. p. 105.) root rather bulbous, stoloniferous; stem filiform, ascending; leaves pinnate: leaflets verticillate, short, trifid; umbels opposite the leaves, pedunculate, 4-5-rayed, involucrated. ♃. W. H. Native of France, near Dax, in inundated places. Sison verticillàto-inundàtum, Thore, chl. land. p. 101. Sium intermèdium, D. C. fl. fr. 4. p. 302. Sium bulbòsum, Thore, journ. bot. 1. p. 193. t. 7. f. 2. but not of Poir. Helosciad. bulbòsum, Koch, umb. p. 126. Flowers white.

Intermediate Helosciadium. Fl. July, Aug. Clt. 1826. Pl. $\frac{1}{2}$ foot.

6 H. Califo'rnicum (Hook. et Arn. in Beech. bot. p. 143.) plant procumbent? leaves pinnate, with 8-11 ovate, acute, deeply serrated leaflets; lower leaflets pinnatifid or pinnate, with few leaflets; umbels lateral and terminal; involucra and involucels of many leaves; styles elongated. ♃. B. H. Native of North California, and on the low moist soils of the Columbia. The plant has a good deal the habit of *H. rèpens*. Douglas says the stems are 2-3 feet high, from which expression it may be inferred that the plant is not procumbent.

Californian Helosciadium. Pl. 2 to 3 feet.

Sect. II. Cyclospe'rmum (from κυκλος, *kyclos*, a circle, and σπερμα, *sperma*, a seed). Lag. am. nat. 2. p. 101. D. C. prod. 4. p. 105. Both the involucra and involucels are wanting. Fruit quite glabrous.

7 H. leptophy'llum (D. C. mem. soc. genev. vol. 4.) plant glabrous, erectish or diffuse; leaves many times ternately divided: leaflets capillary: cauline leaves nearly sessile; umbels opposite the leaves, sessile or pedunculate, 2-3-rayed; umbellules pedunculate. ⊙. H. Native nearly throughout the whole of America, especially in Chili, Mexico, St. Domingo, Brazil, and Louisiana. Sison A'mmi, Lin. spec. 363.? Jacq. hort. vind. t. 200. Schultes, syst. 6. p. 412. exclusive of Schaw. and Poir. synonymes. Cham. et Schlecht. in Linnæa. 1. p. 386. Æthùsa A'mmi, Spreng. umb. prod. p. 22. Pimpinélla leptophýlla, Pers. ench. 1. p. 324. Schultes, syst. 6. p. 390. Pimpinélla lateriflòra, Link, enum. 1. p. 285. exclusive of the synonymes. Heliosciàdium lateriflòrum, Koch, umb. p. 126. Pimpinélla Domingénsis, Willd. herb. Æthùsa leptophýlla, Spreng. umb. prod. 22. Nutt. gen. amer. 1. p. 190. Sison fasciculàtum, Pohl in litt. Pimpinélla capillàcea, Poir. 1828. Anèthum pinnàtum, Ruiz et Pav. in herb. Deless. A plant in Sieb. fl. nov. holl. exsic. no. 481. is apparently referrible to this species, as also Sison Hæ'nkei, Presl, in herb. Hænke. Flowers white.

Slender-leaved Helosciadium. Fl. July, Aug. Clt. 1819. Pl. 1 foot.

8 H. lacinia'tum (D. C. mem. soc. genev. vol. 4.) plant glabrous, erect; leaves many times ternately divided: leaflets cut, oblong-linear: cauline leaves all petiolate; umbels sessile, opposite the leaves, 3-rayed, one-half shorter than the petioles. ⊙. H. Native of Peru and of Chili, in stony pastures. Bertero, herb. no. 101. Poepp. no. 93. p. 281. Very like *H. leptophýllum*, but differs in the leaflets being broader, and in the petioles of the cauline leaves being much longer. Sison laciniàtum, Lher. herb. in herb. Domb.

Jagged-leaved Helosciadium. Pl. 1 foot.

9 H. ranunculifòlium (D. C. prod. 4. p. 105.) plant glabrous, erect, dichotomous; lower leaves bipinnate: upper pinnate and ternate, opposite; leaflets cuneated at the base, cut into acuminated lobes; umbels rising from the forks of the branches, on short peduncles. ⊙? W. H. Native of Chili, on the Andes in Rio Saladillo, in the province of Cordova; and about Conception. H. lateriflòrum, Hook. et Arn. Some of the petals are entire, and some of them somewhat emarginate, from the point being bent in so much. Calyx obsolete. Fruit cordate at the base when young, more compressed, and less ribbed than in the rest.

Crowfoot-leaved Helosciadium. Pl. 1 foot?

10 H. te'nerum (D. C. prod. 4. p. 105.) plant glabrous, erect; leaves bipinnate: leaflets tripartite: lobes obovate, obtuse, small; umbels rising from the axils, pedunculate, 4-5-rayed, without any involucrum.—Native of Nipaul, on the high mountain of Sheopore. Sìson? téner, Wall. mss. Herb 6-8 inches high. Sheath of petioles dilated and membranous. Fruit small, ovate, glabrous in the immature specimen. Styles very short.

Tender Helosciadium. Pl. ½ foot.

11 H.? Ru'ta (D. C. prod. 4. p. 106.) stem multiple, diffuse; leaves biternate: lower ones on long petioles: lobes oval, confluent a great way, obtuse: upper leaves on short petioles, with oblong lobes; umbels opposite the leaves, sessile, 3-5-rayed: rays elongated.—Native of the Cape of Good Hope. Sìum fortè Africànum foliis trifidis seu Rutæ hortensis Oldenl. herb. Sìson trífidum, Burm. herb. Sìson Rùta, Burm. fl. cap. p. 7. A rather doubtful species, but from the immature fruit it appears to belong to this genus.

Rue-leaved Helosciadium. Pl. diffuse.

12 H. Heynea'num (D. C. prod. 4. p. 106.) stem nearly simple, erect; leaves on long petioles, ternate; leaflets petiolate, lanceolate, acuminated, deeply toothed; umbels on long peduncles, opposite, with 5-6 elongated rays; and the umbellules 5-8-flowered. ⊙. H. Native of the East Indies, but in what place is unknown. Pimpinélla Heyneàna, Wall. mss. Mature fruit not seen. Allied to the following section, but differs in the fruit being glabrous while young.

Heyne's Helosciadium. Pl. 1 foot.

Sect. III. Trachyscia'dium (from τραχυς, *trachys*, rough, and σκιαδιον, *skiadion*, an umbel; in reference to the rough fruit of the species). D. C. prod. 4. p. 106. Both involucra and involucels are wanting. Fruit rough from short stiff hairs.

13 H. trifolia'tum (D. C. prod. 4. p. 106.) stem glabrous, branched, erect: lower leaves 3-5-parted, the rest ternate: leaflets nearly sessile, ovate-lanceolate, smooth above, but scabrous from pili along the nerves beneath, deeply toothed: teeth mucronate; fruit ovate, scabrous from rigid pili.—Native of Nipaul, on the higher mountains about Gosaingsthan. Pimpinélla? trifoliàta, Wall. mss. Umbels terminal, and opposite the leaves, 6-8-rayed. Styles very short. Fruit rather didymous.

Trifoliate Helosciadium. Pl.

14 H. pube'scens (D. C. prod. 4. p. 106.) stem erect, multiple, pubescent, as well as the petioles, rays of umbel, and under side of leaves: lower leaves ternate: leaflets ovate, toothed, stalked: upper leaves on long petioles, ovate-cordate, toothed, rarely cut; fruit scabrous.—Native of Kamaon, in the East Indies. Pimpinélla pubéscens, Wall. mss. Very like the preceding, but differs in the pubescence and structure of the leaves. The immature fruit has only been seen.

Pubescent Helosciadium. Pl.

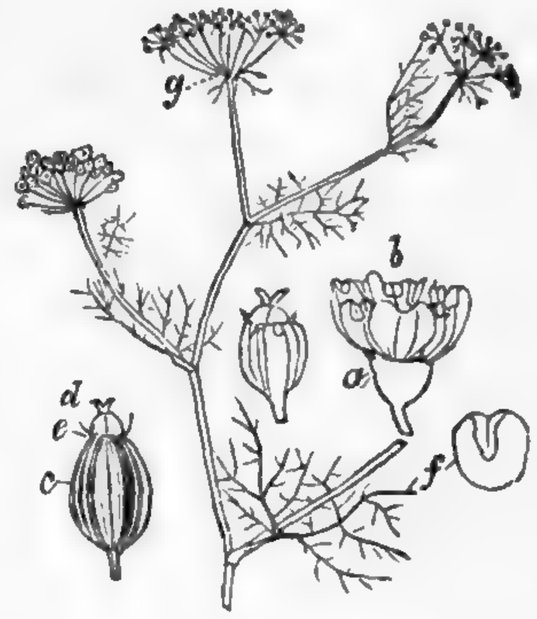
Cult. Those species belonging to the first section of the genus being aquatic perennial plants, should be grown in ponds of water; the rest being annual, the seeds of them should be sown in any warm situation.

XLII. DISCOPLEU'RA (from δισκος, *diskos*, a disk, and πλευρα, *pleura*, a rib; the 2 lateral nerves of the fruit form a disk on both sides of the fruit). D. C. coll. mem. 5. p. 38. t. 8. and 9. prod. 4. p. 106.—A'mmi species of Michx. Ell. &c.

Lin. syst. *Pentándria, Digýnia.* Calycine teeth 5, subulate, permanent (f. 61. *e.*). Petals ovate, entire, each furnished with a replicate point (f. 61. *f.*). Fruit ovate (f. 61. *c.*), rather didymous; mericarps with 5 ribs; the 3 dorsal ones filiform, exserted, and acutish: the 2 lateral ones rather concrete, with the thick accessory margin, forming a broad disk on both sides of the fruit: having the furrows between the ribs furnished with one vitta each; carpophore bifid. Seed nearly terete.—Smooth North American herbs. Stems terete. Leaves compound; leaflets linear-setaceous, some trifid, and others entire. Leaves of involucel few, linear-setaceous. Flowers white. A genus of elegant plants.

1 D. capilla'cea (D. C. l. c. t. 8. A.) plant erect or procumbent; umbels 3-10-rayed; leaflets of involucrum 3-5, nearly all trifid. ⊙. W. H. Native of North America, from Carolina to New York, in humid places; and of North California. A'mmi màjus, Walt. fl. carol. 6. p. 113. but not of Lin. A'mmi capillàceum, Spreng. in Schultes, syst. 6. p. 411. exclusive of the synonyme of Nutt. and Pers. ex Torrey, fl. un. st. 1. p. 306. Æthùsa capillàcea, Nutt. in herb. Mercier. Flowers white. (f. 61.)

FIG. 61.



Var. β? *costàta* (D. C. l. c. t. 8. β,) plant large, erect; stem simple below; segments of the leaves somewhat verticillate; involucrum of 10 or 12 leaves; fruit deeply furrowed. ⊙. W. H. Native of Georgia, in marshes on the banks of the river Ogeechee. A'mmi costàtum, Ell. sketch. 1. p. 350. Said to be nearly allied to the species, but differs according to Elliot, in the plant being of taller stature, 4-5 feet high, not 1 or 2 feet high, as in the species, and in the time of flowering, which is in autumn, and not in the spring, and in the leaves of the involucel being equal in length to the umbellules.

Capillary-leaved Discopleura. Pl. 1 to 2 feet.

2 D. Nutta'llii (D. C. l. c. t. 9.) plant erect; umbels 20-rayed; leaves of involucrum 5-6, and for the most part undivided; involucels of 5 leaves, about equal in length to the umbellules. ⊙. H. Native of North America, at the Red river. Cicùta capillàcea, Nutt. in litt. 1825. Fibres of roots in fascicles. Stem simple at the base, 1-2 feet high. Involucrum deflexed.

Nuttall's Discopleura. Pl. 1 to 2 feet.

Cult. The seeds only require to be sown early in spring in the open border.

XLIII. LEPTOCAU'LIS (from λεπτος, *leptos*, slender, and καυλος, *kaulos*, a stem; slender stems). Nutt. in litt. 1825. D. C. coll. mem. 5. p. 39. t. 10. prod. 4. p. 107.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals elliptic, entire. Styles permanent, short. Fruit compressed from the sides, ovate; mericarps with 5 hardly prominent ribs: having one vitta in each furrow between the ribs. Seed convex on the outside, and flattish on the inside; carpophore bifid at the apex.—Glabrous, slender, smooth, erect North American annual herbs. Stems terete. Leaves multifid; leaflets linear. Umbels pedunculate, opposite the leaves, and terminal, with few rays, destitute of involucra: rays of umbellules few and unequal; involucels short, few-leaved. Flowers small, white.

§ 1. *Fruit neither scabrous nor echinated.*

1 L. ine'rmis (Nutt. in litt. ex D. C. prod. 4. p. 107.) fruit

unarmed, rather wrinkled. ⊙. H. Native of North America, at the Red river. D. C. mem. 5. t. 10. f. β. Herb a hand high, smooth, slender. Lobes of leaves or leaflets capillaceous. Umbels 4-5-rayed. Involucel of 3-4 leaves. (f. 62.)

Unarmed-fruited Leptocaulis. Pl. ½ foot.

§ 2. *Fruit muricated or echinated.*

2 L. DIFFU'SUS (Nutt. in litt. ex D. C. l. c.) fruit muricated from rather adpressed bristles; branches and rays of umbel divaricate; umbels and umbellules 3-rayed; pedicels of umbellule about equal in length to the rays of the umbel. ⊙. H. Native of North America, at the Red river. Stem erect, slender, branched at the apex. Lobes of leaves or leaflets capillary. Involucels of 1-2 leaves. Pedicels half an inch long. Flowers white.

Diffuse Leptocaulis. Pl. ½ foot.

3 L. DIVARICA'TUS (D. C. mem. 5. t. 10. f. A.) fruit muricated from rather adpressed bristles; branches and rays of umbel divaricate; umbellules 2-3-rayed; pedicels of umbellules one-half shorter than the rays of the umbel; central flower nearly sessile. ⊙. H. Native of Lower Carolina, in dry pastures. Daúcus divaricàtus, Walt. car. p. 114. Sìson pusíllum, Michx. fl. bor. amer. 1. p. 168. Ell. sketch. 1. p. 356. A'mmi divaricàtum and Ligústicum pusíllum, Michx. fl. amer. bor. 1. p. 168. Pers. ench. 1. p. 308. and 315. Sìson divaricàtus, Spreng. umb. spec. p. 113. Æthùsa divaricàta, Nutt. gen. amer. 1. p. 190. Flowers white.

Divaricate Leptocaulis. Pl. 1 foot.

4 L. PA'TENS (Nutt. in litt. ex D. C. prod. 4. p. 107.) fruit muricated from tubercles; branches divaricate; rays of umbels and umbellules 4-5, rather contracted. ⊙. H. Native of North America, at the red river. This is the largest species of the genus, being a foot high or more. Lobes of leaves or leaflets capillaceous. Flowers white.

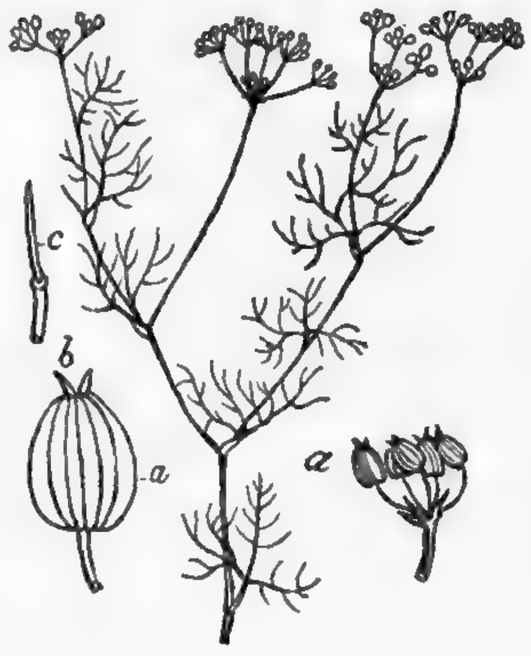
Spreading Leptocaulis. Pl. 1 foot.

5 L. ECHINA'TUS (Nutt. in litt. ex D. C. prod. 4. p. 107.) fruit echinated by spreading bristles; branches at length divaricate; umbels and umbellules 5-rayed, rather diverging. ⊙. H. Native of North America, at the red river.

Echinated Leptocaulis. Pl. ½ foot.

Cult. The seeds only require to be sown in spring.

FIG. 62.



XLIV. PTYCHO'TIS (from πτυχη, *ptyche*, a plait, and ους, ωτος, *ous, otos*, an ear; the petals have a plait in the middle, emitting a little ear or segment). Koch, umb. 124. D. C. coll. mem. 5. p. 39. prod. 4. p. 107.—Bùnium, Lag. am. nat. 2. p. 104.—Séseli species of authors.—Ammoìdes, Adans. fam. 2. p. 96.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals obovate, bifidly emarginate, having a transverse plait in the middle, which emits a little segment. Fruit compressed from the sides, ovate or oblong; mericarps with 5 filiform equal ribs; lateral ribs marginating, having the furrows between the ribs furnished with one vitta each; carpophore bipartite. Seed terete or gibbously convex, flat in front.—Annual or biennial herbs. Cauline leaves multifidly capillaceous. Umbels compound, having the universal involucra variable, and the partial ones of many leaves. Flowers white. This is a very distinct genus from the form of the petals, having the segment not at the apex, but rising from the transverse plait.

Sect. I. Euptychòtis (altered from the generic name). D. C. prod. 4. p. 108. Universal involucrum wanting. Ribs of fruit smooth, not muricated.

1 P. HETEROPHY'LLA (Koch, l. c.) stem erect, much branched, divaricate; radical leaves pinnate; leaflets roundish, deeply serrated; cauline leaves multifid, with linear-filiform segments; fruit oblong; leaves of involucel all setaceous. ♂. H. Native of the south of France, Piedmont, Switzerland, &c. in gravelly and stony fields. Æthùsa Bùnius, Murr. syst. p. 236. D. C. fl. fr. 4. p. 293. Càrum Bùnius, Lin. syst. nat. 12. p. 733. Jacq. vind. 2. t. 198. Æthùsa montàna, Lam. fl. fr. 3. p. 649. Séseli saxífragum, Lin. spec. p. 374. D. C. fl. fr. p. 503. Pimpinélla Genevénsis, Vill. dauph. 2. p. 604. (exclusive of Barrel. syn.) Séseli Bùnius, Vill. dauph. 2. p. 588. Mèum heterophýllum, Mœnch, meth. p. 86. Sìum saxífragum, Roth, fl. germ. 2. p. 338. Sìson divaricàtus, Spreng. in Schultes, syst. 6. p. 411.—Dalech. lugd. p. 774. f. 2.

Variable-leaved Ptychotis. Fl. July. Clt. 1778. Pl. 1½ foot.

2 P. VERTICILLA'TA (Duby, bot. gall. p. 235.) stem erect, branched; leaves all cut into somewhat verticillate capillaceous multifid segments; fruit ovate; some of the leaves of the involucel are setaceous, and others spatulate and awned. ⊙. H. Native of Mauritania, Portugal, Sicily, Corsica, Sardinia, Etruria, Dalmatia, in fields. A'mmi Matthìoli, Dalech. lugd. p. 695. f. 2. Sìson A'mmi, Ucr. hort. pan. p. 132. but not of Lin. ex Guss. Séseli ammoìdes, Gouan. ill. p. 16. but not of Jacq. but perhaps also of Lin. and Spreng. Séseli Túrbith, Ten. ex Steudel. Séseli verticillàtum, Desf. atl. 1. p. 260. D. C. fl. fr. suppl. 5. p. 504. and probably of Spreng. and Link. Ptychòtis ammoìdes, Koch, umb. p. 124. Séseli Córsicum, Link, enum. hort. berol. 1. p. 283. Séseli pusíllum, Brot. fl. lus. 1. p. 457.

Whorled-leaved Ptychotis. Fl. Ju. July. Clt. 1820. Pl. 1 ft.

Sect. II. Trachyspe'rmum (from τραχυς, *trachys*, rough, and σπερμα, *sperma*, a seed; in reference to the muricated fruit). Link, enum. 1. p. 267. Universal involucra composed of a few linear entire or trifid leaves. Fruit muricated.

3 P. Cóptica (D. C. mem. soc. gen. vol. 4.) stem erect, branched; leaves nearly all cut into linear multifid lobes: upper leaves simply pinnate-lobed; umbels 8-12-rayed; leaves of involucra linear, rarely trifid; leaves of involucels linear; fruit ovate, muricated. ⊙. H. Native of Egypt and Candia. A'mmi Cópticum, Lin. mant. p. 56. Jacq. hort. vind. 2. p. 196. Daúcus Cópticus, Pers. ench. 1. p. 307. Bùnium Cópticum, Spreng. prod. umb. p. 28. Trachyspérmum Cópticum, Link, enum. 1. p. 267. A'mmi, Riv. pent. irr. t. 95. Bùnium aromáticum, Lin. mant. 218. A'mmios Cóptica, Mœnch. meth. p. 99.—J. Bauh. hist. 3. p. 2. p. 25. with a figure. Lob. icon. 725. f. 2. The petals exhibit a little segment, but it is adnate to the middle nerve. The plant is falsely called *Còn*ium *Africànum* in the gardens.

Var. β, fœniculifòlia (D. C. prod. 4. p. 108.) umbels of 6-7 rays. ⊙. H. Native of Greece, in corn-fields. Séseli ammoìdes, Jacq. hort. vind. 1. t. 52. Smith, prod. fl. græc. 1. p. 199. but not of Gouan, but probably of Lin. and Spreng. Séseli fœniculifòlium, Poir. dict. 7. p. 137. Sìson A'mmi, Lam. herb. Habit of *Helosciàdium capillàceum* or *H. leptophýllum*, but with the petals of the rest of the genus *Ptychòtis*.

Coptic Ptychotis. Fl. June, July. Clt. 1773. Pl. 2 feet.

4 P. ANETHIFÒLIA (D. C. prod. 4. p. 108.) stem erect, branched; leaves all multifid, with linear hair-like segments; umbels of 20 rays; rays rather pubescent; leaves of involucra linear, undivided. ⊙. H. Native of Nipaul. Athamántha? anethifòlia, Wall. mss. Pimpinélla anethifòlia, D. Don, prod. fl. nep. p. 184. Perhaps only an uncultivated variety of P. Ajòwan, ex Wall. but the leaves are much more jagged and larger, and the rays of the umbel more numerous.

Fennel-leaved Ptychotis. Pl. 1 foot.

5 P. Ajo'wan (D. C. mem. soc. gen. vol. 4.) stem erect, dichotomous; leaves few, cut into multifid linear segments: upper leaves pinnatifid; umbels of 7-9 rays; leaves of the involucra linear, undivided. ⊙. H. Native of the East Indies, where it is called *Juvanee*, *Ajouan*, *Ajowan* or *Ajawain*. Ligústicum Ajòuan, Roxb. hort. beng. p. 21. Athamántha Ajòwan, Wall. mss. Ligústicum Ajàwain, Schultes, syst. 6. p. 556. Fleming, ind. med. in asiarch. 1. p. 170. journ. bot. 4. p. 200. Ajava-seed, Perciv. ess. 1. p. 453. Very like *P. Cóptica*, but differs in the stem being less leafy, in the umbels being of fewer rays, in the rays being puberulous, and in the fruit being more ribbed, but puberulously tubercular in the same way. The fruit of this plant is prescribed in India in diseases of horses and cows.

Ajowan Ptychotis. Pl. 1 to 2 feet.

6 P. Roxburghia'na (D. C. prod. 4. p. 109.) stem erect, dichotomous; leaves ternate; leaflets deeply pinnatifid: lobes oblong-linear; umbels of 6-8 rays; leaves of involucrum few. linear, undivided. ⊙. H. Native of and cultivated in various parts of India, but particularly in Bengal, in the island of Singapore, and the mountains of Prome, &c. ex Wall. A'pium involucràtum, Roxb. ex journ. bot. 1824. vol. 2. p. 188. Athamántha Roxburghiàna, Wall. mss. and herb.

Roxburgh's Ptychotis. Pl. 1 to 2 feet.

7 P. achilleæfòlia (D. C. prod. 4. p. 109.) stem erect, a little branched; leaves bipinnate; leaflets pinnatifid; lobes linear-subulate, trifid, stiffish; umbels of 6-8 rays; leaves of involucra few, linear-lanceolate; fruit glabrous, rather muricated on the back along the ribs. ⊙. H. Native of Nipaul and Kamaon. Athamántha achilleifòlia, Wall. mss. A very distinct species, but the fruit on the specimen examined not being mature, the genus to which it belongs is still rather doubtful.

Milfoil-leaved Ptychotis. Pl. 1 foot.

Sect. III. Heteróptycha (from ἕτερος, *heteros*, variable, and πτυχη, *ptyche*, a plait; in allusion to the middle nerve of the petals being lamellate above, and varying in this respect from the rest of the sections). D. C. prod. 4. p. 109. Universal involucra none. Teeth of calyx nearly obsolete. Petals rather emarginate, having the middle nerve lamellate above. Fruit echinated by bristles. Styles long, diverging a little.—Perhaps a proper genus. Mature fruit unknown, and therefore also the vittæ.

8 P. pube'rula (D. C. prod. 4. p. 109.) stem erect; leaves and rays of umbel beset with short hairs in every part. ⊙. H. Native of the Levant, about Bagdad. Rays of umbel 6-9 lines long; and those of the umbellules 2 lines long.

Puberulous Ptychotis. Pl. 1 to 2 feet.

9 P. barba'ta (D. C. l. c.) stems erect, and are as well as the lobes of the leaves glabrous; but with the sheath of the petiole and limb of the leaf at the origin of the leaflets bearded with soft hairs. ⊙. H. Native of the Levant, between Bagdad and Kermancha. Rays of umbel 5-6 lines long, and those of the umbellules hardly 2 lines long. Perhaps only a variety of the preceding species.

Bearded Ptychotis. Pl. 1 foot.

10 P. Vargasia'na (D. C. l. c.) stem much branched, erect, glabrous as well as the leaves: leaves pinnate: leaflets cuneated, cut at the apex; involucrum almost wanting; fruit clothed with short pubescence. ⊙. H. Native of South America, about Caraccas, where it was collected by Vargas. Perhaps this plant belongs to a different section of the genus.

Vargas's Ptychotis. Pl. 1 to 2 feet.

Cult. The species being natives of rather warm latitudes, their seeds will require to be sown in warm sheltered situations, or they may be reared in a hot-bed in spring, and the plants afterwards planted out in the open border in May.

XLV. FALCA'RIA (from *falx*, a sickle). Riv. pentap. (1699) no. 48. with a figure. Host, fl. austr. 1. p. 381. but not of Cav. . D. C. prod. 4. p. 109.—Drepanophýllum, Koch, umb. p. 123. but not of Hook.—Drepanophýllum species, Hoffm. umb. 110.—Critàmus, Bess. Vohl. p. 93. Koch, emend. umb. l. c. but not of Hoffm.—Sium species of Lin.—Prionìtis, Delarb. fl. auv.—Critàmus species, Koch, deutschl. fl. 2. p. 441.

Lin. syst. *Pentándria*, *Digýnia*. Margin of calyx 5-toothed; the tube in the sterile flowers wanting, but those in the fertile flowers are cylindrical. Petals obovate, curved, emarginate, with a broad recess, having the terminating segment reflexed. Styles divaricate. Fruit oblong, compressed from the sides; mericarps furnished with 5, filiform, equal ribs: lateral ribs marginating; carpophore free, bifid; furrows between the ribs furnished with 1 filiform vitta each. Seed teretely convex, flattish in front.—Glabrous, perennial herbs. Leaves pinnate; leaflets broad-linear, decurrent, cartilaginously serrated. Umbels opposite the leaves and terminal, compound, of many rays; involucra of many leaves; involucels somewhat dimidiate, in consequence of the inner leaves being small. Flowers white, having hermaphrodite, fertile ones, and male sterile ones in the same umbellule. This genus differs from *Sium* in the petals being curved, in the furrows of the fruit being furnished with 1 vitta each, and in the carpophore being free and bifid.

1 F. Rivi'ni (Host, l. c.) leaves pinnate, glaucescent; leaflets decurrent, linear-lanceolate, sharply serrated; serratures contiguous. ♃. H. Native of south and middle Europe, Caucasus, and Altaia, in plains at the river Irtysch; and of the Levant, in the more elevated fields and pastures. Sium Falcària, Lin. spec. p. 362. Jacq. fl. aust. t. 257. Bùnium Falcària, Bieb. fl. taur. 1. p. 211. Drepanophýllum agréste, Hoffm. et Koch, l. c. Séseli falcària, Crantz, austr. p. 208. Critàmus agréstis, Bess. enum. volh. p. 93. Sium falcàtum, Dub. orl. p. 442.—Lob. icon. 2. t. 24. f. 1. Críthmum umbellíferum, Bauh. hist. 3. p. 195. Roots creeping under ground.

Rivin's Falcaria. Fl. July, Aug. Clt. 1726. Pl. 1 to 2 feet.

2 F. Dahu'rica (D. C. prod. 4. p. 110.) leaflets somewhat serrated: serratures acute, distant. ♃. H. Native of Dahuria. Sium, Gmel. sib. 1. p. 200. no. 14. t. 47. Sium cicutifòlium, Gmel. syst. 2. p. 1. t. 482. Sium latifòlium β, Bieb. fl. taur. 1. p. 243. Cicùta Dahùrica, Fisch. cat. hort. gor. p. 45. Spreng. in Schultes, syst. 6. p. 453. Critàmus Dahùricus, Hoffm. umb. p. 184. Furrows of the fruit, according to Hoffmann, furnished each with 1-3 vittæ, and the commissure with 4-5 vittæ. Flowers all fertile, according to the plants examined.

Dahurian Falcaria. Fl. July, Aug. Clt. 1817. Pl. 2 to 3 ft.

† *Species hardly known.*

3 F. Java'nica (D. C. prod. 4. p. 110.) leaves pinnate or bipinnate; leaflets ovate-oblong, deeply serrated; umbels opposite the leaves; involucrum wanting; but the involucels are of many setaceous leaves. ♃. B. F. Native of Java, in marshes, where it is called *Tespong* by the natives. Sium Javánicum, Blum. bijdr. p. 881. The furrows of the fruit are furnished with 1 vitta each, and the commissure with 2, as in the following species.

Java Falcaria. Pl. 1 to 2 feet.

4 F. lacinia'ta (D. C. prod. 4. p. 110.) leaves bipinnate; leaflets pinnatifid; umbels opposite the leaves; involucrum wanting; involucels of many setaceous leaves. ♃. B. F. Native of Java, in the province of Batavia, in marshes. Sium laciniàtum, Blum. l. c. Perhaps a species of *Oenánthe*.

Jagged-leaved Falcaria. Pl. 2 to 3 feet.

5 F.? diversifòlia (D. C. l. c.) superior leaves ternate;

leaflets petiolate, quite entire, some linear and others filiform. ♃. H. Native of Nipaul. Sìson? diversifòlius, Wall. mss. Stem much branched. Herb glabrous. Lower leaves unknown. Fruit ovate. Flowers all hermaphrodite. Mature fruit not seen, and therefore the vittæ are not well known. Both the involucra and involucels are composed of a few linear, short, acute, undivided leaves.

Diverse-leaved Falcaria. Pl. 2 feet.

Cult. The two first species will grow in any soil, and under any circumstance. Those natives of Java will require to be grown in a stove.

XLVI. SI'SON (from *sisum*, Celt. a running stream; some plants formerly contained in this genus were inhabitants of running streams). Lag. am. nat. 2. p. 103. Koch, umb. p. 123. D. C. prod. 4. p. 110.—Sìson species, Lin. and all other authors.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals roundish, curved, deeply emarginate, with an inflexed point. Styles very short. Fruit compressed from the sides, ovate; mericarps with 5 filiform equal ribs; lateral ribs marginating: having one short, club-shaped vitta in each furrow between the ribs; carpophore bipartite. Seed gibbously convex, flattish in front.—Herbs paniculately branched. Leaves pinnate; lower leaflets a little lobed, toothed, or cut: upper ones linear, multifid. Both the involucra and involucels are composed of few leaves. Umbels of 4 unequal, elongated rays; and the umbellules of 4-5-short rays.

1 S. Amòmum (Lin. spec. p. 362.) stem erect, terete, paniculately branched; leaves pinnate; lower leaflets rather lobed and toothed: upper ones linear-multifid; upper leaves ternate. ♂. H. Native of Britain, France, Italy, Sicily, Greece, &c. in fields, on a dry calcareous soil; in Britain not unfrequent in rather moist spots under hedges, where the soil is marly or chalky. Jacq. hort. vind. 3. t. 17. Hayn. term. bot. t. 36. f. 10. Schkuhr, handb. t. 65. Smith, engl. bot. t. 954. Sìum aromáticum, Lam. dict. 1. p. 405. Séseli Amòmum, Scop. carn. ed. 2. no. 355. Cicùta Amòmum, Crantz, aust. p. 96. Smýrnium heterophýllum, Mœnch, meth. p. 97. Flowers cream-coloured. Seeds aromatic and pungent when dry and ripe; but in an early state they, like the whole herb, have a peculiar nauseous smell.

Amomum or Ginger-seeded Stone-parsley. Fl. July, Aug. Britain. Pl. 2 to 3 feet.

† *Doubtful species.*

2 S.? Sieberia'num (D. C. prod. 4. p. 111.) plant glabrous, dwarf; leaves almost radical, ternate, or tripartite; segments approximate, cuneated at the base, very blunt at the apex, crenately toothed, or somewhat cut; involucrum wanting. ⊙.? H. Native of Candia, on the tops of the Sphaceotic mountains. Sìson alpìnus, Sieb. in Schultes, syst. 6. p. 414. Peucédanum Créticum, Sieb. herb. cret. 1826. Spreng. neu. entd. 2. p. 148. From the immature fruit this appears to be a species of *Càrum* or *Bùnium*, the fruit being compressed from the margin, not from the back. Stem a finger in height. Umbels 4-5-rayed.

Sieber's Stone-parsley. Pl. ¼ foot.

3 S. trine'rve (Hamilt. ex D. Don, prod. fl. nep. p. 184.) stem erect, terete, dichotomous, striated, nearly naked; leaves all radical, pinnate; leaflets lanceolate, acute, quite entire, 3-nerved, glabrous; involucrum 5-leaved; leaves of involucels lanceolate, awned. ♃. H. Native of Nipaul, about Bassaria. The fruit is undescribed, and the genus is therefore doubtful.

Three-nerved-leaved Stone-parsley. Pl. 1 foot.

Cult. The seeds of the species only require to be sown in spring, in any common earth.

XLVII. SCHU'LTZIA (in honour of John Henry Schultze, a celebrated German botanist). Spreng. umb. spec. p. 102. and in Schultes, syst. 6. p. 44. Lag. am. nat. 2. p. 99. D. C. prod. 4. p. 112. Sìson species, Pall.—Schúltzia, Spreng. umb. prod. p. 30.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals elliptic, terminated by a short inflexed point. Stylopodium conical. Styles erect, rather capitate at the apex, permanent, at length diverging. Fruit cylindrically prismatic, the transverse section nearly terete; mericarps somewhat compressed from the sides, and furnished with 5 filiform, exserted ribs: the 2 lateral ribs nearly marginal: having the furrows between the ribs flat, and furnished with 1 vitta each. Carpophore undivided. Seed nearly terete.—Smooth perennial herbs. Leaves either radical, or from the lower part of the stem, bipinnate; leaflets many-parted, decussate at the rachis: segments linear, acute. Umbels terminal, on long peduncles of many rays. Both the involucra and involucels are composed of many multifid leaves; the lobes linear and acute. Flowers white, all fertile.

1 S. crini'ta (Spreng. l. c.). ♂. H. Native of the Altaia, on the highest of the mountains, not far from the torrent of Tegerek. Sìson crinìtum, Pall. act. petrop. 1779. 12. p. 250. t. 7. Willd. spec. 1. p. 1438.

Long-haired Schultzia. Fl. July, Aug. Clt. 1818. Pl. 1 ft.

Cult. The seeds only require to be sown in the open ground.

XLVIII. A'MMI (from αμμος, *ammos*, sand; habitation of plants). Tourn. inst. t. 159. Lin. gen. no. 334. Spreng. umb. prod. p. 41. Lag. am. nat. 2. p. 104. Koch, umb. p. 122. D. C. prod. 4. p. 112.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals obovate, emarginately 2-lobed, with an inflexed point; lobes of petals unequal, irregular, those of the outer part of the umbel usually the largest. Fruit ovate-oblong, compressed from the sides; mericarps furnished with 5 equal, filiform ribs: lateral ribs marginating: having the furrows between the ribs furnished with one vitta each; carpophore free, bipartite. Seed teretely convex on the outside, and flattish in front.—Herbs with the habit of *Daúcus*, having fusiform roots and pinnate or many-parted leaves. Umbels compound, of many rays. Both the involucra and involucels are of many leaves; the leaves of the involucrum trifid or pinnatifid. Flowers white.

1 A. ma'jus (Lin. spec. p. 349.) stem glabrous; leaves pinnate; leaflets with cartilaginous, sharply serrulated margins; those of the inferior leaves obovate-oblong, and those of the upper ones multifid, linear-lanceolate. ⊙. H. Native of south and middle Europe, Egypt, and the Levant; also of Newfoundland. Lam. ill. 193. Smith, fl. græc. t. 273. Schkuhr, handb. t. 61. A'pium A'mmi, Crantz, aust. 217. A'mmi Boebèri, Hoeq. diss. abo. 1810. and A. cicutæfòlium, Willd. herb. ex Schultes, syst. 6. p. 591. do not differ in any particular from *A. màjus*. The A. Boebèri, Hoffm. umb. XVIII. Horn. suppl. p. 32. is merely a larger variety of the present species.—Lob. icon. t. 721. f. 1. Mill. fig. 25.—Plench. icon. 181. Blackw. t. 447. Flowers white: outer ones of the umbels large, like those of the rest of the species. Stem-leaves biternate.

Greater or Common Bishop's-weed. Fl. June, July. Clt. 1557. Pl. 3 to 4 feet.

2 A. glaucifòlium (Lin. spec. 349. exclusive of the synonyme of J. Bauh.) stem glabrous; leaves all bipinnate, jagged; segments narrow-linear, acute, and a little serrated. ♂. H. Native of France, at Lucon (Guett. etamp. 2. p. 433.), about Paris (Thuill. par. 137.) Andegaveny (Bast. ess. 105.), Rouen, Nannetes, and in Dauphiny (Vill. dauph. 2. p. 592.), Greece, (Smith, prod. fl. græc. 1. p. 185.), Spain at Aranjuez, Sicily, Liguria. This species differs from *A. màjus* in the characters mentioned above, and in the more branched habit and glaucous

hue. There is a monstrous variety of this species, found about Rouen, which has the 2 carpels changed into petals, besides having also the usual number of petals.

Glaucous-leaved Bishop's-weed. Fl. June, July. Clt. 1816. Pl. 2 to 3 feet.

3 A. intermedium (D. C. prod. 4. p. 113.) plant glabrous; leaves all decompound, many-parted, greenish; segments cut or toothed: lower ones cuneated: upper ones linear-subulate, serrated, and ending in long taper points. ⊙. H. Native of the Pyrenees, and the kingdom of Naples. A. glaucifòlium, Lapeyr. fl. pyr. p. 144. An intermediate plant between *A. glaucifòlium* and *A. Visnàga*. It differs from the first in the leaves being greenish, not glaucous, and in being tripinnate; from the last in the lobes or leaflets of the upper leaves being much acuminated and serrated, and in the umbel spreading after flowering.

Intermediate Bishop's-weed. Pl. 1 to 2 feet.

4 A. Visna'ga (Lam. dict. 1. p. 132.) stem terete, striated, glabrous; leaves decompound; lobes or leaflets linear, cuspidate, divaricate; rays of umbel contracted after flowering, and indurated. ⊙. H. Native of the south of Europe, in fields; north of Africa, Caucasus near Kuby, and in plains towards the Caspian Sea, and the Levant; also in Chili, at Mendoza and Hacienda de Vasquez, between Casa Blanca and Valparaiso. D. C. fl. fr. 4. p. 327. Daúcus Visnàga, Lin. spec. 348. Jacq. hort. vind. 3. t. 26. Visnàga daucoìdes, Gærtn. fruct. 1. p. 92. t. 21. Visnàga, Vill. dauph. 2. p. 594. Daúcus gingídium, Lin. herb. ex Smith, Gohòria, Neck. elem. no. 287.—Garid. aix. t. 36.—Lob. icon. 726. f. 1. Umbels often not very much above the leaves. Receptacle of the rays of the umbel not much dilated. Rays crowded, very numerous, and at length they become so hard as to be used as tooth-picks, hence the name of the plant in France *herbe aux cure-dents*. In Spain, when they have served this purpose, they are chewed, and thus are supposed to be of service in cleaning and fastening the gums; however this may be, the leaves have a pleasant aromatic taste in the mouth. Flowers with white petals and purple anthers.

Tooth-pick Bishop's-weed. Fl. June, Aug. Clt. 1596. Pl. 2 to 3 feet.

5 A. daucoìdes (Salzm. pl. exsic. ann. 1825. ex D. C. prod. 4. p. 113.) stem terete, striated, muricated, having a few scattered bristles at the top of the petioles and branchlets; leaves bipinnate, rather ciliated; leaflets linear, cut, acute; leaves of involucel either simple or trifid; fruit covered all over with small, obtuse tubercles. ⊙. H. Native about Tangiers. Habit almost of *Daúcus*. Umbels nearly as in *A. Visnàga*, having the receptacle of the rays of the umbel thickened, and the rays very numerous. Fruit ribbed, as in the rest of the genus, but differs in being muricated.

Carrot-like Bishop's-weed. Pl. 2 feet.

6 A. crini'tum (Guss. pl. rar. p. 128. t. 25. prod. p. 332.) stem terete, striated, glabrous, rather setose at the apex; leaves supra-decompound; lobes or leaflets linear-setaceous, glabrous; petioles bristly; margins of the sheaths of the petioles scarious; fruit glabrous, somewhat tetragonal. ⊙. H. Native of Calabria and Sicily, in fields. Leaves of involucrum multifid, reflexed. Flowers yellow in the dry state, as in *Daúcus aúreus*.

Hairy Bishop's-weed. Pl. 2 to 4 feet.

7 A. anethifòlium (Lam. dict. 1. p. 132.) stem furrowed, glabrous; leaves decompound; lobes or leaflets multifid, capillary; petioles channelled; leaves of involucrum capillary, trifid. ♂.? H. Native of the Levant, or Siberia. Daúcus meoìdes, Pers. ench. 1. p. 308. Umbels terminal, flat. Stem and rays of umbel reddish. Fruit quite glabrous. Leaves of involucels sometimes trifid.

Fennel-leaved Bishop's-weed. Fl. Ju. Jul. Clt. 1818. Pl. 2 feet.

8 A. pu'milum (D. C. prod. 4. p. 113.) stem erect, angular, leafy, glabrous; leaves bipinnate; segments or leaflets pinnatifid; lobes linear; umbels opposite the leaves, pedunculate; leaves of involucels numerous, with scarious margins, and are rather scabrous, as well as the rays; some of the leaves of the involucra are trifid at the apex. ⊙. H. Native of Portugal, in sandy places, at the river Tavora, and elsewhere in Beira. Sìson pùmilus, Brot. fl. lus. 1. p. 425. Fruit, according to Brotero, like that of parsley. Lower leaves like *A. glaucifòlium*. Petals obovate, unequally obcordate. Herb a foot high, not dwarf. This is joined by Sprengel with *Ptychòtis verticillàta*, but it is very distinct from that plant; but from the obsolete teeth of the calyx, and from the leaves of the involucrum being sometimes trifid, it comes nearest to the present genus, although it may hereafter form a proper genus, from the fruit being much more angular?

Dwarf Bishop's-weed. Pl. 1 to 1½ foot.

9 A. Broussone'tii (D. C. prod. 4. p. 113.) stem erect, terete, leafy, glabrous, branched; lower leaves unknown; upper ones tripartite: lobes cuneate-oblong, entire or tridentate; leaves of involucrum linear or rarely trifid; young fruit rather scabrous from adpressed short hairs. ⊙. H. Native of Africa, probably about Mogador. Habit nearly of *A. màjus* and *A. glaucifòlium*, but the involucra are very different.

Broussonet's Bishop's-weed. Pl. 1 to 2 feet.

10 A. cicuta'rium (Willd. rel. in Schultes syst. 6. p. 531.) stem angularly-furrowed, quite glabrous, furnished with few leaves; leaves ternately tri-pinnatifid: ultimate segments lanceolate, very acute, trifid; umbels with 6-8 rays; leaves of involucra bipinnate: having the lobes or leaflets linear, and deeply toothed. ⊙.? H. Native of South America, but in what place is unknown. Plant small. Schlecht in litt. Petioles 3 to 4 inches long. Rays of umbel stiff, angular, shorter than the involucrum. Leaves of involucel pinnatifid or trifid. Fruit ovate, compressed from the sides, glabrous; styles short, diverging. Ribs of mericarps rather prominent, having the furrows between the ribs furnished with 1 vitta each, and the commissure with 2 vittæ.

Cicuta-like Bishop's-weed. Pl. 1 foot.

* *Species not sufficiently known.*

11 A.? Pyrena'icum (Lapeyr abr. p. 145.) stem glabrous, flexuous; leaves somewhat bipinnate; lobes or leaflets entire or cut, ultimate ones decurrent; leaves of involucels setaceous or trifid, twice the length of the umbellules. ⊙. H. Native of the Pyrenees, in fields about Madres and St. Beat. The petals are said by La Peyrouse to be rounded (arrondis) which indicates that the plant does not belong to this genus.

Pyrenean Bishop's-weed. Pl. 1 foot.

12 A. rubricau'le (Horn. hort. hafn. 1. p. 272.) stem unknown; leaves somewhat verticillately tripinnate: leaflets capillary; leaves of involucel compound, longer than the umbellule. ♂. H. Native of North America, near Baltimore. Perhaps the same as *A. anethifòlium*.

Red-stemmed Bishop's-weed. Pl. 1 to 2 feet.

Cult. The species of *Ammi* are very showy while in flower; the seeds of them only require to be sown in the open ground early in spring.

XLIX. ÆGOPO'DIUM (from αιξ, *aix*, a goat, and ποδιον, a dim. of πους, *pous*, a foot; probably from the shape of the leaves.) Lin. gen. no. 368. Hoffm. umb. gen. p. 82. t. 1. f. 6. Koch, umb. p. 122. D. C. prod. 4. p. 114.—Podagrària Riv. peut. t. 47.

Lin. syst. *Pentándria Digýnia*. Margin of calyx obsolete. Petals obovate emarginate, with an inflexed point. Stylopodium

distinct, conical, terminated by the long deflexed styles. Fruit compressed from the sides, ovate; mericarps with 5 filiform ribs: lateral ribs marginating; furrows between the ribs destitute of vittæ. Carpophore setaceous, forked at the apex. Seeds teretely convex on the outside, and flattish on the inside. Branching herbs, with creeping roots. Leaves biternate or triternate; upper cauline ones ternate: leaflets ovate-oblong, acuminated, serrated. Umbels composed of many rays. Both the involucra and involucels are wanting. Flowers white: anthers when young purple.

1 Æ. PODAGRA'RIA (Lin. spec. p. 379.) stem furrowed; leaves biternate or triternate; leaflets oblong-serrated, unequal at the base, lower ones binate. 4. H. Native throughout the whole of Europe, even to Caucasus and Siberia, in hedges and orchards. Very common in some parts of Britain. Oed. fl. dan. t. 670. Smith engl. bot. t. 940. Schkuhr, handb. t. 79. Riv. t. 47. Tragoselìnum angélica Lam. fl. fr. 3. p. 449. Pimpinélla angelicæfòlia, Lam. dict. 1. p. 451. Ligústicum podagrarìa, Crantz. aust. p. 200. Séseli Ægopòdium, Scop. carn. ed. 2. no. 359. Podagrària Ægopòdium Mœnch, Meth. p. 90. Sìson Podagrària Spreng. umb. prod. p. 35.—Lob. icon. t. 700. f. 2. The plant is called *Herb Gerard*, *Gout-weed*, *Ash-weed*, or *Ach-weed*, and *Wild Masterwort*, and being a great creeper, it cannot be admitted into gardens, for after it gets hold it is next to impossible to eradicate it again. Though it has the quality of most umbelliferous plants, of being aromatic, yet it is not used at all in medicine; nor has it any title to its name gout-weed, though the Germans formerly used it to assuage the pain both of the gout and piles. Linnæus says it is eaten in Sweden, boiled for greens, when tender in the spring. The roots are sometimes sold for those of the true Masterwort, the *Imperatòria Ostrùthium*.

Gout-weed. Fl. May, July. Britain. Pl. 2 to 3 feet.

2 Æ. ALPE'STRE (Led. fl. ross. alt. ill. t. 7. fl. alt. 1, p. 354.) stem smooth; lower leaves ternately pinnate; leaflets ovate, cut, lower and terminal ones somewhat tripartite; upper leaves ternate, having the leaflets pinnate at the base, but drawn out at the apex, and nearly entire. 4. H. Native of Altaia, in shady places on the north sides of the mountains near Riddersk, about the fountains of the rivers Uba and Tscharuych. Root creeping. Flowers white.

Alp Gout-weed. Fl. Ju. July. Pl. 1 to 2 feet.

Cult. The plants will grow under any circumstance.

L. CA'RUM (so named from Caria, in Asia Minor; originally found there) Kock. umb. p. 121. D. C. coll. mem. 5. p. 41. prod. 4. p. 414. Càrum, Sìson, and Bùnium species of Lin. and Hoffm.—Càrum and Sìum species of Spreng.

LIN. SYST. *Pentándria Digýnia*. Margin of calyx obsolete. Petals regular obovate, emarginate, with an inflexed point. Stylopodium depressed; styles deflexed. Fruit contracted from the sides, ovate or oblong; mericarps furnished with 5 filiform, equal ribs: lateral ribs marginating; having the furrows between the ribs furnished with one vitta each, and the commissure, which is flat, with two vittæ. Carpophore free, forked at the apex. Seed terete, convex on the back, and flattish in front. Herbs glabrous, usually perennial. Roots tuberous, edible. Leaves pinnate; segments or leaflets multifid. Both the involucra and involucels are variable. Flowers white.

SECT. I. CA'RVI (an alteration of the generic name). D. C. prod, 4. p. 115.—Càrum, Lin.—Càreum, Adans. fam. 2. p. 98. Involucrum wanting; involucels wanting, or of very few leaves.

1 C. CA'RVI (Lin. spec. 378.) root fusiform; leaves bipinnate; leaflets decussate, multifid; stems furrowed; involucra and involucels wanting. 4. H. Native throughout the whole of Europe, in meadows and pastures; and of Altaia, in dry grassy places at the river Tscharaiych. Frequent in Britain, but is only a naturalised plant. Fl. dan. 1091. Smith, engl. bot. t. 1503. Nees, off. pfl. 14. t. 17. Mart. rust. t. 55. Hayn. arzn. gew. 7. t. 19. Woodv. med. bot. Jacq. aust. t. 393. A'pium Cárvi Crantz, aust. p. 218. Séseli Cárvi, Scop. carn. no. 361. Bùnium Cárvi, Bieb. fl. taur. 1. p. 211. suppl. p. 206. Lagæ'cia cuminoìdes, Willem. phyt. 1. p. 254. but not of Lin. Cárvi, Riv. pent. irr. with a figure. Flowers white. Leaflets of leaves in sixes, appearing rather verticillate. The caraway is called *Carvi* in France, Italy, and Scotland, and Kummel in Germany. The plant is cultivated chiefly for the seed, which is used in confectionary and in medicine. In spring the under leaves are sometimes put in soups; and in former times the fusiform roots were eaten as parsnips, to which Parkinson gives them the preference.

Garden culture.—The plant is raised from seed, of which a quarter of an ounce is sufficient for a seed-bed 4 feet by 6. Sow annually, in autumn, soon after the seed is ripe: the seedlings will rise quickly, and should be thinned to a foot distance each way. In default of sowing in autumn, sow in March or April, either in drills or broad-cast; but the plants so raised will not, in general, flower till the following year. When the seed is ripe, the plant is generally pulled up in gathering, especially in field culture.

Field culture.—The culture and management of the caraway is the same as that of *Coriander*. In all probability both plants would answer if sown like clover among a crop of corn, hoed and thinned when the crop was removed, and again in the following spring. The method of culture in Essex is, about the beginning of March to plough some old pasture land; if it has been pasture for a century the better; and the soil should be very strong clayey loam. Twelve pounds of caraway-seed are mixed with ten pounds of coriander, and twelve pounds of teazle-seed; this is sufficient for an acre, and is sown directly after the plough, harrowing the land well. When the plants appear of sufficient strength to bear the hoe, which will not be until about ten weeks after sowing, it must not be omitted; and in the course of the summer the crop will require three hoeings, besides one at Michaelmas. The coriander, being annual, will be fit to cut about the beginning of July. It is left in the field after cutting, and threshed on a cloth in the same manner as rape-seed. About April following the caraway and teazle will want a good hoeing, done deep and well, and another about the beginning of June. The caraway will be fit to cut the beginning of July, and must be threshed in the same manner as the coriander. This compound crop is mostly sown on lands so strong as to require being a little exhausted to make it fit for corn. Caraway and coriander are oftenest sown without teazle; the latter being a troublesome and uncertain crop, and the produce of caraway much greater without it. The produce of caraway, on very rich old leys, in the hundreds or low lands of Essex, has often been twenty cwt. to the acre. There is always a demand for the seed in the London market. The uses of caraway-seed are the same as those of coriander, and its oil and other preparations are more used in medicine. Dr. Anderson says, both the roots and tops may be given to cattle in spring. The seeds have an aromatic smell, and warm pungent taste, and yield much essential oil. They are employed as stomachic and carminative, in flatulent colics. The oil is used in the same way as other volatile oils.

Var. β, pterochlœ'num (D. C. prod. 4. p. 115.) leaves of involucrum few and multifid. ⊙. H. Native of Montbelliard, in humid meadows not unfrequent.

Var. γ, nànum (D. C. l. c.) stems short. 4. H. Native of the Apennines. Pimpinélla vaginàta, Jan. herb.

Var. δ, elongàtum, segments of the leaves linear, elongated. 4. H. Native of Canada. C. Cárvi, var. β, Hook, fl. bor.

amer. 1. p. 661. Differing from the European plant in the leaves being remarkably long and slender.

Var. ε, *ròseum*, flowers rose-coloured. ♃. H. Native of Altaia, near Krasnajaparki, at the river Irtysh.

Common Carvi, or Caraway. Fl. May, Ju. Britain. Pl. 1½ foot.

2 C. RIGÍDULUM (Koch, in litt. ex D. C. prod. 4. p. 115.) root fusiform; stem nearly naked, sparingly branched, quite glabrous; lower leaves pinnate: leaflets many-parted, even from the base: lobes linear-subulate, acute, undivided or parted; upper sheaths adpressed, almost leafless; involucrum almost wanting; leaves of involucels linear-subulate, about equal in length to the umbellules; fruit glabrous. ♃. H. Native of Liguria, about Sarzana, &c. Selìnum rigídulum, Viv. fl. ital. fragm. 1. p. 14. t. 15. ann. bot. 1. p. 2. p. 164. Spreng umb. spec. 76. Bertol. amœn. ital. p. 348. S. Appiànum, Pers. ench. 1. p. 309. S. Appiànum, Viv. cat. Séseli pimpinelloìdes Lin. spec. p. 372. Willd. nov. act. nat. cur. 4. p. 109. spec. 1459; but the plant under this name from Sprengel is S. Peucédanum Chabræ'i, var. β, Podòlicum.

Stiff Caraway. Fl. July, Aug. Clt. 1826. Pl. 1 foot.

SECT. II. BULBOCA'STANUM (from *bulbus*, a bulb, and *castanea*, a chestnut; the root is bulbous, and tastes like a chestnut.) Adans. fam. 2. p. 97. but not of Lag. Both the involucra and involucels are many-leaved.

* *Root bulbous.*

3 C. BULBOCA'STANUM (Koch, umb. p. 121.) root globose; stems terete, branched; leaves decompound; leaflets linear, cuspidate, a little channelled, quite entire, and rather bifid: leaves of involucra and involucels numerous, subulate. ♃. H. Native of Europe in heaths, pastures, among bushes, and in woods. Bunium, bulbocástanum, Lin. spec. p. 349. Fl. dan. t. 220. Lam. ill. t. 197. Bùnium mìnus Gouan. ill. p. 10. Bùnium flexuòsum, Smith. Sìum Bulbocástanum, Spreng in Schultes, syst. 6. p. 538. Scándix Bulbocástanum, Mœnch, meth. p. 101.—Lob. icon. t. 745. f. 1. Tuber or root spherical, black on the outside and white inside, of an agreeable sweet taste. Root leaves tripinnate, cauline ones bipinnate.

Bulbocastanum, or Earth-nut. Fl. May, Ju. Pl. 1 to 2 ft.

** *Root fasciculate.*

4 C. VERTICILLA'TUM (Koch, umb. p. 122.) root fasciculate, with spindle-shaped branches; stem terete, hardly branched; leaves pinnate; leaflets many-parted; segments crowded in a whorled manner, linear-filiform; leaves of both involucra and involucels numerous, short, and deflexed. ♃. H. Native of the western parts of Europe, from Corsica to Britain; plentiful in the western parts of Scotland and Wales; in Ireland, near Lane bridge, Killarney, and between Bantry Bay and the river Kenmare. Sìson verticillàtum, Lin. spec. 363. Smith, engl. bot. t. 395. Lightf. scot. 1096. t. 35. Sìum verticillàtum, Lam. dict. 1. p. 407. Carvi foliis tenuissimis asphodeli radice, Tourn. inst. 306. Carvi Lusitánicum, &c. Juss. herb. Sprengel refers to this the Æthùsa fàtua, Ait. hort. kew, 1. p. 355. or Mèum fàtuum, Pers. ench. 1. p. 319. but it appears to have nothing to do with the present plant. Flowers white.

Whorled-leaved Caraway. Fl. July. Britain. Pl. 1 foot.

Cult. The more sandy the soil is the better the species will grow. They are increased either by dividing at the root, or by seed.

LI. CHAMÆSCIA'DIUM (from χαμαι, *chamai*, on the ground, and σκιαδιον, *skiadion*, an umbel; in allusion to the plant being dwarf as well as umbelliferous). Meyer, verz. pflanz. p. 122.—Bùnium species of Bieb.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx a little toothed. Petals ovate-lanceolate, quite entire, oblique or inflexed at the apex. Stylopodium depressed, margined. Styles reflexed. Fruit ovate-oblong, compressed from the sides; mericarps solid, having 5 equal filiform ribs: the lateral ribs marginating; with the furrows between the ribs furnished with 3-4 vittæ each. Seed somewhat semi-terete, flattish in front; carpophore adnate, bifid at the apex.—An herb with a fusiform root, supra-decompound or bipinnate leaves: having the segments or leaflets divided into many setaceous lobes. Scapes radical. Involucra and involucels of many leaves. Petals yellow. Commissure of fruit furnished with 4-6 vittæ. The fruit is nearly like that of *Sìum*, and the petals that of *Helosciàdium*.

1 C. FLAVE'SCENS (Meyer, l. c.). ♃. H. Native throughout the whole of Caucasus, in grassy places, at the elevation of from 2400 to 8000 feet; and of Cappadocia. Bùnium acaúle, Hoffm. umb. 1. p. 87. and 108. Bieb. fl. taur. suppl. p. 205. A'mmi acaúle, Schultes, syst. 6. p. 530. Cárvi Cappadócicum acaúlon fòliis Chamæmeli, Tourn. cor. p. 21.

Yellowish-flowered Chamæsciadium. Fl. June, July. Clt. 1820. Pl. 1 foot.

Cult. See *Bùnium* for culture and propagation.

LII. BU'NIUM (from βουνος, *bounos*, a hill; habitation of some of the species) Koch, in litt. 1828. Link. enum. 1. p. 267? D. C. coll. mem. 5. p. 41. prod. 4. p. 115.—Bulbocástanum, Lag. am. nat. 2. p. 99. but not of Adans.—Mýrrhis and Wallróthia species Spreng.—Bùnium species of Lin.

LIN. SYST. *Pentándria, Monogýnia.* Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point. Fruit contracted from the sides, linear-oblong; mericarps furnished with 5 equal filiform, obtuse ribs: lateral ribs marginating; having the furrows between the ribs furnished with 2-3 vittæ each, and the commissure with 4 vittæ; the vittæ all superficial. Carpophore free, bifid. Seed teretely convex on the outside, and flattish in front. Herbs perennial. Roots usually tuberous and globose. Stems terete and attenuated at the base in the tuberous rooted species. Leaves decompound; segments or leaflets divided into many slender linear lobes; involucra various: involucels few-leaved. Flowers white, rarely yellow or green.

SECT. I. CHRY'SEUM (from χρυσος, *chrysos*, gold; in allusion to the yellow flowers of the species.) D. C. coll. mem. 5. p. 41. prod. 4. p. 116. Both the involucra and involucels are many-leaved. Flowers yellow or greenish. Styles diverging. The vittæ in the furrows of the fruit in the different species are variable in number. This section is intermediate between Càrum and Bùnium, but differs from both these genera in the flowers being yellow.

1 B. PEUCEDANOÌDES (Bieb. fl. taur. 1. p. 211. suppl. 208.) root fusiform; stem striately furrowed, branched; leaves bipinnate: leaflets of the radical leaves decussated, with broader lobes; segments of the cauline leaves linear and divaricate; leaves of involucra and involucels short and setaceous; rays of umbel very unequal. ♃. H. Native of Caucasus, about Nartzana, and on Mount Bechtau, among grass. Sìum peucedanoìdes, Spreng. umb. spec. 41. no. 5. syst. 1. p. 906. Peucédanum carvifòlium, Bieb. Petals pale yellow. The furrows of the fruit are only furnished with one vitta each, according to Besser; but in fruit of the plant sent from Fischer, the furrows are furnished with 2-3 vittæ each, rarely solitary.

Sulphur-wort-like Earth-nut. Fl. July, Aug. Clt. 1818. Pl. 1 to 2 feet.

2 B. VIRE'SCENS (D. C. mem. soc. gen. vol. 4. prod. 4. p. 116.) root fusiform; stem striately furrowed, branched; leaves bipinnate; leaflets of all the leaves linear; leaves of involucra and involucels short and setaceous; rays of umbel very unequal. ♃. H. Native of Burgundy, on a mountain called Afrique, near

Divion. Sium viréscens, Spreng. umb. spec. 94. syst. 1. p. 906. and in Schultes, syst. 6. p. 542. Peucédanum Taúricum, hort. par. 1821. Lor et Dur. cat. pl. côte-d'or, p. 37. Peucédanum alpéstre, Stev. in litt. 1819. Bùnium peucedanoìdes, Bieb. ex Stev. Siùm Cordiènii and Sium viréscens, Lois. fl. gall. ed. 2. p. 194. Petals greenish, nearly entire, at the apex involute; section of fruit nearly terete. Vittæ in the outer furrows of the fruit 3; 2 of these are incomplete; and 2 or 4 in the commissure.

Greenish-flowered Earth-nut. Pl. 1 to 2 feet.

3 B. lu'teum (Hoffm. umb. p. 108.) root nearly globose; stem terete, branched; leaves pinnate; leaflets decussate, pinnatifid: lobes linear, very fine; leaves of involucra and involucels very short, with membranous margins; fruit linear-cylindrical. ♃. H. Native of Siberia, in deserts, at the river Don, near the colony of Sarepta. Bùnium lùteum, Bieb. suppl. p. 207. Sìum lùteum, Spreng. syst. 1. p. 906. There are 3 vittæ in each furrow of the fruit, according to Koch. Petals yellow.

Yellow-flowered Earth-nut. Pl. 1 to 2 feet.

Sect. II. Caroi'des (from *Càrum*, the caraway, and *idea*, form; plants with the habit of Càrum,) D. C. coll. mem. 5. p. 41. prod. 4. p. 116. Involucra usually of many leaves, rarely absent. Flowers white. Stylopodium depressed: styles diverging. This section is intermediate between the genera *Càrum* and *Conopòdium*.

4. B. carvifòlium (D. C. prod. 4. p. 116.) root fusiform, terete, elongated; leaves bipinnate; leaflets divided into many linear acute lobes; stem flexuous, erect, furnished with a few leaves; leaves of involucrum and involucels linear acute. ♃. H. Native of Abruzzo, and on Mount Fiori among the Appenines; but not of Sicily, ex Guss. prod. 1. p. 339. Sìson flexuòsum, Ten. prod. fl. neap. p. 67. Sìson carvifòlium, Bert. in herb. Moric. Sìson prólifer, Brochi and Jan. Petals of a greenish white colour when dried. The furrows of the fruit, when immature, are furnished each with 2 or 3 vittæ.

Caraway-leaved Earth-nut. Pl. 1 to 2 feet.

5 B. glauce'scens (D. C. prod. 4. p. 117.) bulb ovate-oblong; stem erect, straight, terete; branches alternate; leaves glaucous: radical ones bi-tripinnate, with multifid leaflets, and linear short lobes; cauline leaves distant, small, multifid; leaves of involucra as well as of involucels, 6-7 in number, linear-oblong, acute, white. ♃. H. Native of Persia, in grassy valleys among the mountains about Seidkhodzi. Stem 1½ foot high. Umbels 10-11-rayed. Flowers white.

Glaucescent Earth-nut. Pl. 1½ foot.

6 B. paucifòlium (D. C. prod. 4. p. 117.) bulb globose; stem erect, straight, terete; branches alternate; superior leaves tripartite, having the lobes linear and entire; upper leaves undivided, linear; involucrum of 3-4-leaves, and the involucel of 5-6 linear white leaves. ♃. H. Native of Persia, in grassy valleys of the mountains about Seidkhodzi. Herb 2 feet high. Lower leaves unknown. Flowers white. Umbels of 4-5 rays. Fruit unknown.

Few-leaved Earth-nut. Pl. 2 feet.

7 B. aphy'llum (Jan. herb. ex D. C. prod. 4. p. 117.) root nearly globose, thick; stem terete, erect, nearly simple: cauline leaves striated at the sheaths, reduced to a short limb: both the involucrum and involucel are composed of 4-5 acuminated leaves. ♃. H. Native of Sicily, on the Nebrodes. Herb 4 to 5 inches high.

Leafless Earth-nut. Pl. ½ foot.

8 B. alpi'num (Waldst. et Kit. pl. rar. hung. 2. p. 199. t. 182.) root nearly globose, thick; stem terete, flexuous, hardly longer than the radical leaves; segments of leaves linear-oblong, fleshy; involucra of 5 linear-subulate leaves. ♃. H. Native of Croatia, on chalky mountains; and of Persia, in the province of Aderbijan. Wallróthia tuberòsa. Spreng. pug. 2. p. 52. and in Schultes, syst. 6. p. 556. Flowers white. There are 3 vittæ in each furrow of the fruit.

Var. β, *petræ'um* (D. C. prod. 3. p. 117.) plant rather glaucous; leaves of involucrum oblong-linear. ♃. H. Native of the kingdom of Naples, on mountains about Magella. Bùnium petræ'um, Ten. prod. fl. neap. p. 60. Perhaps Wallróthia divaricàta, Presl, del. p. 134. Tuber large, pushing out many fibres like the tuber of a *Cyclamen*. Fruit not seen.

Alpine Earth-nut. Fl. May, Jul. Clt. 1823. Pl. ½ foot.

9 B. ferulæfòlium (Desf. ann. mus. 11. p. 275. t. 30. cor. Tourn. 55. t. 43.) root nearly globose; stem terete, dichotomous; leaves all somewhat triternate: leaflets linear; leaves of involucrum 1-5, of the involucel 4-5, very short; fruit narrow, cylindrical. ♃. H. Native of the islands of Cyprus, Candia, and Scio. Sìum ferulæfòlium, Spreng. in Schultes, syst. 6. p. 539. B. ferulàceum, Smith. Tuber about the size of a filbert, rufous on the outside, and white on the inside. Flowers white. Fruit not sufficiently known. The involucrum is very variable in the number of leaves.

Ferula-leaved Earth-nut. Fl. June, Jul. Clt. 1824. Pl. 1 ft.

10 B. coryda'linum (D. C. prod. 4. p. 117.) root globose; stem flexuous; segments of leaves linear-oblong; involucrum almost wanting; involucels of few leaves. ♃. H. Native of Corsica, on the mountains. B. petræ'um, Lois. fl. gall. ed. 2. vol. 1. p. 195. Tuber hardly so large as a pea. Stem 4-5 inches high, sparingly branched. Umbels of 3-5 rays; and the umbellules of 8-10 flowers; involucels of 5-6 leaves. Fruit oblong: having the furrows furnished with 2-3 vittæ each.

Corydalis-like Earth-nut. Pl. ½ foot.

11 B. Cre'ticum (D'Urv. enum. p. 31.) root turnip-formed; stem dichotomous, nearly naked; leaflets of radical leaves ovate and cut: of the cauline ones linear; involucrum none; involucels of few leaves. ♃. H. Native of the Island of Cos, among rocks. Bulbocástanum Créticum, radice napiformi, Tourn. cor. 21. and therefore Sìum napifórme, Spreng. and Bùnium napifórme, Willd. rel. in Schultes, syst. 6. p. 539. Flowers white. Fruit unknown.

Cretan Earth-nut. Pl. 1 foot.

Sect. III. Conopòdium (from κονος, *konos*, a cone, and πους, ποδος, *pous*, *podos*, a foot; in allusion to the stalk or foot of the style, called the stylopodium, being conical). D. C. coll. mem. 5. p. 41. prod. 4. p. 117.—Conopòdium, sect. 1. Koch, umb. p. 118. Involucrum wanting, or of few leaves. Stylopodium conical, exserted. Styles straight.—Perhaps a proper genus.

12 B. denuda'tum (D. C. fl. fr. 4. p. 525.) root globose; cauline leaves nearly sessile, with short sheaths and toothed or cut leaflets; involucels unilateral, few-leaved. ♃. H. Native of the west and south of Europe, and Caucasus, in mountain meadows and grassy pastures and among bushes, especially on a gravelly soil; plentiful in Britain. Mýrrhis capillifòlia, Guss. prod. fl. sic. 1. p. 351. Mýrrhis Bùnium, Spreng. umb. spec. 1. p. 131. syst. 1. p. 903. exclusive of numerous synonymes. Bùnium flexuòsum, With. 291. Smith, fl. brit. 1301. engl. bot. 988. Bùnium bulbocástanum, Huds. angl. 122. Curt. lond. fasc. 4. t. 24. Bùnium màjus, Gouan. ill. p. 10. This species varies much in height. Styles long, pale, short, and reddish. Fruit ovate and oblong. Involucrum wanting, or 1-3-leaved. Segments of the leaves linear and lanceolate, more or less toothed. Sprengel refers Bùnium ammoìdes, Link. or Mýrrhis ammoìdes, Spreng. in Schultes, syst. 6. p. 517. to the present plant; and probably Mýrrhis tenérrima, Presl, del. prag. 131. is also referrible to it. Flowers white. There are probably numerous species confused under this name. The plant has several names in England, as *earth-nut*, *pig-nut*, *ar-nut*, *kipper-nut*, *hawk-*

nut, jur-nut, or *yer'nut, earth chestnut,* and *ground-nut;* in Germany it is called *erdnuss;* in Holland *aardnoot;* in Sweden *jordnot;* in France *suron, terre noix;* in Italy *castagna de terra;* in Spain *castano de tierra.* Root nearly globular, black, or chestnut-coloured on the outside and white inside; aromatic, sweet, and mucilaginous, with some acrimony: they are frequently dug up and eaten by children. Swine are very fond of them, and will soon become fat with feeding on them. When boiled they are very pleasant and delicious, and are supposed to afford great nourishment. Thus prepared, they are said to be eaten in Holland and the Alps, and in some parts of England in soup or broth. Roasted they are even superior to chestnuts.

Var. β, Pyrenæ'um (D. C. prod. 4. p. 118.) sheaths of leaves ciliated. ♃. H. Native of the Pyrenees. Bùnium denudàtum, var. β, Pyrenæ'um, D. C. fl. fr. suppl. p. 511. no. 3496. Myrrhis Pyrenæ'a, Spreng. in Schultes, syst. 6. p. 518. Lois. fl. gall. ed. 2. vol. 1. p. 208. t. 5. Bùnium Pyrenæ'um, Lois. fl. gall. p. 161. t. 5. Bùnium pilòsum, Willd. rel. in Schultes, syst. 6. p. 500.

Naked-stemmed or Common Earth-nut. Fl. May, June. Britain. Pl. 1 to 2 feet.

13 B. pu'milum (Smith, fl. græc. 274. prod. 1. p. 187.) root globose; leaves bipinnate: cauline ones petiolate, pilose; sheaths short; segment of leaves cut and acute; involucrum wanting or 1-leaved; involucels of many leaves. ♃. H. Native of Mount Parnassus. Fruit ovate-oblong. Flowers white.

Dwarf Earth-nut. Pl. ½ foot.

14 B. tenuifòlium (Salzm. pl. exsic. ex D. C. prod. 4. p. 118.) root unknown: cauline leaves petiolate; sheaths elongated, glabrous; segments of leaves few, linear, very narrow, elongated, and quite entire; involucels of many leaves. ♃. H. Native of Mauritania, about Tangiers. Perhaps Bùnium ammoìdes, Link. is referrible to this plant. Flowers white.

Fine-leaved Earth-nut. Pl. 1 foot.

15 B. glabe'rrimum (D. C. prod. 4. p. 118.) plant glabrous; stem terete, striated; lower leaves biternate: leaflets ovate, lobed, and toothed; superior leaves biternate: leaflets lanceolate, quite entire; both the involucra and involucels are usually 1-leaved. ♃. H. Native of Mount Atlas, near Tlemsen. Chærophýllum glabérrimum, Pers. ench. 1. p. 322. Poir. dict. 5. p. 136. Spreng. in Schultes, syst. 6. p. 523. Scándix glabérrimum, Desf. atl. 1. p. 260. t. 74. Flowers white. Immature fruit similar to that of *B. denudàtum.*

Quite-glabrous Earth-nut. Pl. 1 foot.

16 B.? rígens (Spreng. in Schultes, syst. 6. p. 500.) root unknown; stem stiff, sheathed; branches spreading; leaves bipinnate; leaflets obtuse, conduplicate, crenulated; involucrum of many short leaves. ♄. G. Native of the Cape of Good Hope, and of the Mauritius. Còntum rígens, Lin. mant. p. 352. Thunb. prod. p. 50. fl. cap. 2. p. 203. Dasyspérmum species, Neck. elem. p. 295. (Trachyspérmum rígens, G. Don, in Loud. hort. brit. 103.). Perhaps 2 species are confused here. Perhaps it is a true species of *Bùnium.* Flowers white.

Stiff Earth-nut. Fl. Ju. Jul. Clt. 1787. Shrub 1½ foot.

Cult. A light sandy soil suits all the species best; and they can only be increased by seeds.

LIII. CRYPTOTÆ'NIA (from κρυπτος, *cryptos,* hidden, and ταινια, *tainia,* vitta; the vittæ of the mericarps are hidden by a pericarp, and are invisible, unless the mericarps are cut transversely). D. C. coll. mem. 5. p. 42. prod. 4. p. 118.—Conopòdium, sect. 2. Koch, umb. 119. Cyrtospérmum, Rafin. in litt. 1819.—Alacospérmum, Neck. elem. no. 276.?

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals obovate, nearly entire, ending in a narrow inflexed point. Fruit contracted from the sides, linear-oblong, crowned by a short stylopodium and 2 short styles; mericarps with 5, equal, filiform, obtuse ribs: the 2 lateral ribs placed before the margin; vittæ in the furrows between the ribs numerous, covered by a somewhat corky pericarp, but closely adnate, and only visible when the carpels are cut transversely. Seed teretely convex, flattish in front. Carpophore free, bifid at the apex.—Perennial, glabrous, erect herbs. Roots not bulbous. Leaves ternate; leaflets ovate, coarsely toothed: teeth mucronate. Umbels numerous, almost disposed in a panicle. Rays of umbels and umbellules few, very unequal. Involucrum wanting; involucels few-leaved. Flowers white.

1 C. Canade'nsis (D. C. prod. 4. p. 119.) lower umbels rising from the axils of the superior leaves; fruit oblong. ♃. H. Native of North America, in woods among rocks; Canada about Lake Huron and Quebec; frequent about Boston, in the United States. Sìson Canadénse, Lin. spec. 363. Hoffm. umb. p. 36. Sìum Canadénse, Lam. dict. 1. p. 407. Big. fl. bost. ed. 2. p. 114. Chærophýllum Canadénse, Pers. ench. 1. p. 320. Myrrhis Canadénsis, Mor. oxon. sect. 9. t. 11. Nutt. gen. amer. 1. p. 141. Gærtn. fruct. t. 23. Conopòdium Canadénse, Koch, umb. 119. Myrrhis ternàta, Mœnch, meth. p. 101. Sìson trifoliàtum, Michx. fl. bor. amer. 1. p. 168.? Cyrtospérmum trifoliàtum, Rafin. in litt. Flowers white.

Canadian Cryptotænia. Fl. Jul. Aug. Clt. 1699. Pl. 1½ ft.

2 C. Thoma'sii (D. C. prod. 4. p. 119.) umbels disposed in a naked leafless panicle; fruit ovate. ♃. H. Native of Ulterior Calabria, near rivulets, in groves on the mountains called Della Serra. Sìson Thomàsii, Ten. prod. neap. suppl. 2. p. 66. syn. p. 40. Schultes, syst. 6. p. 412. A'pium trifoliàtum semínibus spársis péndulis diapénsiæ fòlio, Bocc. mus. append. 4. ex herb. Vaill.

Thomas's Cryptotænia. Pl. 1 foot.

Cult. The species of this genus will grow in any soil; and may either be increased by cuttings or by seed.

LIV. PIMPINE'LLA (altered from *bipinnate,* twice pinnate; the leaves). Lin. gen. no. 366. Koch, umb. p. 120. f. 65. and 66. D. C. coll. mem. 5. p. 42. but not of Tourn. Gærtn. D. C. prod. 4. p. 119.—Pimpinélla and Tràgium, Spreng. Hoffm. Lag.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point. Fruit ovate, contracted from the sides, crowned by the pulvinate stylopodium and reflexed styles, which are capitate at the apex; mericarps with 5, equal, filiform ribs: lateral ribs marginating: having the furrows between the ribs furnished with many vittæ; carpophore free, bifid. Seed gibbously convex, flattish in front. —Herbs, for the most part natives of Europe. Roots simple. Radical leaves pinnate: leaflets roundish, toothed, rarely undivided; cauline leaves more finely dissected than the radical ones. Umbels and umbellules of many rays, without any involucra. Flowers usually white, rarely reddish or yellow.

Sect. I. Tragoseli'num (from τραγος, *tragos,* a goat, and σελινον, *selinon,* parsley; goats' parsley). Tourn. inst. p. 309. t. 163. Mœnch, meth. 99. D. C. prod. 4. p. 119.—Pimpinélla, Spreng. umb. prod. p. 35. Schultes, syst. 5. p. 34. Hoffm. umb. 88. Fruit glabrous. Roots perennial.

1 P. rotundifòlia (Bieb. fl. taur. 1. p. 242.) radical and cauline leaves reniform, crenated; superior ones glabrous, lobed a little. ♃. or ♂. H. Native of Iberia and Caucasus, in groves. Hoffm. umb. ed. 2. vol. 1. p. 92. Sìson rotundifòlius, Spreng. anleit. ed. 2. p. 2. t. 4. f. 1-4. umb. spec. p. 110. Leaves rather pubescent, of a form almost like those of *Málva sylvéstris.* Involucrum none. Petals white. Stigmas purple.

Round-leaved Burnet-saxifrage. Fl. June, July. Clt. 1817. Pl. 2 feet.

2 P. ma'gna (Lin. mant. 217.) radical leaves pinnate; leaflets serrated and somewhat cut, ovate or oblong: the terminal one 3-lobed. ♃. H. Native throughout the whole of Europe, Caucasus, and the Levant, in mountain meadows, pastures, and woods. In Britain it grows chiefly in woods and hedges, in a calcareous soil. Smith, engl. bot. t. 408. Fl. dan. 1155. Hayn. arz. gew. 7. t. 21. Jacq. aust. 4. t. 396. P. màjor, Mill. dict. no. 1. Gouan. ill. p. 21. P. saxífraga, Spreng. syn. 213. Tragoselìnum màjus, Lam. fl. fr. 2. p. 448. Tragoselìnum mágnum, Mœnch, meth. 99.—Barrel. icon. t. 248. P. saxífraga, Ray. syn. 213. Petiv. brit. t. 26. f. 5. Saxífraga mágna, Dod. pempt. 315. f. 1. This and the following species partake nearly of the same qualities. The root is very acrid, burning the mouth like pepper. It affords a blue oil. Its acrimony has occasioned it to be used to cure tooth-ache, and to clear the skin from freckles. It is chewed to promote the secretion of saliva, and is used in gargles to dissolve viscid mucous in the throat. In Germany it is prescribed in the asthma and dropsy. Flowers either white or reddish.

Var. β, rùbens (D. C. prod. 4. p. 120.) flowers reddish. P. rùbra, Hoppe. exsic.

Var. γ, orientàlis (D. C. l. c.) leaflets all pinnatifid; lobes lanceolate, acute; flowers white. P. orientàlis, Gouan. ill. t. 15. Jacq. aust. t. 397. Plenck, icon. t. 224. P. mèdia, Hoffm. ex Spreng.

Var. δ, ròsea (Stev. in litt. ex D. C. prod. 4. p. 120.) leaflets acutely and deeply pinnatifid; flowers rose-coloured. Native of Caucasus, at Nartzana. P. dissécta, Bieb. fl. taur. 1. p. 241.

Var. ε, dissécta (D. C. prod. 4. p. 120.) leaflets of the superior leaves bipinnatifid: having the segments linear-lanceolate. P. dissécta, Retz. obs. 3. t. 2. P. praténsis, Thuill. P. laciniàta, Thor. land. p. 108. Horn. hort. hafn. suppl. p. 36. Nees. off. pflz. 10. t. 19. P. peregrìna, Lejeune, fl. spa. 1. p. 145. Flowers white.

Large Burnet-saxifrage. Fl. Ju. Aug. Brit. Pl. 3 to 4 ft.

3 P. saxi'fraga (Lin. spec. 378.) radical leaves pinnate; leaflets of the radical leaves toothed or cut, roundish: of the uppermost in various linear segments. ♃. H. Native throughout the whole of Europe, Tauria, Caucasus, and Persia, in dry sandy, gravelly, or chalky pastures, on banks, and on rocks; plentiful in some parts of Britain. Smith, engl. bot. t. 407. Hayne, arzn. gew. 7. t. 20. Schkuhr, handb. t. 78. Hoffm. umb. p. 90. Martyn. fl. rust. t. 127. Woodv. med. bot. t. 179. Jacq. austr. t. 395. Fl. dan. t. 699. Tragoselìnum mìnus, Lam. fl. fr. Tragoselìnum saxífragum, Mœnch, meth. 99. P. crìspa, Horn. hort. hafn. 1. p. 289. Flowers white. A very variable plant.

Var. β, nìgra (D. C. prod. 4. p. 120.) plant pubescent; leaflets of lower leaves ovate, serrated, somewhat lobed, rather cordate at the base; the upper leaves bipinnate; root black. P. nìgra, Willd. spec. 1. p. 1471.—J. Bauh. hist. 3. p. 111. f. 2.

Var. γ, hircìna (D. C. l. c.) plant rather pubescent; leaflets of nearly all the leaves pinnatifid or jagged. P. hircìna, Mœnch, hass. no. 255. P. Genevénsis, Vill. dauph. 2. p. 604.

Var. δ, dissécta; leaflets all bipinnatifid, with narrow segments.

Common Burnet-saxifrage. Fl. Ju. Aug. Brit. Pl. 1 to 2 ft.

4 P. lu'tea (Desf. atl. 1. p. 255. t. 76.) radical leaves pinnate, pubescent; leaflets cordate, toothed, cut in front; superior leaves entire, small, and linear. ♃. H. Native of Mount Atlas. Tragoselìnum altíssimum Africànum, Tourn. inst. p. 309. P. máxima Africàna, Magn. bot. monsp. app. ex herb. Vaill. Terminal leaflet of radical leaves somewhat 3-lobed. Stem erect, branched, dichotomous; branches filiform, twiggy, almost leafless. Flowers yellow, with an aromatic odour.

Yellow-flowered Burnet-saxifrage. Fl. Ju. Aug. Clt. 1823. Pl. 3 to 4 feet.

5 P. au'rea (D. C. prod. 4. p. 120.) lower leaves pinnate, glabrous; leaflets cuneated, 2-3-lobed at the apex: teeth large, few, mucronate; cauline leaves trifid or undivided and linear, few; petals ciliated, hardly emarginate. ♃. H. Native of Persia, in gravelly places at Khoi, in the province of Aderbeidjan. A very distinct species, with yellow flowers, differing from *P. lùtea* in the plant being glabrous, in the form of the leaflets, and in the petals being ciliated. Fruit subglobose, didymous, compressed, furnished with many vittæ in the furrows. There is a variety with smaller bipinnate leaves, also a native of Persia.

Golden-flowered Burnet-saxifrage. Pl. 2 to 3 feet?

6 P. ramosi'ssima (D. C. l. c.) plant glabrous; lower leaves bipinnate; leaflets ovate-rhomboid, rather trifid, acuminated, quite entire at the base, deeply toothed at the apex, some of them crossed in a decussate manner; stem much branched; the leaves under the branches reduced to short ligulæ; umbels 5-rayed; fruit glabrous, ovate, not contracted at the commissure. ♃.? H. Native of Persia. Flowers unknown. Transverse section of fruit terete, as in the genus *Séseli*, but without either involucrum or involucel, but with the habit of *Pimpinélla*. Leaves like those of *Peucédanum cervària*. Perhaps a proper genus.

Much-branched Burnet-saxifrage. Pl.

7 P. anisoìdes (Brign. act. acad. neap. 1819. vol. 1. p. 1. t. 1.) plant glabrous; radical leaves bipinnate; leaflets roundish-ovate, serrated; umbels numerous; styles erect; fruit glabrous. ♃. H. Native of the kingdom of Naples. It differs from *P. bubonoìdes*, ex Guss. prod. 1. p. 331., in the fruit being glabrous, in the styles not being divaricate, and in the stigmas not being globose.

Anise-like Burnet-saxifrage. Pl. 1 to 2 feet.

Sect. II. Tra'gium (from τραγος, *tragos*, a goat; odour of plants). Spreng. umb. prod. p. 26. Schultes, syst. 6. p. 35. Hoffm. umb. gen. p. 91. t. A. f. 22. D. C. prod. 4. p. 120.—Bùbon species, Lag. obs. apar. 26. Fruit villous. Roots perennial, rarely biennial. Radical leaves pinnate or bipinnate; leaflets ovate.

8 P. depre'ssa (D. C. prod. 4. p. 120.) stem pubescent; radical leaves pinnate; leaflets cuneated, pinnatifid, smoothish, ciliated: lobes lanceolate, obtuse; cauline leaves pinnatifid, 1 under each branch; fruit rather puberulous from small, adpressed bristles. ♃. H. Native of Candia, on the Sphaciotic mountains. Tràgium depréssum, Sieb. cret. exsic. Spreng. in Schultes, syst. 6. p. 392. Herb 1-2 inches high. Stem terete. Root woody. Flowers white.

Depressed Burnet-saxifrage. Fl. June, Aug. Clt. 1822. Pl. $\frac{1}{8}$ to $\frac{1}{2}$ foot.

9 P. nodòsa (D'Urv. enum. or. p. 33.) plant glabrous; stem branched, dichotomous; leaves many-parted, with linear segments; umbels numerous; petals glabrous; fruit small, ovate, with a few adpressed hairs. ♃. H. Native of the Island of Samos, among stones, frequent, and on the old walls of cities. In the place of the stem where the involucrum ought to be, there is a thick turbinate knot, probably caused by insects.

Nodose Burnet-saxifrage. Pl. 1 foot.

10 P. tra'gium (Vill. dauph. 2. p. 606.) stem canescent; radical leaves pinnate, smoothish; leaflets cuneate-obovate, deeply serrated, usually variously cut; cauline leaves very few; petals pilose on the outside; fruit clothed with canescent tomentum. ♃. H. Native of the south of France, Italy, Sicily,

Podolia, and Tauria, in arid places, and among rocks. D. C. fl. fr. suppl. p. 501. Bertol. amœn. ital. p. 350. P. canéscens, Lois. not. p. 47. t. 4. Tràgium Colúmnæ, Spreng. umb. spec. 134. P. saxífraga γ, Lois. fl. gall. 177. Flowers white. There are several varieties, which differ in height and size of leaves, but there are hardly any limits between these varieties.

Var. β, *glaúca* (D. C. prod. 4. p. 121.) plant of a canescent glaucous hue: radical leaves pinnate; leaflets roundish-ovate, somewhat 3-lobed, toothed, pubescent on both surfaces, the 3 or 4 superior lobes linear; petals and fruit clothed with adpressed villi. ♃. H. Native of Sicily, on the Nebrodes. Tràgium glaúcum, Presl, del. prag. p. 125. Flowers white. Allied to *P. Cúmbræ*, but the leaflets are all 3-lobed, and the terminal one deeply so.

Var. γ, *laciniàta* (D. C. l. c.) leaflets of all the leaves dissected into narrow linear segments. ♃. H. Native of Tauria. P. Tràgium var. Bieb. suppl. p. 250. P. petræ'a, Beaupre, ined. Perhaps a proper species. The whole plant is clothed with canescent pubescence.

Goats' Burnet-saxifrage. Fl. Ju. Jul. Clt. 1810. Pl. 1 to 2 ft.

11 P. PEREGRI'NA (Lin. mant. p. 357.) plant pubescent; radical leaves pinnate; leaflets ovate-cordate, serrated: terminal one usually 3-lobed; cauline leaves narrow, wedge-formed, jagged; fruit hispid. ♂. H. Native from the south of France to Sicily, Caucasus, and Tauria. Jacq. hort. vind. 2. t. 131. P. híspida, Lois. not. p. 48. Tràgium peregrìnum, Spreng. umb. spec. p. 135. syst. 1. p. 884. exclusive of the synonyme of Presl. Ledebùria pimpinelloìdes, Link, enum. 1. p. 286. Tràgium Taúricum, Ledeb.—Barr. icon. 1184.—Column. ecphr. 1. t. 109. Flowers white. The herb varies in smoothness and hairiness; in the first state it is *P. peregrìnum*, D. C. fl. fr. suppl. p. 502.: in the second it is *P. híspida*, Lois. ex. D. C. l. c. The first leaves are simple, the second ternate, but the succeeding ones are pinnate, also the lower stem ones; but the upper stem leaves are variously divided into lanceolate segments. The umbels are drooping before the expansion of the flowers. The seeds have no smell, and when first chewed have scarcely any taste, but in a short time are very acrimonious, and excite a great heat in the fauces.

Var. β, *mìnor* (D. C. prod. 4. p. 121.) plant smaller. Native of Egypt, about Alexandria. Torìlis trilobàta, Viv. herb.

Foreign Burnet-saxifrage. Fl. Ju. Aug. Clt. 1640. Pl. 2 ft.

12 P. BUBONOÌDES (Brot. fl. lus. 1. p. 463. phyt. t. 35.) plant puberulous when young, but at length becoming glabrous; radical leaves bipinnate; leaflets roundish-ovate, serrated; umbels numerous; petals glabrous; fruit rather villous. ♃. H. Native of Portugal, Sicily, and Calabria, in sandy places. Tràgium Brotèri, Spreng. in Schultes, syst. 6. p. 393. P. anisoìdes, Guss. cat. hort. boccad. p. 50. but not of Brign. Tenore, prod. p. 20. Tràgium Gussònii, Presl, del. prag. 1822. p. 126. Guss. pl. rar. 117. prod. fl. sic. 1. p. 330. Perhaps Athamántha lasiántha, Willd. herb. ex Schultes, syst. 6. p. 464. Flowers white.

Bubon-like Burnet-saxifrage. Fl. June, Aug. Clt. 1822. Pl. 1 to 2 feet.

13 P. VILLÒSA (Schousb. mar. p. 125.) plant glaucous, rather pubescent; radical leaves bipinnate; leaflets obovate-cuneated, crenated; stem nearly leafless, much branched; petals villous. ♃. H. Native of the kingdom of Morocco at Mogodor and Tangiers. Salzm. exsic. Poir. suppl. 1. p. 684. Tràgium, Schousbœ'i, Spreng. in Schultes, syst. 6. p. 394. Tràgium villòsum, Desf. hort. par. Leaves almost like those of *P. bubonoìdes*, but larger. This species differs from the preceding in the petals being villous not glabrous.

Villous Burnet-saxifrage. Fl. Ju. Aug. Clt. 1817. Pl. 2 ft.

14 P. CU'MBRÆ (Buch. ubers. can. p. 29. and beschreib. d. can. ins. p. 152.) the whole plant is hoary from short down; radical leaves pinnate; leaflets 5-7, ovate, deeply serrated, terminal one usually 3-lobed: stem nearly leafless, branched; petals villous. ♃. G. Native of Teneriffe, on the highest mountains. Tràgium incànum, Chois. ined. Said to be allied to *P. villòsa*, but differs in being more hoary, and in the leaves being simply pinnate, not doubly pinnate. Root woody, throwing out many stems at the neck.

Cumbre Burnet-saxifrage. Pl. 1 foot.

15 P. PSEU'DO-TRA'GIUM (D. C. prod. 4. p. 122.) plant glaucous and canescent; radical leaves pinnate; leaflets roundish-ovate, somewhat 3-lobed, deeply toothed, velvety-canescent on both surfaces: upper ones trifid: lower ones undivided, linear; petals rather villous on the outside; fruit very hairy. ♃. H. Native of Persia, in dry exposed stony places about Seidkhodzi. This is an intermediate plant between *P. tràgium* and *P. aromáticum*. The fruit is larger than in either, and the hairs on the plant are soft and spreading, not as in *P. tràgium*, adpressed. Petals rather villous on the outside, not as in *P. aromátic* very hairy.

False Tragium. Pl. 2 feet.

16 P.? FLA'VA (Meyer, verz. pflanz. p. 122.) the whole plant is canescent from minute down; radical leaves supra-decompound; leaflets cut: lobes lanceolate, mucronately acuminated; sheaths of upper cauline leaves leafless; petals yellow, canescent on the back, as well as on the germs. ♃. H. Native of Caucasus, in dry stony places on the mountains of Talusch, near Swant, at the elevation of about 3000 feet.

Yellow-flowered Burnet-saxifrage. Pl. 1 to 2 feet?

17 P. AROMA'TICA (Bieb. fl. taur. 1. p. 241. suppl. 251.) plant clothed with hoary pubescence; leaves pinnate; leaflets of the lower leaves all cuneiform, deeply serrated at the apex, lined; petals and fruit tomentose. ♂. H. Native of Iberia and Eastern Caucasus, on the edges of woods, and the sides of torrents. Tràgium aromáticum, Spreng. umb. prod. p. 26. syst. 1. p. 884. exclusive of the synonymes. Schultes, syst. 6. p. 392. Hoffm. umb. ed. 2. p. 91. Flowers white.

Aromatic Burnet-saxifrage. Fl. Ju. Aug. Clt. 1820. Pl. 1 ft.

18 P. DIVERSIFÒLIA (D. C. prod. 4. p. 122.) leaves ternate or biternate: leaflets petiolulate, cordate, coarsely toothed, membranous, glabrous above, but puberulous along the nerves beneath; involucrum wanting; involucels 3-leaved; rays of umbels and umbellules 15-20 in number, and are as well as the fruit pubescent. ♃. ♂. H. Native of the East Indies, in Sirmore. Heràcleum diversifòlium, Wall. mss. Leaves as if they were pinnate, from the 2 lateral leaflets being undivided, and the middle one ternate. Teeth of lower leaves rounded and mucronate; of the superior leaves acute. The immature fruit has only been seen.

Diverse-leaved Burnet-saxifrage. Pl. 1 to 2 feet.

19 P. LESCHENAU'LTII (D. C. l. c.) radical leaves petiolate, orbicular, cordate, toothed, rather coriaceous, many-nerved at the base, glabrous above, velvety from short down beneath: cauline leaves few, parted, almost reduced to the sheaths; stem a little branched, glabrous. ♃. H. Native of the East Indies, on the Nellygerry Mountains, where it is called by the natives *Tourassou*. Petals hardly emarginate. Young fruit rather puberulous, when examined under a lens, but at length becoming glabrous. Plant 1-2 feet high. Rays of umbel 5, of the umbellules 12-15. Flowers white.

Leschenault's Burnet-saxifrage. Pl. 1 to 2 feet.

20 P.? JAVA'NA (D. C. prod. 4. p. 122.) cauline leaves petiolate, cordate, acute, cartilaginously serrated, many-nerved at the base, velvety beneath as well as the petioles, but pubescent above; sheaths ciliated; involucrum wanting, or of 1 linear leaf; fruit hairy. ♃. H. Native of Java. Herb said to be

2 feet high. Stem terete, velvety at the apex. Umbels of many rays. Fruit ovate, hairy. Styles diverging.

Java Burnet-saxifrage. Pl. 2 feet.

Sect. III. Ani'sum (the herb anise; containing plants agreeing with it). Adans. fam. 2. p. 95. Gærtn. fruct. 1. p. 102. —Bùbon species of Lag. Fruit puberulous. Annual plants.

21 P. anìsum (Lin. spec. 399.) stem glabrous; radical leaves cordate-roundish, lobed, deeply serrated: middle ones pinnatifid, with cuneate-lanceolate lobes: upper ones trifid and undivided, linear; fruit bearing a few scattered hairs. ⊙. H. Native of the Island of Scio, Egypt, and cultivated in Europe. Nees, off. pflz. 12. t. 17. Hayn. arz. gew. 7. t. 22. Woodv. med. bot. t. 180. Anìsum vulgàre, Clus. hist. 2. p. 202. Gærtn. fruct. 1. t. 23. f. 1. Anìsum officinàle, Mœnch, meth. p. 100. Sìson anìsum, Spreng. in Schultes, syst. 6. p. 407. A'pium anìsum, Trag.—Blackw. herb. t. 374.—Lob. icon. 731. Flowers of a yellowish white colour. Fruit pubescent when young. Styles short, straight. The anise is cultivated in Malta and Spain for its seeds, which are annually imported as medicinal, and for distillation and expression. In this country it is occasionally grown in the garden, to be used as a garnish, and for a seasoning like the fennel. For this last purpose, the seeds require to be sown in April, in a warm border, in a dry light soil, or raised in pots on heat, and removed to a warm site in May, where the plants will blossom and ripen their seeds in August, in favourable seasons. The plants should be thinned to 3 or 4 inches' distance.

Anise. Fl. June, Aug. Clt. 1551. Pl. 1 to 1½ foot.

22 P. Cre'tica (Poir. suppl. 1. p. 684.) plant dwarf; radical leaves roundish, 3-lobed, toothed; superior leaves small, ternately multifid; segments rather filiform; fruit puberulous. ⊙. H. Native of Candia, Scio, and the Morea. A'pium Créticum mínimum anisi facie, Tourn. herb. P. ténuis, Sieb. pl. exsic. Stems filiform, 4-5 inches high. Umbels spreading; with capillary rays; umbellules small. Fruit shorter than the styles, not glabrous, but puberulous, as in *P. anìsum*, of which it is probably only a small variety. Flowers whitish.

Cretan Anise. Fl. June, July. Clt. 1820. Pl. ½ foot.

23 P. dichótoma (Lin. mant. 58.) plant glabrous, dichotomously branched, erect; leaves biternate or triternate; leaflets linear; petioles winged, membranous; peduncles opposite the leaves; fruit muricated from short hairs. ⊙. H. Native of Spain, on hills about Aranjuez. Habit of *Trínia*, but differs from that genus in the flowers not being dioecious. Petals all emarginate at the apex, from the point being incurved. Fruit nearly globose, striated. Styles reflexed. Flowers white.

Dichotomous Anise. Pl. 1½ foot.

† *Species not sufficiently known.*

24 P. tenuifòlia (D. C. prod. 4. p. 123.) plant glabrous; leaves decompound, glaucous, linear, somewhat divaricate; umbel terminal, compound.—Native of Persia. Tràgium tenuifòlium, Spreng. in Schultes, syst. 6. p. 393. Flowers white.

Fine-leaved Burnet-saxifrage. Pl. 1 foot.

25 P. eriocá'rpa (Russel, beschr. alep. ex Schultes, syst. 6. p. 394.) radical leaves pinnate: leaflets cuneiform, cut, glabrous: superior ones filiform; fruit hispid.—Native about Aleppo. Tràgium eriocárpos, Schultes, l. c. Pimpinélla ténuis, Sieb. Crete, exsic. ex Schultes, l. c. Tràgium ténue, Link, enum. 1. p. 286. The same as P. tenuifòlia, Spreng. syst. 1. p. 284. Flowers white.

Hairy-fruited Burnet-saxifrage. Pl. 1 foot.

26 P. alpi'na (Host, fl. austr. 1. p. 399.) radical leaves pinnate, glabrous; leaflets of lower leaves ovate, cut: of the intermediate ones, pinnatifid, and of the upper ones linear-subulate, entire. ♃. H. Native of the Alps of Styria and Austria, in stony places. The petals are said to be yellowish-white. Fruit striated, probably glabrous, or villous. This is perhaps only a variety of *P. mágna*.

Alpine Burnet-saxifrage. Fl. Ju. Jul. Pl. 2 to 3 feet.

27 P. rupe'stris (Bory, ann. gen. sc. ph. 3. 1820. p. 12.) radical leaves on long petioles, pinnate; leaflets deeply crenated, acute; stems rather dichotomous. ♃. H. Native of Spain, among stones, on Sierra Nevada. Plant glaucous, stiff, slender. Perhaps only a variety of *P. saxífraga*.

Rock Burnet-saxifrage. Pl. 1 foot.

28 P.? Cape'nsis (Thunb. prod. p. 51. fl. cap. 2. p. 207.) stem terete, striated, glabrous; leaves ternately decompound; leaflets lanceolate, acute, deeply pinnatifid; involucrum composed of many short leaves.—Native of the Cape of Good Hope, on the Table Mountain. Sìson Capénsis, Schultes, syst. 6. p. 411. Flowers white. Fruit ovate, obtuse, striated: with the ribs obtuse.

Cape Burnet-saxifrage. Pl. 1 foot?

Cult. All the species are of easy culture.—A dry sandy soil suits them best; and they are only to be increased by seeds, which ripen in abundance. Those species marked perennial are little better than biennial in the gardens.

LV. SI'UM (from *siu*, water in Celtic; habitation of most of the species). Koch, umb. 117. D. C. prod. 4. p. 124.—Sìum species of Lin. Spreng. and others.—Sisàrum, Adans. fam. 2. p. 97.

Lin. syst. *Pentándria, Digýnia*. Margin of calyx 5-toothed, now and then obsolete. Petals obovate, emarginate, with an inflexed point. Stylopodium pulvinate, depressed at the margin. Styles divergingly reflexed, rather capitate at the apex. Fruit compressed from the sides or contracted, and rather didymous, crowned by the stylopodium and styles; mericarps having 5 equal filiform bluntish ribs: with the furrows between the ribs, as also the commissure, furnished with many vittæ; carpophore bipartite; the stalks adnate to the mericarps. Seed nearly terete. —Mostly aquatic herbs. Leaves pinnate; leaflets ovate-oblong, toothed or many parted. Umbels terminal, many parted: surrounded by many leaved involucra, which are very rarely composed of one leaf. Umbellules many flowered, surrounded by many leaved involucels. Flowers white.

Sect. I. Sisa'rum (altered from the Arabic name of the plant *dgizer*; this word signifies a carrot in Persian, and *Sisàrum* has small bundles of roots resembling carrots). D. C. prod. 4. p. 124.—Sìum, Koch, deutschl. fl. Lateral ribs of fruit marginating, having 3-4 superficial vittæ in each furrow between the ribs. Seed terete, convex on the back, and flattish in front.

1 S. Sisa'rum (Lin. spec. p. 361.) root composed of fascicles of fusiform tubers; stem terete; leaves pinnate, but the uppermost ones are ternate; leaflets ovate-lanceolate, acute, serrated; involucra of 5 reflexed leaves; calycine teeth almost obsolete. ♃. H. Native of China, Japan, Corea, Altaia, Mongol, and Cochin-china, but only cultivated in Europe. Schkuhr, handb. t. 69.—Lob. icon. t. 710. f. 1. Col. phyt. 89. with a figure.—Park. par. t. 507. f. 1. The commissure of the fruit, according to Koch, is furnished with 4 vittæ. *Sìum brevifòlium* and *S. Podòlicum* are probably hardly varieties of this species. Flowers white. The tubers of the root are about the size of the finger, joined together at the crown or head; they were formerly much esteemed in cookery. The Skirret is called *Chervis* in French, *Zuckerwurzel* in German, and *Sisaro* in Italian; it is also cultivated in the north of Scotland, under the name of *crummock*. The tubers are boiled, and served up with butter,

and are declared by Worlidge, in 1682, to be "the sweetest, whitest, and most pleasant of roots." This plant grows freely in lightish soil, moderately good. It is propagated both from seed and by offsets of established roots. The better method is to raise seedlings to have the root in perfection, young, and tender.

By seeds.—"Sow between the 21st of March and the 15th of April; a fortnight later, rather than earlier, for a full crop, as plants raised forward in spring are apt to start for seed in summer. Sow on an open compartment of light ground, in small drills 8 inches apart. When the plants are 1 or 2 inches high, thin them to 5 or 6 inches asunder. They will enlarge in growth to the end of autumn; but before the roots are full grown, in August, September, or October, some may be taken up for consumption, as wanted; those left to reach maturity will continue good for use throughout winter and in spring, till the stems run.

By slips.—"Having some plants of last year's raising, furnished with root offsets, slip them off; taking only the young outward slips, and not leaving any of the large older roots adhering to the detached offsets; which plant by dibble, in rows from 6 to 9 inches asunder. They will soon strike and enlarge, and divide into offsets; which, as well as the main roots, are eatable, and come in for use in proper season.

To save seed.—"Leave some old plants in the spring: they will shoot in stalks, and ripen seed in autumn."

Var. β, Nínsi; stem bulbiferous; leaflets broader, rather cordate. Sium Nínsi, Burm. ind. t. 29. Thunb. jap. 118.

Skirret. Fl. July, Aug. Clt. 1548. Pl. 1 to 2 feet.

2 S. sisaroídeum (D. C. prod. 4. p. 124.) root unknown; stem furrowed; leaves pinnate; leaflets ovate, rather cordate at the base, toothed: upper leaves ternate, having the leaflets oblong, acuminated, and serrated; involucrum of 4-5 reflexed leaves; calycine teeth almost wanting. ♃. H. Native of Persia, in the province of Aderbeidjan, about Badelan, in shady sandy places, where it was collected by Szowits. The root is said to be creeping, but according to the specimens examined, they appear to be fasciculate like those of the common skirret. The whole plant is like *S. Sisàrum*, and especially variety *β*, but differs in the stem being furrowed, in the leaves being broader, in the fruit being shorter, and in the fibres of the roots being cylindrical.

Skirret-like Water-parsnip. Pl. 1 to 2 feet.

3 S. lancifòlium (Bieb. suppl. p. 230.) root creeping; leaves pinnate; leaflets lanceolate, equally and sharply serrated; involucrum of many leaves; calycine teeth very short. ♃. H. Native of Tauria and Caucasus, in marshes and humid places; and of Altaia, at the river Irtysh. S. latifòlium, Bieb. fl. taur. 1. p. 225. exclusive of the synonymes. S. latifòlium Ukránicum, Fisch. cat. hort. gor. 1812. Bèrula lancifòlium, Bess. enum. pl. volh. p. 44. Very nearly allied to *S. latifòlium*. The commissure of the fruit, according to Koch, is furnished with 4-6 vittæ.

Var. β; leaflets narrower, linear-lanceolate. ♃. H. Gmel. sib. 1. p. 201. no. 14. t. 47.

Lance-leaved Water-parsnip. Fl. July, Aug. Clt. 1819. Pl. 1 to 2 feet.

4 S. latifòlium (Lin. spec. p. 361.) root creeping; stems angularly furrowed; leaves pinnate; leaflets lanceolate, acuminated, unequal at the base, serrated, rarely pinnatifid; involucrum of many leaves; calycine teeth elongated. ♃. H. Native throughout the whole of Europe and North America, in ditches and marshes. In Britain in rivers, ditches, and fens. Jacq. fl. austr. t. 66. Smith, engl. bot. t. 204. Oed. fl. dan. t. 246. Hayn. arz. gew. 1. t. 38. good. Coriándrum latifòlium, Crantz. austr. p. 219. Drepanophýllum palústre, Hoffm. umb. 110. The leaflets of the submersed leaves are in the same plant often multifidly jagged. The commissure of the fruit, according to Koch, is furnished with 6 vittæ. Stem with whorles of fibres under water. The plant is of an acrid poisonous quality, particularly the roots.

Broad-leaved Water-parsnip. Fl. July, Aug. Britain. Pl. 3 to 6 feet.

5 S. longifòlium (Presl, fl. cech. p. 65. but not of Pursh,) root unknown; stem striated; leaves pinnate; leaflets linear-lanceolate, elongated, unequally toothed, very acute; involucrum usually one-leaved. ♃. H. Native of Bohemia, in marshes and ditches.

Long-leaved Water-parsnip. Pl. 2 to 3 feet.

6 S. linea're (Michx. fl. bor. amer. 1. p. 167.) stem angularly furrowed; leaves pinnate; with 4-5 pairs of linear-lanceolate leaflets, which are acutely and finely serrated; involucrum of a few linear leaves. ♃. H. Native of North America, from Canada to Carolina; on the mountains and at the Saskatchawan, in marshes; watery places about Lake Huron; moist and overflowed grounds of the Columbia. Nutt. gen. amer. 1. p. 186. exclusive of the synonyme of Pursh ex Torrey, fl. un. st. 1. p. 311. The young submersed leaves are deeply multifid or tripinnate, with very narrow linear subulate segments.

Linear-leaved Water-parsnip. Fl. July, Aug. Clt. 1810. Pl. 1 foot.

7 S. Dougla'sii (D. C. prod. 4. p. 125.) stem terete; leaves pinnate; lower leaflets ternate, the rest petiolulate, ovate-oblong, coarsely serrated; umbels opposite the leaves, and terminal, pedunculate, without an involucrum, of many rays. ♃. H. Native of the north-west coast of America. Stems and petioles reddish. Lower leaves 1½ foot long. Flowers white. Calyx 5-toothed.

Douglas's Water-parsnip. Pl. 3 to 4 feet.

Sect. II. Be'rula (probably from *βηρος, beros*, a cloak or garment). Koch, deutschl. fl. 2. p. 455. D. C. prod. 4. p. 125. Lateral ridges of the fruit placed a little before the margins of the mericarps. Transverse section of seed perfectly terete.

8 S. angustifòlium (Lin. spec. 1672.) root fibrous, having stolons running from the neck; stem hardly striated; leaves pinnate; leaflets ovate, unequally lobed and serrated; umbels pedunculate, opposite the leaves, and terminal; involucrum of many, rather pinnatifid leaves. ♃. B. H. Native throughout the whole of Europe, even to Caucasus and Persia, in ditches and rivulets; plentiful in some parts of Britain. Jacq. fl. austr. t. 67. Hayne, arz. gew. 1. t. 39. Smith, engl. bot. t. 139. Hook. fl. lond. fasc. 2. t. 111. S. nodiflòrum, Fl. dan. 247. S. eréctum, Huds. ed. 1. p. 103. S. Bèrula, Gouan. fl. monsp. p. 218. A'pium Sium, Crantz, p. 215. Bèrula angustifòlia, Koch, deutschl. fl. 2. p. 455. Root creeping extensively. Stem with whorles of fibres under water.

Narrow-leaved Water-parsnip. Fl. July, Aug. Britain. Pl. 2 to 3 feet.

9 S. Thunbe'rgii (D. C. prod. 4. p. 125.) root fibrous, throwing out stolons from the neck; stem erect, striated; branches angular; leaves pinnate; leaflets ovate, acute, regularly and callously serrated; umbels pedunculate, opposite the leaves, and terminal; involucrum of 3-5 linear acute undivided leaves. ♃. B. H. Native of the Cape of Good Hope, in marshes near Seekhuwallei. Sium angustifòlium, Thunb. prod. p. 51. Leaflets approximate and regularly disposed. Plant erect.

Thunberg's Water-parsnip. Pl. 2 to 3 feet.

† *Species not sufficiently known, and are therefore doubtful whether they belong to the genus.*

10 S.? HI'SPIDUM (Thunb. prod. p. 51. fl. cap. 2. p. 210.) stem branched, striated, glabrous, rather hispid at the nodi; leaves tripinnate, hispid beneath, as well as on the petioles; leaflets short, divided into multifid lobes; umbels opposite the leaves; involucrum of 5 leaves. ♃. F. Native of the Cape of Good Hope. Anthríscus Capénsis, Spreng. in Schultes, syst. 6. p. 526. Sium híspidum, Spreng. umb. spec. 96. Root fusiform. Fruit unknown.

Hispid Water-parsnip. Pl.?

11 S.? A'SPERUM (Thunb. prod. p. 51. fl. cap. 2. p. 210.) stem striated, glabrous, erect; leaves somewhat tripinnate, glabrous; leaflets multifid, lanceolate; petioles and peduncles scabrous; umbels terminal; involucrum of 6 leaves.—Native of the Cape of Good Hope. Spreng. umb. spec. 96. Fruit unknown.

Rough Water-parsnip. Pl. 1 to 2 feet.

12 S. VILLÒSUM (Thunb. l. c.) stem erect; branches divaricate, striated; leaves tripinnate; leaflets ovate, deeply serrated, and are, as well as the petioles, ciliated with villi; umbels terminal; leaves of involucrum 6, ovate, with scarious margins.—Native of the Cape of Good Hope. Spreng. umb. spec. 97.

Villous Water-parsnip. Pl.

13 S.? FILIFÒLIUM (Thunb. prod. p. 50. fl. cap. 2. p. 207.) stem erect, flexuous, terete; radical leaves simple, linear-filiform, elongated; umbels terminal; involucrum of 8 leaves, which are about equal in length to the umbel.—Native of the Cape of Good Hope. Spreng. umb. spec. 99. exclusive of the synonymes. Schultes, syst. 6. p. 544. exclusive of the synonymes.

Thread-leaved Water-parsnip. Pl. 2 feet.

14 S. GRANDIFLÒRUM (Thunb. prod. p. 50. fl. cap. 2. p. 208.) stem erect, striated, branched a little; leaves glabrous, bipinnate; leaflets roundish, deeply toothed; umbels terminal; leaves of involucrum 8, ovate, acuminated. ♃. G. Native of the Cape of Good Hope. Spreng. umb. spec. 99. Fruit said to be obovate, and striated.

Great-flowered Water-parsnip. Pl. 2 feet?

15 S.? PA'TULUM (Thunb. l. c.) stem striated, glabrous; branches divaricate; leaves bipinnate, somewhat fasciculate; leaflets linear, trifid; umbels terminal; involucrum of 6 lanceolate leaves, with scarious margins.—Native of the Cape of Good Hope. Spreng. umb. spec. 89. Fruit unknown.

Spreading Water-parsnip. Pl. spreading.

16 S. PANICULA'TUM (Thunb. l. c.) stem terete, striated, glabrous, panicled; leaves bipinnate; leaflets deeply pinnatifid, linear, channelled; umbels terminal; involucrum of 6 lanceolate leaves, with scarious margins.—Native of the Cape of Good Hope. Spreng. umb. spec. 98. Fruit unknown.

Panicled Water-parsnip. Pl.?

17 S. JAPO'NICUM (Thunb. fl. jap. p. 118.) stem erect, flexuous, branched above; leaves pinnate, glabrous; leaflets unequal, oblong-obovate, deeply toothed at the top: upper ones lanceolate, quite entire; umbels terminal.—Native of Japan. Stem terete. Superior leaves ternate. Umbels of many rays.

Japan Water-parsnip. Pl. 1 to 2 feet?

18 S.? DECU'MBENS (Thunb. fl. jap. p. 118.) stems decumbent; leaves bipinnate, on long petioles, glabrous; leaflets trifid; umbels terminal, nearly simple. ♃. H. Native of Japan. Perhaps S. Græ'cum, Lour. coch. p. 179. is referrible to this species.

Decumbent Water-parsnip. Pl. decumbent.

19 S.? OPPOSITIFÒLIUM (Kit. in Schultes, fl. austr. 2. p. 495. syst. 6. p. 506.) leaves numerous, opposite, doubly pinnate; leaflets linear, acuminated, quite entire.—Native of Hungary, on the mountains.

Opposite-leaved Water-parsnip. Pl.?

Cult. All the species of this genus do best in a moist soil, and most of them altogether in water. They are increased by separating the roots and stolons.

LVI. BUPLEU'RUM (from *βους*, *bous*, an ox, and *πλευρον*, *pleuron*, a side; so called from a supposed bad quality in swelling kine that feed on some species of the genus). Tourn. inst. 309. t. 163. Lin. gen. no. 328. Lag. am. nat. 2. p. 100. Koch, umb. 114. f. 51, 52. Spreng. syst. 1. p. 880. D. C. prod. 4. p. 127.—Bupleùrum, Tenòria, Bupréstis, and Odontìtes, Spreng. prod.—Bupleùrum and Trachypleùrum, Reichb. consp. 1. p. 143. Bupleùrum, Diaphýllum, Isophýllum, and Odontìtes, Hoffm. umb.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals roundish, entire, strictly involute, with a broad retuse point. Fruit compressed from the sides or somewhat didymous, crowned by the depressed stylopodium; mericarps with 5 filiform acute winged ribs, or with obsolete ones; lateral ribs marginating; furrows between the ribs either furnished with vittæ or without them, smooth or granular. Seed teretely convex, flattish in front.—Quite glabrous herbs or shrubs. Leaves rarely cut, but mostly quite entire in consequence of the limbs, which are supposed to be absent, and the petioles being dilated, and changed into quite entire phyllodia, as in many species of *Acàcia*. Umbels compound. Involucrum variable. Flowers yellow.—A very natural genus, with a distinct habit from all other umbelliferous genera, but the fruit is variable in character.

* *Annual plants.*

1 B. PAPILLÒSUM (D. C. prod. 4. p. 127.) stem erect, branched; leaves linear, acute, stiffish; umbels terminal, of 3-4 rays; involucrum of 3-4 unequal leaves; umbellules 10-flowered; involucels of 5 reflexed leaves, longer than the fruit; fruit coarsely papillose all over. ⊙. H. Native of the Levant. Allied to *B. glaúcum* and *B. tenuíssimum*, but the branches of the umbel are perfect; and the fruit is beset with large, obtuse, white papillæ.

Papillose-fruited Hare's-ear. Pl. ½ to 1 foot.

2 B. TENUÍSSIMUM (Lin. spec. p. 343.) stem erect, branched; leaves linear, tapering to each end, rather glaucous; umbels simple, alternate, of about 3-5 flowers, surrounded by 5 awl-shaped bracteas; fruit roundish-ovate, with 5 ribs, and between the ribs beset with fine granulations. ⊙. H. Native of middle and south Europe, even to Caucasus, in sterile grassy places, particularly by the sea-side. In England in muddy salt marshes; on the shore near Worthing; at Lynn, Wisbeach, Cley, Holkham, &c. in salt water ditches or muddy places over-flowed by the tide. Fl. dan. t. 1090. Smith, engl. bot. t. 478. Reichb. icon. 2. p. 58. t. 167. B. mínimum, Ray, syn. p. 221. Odontìtes tenuíssima, Spreng. prod. 33. Agostàna tenuíssima, Bute, vol. 8. p. 299. B. júnceum, Poll. B. Pollíchii, Gmel. fl. bad. 1. p. 613. B. júnceum var. γ, Schultes, syst. 6. p. 312.—Barrel. icon. t. 1168.

Var. β, *nànum* (D. C. fl. fr. 4. p. 350.) stem very humble, and very much branched, diffuse. ⊙. H. Native of Normandy and Picardy, by the sea-side. B. tenuíssimum, Bouch. fl. abb. p. 20. Habit almost of *B. glaúcum*, but the leaves of the involucels are quite entire, and the fruit is furnished with 10 ribs.

Very-slender Hare's-ear. Fl. Aug. Sept. Britain. Pl. ½ to 1 foot.

3 B. PROCU'MBENS (Desf. fl. atl. 1. p. 230. t. 56.) stems procumbent, paniculately branched; lower leaves narrow-lanceolate, the rest linear-subulate; involucrum of 2 leaves; involucels of 5, nearly ovate, acute, very short leaves; fruit short and muricated by tubercles. ⊙. H. Native about Tunis. Odontìtes procúmbens, Spreng. in Schultes, syst. 6. p. 383. Habit

almost of *B. tenuíssimum*, but the stems are procumbent, and the umbels are 2-5-rayed.

Procumbent Hare's-ear. Pl. procumbent.

4 B. glau'cum (Rob. et Cast. in D. C. suppl. fl. fr. p. 515.) stem branched, diffuse; leaves linear; umbels terminal, usually of 3 rays: lateral rays incomplete; involucels of 5 lanceolate cuspidate denticulated leaves, exceeding the flowers and fruit; fruit without vittæ, and almost without ribs, echinated with tubercles. ⊙. H. Native of Provence, Nice, Corsica, Narbonne, Spain, and Sicily, on the sea shore; and of Caucasus, on dry hills near Baku and Sallian. Rchb. icon. 2. p. 60. t. 178. Odontìtes glaûca, Spreng. in Schultes, syst. 6. p. 383. The whole plant is very humble and glaucous.

Glaucous Hare's-ear. Fl. July, Aug. Clt. 1819. Pl. $\frac{1}{2}$ foot.

5 B. semicompo'situm (Lin. spec. p. 342.) stem erect, branched; leaves oblong-spatulate; umbels terminal, of 3-5 rays: lateral rays incomplete; leaves of involucels lanceolate, cuspidate, quite entire, 3-nerved, exceeding both the flowers and fruit; fruit without vittæ, and the ribs are obliterated, and the furrows are granular. ⊙. H. Native of the south of France, Italy, Corsica, Sardinia, Dalmatia, Istria, Algiers, Greece, &c. in cultivated fields. Gouan. ill. t. 7. f. 1. Smith, fl. græc. t. 261. Rchb. icon. 2. p. 77. t. 183. B. divaricàtum β, Lam. fl. fr. Odontìtes lutèola, Hoffm. umb. 209. t. 1. B. f. x. but not of Spreng.

Semi-compound-umbelled Hare's-ear. Fl. June, Aug. Clt. 1778. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

6 B. gra'cile (D. C. prod. 4. p. 128.) stem erect, much branched; leaves linear, acute; umbels terminal: lateral ones somewhat 3-rayed; leaves of involucel lanceolate, shorter than the fruit-bearing umbel; fruit granular, having the ribs obliterated. ⊙. H. Native of the south of Tauria, in gravelly saltish places; and of the plains of Caucasus, adjoining the river Terek. Odontìtes gràcilis, Bieb. suppl. p. 198. Allied to *B. decompósitum*, but differs in the involucels being shorter than the umbellules, not longer than them.

Weak Hare's-ear. Fl. July, Aug. Clt. 1820. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

7 B. Chine'nse (D. C. prod. 4. p. 128.) stem with erect branches; leaves broadly linear, 5-nerved; umbels of 5-6 rays; involucra and involucels of 1-2 linear leaves, shorter than the flowers; fruit with 5 acutish ribs, having the furrows smooth. ⊙. H. Native of China. Habit of *B. ténue*, but differs in the involucels being narrower and fewer, and in the pedicels being hardly equal in length to the flowers.

China Hare's-ear. Pl. $1\frac{1}{2}$ foot.

8 B. te'nue (D. Don, prod. fl. nep. p. 182.) stem erect, filiform, branched; leaves 7-nerved; lower ones linear-mucronate, 5-nerved: upper and rameal ones lanceolate; umbels of usually 4 rays; involucels of 4-5 elliptic mucronate leaves, which are about equal in length to the fruit; fruit acutely ribbed, with the furrows smooth. ⊙. H. Native of Nipaul, at Narainhetty, Kamaon, and Gosaingsthan. B. virgàtum, Wall. cat. 555. Very like *B. tenuíssimum*, but differs in the umbels being of 4 rays, instead of 6, and in the leaves of the involucels being elliptic, not lanceolate, &c. Umbels numerous.

Var. β, *flexuòsum* (Wall. mss.) stem much branched, flexuous; leaves having 7-9 nerves, and dotted between the nerves. ⊙. H. Native of Nipaul.

Slender Hare's-ear. Pl. 1 to 2 feet.

9 B. Gera'rdi (Jacq. austr. 3. t. 256.) stem erect, branched; leaves linear, cuspidate; umbels terminal, of 5-7 rays; leaves of involucel linear, cuspidate, exceeding the flowers, which are 5 or 6 in each umbellule; ribs of fruit hardly elevated, and the furrows between the ribs are furnished with 3 vittæ. ⊙. H. Native of Provence, Nice, Sicily, Austria, Tauria, Caucasus, &c. in dry fields. Rchb. icon. 2. p. 56. t. 164. and t. 165. B. júnceum var. Lam. Spreng. B. filicaûle, Brot. ex Steud. Isophýllum Gerárdi, Hoffm. Bupréstis Gerárdi, Spreng.—Ger. Galloprov. t. 6. There are varieties of this plant with either erect or spreading branches, and with the involucels either shorter or longer than the flowers.

Gerard's Hare's-ear. Fl. July, Aug. Cl. 1804. Pl. 1 to 3 feet.

10 B. ju'nceum (Lin. spec. p. 343.) stem erect, panicled; leaves linear-lanceolate, cuspidate; umbels terminal, of 3 rays; leaves of involucel linear-lanceolate, cuspidate, shorter than the flowers, which are 3-5 in each umbel; ribs of fruit elevated, acute: having the furrows smooth, and almost without vittæ. ⊙. H. Native of south and middle Europe, even to Caucasus, in fields. Rchb. icon. 2. p. 57. t. 166. B. júnceum β, Lam. dict. 1. p. 519. B. Gerárdi, Smith, fl. græc. t. 262. B. júnceum α, Spreng. in Schultes, syst. 6. p. 371.—Lob. icon. t. 243. f. 1.

Var. β, *Rissòni* (D. C. prod. 4. p. 128.) fruit-bearing peduncles short, axillary, hardly attaining one-half the length of the leaves.

Rushy Hare's-ear. Fl. July, Aug. Clt. 1772. Pl. 3 to 4 ft.

11 B. gluma'ceum (Smith, prod. fl. græc. 1. p. 177. but not of Spreng.) stem erect, very slender, panicled; leaves linear, 3-nerved; involucra and involucels of 5 lanceolate cuspidate 3-nerved leaves, which are pellucid between the nerves and veins, exceeding the umbels; furrows of fruit smooth, furnished each with one vitta, and the ribs are acute and very slender. ⊙. H. Native of Calabria, in barren fields; island of Scio; about Constantinople, Cephalonia, Candia, and Cyprus. Rchb. icon. 2. p. 71. t. 179. B. flàvum, Forsk. eg. ar. suppl. p. 205.? B. gràcile d'Urvill. enum. 30. p. 250. but not of Bieb. Nearly allied to *B. odontìtes*, but perfectly distinct, in the leaves of the involucel being diaphanous between the nerves, not reticulated.

Glumaceous Hare's-ear. Pl. 1 foot.

12 B. Odonti'tes (Lin. spec. p. 342. exclusive of the syn. of Haller.) stem erect, panicled; leaves linear, 3-nerved; leaves of involucel 5, linear-lanceolate, cuspidate, 3-nerved, reticulately veined from the middle nerve being pinnate; fruit having the furrows smooth, and furnished with one vitta each, and the ribs acute and very slender. ⊙. H. Native of Italy, Sicily, Greece, Smyrna, Montpelier, and Mauritania. Jacq. hort. vind. 3. t. 91. Rchb. icon. 2. t. 68. t. 177. B. Fontanèsii, Guss. ind. sem. hort. bocc. 1825. ex ind. sem. 1826. pl. rar. 112. and prod. 1. p. 312.

Odontites Hare's-ear. Fl. Ju. Aug. Clt. 1749. Pl. 1 foot.

13 B. arista'tum (Barth. in Rchb. icon. 2. p. 70. t. 178.) stem erect, panicled; leaves lanceolate, linear, 3-nerved; leaves of involucel 5, elliptic, aristately cuspidate, reticulately veined, from the middle nerve being pinnate, exceeding the umbellules; fruit with smooth furrows, furnished with one vitta each, and acute very slender ribs. ⊙. H. Native of England, France, Balearic Islands, Corsica, Sardinia, Sicily, Liguria, Dalmatia, &c. in dry fields and on hills. In England on a marble rock in Devonshire, unquestionably wild. B. divaricàtum, Lam. fl fr, 3. p. 410. B. glumàceum, Spreng. umb. spec. 18. t. 3. f. 5. but not of Sibth. B. Odontìtes, Smith, engl. bot. t. 2468. Odontìtes lùtea, Spreng. prod. 33. Schultes, syst. 6. p. 380. but not of Hoffm. By most authors this species has been confused with the preceding.

Awned Hare's-ear. Fl. July. England. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

14 B. nodiflòrum (Sibth and Smith, fl. græc. t. 260.) stem dichotomous or trichotomous from the base; branches spreading, forked; leaves linear: radical ones distich; umbels axillary and terminal, rather capitate; leaves of involucrum 5, ovate, cuspidate, 3-nerved, transparent between the nerves, as well as the margins of the upper leaves; fruit with smooth furrows. ⊙. H. Native of Candia, in corn-fields; in Syria near Baruth; and Egypt. B. nànum, Poir. suppl. 1. p. 750. B. Mareóticum,

Delil. ined. B. proliferum, Delil. fl. egypt. p. 61. t. 22. f. 2. B. mínimum, Spreng. neue entd. 3. p. 163. Fruit striated, not warted.

Knot-flowered Hare's-ear. Fl. July, Aug. Clt. 1823. Pl. 1 foot.

15 B. HETEROPHY'LLUM (Link, enum. 1. p. 262.) leaves stem-clasping: lower ones lanceolate-linear: upper ones oblong-acuminated, almost perfoliate; umbels bifid; involucrum none; involucels of 5 ovate acuminated leaves. ⊙. H. Native of Egypt; and the Levant, near Aleppo. B. Ægyptìacum, Willd. B. lancifòlium, Horn. cat. hort. taur. 1812. ex herb. Furrows of fruit granular, ex Koch, umb. p. 157. This species is confounded with B. protráctum by Spreng. in Schultes, syst. 6. p. 365.

Variable-leaved Hare's-ear. Fl. May, July. Clt. 1818. Pl. 1 ft.

16 B. PROTRA'CTUM (Link, fl. port. 2. p. 387.) cauline leaves perfoliate, ovate-oblong, acuminated; umbels of 3 rays; involucrum wanting; leaves of involucel 5, mucronate; furrows of fruit granular. ⊙. H. Native of the south of Europe, from Spain to Greece and Egypt, and from Mauritania to Andegavany. Camb. bal. p. 83. B. subovàtum, Spreng. in Schultes, syst. 6. p. 365. exclusive of the synonymes. B. rotundifòlium β intermèdium, Lois. not. 45. D. C. fl. fr. suppl. p. 514. B. rotundifòlium, Brot. fl. lus. 1. p. 452. Diaphýllum triradiàtum, Hoffm.

Protracted Hare's-ear. Fl. May, July. Clt. 1819. Pl. ½ to ¾ foot.

17 B. ROTUNDIFÒLIUM (Lin. spec. p. 340.) cauline leaves perfoliate, roundish-ovate; umbels of 5-6 rays; involucrum wanting; involucels of 5 mucronate leaves; furrows of fruit smooth, and destitute of vittæ: ribs very slender. ⊙. H. Native of Europe, in fields, especially in Caucasus, south of Siberia, and Persia; in England in corn-fields, especially on a chalky soil. Smith, engl. bot. t. 99. Sturm, deutschl. fl. with a figure. Hayn. arz. gew. 7. t. 1. B. perfoliàtum, Lam. fl. fr. 3. p. 405. B. rotundifòlium *a*, Spreng. in Schultes, syst. 6. p. 364.—Moris, hist. 3. p. 299. sect. 9. t. 12. f. 1. This plant has been reckoned among the vulnerary herbs; but its virtues, whether ever experienced or not, are recorded in old herbals only.

Round-leaved Hare's-ear or Thorow-wax. Fl. July. England. Pl. 1 to 2 feet.

** *Perennial plants.*

18 B. AU'REUM (Fisch. in Schultes, syst. 6. p. 366.) leaves coriaceous; radical ones ovate, ovate-oblong, obovate, attenuated into the petioles at the base: cauline ones ovate, acute, stem-clasping; leaves of involucrum 3-5, elliptic, or nearly orbicular, mucronate; of the involucels 5, conforming to those of the involucrum, coloured, longer than the flowering umbels. ♃. H. Native of Siberia, on mountains beyond the Baikal; and of Altaia. B. longifòlium var. Spreng. umb. spec. p. 119. Very nearly allied to *B. longifòlium*, but differs in the involucels being yellow, obtuse with a mucrone, not acuminated.

Golden-umbelled Hare's-ear. Fl. May, June. Clt. 1820. Pl. 1 to 2 feet.

19 B. LONGIFÒLIUM (Lin. spec. p. 341.) leaves ovate-oblong: radical ones petiolate: cauline ones stem-clasping; leaves of involucrum 3-5, ovate, somewhat acuminated; of the involucels 5. ♃. H. Native of France, Germany, Transylvania, Switzerland, Savoy, &c. on the mountains.—J. Bauh. hist. 3. p. 199. f. 1. Cam. hort. t. 38. Umbellules 7-14 flowered. Fruit with elevated, sharp, rather winged ribs: and with the furrows between the ribs smooth, and furnished with 3 vittæ each, which are full of pellucid dots, ex Koch, umb. p. 117.

Long-leaved Hare's-ear. Fl. May, July. Clt. 1713. Pl. 1 to 2 feet.

20 B. PYRENÆ'UM (Gouan, ill. p. 8. t. 4.) radical leaves lanceolate, elongated: cauline ones cordate-lanceolate, half stem-clasping, acuminated; umbels of 5, very rarely of 3 rays; involucrum of 3 broadly ovate leaves; involucels of 5 obovate distinct leaves, which are almost twice the length of the umbellules. ♃. H. Native of the Pyrenees, in rocky meadows, in the places called Llaurenti, Ereslids, Estive de Luz, Port d'Oo; and in the Eastern Pyrenees. D. C. fl. fr. 4. p. 346. P. Pyrenàicum, Willd. spec. 1. p. 1371. B. angulòsum var. α, Lin. spec. p. 341. Leaves of involucrum rarely lobed at the base. Ribs of fruit broadly winged; wings sharply and membranously keeled; furrows smooth, furnished each with 3 vittæ, which are full of pellucid dots. Koch, umb. p. 116.

Pyrenean Hare's-ear. Fl. May, July. Clt. 1814. Pl. 1 ft.

21 B. STELLA'TUM (Lin. spec. p. 340.) radical leaves linear-lanceolate, elongated: cauline ones almost wanting; involucrum of 3 ovate-lanceolate leaves; involucels of 8 leaves, which are joined together into an 8-cleft disk, longer than the umbellules. ♃. H Native of the Alps of Switzerland, Piedmont, Dauphiny, and Savoy, in stony meadows; and of Corsica, on the mountains, and probably of the Pyrenees. D. C. fl. fr. 4. p. 346.—Hall. helv. hist. no. 771. t. 18. Ribs of fruit broadly winged; wings sharply and membranously keeled; furrows smooth, each furnished with one vitta.

Stellate-involucelled Hare's-ear. Fl. May, July. Clt. 1775. Pl. 1 to 1½ foot.

22 B. TRIRADIA'TUM (Adams, ex Fisch. in litt. ex D. C. prod. 4. p. 130.) radical leaves linear-oblong: cauline ones 3, stem-clasping, oblong or ovate, hardly acute; umbels of 3 rays; involucrum of 3 obovate leaves; involucel of 7-8 obovate leaves, which are scarcely longer than the umbellule. ♃. H. Native of Altaia or the mountains, and at Lake Baikal. Allied to *B. Pyrenæ'um*, but differs in the leaves being much less acute, in the umbels being of 3 rays, in the involucels being hardly longer than the flowers, and in the young fruit not being glaucous.

Three-rayed-umbelled Hare's-ear. Pl. 1 foot.

23 B. MULTINE'RVE (D. C. mem. soc. gen. vol. 4.) radical leaves oblong-linear, attenuated at both ends: cauline ones stem-clasping, ovate, acuminated, with many parallel nerves; involucra of 5 unequal leaves, having many parallel nerves; leaves of involucel 5, ovate, acuminated, coloured, hardly longer than the umbellule. ♃. H. Native of Altaia, on the mountains. Allied on the one hand to *B. aúreum* and *B. longifòlium*, and on the other to *B. graminifòlium*.

Var. β, angústius (D. C. prod. 4. p. 130.) cauline leaves narrower, more glaucous; involucrum of 2 leaves. ♃. H. Native of Dahuria.

Var. γ, mìnus (D. C. l. c.) involucrum of 3-4 leaves; stem nearly simple; leaves narrow. ♃. H. Native of Altaia, on the mountains.

Many-nerved-leaved Hare's-ear. Pl. 1 foot.

24 B. GRAMINIFÒLIUM (Vahl. symb. 3. p. 48.) stem nearly naked; leaves radical, linear; involucrum of 3-5 elongated leaves, about one-half shorter than the rays of the umbel; leaves of involucel 5-8, oblong, mucronate. ♃. H. Native of the Alps of Europe and the Pyrenees. Rœm. fl. eur. fasc. 7. with a figure. D. C. fl. fr. 4. p. 367. Spreng. in Schultes, syst. 6. p. 368. B. petræ'um, Vill. dauph. 2. p. 576. t. 14. Jacq. icon. rar. 1. t. 56. This species differs from *B. ranunculoìdes*, in the leaves being all nearly radical, in the involucels being often 7-8-leaved, in the leaves of the involucrum being more elongated. B. incúrvum, Bell. app. 77. t. 11. is hardly a variety of this species, unless that the leaves of the involucrum are more elongated. B. caricifòlium and B. petræ'um of many authors are identical with this.

Var. β, bicalyculàtum (D. C. prod. 4. p. 131.) leaves of in-

volucrum 10, disposed in two series. ♃. H. Native of Piedmont, on the mountains about Limone. B. bicalyculàtum, Bell. st. nov. p. 4. t. 2. in mem. acad. taur. vol. 7.

Grass-leaved Hare's-ear. Fl. May, July. Clt. 1768. Pl. ½ ft.

25 B. ranunculoìdes (Lin. spec. p. 342.) radical leaves linear-lanceolate, attenuated towards the base: cauline ones stem-clasping, oblong-cordate, or ovate-cordate, striated; involucrum of 3 unequal leaves; involucels of 5 ovate or oblong nerved distinct mucronate leaves. ♃. H. Native of the Alps, Pyrenees, Jura, Apennines, Siberia, in rough exposed places; and of North America, at Cape Mulgrave, in Behring's Straits. Lam. dict. 1. p. 518. D. C. fl. fr. 4. p. 348. B. angulòsum, Spreng. in Schultes, syst. 6. p. 366.—Park. theatr. 581. no. 7.—Bauh. hist. 3. p. 199. f. 2. Ribs of fruit elevated and sharp; and the furrows between the ribs smooth, and furnished with one vitta each, ex Koch, umb. p. 116. Habit of herb very variable, from a finger to a foot in height, simple or branched, bearing one or many umbels. Involucra of from 1 to 3 leaves, very variable in length, either broader or narrower than the leaves. The limits between the varieties are hardly perceptible, and to these may be referred the B. angulòsum, ranunculoìdes, rèpens, obtusàtum, and graminifòlium, Lapeyr. abr. and suppl. as well as B. gramíneum and Vapincénse, Vill. B. caricifòlium and Burseriànum, Willd. B. Baldénse, Hort. B. petræ'um, Geners. B. angulòsum β, Lin. &c.

Var. β, *carícinum* (D. C. prod. 4. p. 131.) radical leaves rather convolute, linear-subulate: cauline ones hardly dilated at the base. ♃. H. Native of the Apennines and the Pyrenees, in exposed rocky places. B. caricifòlium of many herbaria. B. petræ'um, Lin. spec. 340.? but the leaves of the involucel are distinct, not joined.

Var. γ, *oblongifòlium* (Led. fl. alt. 1. p. 348.) stem very simple; radical leaves 2, linear-oblong, 1½ to 2 inches long, and 2 to 3 lines broad, acutish; cauline leaves sessile, broader than the radical ones, of different shapes: the uppermost ones cordate-ovate, rounded at the apex, and mucronulate; involucrum of 3-8 unequal leaves; umbels of 4 unequal rays; involucels of 5-7 obovate mucronate leaves. ⊙. ♃. H. Native of Siberia.

Crowfoot-like Hare's-ear. Fl. July, Aug. Clt. 1790. Pl. ¼ to ½ foot.

26 B. Balde'nse (Host, syn. 141.) stem branched; leaves stem-clasping, nearly linear, acute, nerved; radical ones tapering into the petioles; leaves of involucel oblong-linear, about equal in length to the fructiferous pedicels; ribs of fruit sharp; vittæ 3 in each furrow. ♃. H. Native of Mount Baldo; and of Altaia, at the rivers Tscharysch, Kerlyk, Bucktorminsk; and near Schulbinsk. B. bicaûle, Helm. in act. mosq. 2. p. 106. t. 8.—Gmel. sib. 1. p. 209. no. 24. Stems numerous, erect or ascending, simple at the base, and branched at the apex. Radical leaves 2-6 inches long. Involucrum of 4-7 lanceolate-linear leaves, but sometimes only of one elongated deciduous leaf. Umbels of 5-13 rays. Involucels of 5-9 oblong-linear acute 3-nerved leaves; umbellules of 10-20 flowers.

Var. β, *multicaûle* (Led. fl. alt. 1. p. 350.) plant tufted; leaves rather fleshy. ♃. H. Native of Altaia, in saltish deserts at the river Tschuja.

Baldo Hare's-ear. Fl. June, July. Pl. ½ to 1 foot.

27 B. longicau'le (Wall. cat. no. 557.) stems erect, sparingly branched; leaves linear, acute, 5-7-nerved, rather membranous; umbels 3-5-rayed; involucra of 1-3 ovate acute leaves; umbellules 15-rayed; leaves of involucel 5, ovate, mucronate, longer than the flowers, but shorter than the fruit; fruit 3 times longer than the pedicels, acutely ribbed; vittæ 3 in each furrow. ♃. H. Native of Nipaul, at Gosaingsthan, Emodi, and Kamaon. Herb 1½ to 2 feet high, dividing into many stems at the neck. Leaves 3-6 inches long. Mature fruit 2 lines long.

Long-stemmed Hare's-ear. Pl. 1 to 2 feet.

28 B. Cando'llii (Wall. cat. no. 552.) stems rising from horizontal surculi, erect, sparingly branched; leaves lanceolate, acute, membranous, obliquely many nerved on both surfaces; umbels 12-13-rayed; involucrum of 2-3 ovate, acute, many nerved leaves; umbellules 12-15-rayed; involucels of 5 oval acute leaves, which exceed the fruit. ♃. H. Native of Nipaul, at Gosaingsthan and Emodi. Herb 2 feet high. Immature fruit hardly longer than the pedicels, oblong, ribbed, with the furrows smooth.

De Candolle's Hare's-ear. Pl. 2 feet.

29 B. panicula'tum (Brot. fl. lus. 1. p. 455.) leaves linear-narrow, many nerved: radical ones very long; stem erect, panicled; umbels 2-3-rayed; involucrum of 2-3 small leaves; involucels of 4-5 subulate leaves, which are 3 or 4 times shorter than the umbellules; fruit oblong. ♃. H. Native of Portugal, on calcareous hills. Fruit with 3 ribs on each side, usually of one mericarp from abortion. Habit of *B. frutéscens*, but the stems are annual.

Panicled Hare's-ear. Fl. June, Aug. Clt. 1824. Pl. 1 to 3 ft.

30 B. ce'rnuum (Ten. app. 1st cat. hort. neap. ex D. C. prod. 4. p. 131.) stems erect, simple; leaves linear, acute, narrowed at the base so much as to form petioles, many nerved; umbels 5-9-rayed; involucra of 2-4 leaves; involucels of 5 setaceous leaves; furrows of fruit smooth. ♃. H. Native of the kingdom of Naples, on calcareous rocks. B. obtusifòlium, Ten. prod. p. 18. Leaves acute. A very distinct species, although it has been joined by Sprengel with B. semicompósitum. Very nearly allied to *B. paniculàtum*.

Drooping Hare's-ear. Pl. 1 foot.

31 B. exalta'tum (Bieb. tabl. casp. p. 166.) leaves all linear, many nerved: lower ones elongated; stem erect, leafy, paniculately branched; umbels 5-10-rayed; involucra and involucels of 3-5 subulate unequal, small leaves; fruit ovate. ♃. Bieb. ♂. Stev. H. Native of Tauria and Caucasus, in maritime meadows, and on hills. B. Baldénse, Willd. spec. 1. p. 1375. exclusive of the syn. Bieb. fl. cauc. no. 513. but not of Turr. nor Host. Allied to *B. falcàtum*, but differs in the fruit being shorter, and in the ribs being less acute.

Exalted Hare's-ear. Fl. July. Clt. 1807. Pl. 2 feet.

32 B. linearifòlium (D. C. prod. 4. p. 131.) stem erect, paniculately branched; leaves linear, very long, hardly acute, many nerved; umbels of 5-6 rays; involucra and involucels of 4-5 small acuminated leaves; fruit linear-oblong, with rather prominent ribs. ♃. H. Native of Persia, on mountains about Badala, in the district of Khoi in the province of Aderbeidjan, where it was collected by Szowits. Very like *B. exaltàtum*, but differs in the fruit being longer. It is perhaps, however, only a variety of it.

Linear-leaved Hare's-ear. Pl. 1 foot.

33 B. scorzoneræfòlium (Willd. enum. suppl. p. 30.) radical leaves lanceolate: cauline ones linear, all striated with 9-11 parallel nerves; stem paniculately branched; umbels 8-10-rayed; involucrum of 1-2 leaves; involucels of 4-5 lanceolate apiculated leaves, which are shorter than the umbellules. ♃. H. Native of Siberia, at Lake Baikal. Allied to *B. falcàtum*, but differs in the leaves being narrower, and in the nerves being parallel and more crowded.

Scorzonera-leaved Hare's-ear. Fl. June, July. Clt. 1817. Pl. 1½ foot.

34 B. lanceola'tum (Wall. cat. no. 551.) stem erect, sparingly branched; leaves lanceolate, much acuminated, glabrous, membranous, furnished with 2 oblique nerves on each side; umbels 5-6-rayed; involucrum of one small leaf; umbellules 5-8-rayed; involucels of 1-2 small leaves, rarely wanting; fruit ovate-oblong, with the ribs hardly elevated, and the furrows smooth.

♃. H. Native of Nipaul, on the mountains. Herb 2 feet high, quite glabrous. Leaves 4 inches long, and an inch broad. Fruit a line and a half long. Furrows of immature fruit furnished with 3 vittæ each.

Lanceolate-leaved Hare's-ear. Pl. 2 feet.

35 B. MARGINA'TUM (Wall. cat. no. 556.) stems erectly ascending, sparingly branched; leaves linear, acute, stiff, 5 7-nerved; outer nerves nearly marginal; umbels 6-8-rayed; involucra of 3-5 acuminated lanceolate leaves; umbellules 10-12-rayed; involucels of 3-5 leaves, which are shorter than the pedicels; fruit oblong, ribbed, with the furrows smooth. ♃. H. Native of Nipaul and Kamaon. Root hard, branched, thick. Herb a foot and a half high. Lower leaves 3 inches long, and 3 lines broad, usually obtuse from some cause; nerves very prominent.

Marginate-leaved Hare's-ear. Pl. 2 feet.

36 B. TRÍFIDUM (Tenore, prod. fl. neap. p. 18.) stem erect, branched; leaves lanceolate, 9-nerved: upper ones rather falcate, much shorter than the branchlets; involucrum of 3 very short linear-subulate leaves; involucels of 5 setaceous leaves, shorter than the umbellules, which are trifid. ♃. H. Native of Calabria, on dry rocks. Perhaps only a var. of *B. scorzoneræfòlium* or *B. falcàtum*.

Trifid-umbelled Hare's-ear. Pl. 1 to 2 feet.

37 B. FALCA'TUM (Lin. spec. p. 341.) leaves oblong: lower ones oblong, petiolate: cauline ones sessile, linear-lanceolate, attenuated at both ends; leaves of involucel oblong-lanceolate, acuminated, about equal in length to the fructiferous pedicels. ♃. H. Native of Middle Europe, in hedges and among bushes in dry situations; and of Siberia, on the Altaian mountains; and throughout the whole of Caucasus. Jacq. austr. 2. t. 158. D. C. fl. fr. 4. p. 347.—Lob. icon. t. 456. f. 1. Ribs of fruit elevated, narrow, and a little winged; vittæ 3 in each furrow: furrows smooth, ex Koch, umb. 116.

Var. β, petiolàre (D. C. fl. fr. suppl. p. 514.) radical leaves ovate or oval, 7-nerved. ♃. H. Native of the Eastern Pyrenees. B. petiolàre, Lapeyr. abr. pyr. p. 141. B. rígidum β, Spreng. in Schultes, syst. 6. p. 370.

Falcate-leaved Hare's-ear. Fl. May, Sept. Clt. 1739. Pl. 1 to 2 feet?

38 B. RI'GIDUM (Lin. spec. p. 342.) lower leaves petiolate, oblong or oval, nerved, coriaceous: upper ones small; stem nearly naked, dichotomously panicled; involucra of 3 small leaves. ♃. H. Native of the south of France, from Provence to Narbonne, in rugged sterile places. D. C. fl. fr. 4. p. 349. B. rígidum, Spreng. in Schultes, syst. 6. p. 370. exclusive of variety β. B. falcàtum β, Lam. fl. fr. 3. p. 408.—Lob. icon. t. 456. f. 2.—Ger. 608. f. 2.—Bauh. hist. p. 200. f. 2. Umbels 3-rayed. Ribs of fruit acute, very slender, but not elevated; furrows smooth, furnished with one vitta each, ex Koch, umb. 115.

Stiff Hare's-ear. Fl. May, July. Clt. 1820. Pl. 2 feet.

39 B. NU'DUM (Ait. hort. kew. 1. p. 331.) stem dichotomous, 2-leaved; radical leaves decompound, flat, cut; involucrum of one leaf; involucels of 5 lanceolate acute leaves, which are shorter than the umbellules. ♃. G. Native of the Cape of Good Hope. Flowers pale yellow. The rest unknown.

Naked Hare's-ear. Fl. Oct. Clt. 1778. Pl. 1½ foot.

* * * *Shrubby species.—Tenória and Buprèstis, Spreng. l. c.*

40 B. MU'NDTII (Cham. et Schlecht. in Linnæa. 1. p. 384.) shrubby, much branched; leaves linear-setaceous; umbels 2-3-rayed; involucels of 5 narrow lanceolate acute leaves, which are equal in length to the umbellules; fruit oblong, smooth. ♃. G. Native of the Cape of Good Hope. Lower leaves 8 inches long. B. sulcàtum β Africànum, Berg. cap. 76.? but the umbels are said to be 5-rayed, and the involucels of 5 leaves.

Mundt's Hare's-ear. Shrub 1 to 2 feet.

41 B. SIBTHORPIA'NUM (Smith, fl. græc. t. 264. prod. 1. p. 179.) plant suffrutescent; leaves linear, rather falcate, with smooth margins; involucra usually of 3 leaves; leaves of involucel linear-lanceolate, cuspidate, shorter than the umbellules. ♄. H. Native of the Morea. A specimen collected near Teheran agrees very well with the character given to this; and is probably the same. Plant only frutescent at the base.

Sibthorp's Hare's-ear. Shrub 1 foot.

42 B. SPINÒSUM (Lin. fil. suppl. p. 178.) shrubby, erect; floriferous branches divaricate, stiff: the deflowered ones spinose; leaves linear-subulate, many veined, quite entire; involucra of 3-5 small subulate leaves. ♄. H. Native of Spain and Mauritania. Gouan. ill. p. 8. t. 2. f. 3. Desf. atl. 1. p. 232. Tenòria spinòsa, Spreng. Ribs of fruit obtuse.

Spinose Hare's-ear. Fl. Aug. Sept. Clt. 1752. Sh. 1 foot.

43 B. FRUTICE'SCENS (Lin. amœn. 4. p. 269.) suffruticose, erect; branches slender, elongated, erect; leaves linear-subulate, stiff, striated, 5-7-nerved; involucra of 3-5 very short subulate leaves. ♄. H. Native of Mauritania, Spain, and between Perpignan and Narbonne. Cav. icon. 2. t. 106. Tenòria fruticéscens, Spreng. in Schultes, syst. 6. p. 376.—Barr. icon. t. 1255. Umbels small, 3-5-rayed. Ribs of fruit obtuse.

Frutescent Hare's-ear. Fl. Aug. Sept. Clt. 1752. Sh. 1 ft.

44 B. FOLIÒSUM (Salzm. pl. exsic. ex D. C. prod. 4. p. 133.) suffrutescent, erect, nearly simple; leaves sessile, half stem-clasping, linear-lanceolate, acuminated, undulated, crowded, 1-nerved, quite entire; leaves of involucra ovate. ♄. F. Native of Mauritania, about Tangiers. Stem a foot high. Leaves broad and half stem-clasping at the base. Involucra of 3 leaves; involucels of 4-5 leaves. Fruit ovate, with obtuse ribs.

Leafy Hare's-ear. Shrub 1 foot.

45 B. ELA'TUM (Guss. prod. fl. sic. 1. p. 316.) plant suffrutescent at the base; branches elongated; leaves membranous, many veined: radical ones oblong-lanceolate, tapering into the petioles: cauline ones sessile, linear-lanceolate; umbels 8-12-cleft; involucra of 4-5 short leaves; leaves of involucels oblong, acuminated, longer than the umbellules. ♄. F. Native of Sicily, on calcareous rocks. Allied to *B. plantagíneum*, but the plant is frutescent at the base, and the leaves are acute. Ribs of fruit smooth.

Tall Hare's-ear. Shrub 3 to 5 feet.

46 B. CANE'SCENS (Schousb. mar. beob. p. 113.) shrubby, erect, branched; leaves oblong, membranous, very blunt, quite entire, sessile, with many parallel nerves; umbels 8-10-rayed; leaves of involucra oblong, obtuse, short. ♄. F. Native of Mogodor. Branches of a greyish white-colour. Plant glabrous. Fruit like that of *B. fruticòsa*. Leaves much thinner, and one-half smaller than those of *B. plantagíneum*.

Canescent Hare's-ear. Fl. Aug. Sept. Clt. 1809. Shrub 2 to 3 feet.

47 B. PLANTAGI'NEUM (Desf. atl. 1. p. 233. t. 57.) shrubby, erect, branched; leaves lanceolate, mucronate, stiff, coriaceous, sessile, quite entire, many nerved; umbels 4-10-rayed; leaves of involucra elongated, subulate, acute. ♄. F. Native of Mount Atlas, near Bougie. Tenòria plantagínea, Spreng. in Schultes, syst. 6. p. 376. Nerves almost diverging from the base of the leaves, not parallel.

Plantain-leaved Hare's-ear. Fl. July, Aug. Clt. 1810. Shrub 2 to 3 feet.

48 B. GIBRALTA'RICA (Lam. dict. (1784.) 1. p. 520.) shrubby, erect, branched; leaves lanceolate, attenuated at both ends, 1-nerved, coriaceous, glaucous, oblique, quite entire, sessile; leaves of involucra lanceolate. ♄. F. Native of Gibraltar, on the

rocks at Algesira. B. coriàceum, Lher. stirp. nov. fasc. 6. (1785.) t. 67. B. oblìquum, Vahl. symb. 1. p. 24. B. arboréscens, Jacq. icon. rar. 2. t. 351. Tenòria coriàcea, Spreng. in Schultes, syst. 6. p. 345. Bupréstis coriàcea, Spreng. mag. B. verticàle, Ort. fl. esp. The whole plant is rather fragrant when rubbed.

Gibraltar Hare's-ear. Fl. June, Aug. Clt. 1784. Shrub 2 to 3 feet.

49 B. fruticòsum (Lin. spec. 343.) shrubby, erect, branched; leaves oblong, attenuated at the base, coriaceous, 1-nerved, quite entire, sessile; leaves of involucra oblong. ♄. F. Native of Portugal, Spain, south of France, Nice, Corsica, Sicily, Mauritania, and Thessaly. Sibth. fl. græc. t. 263. Wats. dendr. brit. t. 14. Duham. arbr. 1. t. 43. Jaum. pl. fr. 1. t. 65. Mill. fig. 74. Tenòria fruticòsa, Spreng. in Schultes, syst. 6. p. 376. Bupréstis fruticòsa, Spreng. mag. Séseli Æthiòpicum, Bauh. pin. 161. Séseli frùtex, Mor. umb. 16. Ribs of fruit elevated, acute; vittæ broad. Bark of branches purplish. Leaves of a sea green colour.

Shrubby Hare's-ear. Fl. Jul. Aug. Clt. 1596. Sh. 3 to 6 ft.

50 B. diffo'rme (Lin. spec. 343.) shrubby, erect, branched; leaves variable on the same branch, simple or ternate; leaflets undivided or cut; umbels terminal, 8-12-rayed; leaves of involucrum linear, acute, much shorter than the peduncles. ♄. G. Native of the Cape of Good Hope. Burm. afr. t. 71. f. 1. Cham. et Schlecht. in Linnæa. 1. p. 384. Thunb. fl. cap. 248. Tenòria diffŏrmis, Spreng. in Schultes, syst. 6. p. 377. Bupréstis diffŏrmis, Spreng. mag. Ribs of fruit rounded and tumid, lateral ones somewhat dilated; vittæ 2-3 in each furrow. This shrub sends out side branches, which in the spring have on their lower parts leaves, composed of many small flat leaflets, finely cut like those of coriander, and of a sea green colour; these leaves soon fall off, and the upper part of the branches are closely covered with long rush-like leaves, having 4 angles, coming out in clusters from each joint.

Differmed-leaved Hare's-ear. Fl. Aug. Sept. Clt. 1752. Sh. 4 to 6 feet.

† *Species not sufficiently known.*

51 B. polyphy'llum (Ledeb. mem. ac. sc. petrop. 5. p. 528.) stem erect, striated, branched above; leaves lanceolate, stem-clasping; umbels of many unequal rays; involucrum almost wanting; involucels of 6 lanceolate acuminated leaves, which exceed the fruit. ♃. H. Native of Caucasus. Flowers said to be solitary in the axils of the branches.

Many-leaved Hare's-ear. Fl. May, June. Clt. 1823. Pl. 1 ft.

52 B.? oppositifòlium (Lapeyr. abr. pyr. p. 141.) stem naked; branches umbellate; leaves opposite, lanceolate, obtuse, nerved; involucrum almost wanting; involucels of 5 lanceolate awned leaves. ☉. H. Native of the Pyrenees, at a place called Trancade d'Ambouilla. This species is very obscure, and very doubtful whether it is an umbelliferous plant at all.

Opposite-leaved Hare's-ear. Pl. 1 foot.

Cult. All the species grow well in any common garden soil. The seeds of the annual species only require to be sown in the open ground early in spring. The herbaceous perennial kinds are either increased by being divided at the roots, or by seeds; and the shrubby species by cuttings.

LVII. HETEROMO'RPHA (from ἑτερος, *heteros*, diverse, and μορφη, *morphe*, form; leaves). Cham. et Schlecht. in Linnæ. 1. p. 385. t. 5. f. 2. D. C. coll. mem. 5. p. 43. prod. 4. p. 134.—Bupleùrum species of authors.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals roundish, entire, closely involute, ending in a broad retuse point. Fruit obovate-pyriform, 5-winged; mericarps of 2 forms; the outer one 2-winged, and the inner one 3-winged; wings running from the teeth of the calyx, and therefore are the carinal ribs extended; vittæ one in each furrow, and 2 in the commissure.—A glabrous Cape shrub, with the habit of *Bupleùrum fruticòsum.* Leaves petiolate, ovate or oblong, rarely somewhat triple-nerved, sometimes quite entire, sometimes 3-lobed, tripartite or ternate. Umbels of many rays. Involucra and involucels of many short leaves. Flowers yellow as in *Bupleùrum.*

1 H. arbore'scens (Cham. et Schlecht. l. c.) ♄. G. Native of the Cape of Good Hope. Bupleùrum arboréscens, Thunb. prod. p. 50. fl. cap. 247. Bupleùrum trifoliàtum, Wendl. et Bartl. beitr. 2. p. 13. Tenòria arboréscens, Spreng. prod. umb.

Arborescent Heteromorpha. Fl. Aug. Sept. Clt. 1810. Sh. 1 to 2 feet.

Cult. Any common soil will answer this shrub; and cuttings are easily rooted.

Tribe V.

SESELI'NEÆ (plants agreeing with *Séseli* in important characters) or Orthospérmæ paucijugatæ teretiusculæ, Koch, umb. 102. D. C. prod. 4. p. 135. Transverse sections of fruit terete, or nearly so. Mericarps with 5 equal filiform or winged ribs: lateral ribs marginating, and often a little broader than the rest. Seed somewhat teretely convex on the back, and flattish in front. Raphe marginal or submarginal.

LVIII. LICHTENSTEI'NIA (in honour of M. Von Lichtenstein, Professor of Medicine at Berlin, a celebrated German botanist). Cham. et Schlecht. in Linnæa. 1. p. 394. D. C. prod. 4. p. 135. but not of Willd. nor Wendl.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals elliptic, drawn out into a long acumen, which is bent in nearly to the base. Fruit nearly terete, variable in length, crowned by the teeth of the calyx in the immature state, and by the stylopodium and short spreading styles. Mericarps smooth, with 5 filiform ribs, lateral ones marginating; vittæ large, solitary under each rib, but none in the commissure nor furrows.—Perennial herbs, natives of the Cape of Good Hope, yielding an aromatic juice. Radical leaves cut. Stems erect, fistular, naked, branched, furnished with sheathing scales or abortive leaves. Terminal umbels compound, fertile: lateral ones often sterile. Involucra and involucels of many short marcescent leaves. Flowers yellow? This genus from the situation of the vittæ agrees alone with *Melanoselìnum*, but the form of the fruit is very different.

1 L. la'cera (Cham. et Schlecht. l. c. p. 395.) leaves scabrous, almost undivided or jagged: lobes irregularly serrated: serratures setaceously cuspidate; fruit oblong. ♃. G. Native of the Cape of Good Hope, on the Devil's mountain. Sieb. pl. exsic. no. 213. Hérmas rudíssima, Reichb. in Spreng. syst. 4. p. 118. Œnánthe exaltàta, Thunb. prod. p. 50. fl. cap. p. 254. ex herb. Juss. Leaves like those of *Eryngium.* Umbel 15-rayed; involucra of 10 leaves. Immature fruit blackish when dried.

Jagged-leaved Lichtensteinia. Pl. 3 to 4 feet.

2 L. trífida (Cham. et Schlecht. l. c. p. 39.) leaves glabrous, ternate, rarely 2-4 cleft; leaflets lanceolate, entire or toothed; fruit elliptic. ♃. G. Native of the Cape of Good Hope, at Schurfdeberg. Œnánthe obscùra, Spreng. syst. 1. p. 890. Umbels 10-20-rayed.

Trifid Lichtensteinia. Pl. 1 to 2 feet.

3 L. pyrethrifòlia (Cham. et Schlecht. l. c. p. 397.) leaves glabrous, pinnatifid: lobes ovate, cut, serrated; fruit elliptic. ♃. G. Native of the Cape of Good Hope, in the woods of Ruyterbosch. Sieb. pl. cap. exsic. no. 211. and 222. Bùbon proliferum, Burm. fl. cap. p. 8. Œnánthe inèbrians, Thunb.

prod. p. 40. fl. cap. 262. ex Spreng. syst. 4. p. 118. Œnánthe Capénsis, Houtt.? Sprengel says his plant has rough leaves, and Thunb. says his is glabrous; they are, however, only the same. The plant is called *Gli* by the Hottentots, and is made by them into an inebriating liquor.

Pyrethrum-leaved Lichtensteinia. Fl. Aug. Sept. Clt. 1816. Pl. 1 to 2 feet.

4 L. palma`ta (D. C. prod. 4. p. 135.) leaves pilose on both surfaces, palmate; petioles broad, sheathing; lobes or leaflets 5, oblong, rather cuneated, cartilaginously serrated; stem terete, glabrous, sparingly branched; petiolar sheaths short, leafless; fruit ovate. ♃. G. Native of the Cape of Good Hope.

Palmate-leaved Lichtensteinia. Pl.?

Cult. The species of this genus require to be grown in pots so as they may easily be sheltered in the winter. Any light soil will suit them; and they may be easily increased by dividing at the root or by seeds.

LIX. OTTO`A (in honour of Frederick Otto, superintendent of the royal botanic garden of Berlin). H. B. et Kunth, nov. gen. amer. 5. p. 20. t. 423. D. C. prod. 4. p. 136.—Œnánthe species of Spreng.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals equal, with an inflexed point. Styles arcuately divaricate, capitellate at the apex. Fruit oblong; mericarps acutely 5-ribbed, rather compressed at the commissure; ribs membranous.—Smooth perennial herbs. Stems simple, with few leaves. Leaves (phyllodia?) sheathing at the base, intercepted by transverse dissepiments. Umbels terminal, without any involucra, of many rays. Umbellules without involucels. Flowers white, polygamous, 3-4, hermaphrodite, and 6-7 male in each umbellule. This genus is allied to *Œnánthe*, but differs in the margin of the calyx being obsolete, not 5-toothed; in the petals being entire, and in the styles being divaricate.

1 O. œnanthoìdes (H. B. et Kunth, l. c.) ♃. G. Native of Quito, between St. Vincent and Ybarra. Œnánthe Quiténsis, Spreng. syst. 1. p. 888. Herb very like *Tiedemània teretifòlia*, but the generic character is different, and the involucrum is wanting.

Œnanthe-like Ottoa. Pl. 1 foot.

Cult. Any soil will suit this plant, and it may either be increased by seed or by dividing at the root.

LX. ŒNA'NTHE (from *οινος, oinos*, wine, and *ανθος, anthos*, a flower; odour). Lam. dict. 4. p. 526. ill. t. 203. Lag. am. nat. 2. p. 96. Koch, umb. p. 112. diss. ined. in litt. 1828. D. C. prod. 4. p. 136.—Œnánthe and Phellándrium, Lin. gen. no. 352. and 353. Hoffm. umb. p. 73.—Œnánthe species of Spreng. prod. p. 37.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed, permanent, somewhat accrete after flowering. Petals obovate, emarginate, with an inflexed point. Stylopodium conical. Fruit cylindrically ovate, crowned by the long erect styles. Mericarps with 5 rather convex obtuse ribs: lateral ribs marginating, and a little broader than the rest; vittæ one in each furrow. Carpophore indistinct.—Smooth usually aquatic herbs, natives of Europe and Asia. Umbels compound. Involucra variable, usually wanting; involucels of many leaves. Flowers in the rays of the umbellules on long pedicels sterile; those in the disk on short pedicels fertile; petals white. The species of this genus are difficult to extricate, in consequence of the roots having been neglected by the authors who have described them.

§ 1. *True species, natives of Europe, &c. but not of the Cape of Good Hope.*

* *Plants perennial. Roots tuberous; tubers disposed in fascicles.*

1 Œ. fistulòsa (Lin. spec. 365.) roots fasciculate, intermixed with oblong tubers; neck of root throwing out stolons; stems and leaves fistular; radical leaves bipinnate: leaflets cuneated, lobed; cauline leaves pinnate: leaflets filiform; umbels 3-4-rayed, without any involucrum; fruit turbinate, much crowded, ribbed. ♃. H. Native of Europe and Caucasus, in ditches, ponds, and other watery places; plentiful in Britain. Drev. et Heyne. pl. europ. 5. t. 98. Fl. dan. t. 846. Smith, engl. bot. t. 363. O. aquática, Bauh. pin. 162.—Bauh. hist. 3. p. 192. f. 1.—Petiv. herb. brit. t. 25. f. 5. and 6. There is a variety of this whose roots are composed of whorles of fibres. The plant has an unpleasant smell, and a hot nauseous taste, like many other umbelliferous plants. The roots and whole herbage are said to be poisonous. Flowers pale red.

Var. β, Tabernæmontàni (Koch, ex D. C. prod. 4. p. 136.) radical leaves divided into many linear segments. ♃. H. Native of Alsatia, in inundated places. O. Tabernæmontàni, Gmel. fl. bad. 1. p. 676. exclusive of the syn. of Poll.

Var. γ? lanceolàta (Spreng. ex D. C. prod. 4. p. 136.) radical leaves pinnate or bipinnate: leaflets or segments linear-lanceolate; umbels bifid. ♃. H. Native of Mauritania, in humid places on the sea shore near Lacalle. Œ. lanceolàta, Poir. suppl. 4. p. 135. Œ. fistulòsa, Poir. voy. 2. p. 137.

Fistular or Common Water-dropwort. Fl. June, Aug. Britain. Pl. 1 to 2 feet.

2 Œ. Lachena`lii (Gmel. fl. bad. 1. p. 678.) fibres of roots cylindrical, rather fleshy, in fascicles; radical leaves somewhat bipinnate: leaflets cuneiform, obtuse, tridentate at the apex; cauline leaves pinnate: leaflets linear, entire; involucra wanting, or of few leaves. ♃. H. Native of the north of Italy, Germany, valleys of the Rhine, in humid meadows; and of Caucasus, in marshes towards the Caspian sea between Sallian and Lenkeran. Koch, umb. p. 113. Œ. pimpinelloìdes, Poll. pall. 1. p. 291. but not of Lin. Œ. Rhenàna, D. C. suppl. p. 506. Œ. Megapolitàna, Willd. berl. mag. 3. p. 297. Œ. gymnorhìza, Brignoli, pl. forojul. 21. Œ. Jordàni, Tenore, add. 1827.? Styles white after flowering.

Var. β, approximàta (D. C. prod. 4. p. 137.) radical leaves pinnate; leaflets or segments trifid, obtuse, cuneated at the base. ♃. H. Native about Paris, in humid meadows. O. approximàta, Mer. fl. par. 115. D. C. suppl. p. 507.

Var. γ, involucràta (D. C. l. c.) involucrum of many leaves. ♃. H. Œ. peucedanifòlia, Schleich. pl. exsic. Œ. Rhenàna, Moricand, fl. ven. p. 149. In some specimens the involucrum is absent. Fruit ovate, striated; pedicels not thickened after flowering.

La Chenal's Water-dropwort. Fl. June, Aug. Clt. 1817. Pl. 2 to 3 feet.

3 Œ. peucedanifòlia (Poll. pal. 1. p. 289. f. 3.) tubers of roots sessile, elliptic, ending in a fibre each at the apex; radical leaves bipinnate: cauline ones pinnate; lobes or leaflets all linear; umbels 5-8-rayed; involucrum wanting, or of 1 leaf; fruit oblong, attenuated at the base, nearly sessile, coarctate beneath the calyx. ♃. H. Native of middle Europe, in meadows, ditches, and bogs; as in France, Switzerland, &c. In England, near Bury; about Bedford; on the banks of the Isis, beyond Isley; and in peat bogs, under Headington Wick Copse, Oxfordshire. Umbellules dense, many-flowered, surrounded by the many leaves of the involucels, which are of equal length. Smith, engl. bot. t. 348. Œ. filipenduloìdes, Thuill. fl. par. p. 146. Œ. Pollíchii, Gmel. fl. bad. 1. p. 679. Œ. peucedanoìdes, Roth. Œ. pàtens, Mœnch.—Lob. icon. 729. f. 2.—Dalech. hist. 773. f. 1. Flowers often reddish. The roots taste like the garden parsnip, but are probably dangerous food; yet they are not reckoned poisonous, though the roots of other species are virulent.

Sulphur-wort-leaved Water-dropwort. Fl. Ju. Brit. Pl. 1½ ft.

4 Œ. SILAIFÒLIA (Bieb. suppl. p. 232.) knobs of roots of an oblong-fusiform shape, or cylindrical, fasciculate; leaves pinnate; leaflets of the lower leaves lanceolate: of the upper ones linear; involucra almost wanting; fruit ovate, crowded, sessile, hardly longer than the involucel. ♃. H. Native of the south of Tauria and Caucasus, in humid places; Montpelier, at Mireval; Geneva; Germany at Fuessen. Œ. virgàta, Koch, in litt. and perhaps of Poir. Œ. tenuifòlia, Frœl. in litt. and is sometimes to be found in gardens, under the name of *Œ. glaúca;* the whole plant being rather glaucous. Perhaps truly distinct from *Œ. peucedanifòlia.*

Silaus-leaved Water-dropwort. Fl. June, July. Clt. 1817. Pl. 2 feet.

5 Œ. PIMPINELLOÌDES (Lin. spec. 365.) roots of several slender, fleshy, cylindrical fibres, which are dilated into ovate-globose tubers at the apex; radical leaves bipinnate; leaflets cuneated, cut; cauline leaves pinnate; leaflets of the cauline leaves elongated, linear, and entire; involucra of many linear leaves; fruit cylindrical, striated, callous at the base, longer than the pedicels, which are thick and short. ♃. H. Native of Europe, in salt marshes. In Britain, as Quaplod, near Salping, Lincolnshire; near Aber, North Wales; Cambridgeshire; also in Galloway, the Isle of Arran, and other parts of Scotland. Stem cylindrical, hollow, slightly branched. Flowers of a pale flesh colour.

Var. α, chærophylloìdes (D. C. prod. 4. p. 137.) tubers hanging by long fibres. ♃. H. Œ. chærophylloìdes, Pourr. act. tol. 3. p. 323.—Œ. pimpinelloìdes, Smith, engl. bot. 347. Jacq. aust. t. 394. Œ. austràlis, Wulf. Œ. Kársthia, Hacq. carn. t. 3.? —Bauh. hist. 3. p. 191. f. 1. Mor. ox. sect. 9. t. 7. f. 3. Cam. epit. 610. icon. Smith says the roots are of several slender, tapering, fleshy tubercles, intermixed with fibres.

Var. β, pimpinellæfòlia (D. C. prod. 4. p. 137.) tubers on short peduncles, intermixed with fibres.—Bauh. hist. 3. p. 191. f. 2. Œ. pimpinelloìdes, Lam. dict. 4. p. 528. and probably of many other authors. Œ. virgàta, Poir. voy. 2. p. 138. Spreng. umb. 105.

Pimpernel-like Water-dropwort. Fl. Jul. Brit. Pl. 1 to 2 ft.

6 Œ. CALLÒSA (Salzm. mss. ex D. C. prod. 4. p. 137.) roots unknown; stem branched, striated; lower leaves bipinnate: leaflets ovate, deeply serrated; upper leaves pinnate: leaflets lanceolate-linear, acuminated; umbels of many rays; involucrum almost wanting; fruit cylindrically-oblong, striated, callous at the base and apex, longer than the pedicels, which are thick. ♃. H. Native about Tangiers. This species differs from *Œ. apiifòlia* in the fruit being callous, and from *Œ. pimpinelloìdes* in the involucrum being almost wanting. Fruit crowded in the umbellules.

Callous-fruited Water-dropwort. Pl. 2 to 4 feet.

7 Œ. APIIFÒLIA (Brot. fl. lus. p. 420. phyt. t. 33.) knobs of roots sessile, oblong-fusiform; stem branched, furrowed: leaves bipinnate or tripinnate: leaflets wedge-shaped, deeply serrated; upper leaves pinnate, with narrower leaflets; umbels of many rays; involucrum almost wanting; fruit cylindrically-oblong, striated, longer than the pedicels. ♃. H. Native of Portugal, Corsica, &c. Willd. enum. p. 316. Spreng. in Schultes, syst. vol. 6. Stems purplish, particularly at the joints, by which it may be known at first sight from *Œ. crocàta,* to which it is very nearly allied, and from which it only differs in the involucrum being almost absent. Plant strong, very poisonous, abounding in less orange-coloured juice than *Œ. crocàta.*

Celery-leaved Water-dropwort. Fl. July. Clt. 1806. Pl. 2 to 5 feet.

8 Œ. CROCA'TA (Lin. spec. p. 365.) knobs of roots oblong or elliptic, sessile; stem branched, furrowed; leaves all bipinnate; leaflets wedge-shaped, deeply toothed; umbels of many rays; involucra and involucels of many leaves; fruit linear-oblong, with slender intermediate ribs, longer than the pedicels. ♃. H. Native of Europe, common. Plentiful in Britain, in watery places, osier holts, and about the banks of rivers. Jacq. vind. 3. t. 55. Smith, engl. bot. t. 2313. Bull. herb. t. 113. Woodv. suppl. med. bot. t. 267.—Lob. icon. t. 730.—Mor. ox. sect. 9. t. 7. f. 2.—Matt. valg. 2. p. 220. f. 1. Leaves of involucra and involucels various in number and shape. Flowers white, tinged with purple. Plant strong. Roots abounding with an acrid, fetid, very poisonous saffron-coloured juice, such as exudes less plentifully from all parts of the herb, when wounded. Brood mares sometimes eat the root, according to Sir Thomas Franklin, and are poisoned by it. Ehret, the celebrated botanical draughtsman, experienced a giddiness from the scent of the herb. Dr. Pultney remarks, that the root is one of the most virulent poisons of all the vegetable poisons that Great Britain produces. In Westmorland the country people apply a poultice of the herb to the ulcer which forms in the fore part of the cleft of the hoof in horned cattle, which is called the foul. It may be safely used externally, but internally it should be taken with caution, as is evident from the accounts given above, and others recited by Mr. Howell and Sir William Watson, in the Philosophical Transactions. The former of these says that two French prisoners at Pembroke died by eating the root, that the inhabitants call it five-fingered root, and that it is much used there in cataplasms. In the same Transactions, a case is related of eight young lads near Clonmel in Ireland, where the plant is called *tahow,* mistaking its roots for the *water-parsnip:* five of them died. Mr. Miller informed Sir William Watson that a whole family were poisoned with it at Battersea. The more caution is necessary respecting this plant, because it is not uncommon in some places, its appearance and smell resemble smallage or celery, and the roots have not any flavour disagreeable enough to deter persons from eating them.

Saffron-coloured-juiced or Hemlock Water-dropwort. Fl. Jul. Britain. Pl. 2 to 5 feet.

9 Œ. SARMENTÒSA (Presl, in herb. Hænk. ex D. C. prod. 4. p. 138.) root unknown; stems branched, weak, rather scandent; leaves bipinnate: leaflets ovate, toothed: terminal ones somewhat 3-lobed; umbels opposite the leaves, of many rays; involucrum wanting; fruit oblong; styles very long. ♃. H. Native of North America, at Nootka Sound. Leaves nearly as in *Œ. crocàta,* but the umbels are those of *Œ. phellándrium.* Root unknown, and therefore its proper situation among the species is doubtful.

Sarmentose Water-dropwort. Pl. sarmentose.

10 Œ. GLOBULÒSA (Lin. spec. 365.) knobs of roots oblong, attenuated at the base, but ending in an elongated fibre each at the apex; radical leaves bipinnate; leaflets lanceolate, cut; cauline leaves pinnate, with linear leaflets; umbel 5-6-rayed, without any involucrum; fruit nearly globose, sessile (the proper pedicels being almost wanting) spongy, with thick, obtuse ribs, and small furrows. ♃. H. Native of Etruria, Mauritania, Spain, Portugal, &c. in meadows. Gouan. ill. p. 18. t. 9. Spreng. umb. spec. p. 106. Œ. diffùsa, Lag. gen. et spec. p. 13. ex Spreng. Stem compressed at the base, diffuse. Fruit larger than in any other species of the genus. Umbels on long peduncles.

Globular-headed Water-dropwort. Fl. Ju. Aug. Clt. 1710. Pl. 1½ foot.

11 Œ. PROLI'FERA (Lin. spec. p. 365.) knobs of roots fusiform, sessile; leaves bipinnate; leaflets cuneated, lobately toothed; umbels capitate, without an involucrum; outer pedicels of the umbel flat, branched, proliferous; fruit turbinate, 10-ribbed: ribs thick: furrows deep. ♃. H. Native of Candia, Calabria, Lycia, Dalmatia, Carniola. Jacq. hort. vind. 3. t. 62.—P. Alp.

p. 304. with a figure and p. 305. with a description.—Mor. ox. sect. 9. t. 7. f. 5.

Proliferous-umbelled Water-dropwort. Fl. June, Aug. Clt. 1739. Pl. 1½ to 2 feet.

* * *Annual or biennial plants, with fibrous roots.*

12 Œ. Phella'ndrium (Lam. fl. fr. 3. p. 432.) root fusiform, with many whorled fibres; stem furrowed, fistular, branched; leaves stalked, repeatedly pinnate, with innumerable, fine, expanded, dark green, narrow, wedge-shaped, cut, shining, acute, divaricate leaflets; umbels opposite the leaves, on short tumid peduncles, without involucra; involucels of many narrow, taper-pointed leaves; fruit ovate, with 5 broad ribs, and narrow intermediate furrows, rather shorter than the pedicels. ♂. H. Native of Europe, Tauria, and Siberia, in rivers, ditches, and lakes; plentiful in some parts of Britain, as in ditches in Battersea-fields, near London; and near Edinburgh. Phellándrium aquáticum, Lin. spec. 366. Fl. dan. t. 1154. Smith, engl. bot. t. 684. Schkuhr, handb. t. 71. Hoffm. umb. 1. p. 71. descript. and icon. t. 1. f. 17. Hayne, arz. gew. 1. t. 40. Nees. off. pfl. 14. t. 6. Woodv. med. bot. suppl. 266. Bull. fr. t. 147. Erh. pl. off. 24. Œ. aquática, Lam. dict. 4. p. 530. Ligústicum phellándrium, Crantz. hort. fasc. 3. p. 84. Cicutària palústris, Ger. emac. 1063. f. 1. Lob. icon. 735. f. 1. Phellándrium, Dod. pempt. 591. f. 1. Roth always writes the old name *phelándrium*, which agrees with an etymology hazarded by Sir James Smith, in Rees' cycl. vol. 27. from *φηλεω, to be treacherous*, alluding to the poisonous nature of the plant; *φελλος ανδρος*, as Linnæus has it, *cork of man*, is not at all satisfactory. Linnæus informs us that the horses in Sweden are seized with a kind of palsy by eating this plant; hence Withering and Sibthorp have named it horse-bane. This effect, however, is not to be ascribed to the plant, but to a coleopterous insect breeding in the stalks, which he therefore names *Curculio paraplecticus*. The leaves are sometimes applied to discutient cataplasms, and for this reason Boerhaave speaks highly of it. The seeds are recommended in intermittents, and are said to be diuretic, antiseptic, and expectorant. The efficacy of this plant rests chiefly on the testimony of Ernstingius and Lange, by whom various cases of its successful use are published, especially in wounds and inveterate ulcers, and even in cancers; also in phthisis, pulmonalis, asthma, dyspepsia, and intermittent fevers. Dr. Woodville rightly observes, that though the disorders here noticed are so dissimilar as to afford no satisfactory evidence of the medicinal qualities of these seeds, yet they appear to be well deserving of farther investigation.

Phellandrium or Fine-leaved Water-dropwort. Britain. Pl. 2 to 3 feet.

13 Œ. stoloni'fera (Wall. cat. no. 585.) stems creeping at the base, ascending, fistular striated; leaves bipinnate; upper ones pinnate; leaflets lanceolate, acuminated at the base and apex, with a few coarse serratures; umbels opposite the leaves, exinvolucrate; fruit obovate-oblong, much shorter than the pedicels. ♂.? H. Native of Silhet, in the east of Bengal, in rice grounds. Phellándrium stoloníferum, Roxb. hort. beng. p. 81. Teeth of calyx 5, subulate. Styles permanent.

Stoloniferous Water-dropwort. Pl. creeping.

14 Œ. linea'ris (Wall. cat. no. 586.) stems throwing out roots from the nodi at the base, erect, fistular; leaves pinnate; leaflets of the lower leaves oval, toothed: of the upper ones linear, elongated, toothed, or undivided; umbels opposite the leaves, without involucra; rays compressed. ♂. H. Native of Nipaul, in rice grounds. Fruit unknown.

Linear-leaved Water-dropwort. Pl. 1½ foot.

15 Œ. Java'nica (D. C. prod. 4. p. 138.) stems terete, fistular; leaves divided into 3 parts above the sheaths of the petioles, which are bipinnate; leaflets oval-oblong, cuneated at the base, deeply toothed at the apex; umbels opposite the leaves, pedunculate; involucrum of a few small leaves; leaves of involucels setaceous; fruit ovate. ♂. S. Native of Java. Sium Javánicum, Blum.?

Java Water-dropwort. Pl.?

16 Œ. hu'milis (Rafin. prec. som. p. 41.) stem simple, pentagonal; leaves pinnate; leaflets of the lower leaves ovate, jagged: of the upper leaves lanceolate, entire; umbels erect, simple; flowers sessile. ⊙. H. Native of Sicily, on the Nebrode mountains, in woods. The rest unknown. The plant is very doubtful.

Humble Water-dropwort. Pl. 1 foot.

§ 2. *Species, natives of the Cape of Good Hope, the greater part of which are hardly known, and all of them, most probably, belong to different genera from the present.*

17 Œ. filifórmis (Lam. dict. 4. p. 520. ill. t. 203. f. 2.) leaves simple, filiform, striated, bluntish; umbels 3-5-rayed; involucrum of 3-5 leaves. ♃. G. Native of the Cape of Good Hope, on hills near Cape Town. Œ. filifórmis, Sieb. pl. exsic. cap. no. 209. Schultes, syst. 6. p. 427. exclusive of the synonymes. Séseli filifòlium, Thunb. fl. cap. p. 259. Cònium filifòlium, Vahl. symb. 3. p. 49. Sium filifòlium, Willd. herb. ex Cham. et Schlecht. in Linnæa. 1. p. 387. Ecklon, herb. no. 54. but not of Thunb. Fruit cylindrically prismatic, crowned by the 5-toothed calyx. Styles erect. Petals emarginate.

Filiform Water-dropwort. Pl. 1 foot.

18 Œ. tenuifòlia (Thunb. prod. 49. fl. cap. p. 253.) stem simple, striated; leaves bipinnate: leaflets linear-setaceous, deeply pinnatifid; upper leaves undivided, filiform; leaves of involucra and involucels very short; ribs of fruit rather winged. ♃. G. Native of the Cape of Good Hope. Spreng. umb. spec. p. 109.

Fine-leaved Water-dropwort. Fl. June, July. Clt. 1819. Pl. 1 to 2 feet.

19 Œ. ferula'cea (Thunb. prod. 50. fl. cap. p. 253.) root unknown; stem branched, striated; leaves decompound; leaflets lanceolate, acute, furrowed on both sides; involucra of few leaves. ♃. G. Native of the Cape of Good Hope. Spreng. umb. spec. p. 109.

Ferula-like Water Drop-wort. Pl. 1 to 2 feet.

20 Œ. interru'pta (Thunb. prod. p. 50. fl. cap. p. 253.) root unknown; stem simple, terete, nearly leafless; leaves radical, petiolate, divided into 3 parts, and these parts are decompound; leaflets oblong, sinuately pinnatifid, mucronately toothed: lower ones reflexed; involucrum of 5 leaves. ♃. G. Native of the Cape of Good Hope. Spreng. umb. spec. p. 107. Stem said by Thunberg to be villous at the base, but by Sprengel it is said to be smooth. Perhaps the same as *Annesorhiza Capensis*.

Interrupted Water-dropwort. Fl. Ju. Jul. Clt. 1818. Pl. 1 ft.

Cult. Although all the species grow naturally in ditches, rivers, and watery places, they grow well in any kind of soil, whether dry or wet. Increased by dividing at the root, or by seeds.

LXI. ANNESORHI'ZA (from *αγνης, agnes*, chaste, and *ῥιζα, rhiza*, a root; smell of root). Cham. et Schlecht. in Linnæa. 1. p. 398. t. 5. f. 4. D. C. prod. 4. p. 139.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed, permanent. Petals elliptic, acuminated, more or less emarginate, with an inflexed point. Fruit 5-angled, prismatic, crowned by the reflexed calyx and styles; mericarps convex on the back, unequal: one of them 3-winged, in consequence of the carinal and marginal ribs being winged, but the intermediate ribs are filiform: the other 4 winged, in consequence of the carinal

rib being filiform, and the intermediate 2 and marginal 2 being winged; vittæ 1 in each furrow, and 2 in the commissure, which is flat. Carpophore bipartite.—An herb, native of the Cape of Good Hope. Root fusiform. Stem erect. Cauline leaves scale-formed. Umbels of 12-15 rays. Involucra and involucels of many leaves, having hyaline margins.

1 A. Cape'nsis (Cham. et Schlecht. l. c.). ♃. G. Native of the Cape of Good Hope, on the sides of mountains. The root smells of anise, hence the name of the herb at the Cape, *Anyswortel.*

Cape Anise-root. Pl. 1 to 2 feet?

Cult. Any soil will suit this plant; and it will be easily increased by cuttings or by seeds.

LXII. SCLEROSCIA'DIUM (from *σκληρος, skleros,* hard, and *σκιαδιον, skiadion,* an umbel; in reference to the solid fruit). Koch, diss. ined. in litt. 1828. D. C. coll. mem. 5. p. 43. t. 2. f. F. prod. 4. p. 140.

Lin. syst. *Pentándria, Digýnia.* Teeth of calyx 5, conical, permanent. Petals obcordate, with an inflexed point, which is bidentate or tridentate at the apex. Stylopodium conical; styles filiform, at length diverging. Fruit ovate-globose, solid; mericarps with 5 thick, elevated, blunt, equal ribs; vittæ 1 in each furrow, which are narrow, and 2 in the commissure. Carpophore distinct, undivided. Seed terete, flattish on inside.—Herb glabrous. Root fibry. Leaves divided into linear-oblong lobes or leaflets. Umbels axillary, sessile, almost without any involucrum; rays very unequal, that is, some of the umbellules are sessile, and some are on long peduncles in the same umbel. Involucels of 5-7 leaves, having membranous margins. This genus is allied to *Œnánthe,* from which it differs in the carpophore being free, in the stylopodium being conical, and in the ribs of the fruit being prominent, &c. (f. 56. *F.*)

1 S. hu'mile (Koch, l. c. D. C. l. c.). ⊙. H. Native of fields, about Mogodor, and probably of Teneriffe. Œnánthe nodiflòra, Schousb. mar. p. 120. Cònium rígidum, Mert. herb. and perhaps the same as Bùnium rígens, Spreng. but neither the description nor the country agrees with the present plant.

Humble Sclerosciadium. Fl. Ju. Aug. Clt. 1820. Pl. 1 ft.

Cult. The seeds only require to be sown in the open ground in a warm sheltered situation.

LXIII. DASYLO'MA (from *δασυς, dasys,* thick, and *λωμα, loma,* a fringe; in reference to the ribs of the fruit). D. C. prod. 4. p. 140.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals unknown. Stylopodium depressed; styles short. Fruit ovate, with the transverse section terete; mericarps semiovate, not separating at maturity, with 5 corky, cellular ribs: the 3 dorsal ones small, and the 2 lateral ones large and blunt; vittæ 1 in each furrow, which are narrow, and 2 in the middle of the commissure, which is flat. Carpophore indistinct. Seed triangular, that is, convex on the back and angular at the commissure.—Herbs with the habit of *Œnánthe.* Stems fistular. Leaves bipinnate; leaflets cuneated, few-toothed at the apex. Umbels opposite the leaves, 5-6-rayed. Umbellules crowded, many-flowered. Involucra and involucels none.

1 D. Bengale'nsis (D. C. prod. 4. p. 140.) umbels sessile. ⊙. H. Native of the east of Bengal, in the province of Silhet. Séseli Bengalénsis, Roxb. Bíforis Bengalénsis, Wall. Herb greenish, many-stemmed.

Bengal Dasyloma. Pl. 1 foot.

2 D. glau'cum (D. C. l. c.) umbels pedunculate. ⊙. H. Native of Bengal. Bíforis? glaúca, Wall. Differs from the preceding in the umbels being distinctly pedunculate, in the leaves being larger and glaucous, in the dorsal ribs of the fruit being more acute, and the lateral ones smaller.

Glaucous Dasyloma. Pl. 1 foot?

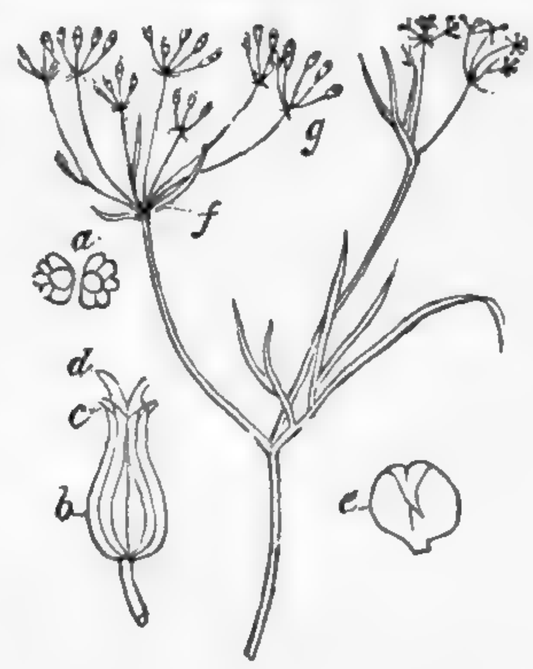
Cult. The seeds only require to be sown in the open ground.

LXIV. CYNOSCIA'DIUM (from *κυων, κυνος, kyon, kynos,* a dog, and *σκιαδιον, skiadion,* an umbel). D. C. coll. mem. 5. p. 44. t. 11. prod. 4. p. 140.

Lin. syst. *Pentándria, Digýnia.* Teeth of calyx 5, subulate, permanent (f. 63. *c.*). Petals obovate, nearly elliptic, obtuse, entire, flat, with an inflexed point. Stylopodium conical, permanent; styles very short, reflexed. Fruit oval-oblong or ovate (f. 63. *b.*), attenuated at the apex; mericarps with 5 thick, corky ribs (f. 63. *a.*), 2 lateral ribs marginating; vittæ nearly straight, 1 in each furrow, and 2 in the commissure. Seed sub-semiterete. Carpophore bipartite.—American glabrous herbs. Stems angular, fistular, branched a foot high and more, with very few leaves. Leaves pinnate or palmate; leaflets linear, elongated, entire, articulated near the base, at which places the leaflets fall off: lower and upper ones undivided, linear, and elongated. Involucra and involucels of many leaves. Flowers white.—This is an intermediate genus between *Œnánthe* and *Æthùsa,* but it differs from both, and from all its allies in the petals being flat and entire; it differs particularly from *Æthùsa* in the calyx being 5-toothed, in the vittæ of the commissure being straightish, and in the involucra and involucels being of many leaves; from *Séseli* in the stylopodium being conical; and from *Œnánthe* in the carpophore being distinct.

1 C. digita'tum (D. C. l. c. t. 11. f. A.) leaves palmate; leaflets 3, linear, quite entire; fruit ovate at the base, but attenuated at the neck.—Native of North America, on plains of the Arkansa River. Œnánthe digitàta, Nutt. mss. Umbels few-flowered. Involucrum of a few unequal leaves: leaves of involucel subulate, very short. Rays of umbel very long.

FIG. 63.



Digitate-leaved Cynosciadium. Pl. 1 to 1½ foot.

2 C. pinna'tum (D. C. l. c. t. 11. f. B.) leaves pinnate; leaflets distant, few pairs, linear, quite entire: terminal one very long; fruit oval-oblong.—Native of North America, along with the preceding species. Æthùsa pinnàta, Nutt. mss. Pedicels a little longer than the leaves of the involucel. Leaves of involucrum 7-8, nearly equal, linear-subulate.

Pinnate-leaved Cynosciadium. Pl. 1 foot.

Cult. Sow the seeds in the open ground, and the plants will rise and flower and seed freely.

LXV. ÆTHU'SA (from *αιθω, aitho,* to burn; acrid taste). Lin. gen. no. 141. exclusive of some species. Hoffin. umb. p. 95. t. 1. f. 5. Spreng. prod. Lag. am. nat. 2. p. 96. Koch, umb. p. 111. D. C. prod. 4. p. 141.—Wepfèria, Heist.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point: outer ones radiating. Fruit ovate-globose; mericarps with 5 elevated, thick, acutely keeled ribs: lateral ribs marginal, and a little broader than the rest, girded by a somewhat winged keel; vittæ 1 in each furrow, and with 2 arched ones in the commissure. Seed semi-globose. Carpophore bipartite.—Erect, annual, poisonous herbs. Leaves uniform, multifid. Involucrum wanting

or of 1 leaf; involucels of 3 or 5 spreading, or pendulous, setaceous leaves, situated on the outside of the umbellules, that is, unilateral. Flowers white. Three species of this genus are admitted, but they are probably only varieties of one.

1 Æ. cyna'pium (Lin. spec. p. 367.) leaflets wedge-shaped, decurrent, with lanceolate segments; rays of umbel nearly equal; involucrum wanting; involucels of 3 leaves, which are longer than the umbellules. ⊙. H. Native throughout the whole of Europe, in cultivated grounds: a common weed. Smith, engl. bot. 1192. Curt. lond. fasc. 1. t. 18. Bull. herb. t. 91. Hayn. arz. gew. 1. t. 35. Hoffm. umb. p. 97. Coriándrum cynàpium, Crantz, fl. aust. p. 221. Cicùta cynàpium, Targ. ist. bot. Cynàpium, Riv. pentap. irr. t. 76. Cicutària tenuifòlia, Raii, syn. 215. C. fàtua, Lob. icon. 2. p. 280. f. 1. Herb erect, lurid green, fetid, and reckoned dangerous. Great carelessness can alone cause this weed to be mistaken for garden parsley; yet such an accident sometimes happens. The 3 long pendulous bracteas under each umbellule distinguish it from all its tribe. Dr. Bigelow, of Boston in New England, observed this *Æthùsa* to be without scent in America, but seeds transmitted by him produced plants with the same nauseous garlick flavour as those of Great Britain. Some curious facts of a similar nature have been observed. The flowers of *Hésperis matronàlis* are said to lose their scent in America, after the first generation.

Dog's-poison, or Common Fool's-parsley. Fl. July, Aug. Britain. Pl. 1 to 2 feet.

2 Æ. cynapioi'des (Bieb. fl. taur. 1. p. 227. suppl. p. 233.) segments of the leaves oblong, acute; rays of umbel nearly equal; involucrum wanting; involucel of 3 leaves, which are shorter than the umbellule; vittæ in the commissure contiguous at the base. ⊙. H. Native of the Ukrane, in shady places. Hoffm. ed. 2. p. 98. and 205. and tit. f. 9. Very nearly allied to the first species, but differs in being larger, more branched, and 3 feet in height, or more.

Cynapium-like Fool's-parsley. Fl. July, Aug. Clt. 1817. Pl. 2 to 3 feet.

3 Æ. ela'ta (Friedlander, ex Fisch. cat. hort. gor. 1813. p. 45.) segments of the leaves bluntish; involucrum usually of 1 leaf; involucels of 1-3 leaves, which are longer than the umbellules; outer rays of umbel longest; pedicels twice the length of the fruit. ⊙. H. Native of Podolia. Hoffm. umb. ed. 2. p. 98. Besser. enum. p. 54. Horn. cat. 4. hort. hafn. suppl. p. 34. Petals white, not as in *Æ. cynàpium*, greenish at the base. Styles purple after flowering. The plant is said to be edible, and not poisonous as the others.

Tall Fool's-parsley. Fl. Jul. Aug. Clt. 1820. Pl. 2 to 3 ft.

Cult. The seeds only require to be sown in the open ground.

LXVI. FŒNI'CULUM (the Latin name of the fennel, from *fœnum*, hay; the smell of the plant resembling that of hay). Adans. fam. 2. p. 101. Gærtn. fruct. 1. p. 105. t. 23. Hoffm. umb. p. 120. t. 1. f. 13. *e*. Lag. am. nat. 2. p. 99. Koch, umb. p. 112. D. C. prod. 4. p. 142.—Anèthum species of Lin.—Mèum species of Spreng.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx tumid, obsolete, toothless. Petals roundish, entire, involute, with a rather square retuse point. Transverse section of fruit nearly terete; mericarps with 5 prominent, bluntly keeled ribs: lateral ribs marginal, and a little broader than the rest; vittæ 1 in each furrow, and 2 in the commissure. Seed somewhat semi-terete. —Biennial or perennial herbs. Roots fusiform. Stems terete, striated, branched. Leaves triply pinnate, decompound: with linear, setaceous leaflets. Involucra and involucels almost wanting. Flowers yellow.—This genus differs from *Anèthum* with which it was formerly combined, by the mericarps being more turgid: having the margin rather more compressed than the back; and the transverse section of the fruit is therefore nearly terete, or with the margin rather compressed.

1 F. vulga're (Ray, syn. 217. Gærtn. fruct. 1. p. 105.) stem terete at the base; leaves bipinnate, distich; leaflets awl-shaped, drooping; umbels 13-20-rayed; involucra and involucels wanting. ♃. H. Native of Europe, in exposed, uncultivated places; in Britain, on chalky cliffs, very plentiful; and of Caucasus, near Baku, and in the plains between Sallian and Lenkeron. Anèthum Fœnículum, Lin. spec. 722. Smith, engl. bot. t. 1208. Mill. fig. t. 13. Hayne, arz. gew. 7. t. 18. Fœnículum officinàle, All. pedem. no. 1359. Mèum Fœnículum, var. *α*, Spreng. prod. p. 32. and in Schultes, syst. 6. p. 433. Ligústicum Fœnículum, Roth. germ. 1. p. 124. Fœnículum, Math. valgr. 2. p. 135. f. 1. Cam. epit. p. 534. f. 1. The taste and aromatic flavour of this our garden fennel are well known, and has long been an inmate of our gardens. The tender stalks are used in salads; the leaves boiled enter into many fish sauces. The sweet and warm seeds are a common carminative medicine for infants. The blanched stalks of the next species, *F. dúlce*, called *finòcchio*, are eaten with oil, vinegar, and pepper, as a cold salad, and they are likewise sometimes put into soups. This thickened part is blanched by earthing up, and is then very tender. "Owing to the peculiar nature of this species," Mr. Neill observes, "it is more tender than the common fennel, and often perishes in the course of the winter. Misled by this circumstance, several horticultural writers describe it as an annual plant, under the name of *Anèthum ségetum*." All are raised from seed, of which half an ounce is sufficient for a seed-bed 4 feet by 6 feet. Sometimes also they are raised from offsets from the old plants, where only a few are wanted. Sow in the spring in light earth, either in drills from 6-12 inches apart, or broad cast and raked in. When the plants are 3 or 4 inches high, thin or transplant a quantity 15 inches asunder. As the roots of old plants divide into offsets, these may be slipped off in spring, summer, or autumn, and planted a foot apart. They will produce immediate leaves for present supply and in continuance; or for immediate larger supply of leaves, you may procure some established full roots, and plant as above; let them be well watered. The same plants remain several years by the root; but as fennel sends up strong stems for seed in summer, these, or a part of them, should be cut down, to encourage a production of young leaves below in succession. It is apt to spread more than is desirable, if suffered to seed. The swelling stems of the *Finòcchio* or *F. dúlce*, when of some tolerable substance, should be earthed up on each side 5 or 6 inches to blanch them white and tender. This will be effected in 10 days or a fortnight; and by successive sowings or cutting down plants during summer, successive crops of blanched stalks may be had from June to December. In procuring seed, permit some of the best flower-stems to shoot; and they will produce large umbels of seeds in autumn.

Common Fennel. Fl. Jul. Aug. Brit. Pl. 4 to 6 feet.

2 F. du'lce (C. Bauh. pin. p. 147.) stem rather compressed at the base; radical leaves rather distich: leaves all tripinnate; with capillary elongated leaflets; umbels 6-8-rayed. ♂. H. Native of Italy, and Portugal, where it is cultivated for the sake of the blanched stalks, under the name of *Finocchio*. Finócchio dúlce, Targ. cors. agr. 2. p. 52. Anèthum dúlce, D. C. cat. hort. monsp. p. 78. Fœnículum dúlce, &c. J. Bauh. hist. 3. p. 4. with a figure. It differs from the preceding species in being hardly a foot high, in the earlier florescence, in the darker hue, in the stalks being edible, and in the characters given above. The use of this kind of fennel is given above with the common fennel.

Sweet Fennel or Finocchio. Fl. May, June. Clt.? Pl. 1 ft.

3 F. piperi'tum (D. C. prod. 4. p. 142.) stem terete; leaflets subulate, very short, stiff, thick; umbels 8-10-rayed. ♃. H. Native of the south of Europe, especially in Sicily, Sardinia, Portugal, &c. Anèthum Fœnículum β, piperìtum, D. C. cat. hort. monsp. p. 79. Mèum piperìtum, Schultes, syst. 6. p. 435. Guss. prod. fl. sic. 1. p. 345. Fœnículum asinìnum, Cup. hort. cath. 79. ex Bert. The plant is called *Finocchio d'asino*, or *Asses' finocchio*, by the Sicilians; it has a hot biting taste, hence the specific name.

Pepper Fennel. Fl. June, July. Clt. 1824. Pl. 4 to 6 ft.

4 F. Panmo'rium (D. C. prod. 4. p. 142.) stem erect, branched; leaves supra-decompound; umbels of 10-12 unequal rays; fruit oblong, deeply furrowed, destitute of wings. ☉. H. Native of the East Indies, where it is cultivated under the name of *Panmuhooree* or *Mudhoorika*. Anèthum Panmòrium, Roxb. hort. beng. p. 22. journ. bot. 1814. vol. 2. p. 188. Said to be very like common fennel.

Panmuhoree Fennel. Pl. 2 to 3 feet.

5 F. Cape'nse (D. C. l. c.) root fleshy; radical leaves tripinnate; leaflets filiform, setaceously acuminated, fastigiate.—Native of the Cape of Good Hope, in the interior of the country. Anèthum Fœnículum, Thunb. prod. p. 51. Anèthum Capênse, Thunb. fl. cap. 262. Root esculent. Flowers unknown. Chamisso and Schlechtendal refer to this the A'pium radice crassâ aromaticâ of Burm. afr. p. 197. t. 72. f. 1.

Cape Fennel. Pl. 2 to 3 feet?

Cult. See the first species for the culture and propagation of the rest.

LXVII. KUNDMA'NNIA (Kundmann, a botanist known to Scopoli). Scop. intr. (1777.) p. 116. no. 332. D. C. prod. 4. p. 143.—Brignòlia, Bertol. in Desv. journ. 4. (1815.) p. 76. amœn. ital. 97. Koch, umb. p. 107.—Campdèria, Lag. am. nat. 2. p. 99. (1821.)

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed, increased a little after flowering. Petals roundish, entire, involute, with a broad retuse segment: stylopodium conical; styles short, somewhat reflexed. Fruit terete, 10-furrowed; mericarps with 5 filiform, obtuse, equal ribs: lateral ribs marginal; vittæ many, both in the furrows and commissure. Carpophore undivided. A glabrous perennial herb. Root fusiform. Radical leaves rarely undivided, but usually pinnate, or bipinnate; leaflets ovate or lanceolate, serrated; upper leaves ternate, and jagged. Umbels compound, terminal, of many rays. Involucra and involucels of many filiform reflexed leaves. Flowers yellow. This genus is very nearly allied to Fœnículum, but differs in the calyx being 5-toothed and permanent.

1 K. Sícula (D. C. prod. 4. p. 143.). ♃. H. Native of the Balearic Islands, Spain, Mauritania, Corsica, Sicily; and in Italy in waste fields about Rome, and on hills about Genoa; and the islands of the Archipelago, as in Melos, Samos, &c. Sìum Sículum, Lin. spec. 362. Jacq. hort. vind. t. 133. D. C. fl. fr. 6. p. 507. Ligústicum Baleáricum, Lin. mant. 218. Brignòlia pastinacæfòlia, Bert. in Desv. journ. 4. p. 76. amœn. 97. Mauri, fasc. rom. alt. p. 8. t. 2. Presl. delic. p. 132. Guss. prod. fl. sic. 1. p. 387. Campdèria Sícula, Lag. l. c. Myrrhis Sicula pastinacifòlia et pastinacæ foliis latè virentibus, Tourn. herb. Athamánta Sícula Ucria, hort. panorm. p. 137. p. 542. Sìum Græ'cum, Lin. hort. cliff. 98.? Sieb. pl. exsic. Schultes, syst. 6. p. 542. Zan. hist. ed. Mont. 171. t. 128. There are varieties of this plant, having the leaves of the involucels either the length of the umbellules, or one half shorter than them.

Sicilian Kundmannia. Fl. July, Aug. Clt. 1686. Pl. 2 feet.

Cult.—The plant will grow in any soil, and is easily increased by dividing at the root, or by seed.

LXVIII. DEVE'RRA (a goddess worshipped by the ancients for encouraging housewifery, or rather the goddess of brooms; the plant having much the appearance of a broom,) D. C. coll. mem. 5. p. 45. prod. 4. p. 143. Bùbon species of authors.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals ovate, acuminated, with an inflexed point. Styles short, at length divaricate. Fruit ovate, or roundish, rather compressed from the sides, rough from scales or spreading pili; mericarps semi-terete, with obsolete ribs; vittæ 1 in each furrow, and 2 in the commissure. Carpophore bipartite.—Aromatic, leafless, glaucous, stiff, broom-like subshrubs, natives of Africa. Petioles sheathing, permanent; limbs of leaves wanting in the adult plants, or nearly so; but in young plants they are small and many-parted, with setaceously linear leaves. Umbels of few rays. Involucra of 4-6 small deciduous leaves; involucels of 4-6 ovate-lanceolate, deciduous leaves, with membranous margins. Flowers white.

Sect. I. Diverra'ria (an alteration from the generic name). D. C. prod. 4. p. 143. Fruit villous or hispid.

1 D. aphy'lla (D. C. prod. 4. p. 143.) stems twiggy; sheaths all bereft of the limbs; fruit very hispid. ♄. G. Native of the Cape of Good Hope, at Warmwaterberg. Bùbon aphýllus, Cham. et Schlecht. 1. p. 389.

Var. β, *Burchéllii* (D. C. prod. 4. p. 143.) young fruit beset with short, tubercular villi. ♄. G. Native of the Cape of Good Hope. Very like the species, but the fruit is much less villous, and is therefore perhaps distinct.

Leafless Diverra. Shrub.

2 D. tortuòsa (D. C. prod. 4. p. 143.) stem much branched, twisted, divaricate; lower sheaths furnished with divided limbs, bearing subulate leaflets; fruit sparingly villous. ♄. F. Native of the north of Africa.

Var. α, *virgàta* (D. C. prod. 4. p. 143.) stem twiggy, bent a little. ♄. F. Native of the kingdom of Tunis, near Kerouan. Bùbon tortuòsus, Desf. fl. atl. 1. p. 357. t. 73. Poir. suppl. 1. p. 733.

Var. β, *rigídior* (D. C. prod. 4. p. 144.) stem much branched, stiff. ♄. F. Native of Egypt, at the Pyramids. Bùbon tortuòsus, Sieb. herb. egypt. Críthmum Pyrenàicum, Forsk. ex Delile, ill. fl. eg. p. 10. Athamántha tortuòsa, Spreng. syst. 1. p. 900.

Twisted Diverra. Fl. Ju. Aug. Clt. 1826. Shrub 1 foot.

Sect. II. Pitura'nthos (from πιτυρον, *pituron*, scurf, and ανθος, *anthos*, a flower; in allusion to the fruit bearing scurf-like scales). D. C. prod. 4. p. 144. Fruit covered with scales.

3 D. pitura'nthos (D. C. l. c.) stem twiggy; branches elongated, leafless, but furnished with sheaths; involucra, involucels, and fruit covered with scurf-like scales. ♄. F. Native of Lybia, in the north of Africa. Pithuránthos denudàtus, Viv. fl. lib. p. 15. t. 7. f. 1-2. Bùnium pituránthos, Spreng. syst. 1. p. 901. Habit nearly of *D. tortuòsa*.

Scurfy-flowered Diverra. Shrub 1 to 2 feet.

Cult. A mixture of loam, peat, and sand will suit the species of *Divérra*; and they can only be increased by seeds.

LXIX. SORA'NTHUS (from σωρος, *soros*, a heap, and ανθος, *anthos*, a flower; in reference to the close capitate umbels of flowers). Led. fl. ross. alt. ill. t. 82. fl. alt. 1. p. 344. D. C. prod. 4. p. 669.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsoletely toothed. Petals broad-oval, permanent, with an inflexed point. Fruit a little compressed from the back, crowned by the divaricate styles: the transverse section elliptic; mericarps with 5 hardly prominent, equal ribs: lateral ribs marginating; vittæ 1 in each furrow, and 4 in the commissure. Carpophore bipar-

tite.—An erect herb, with a habit between *Séseli* and *Œnánthe*, but differs from the first in the teeth of the calyx being obsolete, in the petals being broad-ovate, not obovate, and in the ribs of the fruit being less prominent; and from the last in the shape of the petals, in the styles and in the carpophore being present.

1 S. Meye'ri (Led. l. c.). ♃. H. Native of Siberia, at the river Irtysch, not far from the lake called Noor-Saisan; and at the river Bekin, in sandy places. Root fusiform. Stem erect, striated, simple at the base, and usually bearing 3-4 verticillate branches at the apex; branches leafless, or furnished with membranous scales in the middle. Radical leaves 3-4, tripinnate: leaflets linear; cauline leaves 1-2. Umbels of 10-15 rays, of these 4 are longer than the rest. Involucra wanting, rarely of 1 leaf; involucels of 6-8 leaves, which are ovate-lanceolate, pilose on the outside, and ciliated, shorter than the umbellules. Flowers sessile in the umbellules: outer ones female: intermediate ones hermaphrodite: central ones male.

Meyer's Soranthus. Pl. $1\frac{1}{2}$ to 3 feet.

Cult. This plant will grow in any soil, and is easily increased by seed.

LXX. SE'SELI (*Seycelyous* is the Arabic name of an umbelliferous plant, but to what plant it was given is now unknown). Lin. gen. no. 360. Lag. am. nat. 2. p. 103. D. C. coll. mem. 5. p. 46. t. 3. f. R. prod. 4. p. 144.—Séseli and Bùbon species, Spreng.—Séseli species, Koch.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed; teeth short, thickish, and sometimes obliterated. Petals obovate, coarctate into an inflexed point at the apex, emarginate or nearly entire. Fruit oval or oblong (f. 55. *D. a. E. a.*), with the transverse section nearly terete, and crowned by the styles, which are reflexed (f. 55. *D. b. E. b.*); mericarps with 5 prominent filiform or elevated thick corky ribs; lateral ribs marginating, and a little broader than the rest; vittæ one in each furrow, but there are sometimes 2 in the outer furrows, and always 2 in the commissure, but very rarely 4. Seed somewhat semi-terete.—Usually glaucous biennial or perennial herbs. Leaves pinnate or ternately decompound. Involucrum wanting or almost so; involucels of many leaves. Flowers white, very rarely yellow.

Sect. I. Hippoma'rathrum (from *ιππος, hippos*, a horse, and *μαραθρον, marathron*, fennel; horse fennel). Rivin, Roehl, but not of Link, D. C. prod. 4. p. 144. Involucra wanting. Leaves of involucels joined together nearly to the apex into a bowl-shaped cup, having a toothed margin.

1 S. Hippoma'rathrum (Lin. spec. 373.) stem terete, usually branched at the apex, and nearly naked; leaves glaucous, bipinnate; leaflets linear, trifid, acutish; petioles dilated and sheathing; fruit smoothish; involucel cup-shaped. ♃. H. Native of Alsatia, Piedmont, and Germany, on chalky hills and rocks. Jacq. fl. austr. 2. t. 143. Sium Hippomárathrum, Roth, fl. germ. 1. p. 128. Séseli articulàtum, Crantz, fl. austr. p. 205. t. 5. f. 1-2. Hippomárathrum pelviförme, fl. wett. st. Hipp. vulgàre, Rœhl. Hippomárathrum, Riv. pent. irreg. t. 67. Flowers white. Umbels smoothish, not tomentose as in *S. leucospérmum*. Fruit pubescent while young, but glabrous or nearly so when mature. The wild plant is nearly simple, but the plant branches when cultivated in a garden.

Var. β, hebecárpum (D. C. prod. 4. p. 144.) fruit beset with down, even in the mature state. ♃. H. Native of Siberia. Nearly allied to *S. tomentòsum*, but the habit is more that of *S. Hippomárathrum*, and the umbel is downy, not tomentose.

Horse-fennel. Fl. July. Clt. 1656. Pl. 1 to 2 feet.

2 S. tomentòsum (Vis. dalm. spec. p. 6. t. 3. f. 1.) stem simple, terete; leaves biternate or triternate: leaflets filiform, channelled: upper ones ternate; involucra wanting; involucel cup-shaped, and is, as well as the fruit, tomentose from stellate down. ♃. H. Native of Dalmatia, on stony hills towards the sea. This species is intermediate between *S. Hippomárathrum* and *S. leucospérmum*, nevertheless it is more nearly allied to the former than to the latter.

Tomentose Meadow-saxifrage. Pl. 1 to 2 feet.

Sect. II. Hippomarathroìdes (agreeing with the plants in section *Hippomárathrum*; hence the name). D. C. coll. diss. 5. p. 47. prod. 4. p. 144. Involucra wanting or of few leaves. Leaves of the involucels joined to each other, particularly at the base. Flowers white.

3 S. Ledebou'rii; stem a little branched; leaves glaucous, bipinnate or tripinnate; leaflets ternate, with the segments linear, upper sheaths ventricose, nearly leafless; involucrum of one lanceolate leaf; involucel cup-shaped, divided at the apex into long acuminated marcescent segments, about equal in length to the flowering umbellule; fruit prismatic, on short pedicels, pilose. ♃. H. Native of Altaia, in dry grassy places at the river Irtysch, near Loktewsk and Smejow. S. Hippomárathrum, Led. fl. alt. 1. p. 335. Bess. enum. pl. volh. p. 13. no. 366.

Ledebour's Meadow-saxifrage. Pl. 1 to $1\frac{1}{2}$ foot.

4 S. dicho'tomum (Bieb. fl. taur. 1. p. 235. suppl. p. 245.) stem terete, erect, clothed with fine down; lower branches short: superior ones longer than the central umbel; leaves pinnate; leaflets multifid, with the segments linear; involucrum wanting; leaves of involucels joined together to about the middle, but ovate and mucronate in the free parts. ♃. H. Native of Tauria, on chalky hills. Sims, bot. mag. t. 2073. Bùbon rigídior, Spreng. pug. 2. no. 101. and Bùbon rígidus var. β, Spreng. syst. 1. p. 900. Plant glaucous.

Dichotomous Meadow-saxifrage. Fl. June, July. Clt. 1818. Pl. 1 to 2 feet.

5 S. gummíferum (Smith, exot. bot. t. 120.) stem terete, thick, stiff, branched at the top, clothed with fine pubescence; leaves tripinnate, glaucous; leaflets cuneated, trifid; involucra of few leaves, rarely wanting; umbels 20-rayed; leaves of involucel joined together nearly the length of the pedicels into an expanded disk, having the free parts subulate, and exceeding the umbellules. ♂. H. Native of Tauria. Sims, bot. mag. 2259. Bùbon rígidus var. α, Spreng. in Schultes, syst. 6. p. 497. B. eriocéphalus, Spreng. syst. 1. p. 900. Stem yielding a gum when cut. This is a showy plant, 2-3 feet high. Flowers white, tinged with pink.

Var. crithmifòlia (D. C. prod. 4. p. 145.) stem, rays of umbels, and upper leaves rather velvety; segments of leaves elongated; central umbel surrounded by a 10-12-leaved involucrum. ♃. H. Native of Greece and the islands of the Ægean sea. Apium Græcum saxatile crithmifolio, Tourn. cor. 21. voy. 1. p. 230. with a figure. Athamántha crithmifòlia, Juss. herb. Perhaps a proper species.

Gum-bearing Meadow-saxifrage. Fl. July, Sept. Clt. 1804. Pl. 3 to 4 feet.

6 S. rígidum (Waldst. et Kit. rar. hung. 2. p. 156. t. 146.) stem terete, thick, rather tomentose, stiff, sparingly branched; leaves glaucous, three or four times pinnate; leaflets linear, stiff, mucronate, rather pungent, usually trifid; involucrum none; umbel 20-rayed; leaves of involucel joined together at the base, equal in length to the umbellule; fruit tomentose. ♃. H. Native of Hungary, in the fissures of calcareous rocks. Bùbon rígidus var. γ, Spreng. in Schultes, syst. 6. p. 497. exclusive of the synonyme of Besser. Bùbon rígidus, Spreng. syst. 1. p. 900.

Stiff Meadow-saxifrage. Fl. June, Aug. Clt. 1710. Pl. $1\frac{1}{2}$ ft.

7 S. cuneifòlium (Bieb. fl. taur. 1. p. 230. and suppl. 244. exclusive of the synonymes,) stem unknown; leaves several times

pinnate; leaflets broad, cuneiform, forked: superior ones oblong, entire; leaves of involucels very short, joined together at the base; fruit villous. ♃. H. Native of Eastern Caucasus, in subalpine situations. Bùbon cuneifòlius, Spreng. syst. 1. p. 900.

Wedge-leafleted Meadow-saxifrage. Pl. 1 foot?

8 S. peucedanifòlium (Bess. enum. cont. p. 44.) stem terete, sparingly branched at the apex, glaucous; leaves triternate; leaflets linear-lanceolate, acuminated; sheaths adpressed; involucrum almost wanting; leaves of involucel subulate, joined together at the base; flowers nearly sessile; fruit velvety from flocky short down. ♃.? H. Native of the south of Podolia. Trev. in act. bonn. 13. p. 172. in a note. S. prolíferum, Spreng. in Schultes, syst. 6. p. 402.? Bùbon peucedanifòlius, Spreng. syst. 1. p. 900. Involucrum sometimes of few leaves.

Peucedanum-leaved Meadow-saxifrage. Fl. June, July. Clt. 1818. Pl. 1 foot.

9 S. leucospe'rmum (Waldst. et Kit. pl. rar. hung. 1. p. 92. t. 89.) stem terete, flexuous, branched at the apex; leaves glaucous, decompound; leaflets setaceous, linear; petioles dilated, and sheathing; involucrum usually of one leaf; leaves of involucels subulate, joined together at the base, and are as well as the fruit puberulous. ♃. or ♂. H. Native of Pannonia, about Buda on chalky hills. Athamántha leucospérma, Poir. suppl. 1. p. 534. Very nearly allied to *S. Hippomárathrum*, but differs in the leaves of the involucel being joined only at the base, not to the apex. Umbellules dense. Fruit with elevated corky ribs and narrow furrows, ex Koch, umb. p. 110.

White-seeded Meadow-saxifrage. Fl. July. Clt. 1805. Pl. 1½ foot.

Sect. III. Euse'seli (so called from containing what are considered the true species of the genus). D. C. prod. 4. p. 145.—Séseli vèra, Koch, umb. p. 110.—Hippomárathrum, Duby, in D. C. bot. gall. 1. p. 234. but not of Link, nor Rivin. Involucra wanting or of few leaves. Leaves of involucels distinct, or sometimes somewhat concrete at the very base.

* *Flowers yellow.*

10 S. gra'cile (Waldst. et Kit. hung. 2. p. 122. t. 117.) stem terete; leaves triternate; leaflets triangularly setaceous, very thin and rather flaccid; rays of umbel elongated; involucra wanting or nearly so, very short. ♃. H. Native of Pannonia and Transylvania, on calcareous rocks. Baumg. fl. trans. 1. p. 238. Flowers yellow; petals oval-oblong, incurved at the apex. Caudex ascending. Flowering stems erect. Sheaths of leaves entire. Fruit elliptic and smooth, like the rest of the plant. Umbels opposite the leaves, drooping before expansion.

Slender Meadow-saxifrage. Fl. June, July. Clt. 1805. Pl. 1 to 2 feet.

11 S. triterna'tum (Pursh, fl. amer. sept. 1. p. 197.) root fusiform; leaves sheathing a long way, ternate, biternate, or triternate: leaflets or segments elongated, linear or linear-lanceolate, quite entire, petiolulate; stem leafy at the base; umbels compound, with nearly equal rays; umbellules capitate; flowers dioecious or polygamous; immature fruit oblong, somewhat cylindrical; mericarps with 5 elevated acute ribs; involucrum and involucels wanting. ♃. H. Native of North America, about the Columbia river; common on the dry gravelly soils near Fort Vancouver. Hook. fl. bor. amer. 1. p. 264. t. 94. This has much the habit of *S. leiocárpum*. Petals involute entire. Teeth of calyx obsolete. Flowers yellow.

Triternate-leaved Meadow-saxifrage. Fl. June, July. Clt. 1828. Pl. 2 feet.

12 S. divarica'tum (Pursh, fl. amer. sept. p. 732.) stem dichotomous, leafy; leaves petiolate, with short sheaths, bipinnate or tripinnatifid; segments linear-oblong, acute, short; peduncles lateral and terminal; rays of umbels equal; leaves of involucels linear-subulate; fruit roundish-ovate, crowned by the calycine teeth; mericarps rough, with 5 elevated ribs and many vittæ. ♃. H. Native of North America, on the banks of the Missouri; and about Carlton House upon the Saskatchawan. Sims, bot. mag. 1742. Nutt. gen. amer. 1. p. 194. S. lùcidum, Fras. cat. 1813. Márathrum, Rafin. journ. phys. 1820. Flowers yellow. The vittæ are numerous, and abound in powerfully aromatic oil.

Divaricate Meadow-saxifrage. Fl. June, July. Clt. 1812. Pl. 1 foot.

13 S. leioca'rpum (Hook. in fl. bor. amer. 1. p. 263. t. 93.) leaves with long sheaths, triternate or triternately pinnate; leaflets petiolate, oblong, entire, attenuated or trifid, glaucous; stem nearly naked; umbels compound, with the rays very unequal; umbellules capitate; flowers dioecious or polygamous; immature fruit very smooth; involucra and involucels wanting. ♃. H. Native of the north-west coast of America; on gravelly soils near Fort Vancouver, on the Columbia. Flowers yellowish. Styles reflexed.

Smooth-fruited Meadow-saxifrage. Pl. ¾ foot.

14 S. defolia'tum (Led. fl. ross. alt. 1. p. 343.) radical leaves early, caducous; stem furnished with leafless sheaths; involucra and involucels of few leaves. ♃. H. Native of Siberia, in the Kirghisean Steppe, in sandy wet salt situations. Plant with the habit of *Férula sálsa*. Root perpendicular. Stems solitary, simple at the base, divided into floriferous branches from the middle, which are branched again. Flowers yellow, polygamous. Carpels with 5 prominent equal filiform ribs; vittæ one in each furrow, and 2 in the commissure.

Defoliate Meadow-saxifrage. Pl. 1 foot.

** *Flowers white.*

15 S. ela'tum (Gouan, ill. 16. t. 8.) stem rather dichotomous, terete, few-leaved; leaves bipinnate: leaflets linear-filiform, stiffish; involucra almost wanting; fruit ovate, tubercular while young, but glabrous in the adult state, crowned by the calyx. ♃. H. Native of the south of France, Italy, &c. in open situations. Gmel. syst. p. 489. D. C. fl. fr. 3. p. 284. Spreng. umb. spec. 118. exclusive of the first and perhaps of the second synonyme. S. elàtum, Lin. spec. p. 375. is very probably a distinct plant.—Lob. icon. t. 727. f. 2. Plant glaucous.

Var. β, ligulàre (D. C. prod. 4. p. 146.) superior cauline leaves long-linear, quite entire. Native country unknown, but is usually to be found in gardens, under the name of *S. glaúcum*.

Tall Meadow-saxifrage. Fl. July, Aug. Clt. 1710. Pl. 1 to 2 feet.

16 S. va'rium (Trev. ind. sem. wratis. 1808. nov. act. bonn. 13. p. 168.) stem terete; branches few, erect; petioles furrowed, as well as the leaves, which are tripinnate; leaflets linear, glabrous, glaucous; involucrum almost wanting; leaves of involucels short, subulate; fruit oblong, glabrous, not crowned. ♃. H. Native of Caucasus and Austria. S. vàrium, Koch, umb. p. 110. S. Taúricum, Link, in Spreng. syst. 1. p. 884. but not of Koch. S. glaúcum, Bieb. fl. taur. 1. p. 234. suppl. p. 241. ex Trev. Differs from *S. montànum* and *S. Pallàsii*, in the fruit not being crowned by the teeth of the calyx.

Var. β, brachycárpum (Bess. in litt. 1828.) fruit shorter. ♃. H. S. chærophylloìdes, Hortul. but not of Thunb. Perhaps a proper species.

Various Meadow-saxifrage. Fl. Ju. July. Clt. 1817. Pl. 1 ft.

17 S. ju'nceum (Sibth, et Smith, fl. græc. prod. 1. p. 200.) stem much branched, divaricate, stiff, glabrous; leaves rather glaucous: radical ones triternate; leaflets keeled, trifurcate; cauline petioles very short, spreading; umbels solitary, few-

flowered. ♃. H. Native of Greece. Perhaps sufficiently distinct from *S. montànum*.

Rushy Meadow-saxifrage. Pl. 1 foot.

18 S. monta'num (D. C. fl. fr. 4. p. 285. and suppl. p. 505.) stem striated; leaves glaucous, bipinnate, with entire sheaths, and narrow-linear mucronulate leaflets; involucra of 1-3 leaves, and the involucels of many linear-subulate leaves; fruit elliptic, glaucous, glabrous, or clothed with fine pubescence. ♃. H. Native from France to Tauria, in open mountainous places.

Var. α, *laxiúsculum* (D. C. prod. 4. p. 146.) leaflets flat; umbels rather loose; ribs of fruit triangular, rather prominent. ♃. H. S. montànum, Lin. spec. p. 372. Schultes, syst. 6. p. 397. Koch, umb. p. 110.—Lob. icon. t. 77.

Var. β, *glaúcum* (D. C. l. c.) leaflets with an elevated nerve; umbellules crowded; ribs of fruit filiform. S. glaúcum, Lin. spec. p. 372. Schultes et Koch, l. c. Jacq. austr. 1. t. 45. S. ósseum, Crantz. austr. p. 207.

Var. γ, *multicaúle* (D. C. prod. 4. p. 147.) stem multiple at the base; leaves strictly adpressed. ♃. H. S. multicaûle, Retz. obs. 3. p. 27. Jacq. hort. vind. 2. t. 129.

Var. δ, *peucedanifòlium* (D. C. prod. 4. p. 147.) leaflets elongated. ♃. H. S. peucedanifòlium, Merat, fl. par. p. 115. S. elàtum, Thuill. par. p. 118.

Mountain Meadow-saxifrage. Fl. June, July. Clt. 1659. Pl. 2 to 3 feet.

19 S. Palla'sii (Bess. cat. hort. crem. 1816. p. 130.) stem terete, branched at the top; leaves bipinnate or tripinnate; leaflets trifid; segments linear, flat, acutish, glabrous, glaucous; upper leaves trifid or undivided; involucra wanting; leaves of involucels subulate, very short; fruit ovate, glabrous, crowned by the short 5-toothed calyx. ♃. H. Native of Russia. D. C. mem. soc. gen. vol. 4. S. crassifòlium, Schrad. and Hort. Umbels 10-rayed. Fruit elegantly striated with fuscous vittæ. Petiolar sheaths narrow, elongated. Allied to *S. elàtum*, but the fruit is not tubercled when young; to *S. leucospérmum*, but the fruit is glabrous. According to Koch, it is a variety of *S. glaúcum*.

Pallas's Meadow-saxifrage. Fl. Ju. July. Clt. 1818. Pl. 1 ft.

20 S. tenuifòlium (Ledeb. fl. ross. alt. ill. t. 97. fl. alt. 1. p. 333.) stem branched, flexuous; leaves bipinnate; leaflets linear, stiffish; involucrum almost wanting; involucels short; fruit prismatic, tubercularly warted, rather shorter than the pedicels; receptacle with a membranous margin. ♃. H. Native of Altaia, in dry open sterile places near Ustkamenogorsk, and in the Kirghisean steppe, between the first mentioned place and Ablaikit. Plant glaucescent. Stems many. Leaves with 5 opposite pinnæ, and each pinna bearing 3 or 5, usually entire leaflets. Umbels 6-8-rayed. Involucrum usually wanting, rarely of one setaceous leaf; involucels of 7-8 small lanceolate membranous acuminated reflexed leaves. Styles and teeth of calyx reflexed on the fruit.

Fine-leaved Meadow-saxifrage. Pl. 1 foot.

21 S. corona'tum (Ledeb. fl. ross. alt. ill. 169. fl. alt. 1. p. 336.) stem branched; leaves bipinnate; leaflets linear-oblong, decurrent, entire or tripartite; involucrum of 2 deciduous leaves; involucels of many lanceolate acute membranous reflexed leaves; fruit at length rather prismatic, wrinkled, crowned by the conical stylopodium. ♃. H. Native of Siberia, in the Soongarian desert. Plant glaucous. Radical leaves 8-10 inches long. Petioles dilated, and rather violaceous at the base, with white membranous margins. Umbels 6-8-rayed. Leaves of involucels inflexed at the points. Calyx obsoletely 5-toothed. Styles reflexed.

Crowned Meadow-saxifrage. Fl. July, Aug. Pl. 1½ to 2 ft.

22 S. vagina'tum (Ledeb. fl. ross. alt. ill. t. 171. fl. alt. 1. p. 336.) plant glaucescent; stem very simple; radical leaves pinnate; leaflets entire or trifid, nearly linear, acuminated; involucra and involucels of many broad linear leaves, with membranous margins: one of the leaves of the involucrum larger than the rest: those of the involucels equal in length to the umbellules. ♃. H. Native of Dahuria, near Nertschinsk. Stem nearly leafless, beset with sheaths, which have membranous margins, and truncate at the apex. Umbels 10-12-rayed, equal in length. Flowers rather large. Fruit with prominent ribs.

Sheathed Meadow-saxifrage. Pl. 1 to 1½ foot.

23 S. Gillie'sii (Hook. et Arn. in bot. misc. 3. p. 354.) plant clothed with hoary pubescence; stem angular; branches few, erect; leaves pinnate: leaflets of the lower leaves cuneated, and deeply toothed: of the superior ones linear and entire, or bipartite; involucra of few leaves or wanting; leaves of involucels linear, exceeding the pedicels; young fruit ovate, pubescent; styles elongated: stigmas globose, capitate. ♃. H. Native of Chili, in Valle de la Punta des Vacas, Andes of Mendoza. Petroselìnum satìvum, Hook. et Gill. l. c. p. 335. Flowers white. The ribs of the young fruit are hardly visible.

Gillies's Meadow-saxifrage. Pl. 1 foot.

24 S. polyphy'llum (Ten. ind. sem. 1825. p. 12. append. 5. fl. neap. p. 10.) stems declinate, tufted, having a few short branches; leaves supra-decompound; leaflets trifid, linear, nearly terete, fleshy, rather mucronate; upper leaves reduced to the sheaths; umbels 15-20-rayed; leaves of involucel setaceous, shorter than the umbellules; fruit glabrous. ♃. H. Native of Goat's Island and elsewhere, in the kingdom of Naples. Perhaps sufficiently distinct from *S. montànum*.

Many-leaved Meadow-saxifrage. Pl. 1 foot.

25 S. cœspitòsum (Sibth, et Smith, fl. græc. prod. 1. p. 200.) stem simple, nearly naked; radical leaves tufted, flat, pinnate; leaflets deeply trifid: ultimate ones decurrent; involucrum of 3-5 very short leaves; fruit cylindrical, smooth, obscurely striated. ♃. H. Native of the top of Mount Olympus. Smith, in Rees' cycl. vol. 32. Spreng. umb. spec. 121. Radical leaves 3 lines long.

Tufted Meadow-saxifrage. Pl. 1 foot.

26 S. colora'tum (Ehrh. herb. p. 113.) stem striated, nearly simple; petioles straight, sheathing; leaves decompound, erect; leaflets or segments crowded, linear-cuspidate, having the margins and keel, as well as the rays of the umbel, rather puberulous; involucrum almost wanting; leaves of involucels with membranous edges, about equal in length to the umbellules; fruit glabrous, acutely ribbed. ♂. or ♃. H. Native of France, Germany, Tauria, and Siberia, on mountains and hills. S. ánnuum, Lin. spec. p. 373. Schultes, syst. 6. p. 398. Jacq. fl. austr. t. 55. hort. vind. t. 225. S. biénne, Crantz. austr. p. 204. Sìum ánnuum, Roth, fl. germ. 1. p. 128. Selìnum dimidiàtum, D. C. fl. fr. no. 3492. and suppl. p. 503. S. carvifòlium, Vill. dauph. 2. p. 586. Càrum símplex, Willd. spec. 1. p. 1410.—Vaill. par. p. 54. t. 9. f. 4. S. alpìnum, Bieb. fl. taur. 1. p. 236.? but which is perhaps referrible to Cnídium venòsum. Flowers white, but often reddish when young. The plant not being annual, the name given by Linnæus is therefore not admissable. It differs from all the other species in the leaves of the involucel being equal in length or exceeding the umbellules.

Var. β, *mìnus* (Wallr. sched. crit. p. 124.) stem very humble. In dry situations.

Var. γ, *ferulàceum* (D. C. prod. 4. p. 147.) leaves of involucels exceeding the flowers, usually reflexed.

Coloured-flowered Meadow-saxifrage. Fl. June, July. Clt. 1817. Pl. 1 foot.

27 S. stríctum (Led. fl. ross. alt. ill. t. 174. fl. alt. 1. p. 338.) stem branched, straight; leaves tripinnate: leaflets linear, elongated, straight; petioles sheathing; involucra wanting; involucels of many setaceous leaves, which are shorter than the

umbellules; fruit prismatic, glabrous. ♂. H. Native at the bottoms of the Altaian mountains, frequent; as near Sogra, Loktewsk, Smejow, and elsewhere. Root fusiform. Rays of umbels 15-30, angular, roughish at the angles. Umbellules with 20-30 flowers. Mericarps with 5 prominent ribs. Stylopodium pulvinate. It differs from *S. coloràtum*, in the leaflets of the leaves not being roughish on the margins, in the rays of the umbel not being pubescent, and in the leaves of the involucel.

Var. β simplex; stem simple; leaves bipinnate: leaflets 2-3 inches long, very narrow.

Straight Meadow-saxifrage. Fl. July. Clt. 1830. Pl. 1½ to 2 feet.

28 S. pube'rulum (D. C. prod. 4. p. 147.) stem striated; petioles dilated at the base; sheaths with membranous margins; leaves decompound: leaflets few, linear, acute, glabrous; involucrum of one leaf; rays of umbels and fruit puberulous; involucels shorter than the umbellules. ♃. H. Native about Constantinople. Sheaths and bracteas coloured at the margins. Petals and styles purple. Allied to *S. coloràtum*.

Var. β, pállidum (D. C. prod. 4. p. 147.) sheaths less dilated, with pale margins; petals and styles white, or hardly reddish. ♃. H. Perhaps Selìnum carvifòlium, Vill. is referrible to this variety.

Puberulous Meadow-saxifrage. Pl. 1 foot.

29 S. tortuòsum (Lin. spec. p. 373.) stem striated, stiff, much branched, divaricate; leaves bipinnate, stiffish: leaflets trifid: segments linear, short, acutish, with the margins and keel rather scabrous; petioles sheathing, oblong; involucrum wanting or of 1-2 leaves; umbels 5-10-rayed; leaves of involucel about equal in length to the umbellules. ♃. H. Native of the south of France. D. C. fl. fr. 4. p. 285. Schultes, syst. 6. p. 401. Guss. prod. fl. sic. 1. p. 342. Œnánthe rígida striàta, Lin. hort. cliff. 99. Sìum tortuòsum, Roth, fl. germ. 1. p. 128.—J. Bauh. hist. 3. p. 2. t. 16. f. 1.—Lob. icon. 78. The whole plant is glaucous and stiff, but when growing in gardens it becomes green and flaccid. Flowers white. Fruit rather hairy, with triangular ribs, ex Koch, umb. p. 111.

Var. β, Taúricum (D. C. prod. 4. p. 148.) leaves bipinnate or tripinnate; leaflets trifid: segments linear, elongated, hardly glaucous. ♃. H. Native of Tauria, about Odessa; and of Galicia. S. tortuòsum, Bieb. fl. taur. 1. p. 235. suppl. 1. p. 242. Bess. fl. gal. 1. p. 221. Intermediate from habit between *S. tortuòsum* and *S. campéstre*, but is referred to the first, from the involucra being absent, and from the leaves of the involucels being about equal in length to the umbellules, &c.

Var. γ, Græ'cum (D. C. l. c.) leaves bipinnate: petioles channelled; leaflets distant, trifid: segments rather broader at the apex, obtuse. ♃. H. Native of Greece. S. tortuòsum, Smith, prod. fl. græc. no. 697. D'Urv. enum. 275.

Twisted Meadow-saxifrage. Fl. Oct. Clt. 1597. Pl. 2 to 3 ft.

30 S. campe'stre (Bess. enum. cont. p. 44.) stem terete, spreadingly branched at the apex, stiffish; leaves quadripinnate: leaflets ternate: segments linear, acutish, flat, hardly scabrous on the margins; involucra of 6-8 leaves; umbels 10-15-rayed; involucels shorter than the umbellules; fruit oblong, puberulous. ♃. H. Native of the Ukraine and Bessarabia, in sandy fields. Trev. act. bonn. 13. p. 170. S. arenàrium, Bieb. fl. taur. suppl. p. 242. in a note. S. tortuòsum, Trev. mag. nat. berl. 7. p. 148.

Field Meadow-saxifrage. Fl. Ju. July. Clt. 1823. Pl. 3 ft.

31 S. petræ'um (Bieb. fl. taur. 1. p. 235. suppl. p. 243.) stem short, striated, branched, clothed with velvety pubescence above, especially on the rays of the umbel and fruit; leaves pinnate: leaflets pinnatifid: segments lanceolate, attenuated at the base. ♃. H. Native of Tauria and Caucasus. Bùbon glaúcus, Spreng. umb. 1. p. 136. Schultes, syst. 6. p. 496. Umbellules dense, white. Pedicels thickish, shorter than the fruit. Fruit hairy, oblong, with fine filiform ribs, ex Koch, umb. p. 111.

Rock Meadow-saxifrage. Fl. Ju. July. Clt. 1817. Pl. 1½ ft.

32 S. Boccòni (Guss. cat. pl. 1821. p. 80.) stem terete, suffruticose at the base; leaves ternately decompound: leaflets stiff, lanceolate-cuneated, acute, rather trifid; upper sheaths leafless, loose; involucra wanting; involucels of many setaceous leaves, which are about equal in length to the pedicels; fruit glabrous, ovate-oblong. ♃. H. Native of Sicily on the mountains among chalky rocks by the sea-side, near Palermo; and of Corsica, on rocks about Sagona. Spreng. neue entd. 2. p. 146. syst. 1. p. 885. Bùbon Sículus, Spreng. in Schultes, syst. 6. p. 499. exclusive of the syn. of Bieb. Críthmum Sículum, Bocc. sic. 53. t. 27, 28.—Cup. panph. ed. 1. t. 105. ed. 2. t. 162. but in this last table it is delineated with the stem drooping at the apex, which is not the case.

Bocconi's Meadow-saxifrage. Fl. June, July. Clt. 1820. Pl. 1 foot.

† *Species not sufficiently known.*

33 S. stria'tum (Thunb. prod. p. 51. fl. cap. 259.) stem terete, striated, nearly simple; leaves tripinnate: leaflets linear-subulate, furrowed; involucrum of 4 leaves; umbel contracted; peduncles unequal; involucels reflexed. ♂. G. Native of the Cape of Good Hope. Stem purplish, a foot high or more. Branches few, divaricate. Leaves of involucrum ovate-lanceolate, concave. Leaves glabrous.

Striated Meadow-saxifrage. Fl. June, July. Clt. 1820. Pl. 1½ foot.

34 S. chærophylloi'des (Thunb. prod. p. 51. fl. cap. p. 254.) stem terete, striated, dichotomous at the apex; leaves ternately decompound: leaflets ovate, cut: segments linear, obtuse; involucra and involucels of 4 very short leaves. ♂. G. Native of the Cape of Good Hope. Sheaths of cauline leaves membranaceous, ventricose, entire. Stem 2 feet high and more. Leaves glabrous, pale beneath. Leaves of involucrum ovate, obtuse.

Chervil-like Meadow-saxifrage. Fl. June, July. Clt. 1810. Pl. 2½ feet.

35 S. fra'gile (Gouan. ill. p. 15.) stem unknown; leaves tripinnate; leaflets ternate, brittle, articulated: segments linear; sheaths large, 2-lobed at the apex; involucra none; umbels 12-rayed; involucels of 7-9 leaves, which are 3 times shorter than the umbellules. ♂. H. Native country unknown, as well as the flowers and fruit. Gouan cites under this plant the figures in J. Bauh. hist. 3. p. 18. f. 2. Clus. hist. 2. p. 196. f. 1. Tabern. icon. t. 97. f. 2. but these figures are very different from each other, and therefore the plant is very doubtful.

Brittle Meadow-saxifrage. Pl. 1½ foot.

Cult. The plants of this genus are of easy culture; they require sandy or chalky soil, and are easily increased by seeds. Those species marked perennial prove seldom more than biennial when cultivated in gardens.

LXXI. LIBANO'TIS (from λιβανος, *libanos*, incense, and not from Mount Libanon, as the name would imply; *L. vulgàris* is supposed to exhale an odour like incense). Crantz. austr. p. 222. Gærtn. fruct. 1. t. 21. D. C. coll. mem. 5. p. 17. t. 3. f. 5. prod. 4. p. 149. but not of Scop.—Athamántha, Scop. carn. no. 309. Lag. am. nat. 2. p. 103.—Séseli section, Koch, umb. 111.—Athamántha species of Lin.

Lin. syst. *Pentándria, Digýnia.* All as in *Séseli* but differs in the lobes of the calyx being slender (f. 55. *F. c. a.*), subulate, elongated, coloured, and deciduous, with the base hardly remaining; and in the involucra and involucels being both usually composed of many leaves. Leaves pinnate or bipinnate: leaflets ovate, cut or multifid: lower ones usually decussate.

Sect. I. Eriòtis (from εριον, *erion*, wool, and ους ωτος, *ous, otos*, an ear; in allusion to the petals being covered with short down). D. C. coll. mem. 5. p. 17. t. 3. f. 5. prod. 4. p. 149. Petals canescent from fascicles of short down (f. 55. *F. g.*).

1 L. Buchtorme'nsis (D. C. coll. mem. 5. t. 3. f. 5. mem. soc. gen. vol. 4.) stem angular, branched; leaves stiff, bipinnate, shining: leaflets broad-ovate or oblong, serrated at the top, with the serratures mucronate; peduncles stiff; involucrum almost wanting; involucels of many leaves, which are shorter than the umbellules; fruit villous from fascicles of hairs. ♃. H. Native of Siberia, very common in dry sterile places, especially about Buchtorminsk. Bùbon Buchtorménsis, Fisch. in Spreng. pug. 2. p. 55. Schultes, syst. 6. p. 496. Athamánta rígida, Horn. hort. hafn. 2. p. 960. Athamánta cervariæfòlia, Schrad. ined. Séseli Buchtorménse, Koch, umb. p. 111. Habit almost of *Libanòtis vulgàris*. Rays of umbel unequal in length. Leaves of involucel clothed with white down. Involucrum wanting, or of 2 or 3 entire or trifid or pinnatifid leaves.

Buchtorminsk Stone-parsley. Fl. July, Aug. Clt. 1816. Pl. 1 to 3 feet.

2 L. grave'olens; plant clothed with hoary pubescence; stem branched; leaves pinnate; leaflets in fascicles, unequal, 2-3 times plicately pinnate: segments 2 or 3-parted: lobes linear, cuspidate; involucra variable; involucels of many distinct leaves; fruit villously pubescent. ♃. H. Native of Altaia, on rocks, but rare near the Fort called Ustkamenogorsk, but frequent beyond the river Irtysch. Séseli gravèolens, Led. fl. ross. alt. ill. t. 164. fl. alt. 1. p. 340. Involucrum wanting or of one bipinnate leaf, or of many lanceolate-linear reflexed hoary leaves. Leaves of involucel hoary, length of the umbellules. Petals pilose on the outside. The plant has a strong aromatic smell, and exudes a resinous gummy juice.

Strong-scented Stone-parsley. Fl. June, July. Pl. 1 to 2 ft.

3 L. Patrinia'na (D. C. prod. 4. p. 150.) stem terete, branched; leaves bipinnate, canescent; leaflets multifid: lobes short, linear-subulate; umbellules 30-flowered; fruit rather compressed. ♃. H. Native of Altaia, on a schistous arid hill at the river Irtysch, and at Ustkamenogorsk. The plant exudes a yellow aromatic juice. Mericarps of fruit much compressed from the back, as in other species of *Séseli* and *Libanòtis*. Involucrum of a few multifid leaves. Leaves of involucels linear, connected together a little way at the base. Perhaps the same as *L. gravèolens*.

Patrin's Stone-parsley. Pl. 1 to 2 feet.

Sect. II. Eulibanòtis (this section is supposed to contain the genuine species of the genus). D. C. l. c. Petals glabrous (f. 55. *F. f.*).

4 L. vulga'ris (D. C. prod. 4. p. 150.) stem furrowed; leaves bipinnate: leaflets deeply pinnatifid: lower ones decussate: segments lanceolate; fruit ovate-oblong, villous. ♃. H. Native of the temperate parts of Europe and Asia, on mountains and in fields. In England on elevated chalky pastures, but rare; as on Gogmagog hills, Cambridgeshire; and between Albany and Stony Stratford. Athamántha Libanòtis, Lin. spec. p. 351. Schultes, syst. 6. p. 488. Jacq. fl. austr. 4. t. 392. fl. dan. 754. Smith, engl. bot. 138. Séseli Libanòtis, Koch, umb. p. 111. L. daucoìdes, Scop. carn. no. 317. L. montàna, All. pedem. 1368. t. 72. L. Diviniàna, Scop. carn. no. 316. Athamántha oreoselìnum, Huds. angl. 115. Ligústicum ferulàceum, Lapeyr. abr. p. 155. Libanòtis, Riv. pentap. irr. t. 37.—Bauh. hist. 3. p. 2. 105. f. 1.—Pluk. phyt. t. 173. f. 1. Radical leaves bipinnate or tripinnate; leaflets opposite, deeply and sharply cut, smooth: the lowermost ones crowded, and often crossing each other. Flowers crowded, white or reddish. There are varieties of this plant with the fruit either pilose or nearly glabrous. The following varieties are probably so many species.

Var. β, pubéscens (D. C. fl. fr. no. 3481. var. γ,) stem angular, pubescent; fruit more villous. ♃. H. Native of the Pyrenees, in dry open places, and of the west of France. Athamánta pubéscens, Retz. obs. 3. p. 28. D. C. fl. fr. suppl. p. 511.

Var. γ, daucifòlia (D. C. prod. 4. p. 150.) stem angular; leaflets finely divided into linear-lanceolate lobes. ♃. H. Native of the Pyrenees, Auvergne, Austria, Siberia, &c. on the mountains. Athamánta Pyrenàica, Jacq. hort. vind. 2. t. 197. Atham. crithmoìdes, Lapeyr. abr. p. 148. Críthmum Pyrenàicum, Lin. syst. veg. ed. 15. p. 296. A'mmi daucifòlia, Host, fl. austr. 1. p. 362.—Gmel. sib. t. 40. f. 1. There are varieties of this having the leaves of the involucrum either entire or multifid.

Var. δ, condensàta (D. C. prod. 4. p. 150.) stem nearly terete, striated; umbels very dense. ♃. H. Native of Siberia. Athamánta condensàta, Lin. spec. p. 351. Ligústicum vaginàtum, Spreng. pug. 2. p. 57. Schultes, syst. 6. p. 488.—Lam. ill. t. 194. f. 1.

Var. ε, incàna (D. C. prod. 4. p. 150,) plant hoary from pubescence; leaves supra-decompound; leaflets very minute, wedge-shaped, 4-toothed; leaves of involucra and involucels linear; umbels of many rays. ♃. H. Native of Siberia.

Libanotis or Mountain Stone-parsley. Fl. July, Aug. Britain. Pl. 1 to 3 feet.

5 L. Sibi'rica (Meyer, verz. pfl. p. 123.) leaves pinnate; leaflets pinnatifid or bipinnatifid: segments lanceolate or oblong, cuspidate; involucra of many leaves or wanting; leaves of involucels shorter than the umbellules; fruit pubescent, having the furrows furnished with 2 vittæ each. ♃. H. Native of Siberia, very common; and of Caucasus, in the plains adjoining the mountains of Talusch. Athamánta Sibírica, Lin. mant. p. 56. Atham. Libanòtis γ Sibírica, Schultes, syst. 6. p. 489. Séseli Libanòtis δ, Koch, et Mertens in deutschl. fl. 2. p. 412. Libanòtis vulgàris δ, Sibírica, D. C. prod. 4. p. 150. Séseli athamanthoìdes, Led. fl. alt. 1. p. 342.—Gmel. sib. 1. p. 186. t. 40. f. 2. exclusive of the synonymes. It differs from *L. vulgàris* not only in the leaves being simply pinnate, but in the involucra being usually wanting, in the involucels being shorter than the umbellules, and in the furrows of the fruit being furnished with 2 vittæ, and the commissure with 4.

Var. β, acaúle (Led. fl. alt. 1. p. 342. under *Séseli*,) leaves and umbels simple, rising in fascicles from the root.

Siberian Stone-parsley. Fl. July, Aug. Clt. 1771. Pl. 2 to 3 feet.

6 L. athamanthoi'des (D. C. prod. 4. p. 150.) stem furrowed, angular, sparingly branched; leaves pinnate: radical ones petiolate: upper ones sessile, nearly opposite: leaflets pinnatifid; lobes simple or trifid, linear, short, acute; leaves of involucra many, linear, ciliated, rarely cut. ♃. H. Native country unknown. Ligústicum athamanthoìdes, Spreng. umb. 126. exclusive of the synonymes. Fruit glabrous. It agrees in habit with Athamánta Pyrenàica, Jacq. hort. vind. t. 197., the *Libanòtis vulgàris var. γ daucifòlia*, but differs in the fruit being glabrous.

Athamanta-like Stone-parsley. Fl. July, Aug. Clt. 1817. Pl. 2 to 3 feet.

7 L. verticilla'ta (D. C. prod. 4. p. 151.) stem terete, furrowed, naked at the apex; leaves pinnate: leaflets pinnate-parted, cut: lower lobes decussate; involucra of few leaves; adult fruit naked. ♃. H. Native of Mount Parnassus. There is a plant very similar to this grows about Bayonne, at a place called Chambre d'Amour. Athamánta verticillàta, Smith, fl. græc. t. 275. prod. 1. p. 188. The plant is very different from *Pychòtis verticillàta*, to which it has been joined by Sprengel.

Whorled-leaved Stone-parsley. Pl. 1 to 2 feet.

8 L. tenuifòlia (D. C. prod. 4. p. 151.) plant glabrous; stem terete; leaves supra-decompound: leaflets linear, divaricate; sheaths dilated; leaves of involucrum 5, about equal in length to the middle of the rays of the umbel; leaves of involucels with membranous ciliated edges, length of the umbellules; fruit glabrous. ♃. H. Native of Altaia. Athamánta tenuifòlia, Pall. ex Schultes, syst. 6. p. 495. Umbels lateral. Involucrum of few leaves; the outer leaf the largest. Calyxes glabrous. Mature fruit unknown.

Fine-leaved Stone-parsley. Pl. 1 to 2 feet.

9 L. Stephania'na (D. C. prod. 4. p. 151.) stem simple, fistular, glabrous, striated; leaves glabrous, pinnate; leaflets oblong or ovate, sessile, cut: uppermost leaflets rather trifid; petioles ending in a sheath at the base; lower cauline leaves larger than the radical ones, and on longer petioles; umbels dense, sheathed; sheaths, as well as the involucra and involucels, are membranous and villous; involucrum of many obovate-cuneated leaves; involucels of many linear leaves. ♃. H. Native of Altaia, in the more humid parts of the Alps, especially at the fountains of the river Tscharysch, and elsewhere. Athamánta compácta, Led. fl. ross. alt. ill. t. 81. fl. alt. 1. p. 327. Athamánta cervària? Pall. itin. 2. p. 560. Athamánta monstròsa, Steph. ex Willd. rel. in Schultes, syst. 6. p. 495. Ligústicum athamánticum, Adans, mss. Petals erect, ovate-oblong, with an inflexed point. Styles equal in length or longer than the mericarps. Fruit nearly cylindrical, a little compressed from the sides, pilose, crowned by the permanent calyx and styles; mericarps with 5 filiform ribs: lateral ones marginating; vittæ 2 in each furrow, and 4 in the commissure.

Var. β, pinnatífida; leaves pinnate; leaflets pinnatifid; segments linear, a little cut.

Stephan's Stone-parsley. Pl. 1 to 1½ foot.

10 L. cachroìdes (D. C. prod. 4. p. 151.) plant glabrous, glaucous; stem terete; leaves pinnate; leaflets multifid: lobes linear, entire; superior petioles dilated; involucra and involucels of many elongated acuminated leaflets. ♃. H. Native of Dahuria, near Nerstinski Sawod. Càchrys Sibírica, Steph. ex Fisch. in cat. sem. 1823. Spreng. syst. 1. p. 892. Trev. act. soc. nat. cur. 13. p. 168. This species will probably form a proper genus, from the fruit being very much compressed from the back, in the dorsal ribs being prominent, and in the marginating ones being dilated into narrow wings. Vittæ 2 in the commissure, covered, and one in each furrow. Seed flat, not involute, as in *Càchyrs*. Leaves of *Séseli;* calyx involucra, and petals of *Libanòtis;* fruit nearly of *Peucédanum*. Ovarium sometimes villous when young. Fruit glabrous. Petals glabrous. Perhaps this, with *Séseli Patriniàna*, will form a new genus, nearly related to *Agasýllis* in tribe *Silerìneæ*.

Cachyrs-like Stone-parsley. Pl. 1½ foot.

Cult. See *Séseli*, p. 311. for culture and propagation.

LXXII. CENOLO'PHIUM (from κενος, *kenos*, empty, and λοφος, *lophos*, a crest; the ridges or ribs of the fruit are hollow inside). Koch, umb. p. 103. in add. no. 34. b. diss. ined. in litt. 1828. D. C. coll. mem. 5. p. 48. t. 3. f. T. prod. 4. p. 151. —Críthmum species of Bieb.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point (f. 55. *G. l. b. f.*). Transverse section of fruit nearly terete; mericarps with 5 equal sharp rather winged ribs, which are hollow inside: lateral ones marginating; vittæ one in each furrow, and 2 in the commissure. Seed semi-terete, inclosed in a dry pericarp, which is adnate to it when young (f. 55. *G.*).—Glabrous perennial herbs. Leaves bipinnate or many times ternate; leaflets divaricate, rather trifid: segments lanceolate, cuspidate, quite entire, nerved. Involucrum wanting or of one leaf; involucels of many leaves (f. 56. *G. c.*). Flowers white. This genus is nearly allied to *Cnídium*, but differs in the seed being inclosed in a dry loose pericarp when mature.

1 C. Fische'ri (Koch, l. c.) ♃. H. Native of Siberia, in saltish humid fields on the lower Volga, about Sarepta; and of Lithuania at Grodna. Athamánta denudàta, Fisch. hort. gor. Horn. hort. hafn. suppl. p. 32. Críthmum campéstre, Guld. itin. 1. p. 190.? ex Bieb. Críthmum Mediterràneum, Bieb. suppl. p. 215. Ligústicum Fischèri, Link, enum. 1. p. 276. exclusive of Conioselìnum. Cnídium Fischèri, Spreng. syst. 1. p. 888. Selìnum carvifòlia, Gilib. herb. grodn. ex Besser. Peucédanum álbum, Hort. par. ex Desf. and therefore Peucédanum mìnus, Poir. dict. 5. p. 228. exclusive of the synonymes and country. Angélica Fischèri, Spreng. in Schultes, syst. 6. p. 605, Stems terete, striated.

Fischer's Cenolophium. Fl. June, Aug. Clt. 1820. Pl. 2 ft.

Cult. This plant will grow in any common garden soil; and is easily increased by seeds.

LXXIII. CNI'DIUM (the ancient name of Orach). Cusson, mem. soc. med. par. 1782. p. 280. Hoffm. umb. 1. p. 157. Koch, umb. 108. f. 48. D. C. prod. 4. p. 52.—Selìnum, Lag. am. nat. 2. p. 91. but not of Koch.—Cnídium and Ligústicum species, Spreng. Ligústicum species of Lin.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point. Transverse section of fruit nearly terete; mericarps with 5 equal winged ribs; wings rather membranous; lateral ribs marginal; vittæ one in each furrow, and 2 in the commissure. Seed semi-terete. Albumen flat on one side.—Herbs perennial, rarely suffruticose. Leaves pinnate or ternate; leaflets multifid: lobes linear. Involucra variable; involucels of many leaves. Flowers white or rose-coloured. This genus is very nearly allied to *Séseli*, but differs in the ribs of the fruit being winged, and in the margin of the calyx being obsolete.

1 C. Monnie'ri (Cuss. l. c.) stem branched, angular; leaves bipinnate: leaflets pinnatifid: segments linear-lanceolate, acute; leaves of involucra and involucels setaceous. ⊙. H. Native of the south of France. Selìnum Monnièri, Lin. spec. 351. Jacq. hort. vind. 1. t. 62. Ligústicum mìnus, Lam. fl. fr. 3. p. 454. Cicùta Sinénsis, Zucc. cent. no. 56. in Rœm. coll. 1. p. 135. Athamánta Chinénsis, Lour. coch. p.? Lin. spec. p. 353. Cnídium confértum, Mœnch, meth. 98. Involucra of 1-9 leaves. Ribs of fruit membranous. Flowers white.

Monnier's Cnidium. Fl. July, Aug. Clt. 1771. Pl. 2 feet.

2 C. apioi'des (Spreng. umb. prod. p. 40.) stem branched, striated; leaves bi-tripinnate; leaflets pinnate-parted: segments linear-lanceolate, mucronate; involucrum almost wanting; leaves of involucels setaceous, equalling the umbellules in length. ♃. H. Native of the east of France, Germany, Switzerland, Transylvania, &c. Hoffm. umb. p. 157. Schultes, syst. 6. p. 552. exclusive of Willd. syn. Ligústicum apioìdes, Lam. dict. 3. p. 577. Ligústicum cicutæfòlium, Vill. dauph. 2. p. 612. t. 15. Lig. Lobèlii, Vill. prosp. p. 24. Laserpítium silaifòlium, Jacq. austr. app. t. 44.—Lob. icon. 775. Flowers white or pale yellow?

Celery-like Cnidium. Fl. Ju. July. Clt. 1791. Pl. 1 to 2 ft.

3 C. petroseli'num (D. C. prod. 4. p. 152.) stem striated; lower leaves on trifid petioles: the divisions bi-tripinnate; leaflets linear-lanceolate, quite entire, or trifid: upper ones pinnate, having the segments usually undivided; umbels erect, of many rays; involucrum almost wanting. ♃. H. Native country unknown. Peucédanum petroselìnum, Desf. hort. par. 1821. Leaves large, with elongated segments or leaflets. Umbels 12-20-rayed. Petals greenish-white, with an inflexed point. Calyx entire.

Parsley-like Cnidium. Pl. 2 feet.

4 C. venòsum (Koch, umb. p. 109.) stem terete, smooth, straight, hardly branched above; leaves pinnate: leaflets pinnatifid or bipinnatifid: segments linear, or oblong-linear, acutish, quite entire or trifid; involucra wanting or of few leaves; leaves of involucels setaceous, about equal in length to the umbellules. ♃. H. Native of Germany, about Halle and Witenberg; and of Caucasus and Siberia, in rather moist places. Séseli venòsum, Hoffm. fl. germ. p. 144. Séseli dùbium, Schkuhr, handb. 1. p. 217. Schultes, syst. 6. p. 399. Séseli saxífragum, Schott. barb. p. 307. Selìnum praténse, Spreng. fl. hal. p. 92. t. 2. Séseli selinoìdes, Besser. cat. hort. crem. p. 130. Séseli alpìnum, Bieb. fl. taur. no. 587. ex suppl. p. 243.? Selìnum lineàre, Schum. enum. pl. sæland, 1. p. 95. Sheathes of leaves oblong; superior ones close. Involucra of few leaves. Leaves of involucra and involucels entire. There are varieties of this with more or less dissected leaves. Perhaps the German plant and the Siberian are the same.

Veiny Cnidium. Fl. Ju. Jul. Clt. 1817. Pl. 1 to 2 feet.

5 C. ano'malum (Led. fl. ross. alt. ill.. t. 311. fl. alt. 1. p. 330.) stem furrowed, glabrous, twiggy; leaves pinnate; leaflets bipinnately cut: segments cut or nearly entire, acute; leaves of involucra oblong-linear, entire, pinnatifid, or bipinnatifid. ♂. H. Native of Altaia, in fertile humid meadows, in the valleys of the rivers Tscharysch; and Kotsun, near Alexandrowsk. Gmel. fl. sib. 1. p. 190. t. 42. and 43. There is also a stemless variety found at the fountains of the river Tschegan. Root fusiform. Leaves pale green, glabrous. Involucra and involucels of many leaves; those of the involucels are oblong, entire, and ciliated, and about equal in length to the umbellules. Petals white. Fruit beset with glittering atoms; vittæ 1-3 in each furrow, and 2 in the commissure. Stylopodium pulvinate. Calyx 5-cleft.

Anomalous Cnidium. Pl. $1\frac{1}{2}$ to 2 feet or more.

6 C. cunea'tum (Led. fl. ross. alt. ill. t. 312. fl. alt. 1. p. 331.) stem furrowed, glabrous, branched: superior branches verticillate or opposite; leaves bipinnate: lower leaflets ternate: upper ones 2-3-parted, or cut, cuneated; leaves of involucrum oblong-elliptic, a little toothed at the apex; leaves of involucels broad, elliptic, entire, mucronate. ♂. H. Native of Siberia, in meadows at the river Kerlyk, but rare. Root fusiform. Leaves pale green, glabrous. Rays of umbel 12-20. Calyx with 5 minute teeth.

Cuneate-leafletted Cnidium. Fl. July. Pl. 1 to $1\frac{1}{2}$ foot.

7 C. Fontane'sii (Spreng. umb. spec. p. 41.) stem striated, dichotomous at the apex; leaves ternately decompound; leaflets rather trifid: segments linear, bluntish; leaves of involucra and involucels many, linear, acuminated. ♃. H. Native of Algiers, in fields near Sbiba. Laserpítium peucedanoìdes, Desf. fl. atl. 1. p. 254. t. 71. Laserp. Fontanèsii, Pers. ench. 1. p. 313. Laserp. Atlánticum, Poir. suppl. 3. p. 304. Ligústicum Fontanèsii, Spreng. in Schultes, syst. 6. p. 565. Perhaps the furrows of the fruit are furnished with 1 or many vittæ, and therefore may be either a species of *Ligústicum* or *Cnídium*; but the habit is that of *Cnídium*.

Desfontaines Cnidium. Pl. 1 to 2 feet.

8 C. suffrutico'sum (Cham. et Schlecht. in Linnæa. 1. p. 387.) stem shrubby, naked, decumbent; branches erect, leafy; leaves ternately decompound; leaflets short, rather trifid; sheathes of leaves permanent. ♄. G. Native of the Cape of Good Hope, in sand by the sea-side. Cònium suffruticòsum, Berg. cap. p. 77. The habit of this plant is very different from all the other species.

Suffruticose Cnidium. Shrub decumbent.

9 C. diffu'sum (D. C. prod. 4. p. 153.) stem diffuse, striated; leaves pinnate; leaflets pinnatifid: segments cuneated, bluntly toothed at the apex; peduncles opposite the leaves; leaves of involucra numerous, linear, rather membranous. ☉. H. Native of Bengal. Ligústicum diffùsum, Roxb. hort. beng. p. 21. Smith, in Rees' cycl. 21. no. 11. Willd. mss. in Schultes, syst. 6. p. 655. Athamánta diffùsa, Wall. mss. Petals white, obcordate. Ribs of fruit prominent, rather crested, roughish from short down: vittæ 1 in each furrow.

Diffuse Cnidium. Pl. 1 foot.

10 C. carvifòlium (Bieb. suppl. p. 212.) stem nearly simple; leaves pinnate; leaflets cuneiform, pinnatifid: segments linear, bluntish; involucra of 1-2 elongated, somewhat pinnatifid leaves. ♃. H. Native of Caucasus. Laserpítium Caucásicum, Bieb. fl. taur. 1. p. 222. Said to be allied to *Laserpítium Daúricum*, and *Mèum mutellìnum*. Leaves of involucels subulate, shorter than the umbellules. Stylopodium and styles dark purple.

Caraway-leaved Cnidium. Fl. Ju. Jul. Clt. 1820. Pl. 1 to 2 ft.

11 C. meifo'lium (Bieb. suppl. p. 212.) stem unknown; leaves pinnate: leaflets profoundly pinnatifid: segments linear-subulate; involucra and involucels of many subulate, reflexed leaves. ♃. H. Native of the Alps of Caucasus. Involucrum of 6-8 leaves. Involucels longer than the flowers. Flowers of a beautiful rose colour.

Meum-leaved Cnidium. Pl. 1 to 2 feet?

12 C. Canade'nse (Spreng. in Schultes, syst. 6. p. 415. exclusive of many of the synonymes) stem angular, flexuous; leaves bipinnate, shining; leaflets many-parted: segments lanceolate; involucra and involucels of few leaves. ♃. H. Native of North America, at the mouths of large rivers from Canada to Carolina; at the mouth of the St. Lawrence, in Canada. Selìnum Canadénse, Michx. fl. bor. amer. 1. p. 155. A'pium bipinnàtum, Walt. carol. p. 115. The fruit is unknown, and therefore it is a doubtful species of *Cnídium*. Flowers white.

Canadian Cnidium. Fl. Ju. Aug. Clt. 1817. Pl. 2 feet.

Cult. See *Séseli*, p. 311. for culture and propagation.

LXXIV. PETI'TIA (in honour of M. Felix Petit, author of a memoir on the genus *Althènia*, and who first made known the present plant by a figure and description). Gay, in ann. sc. nat. 26. p. 219.

Lin. syst. *Pentándria, Digýnia.* Calyx toothless. Petals lanceolate, entire, with an involute point. Fruit oblong, crowned by the reflexed styles; transverse section roundish-elliptic, furrowed on both sides, from the raphe being nearly central, not marginal; mericarps rather convex on the back, with 5 contiguous, thick, elevated, wingless, bluntly keeled ribs, therefore the transverse section is triangular, spongy inside; lateral ribs not broader than the rest, nor marginal. Vittæ solitary in the furrows, which are narrow, and twin in the commissure. Seed adhering to the tegument, compressed, not angular.—A glabrous, green, biennial herb: with a very long, branched, thick root, which is spongy inside, and intercepted by transverse, membranous dissepiments. Stem short, nearly simple, thick, fistular, leafy at the base, striated above, and scabrous at the striæ. Leaves tripinnate; sheaths large; rachis smoothish; lobes linear, scabrous on the margins, and on the dorsal nerve, mucronate at the apex. Umbels terminal, of many rays: rays 14-33, very rough, and very unequal: central ones much the shortest. Involucra wanting, rarely of 2 leaves; involucels of from 4-12 linear-subulate, quite entire leaves, which are much shorter than the umbels. Flowers greenish. Stylopodium large.

1 P. sca'bra (Gay, l. c.). ♂. H. Native of the Eastern Pyrenees, in the valley called d'Eynes, at a place called La Cueillade de Nouri, among the debris of schistous rocks, at the elevation of 7200 feet, a little below the limits of perpetual snow. Selìnum scàbrum, Lapeyr. abr. 1813. p. 147. Spreng.

in Rœm. et Schultes, syst. 6. p. 563. Angélica scàbra, Petit, in ann. sc. obs. 1. p. 99. t. 3. D. C. prod. 4. p. 168.

Scabrous Petitia. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

Cult. Sow the seeds in a dry situation in spring, in light earth.

LXXV. ENDRE'SSIA (in honour of M. Endress, a young botanist, who has travelled in the Pyrenees). Gay, in ann. sc. nat. 26. p. 223.

LIN. SYST. *Pentándria, Digýnia.* Teeth of calyx at first obscure, but increase in length as the fruit comes to maturity; they are at last erect and subulate, and longer than the stylopodium. Petals without claws, quite entire, ovate-lanceolate, acuminated, and very acute, with an involute point. Fruit compressed a little from the sides, oblong-elliptic, crowned by the reflexed styles. Mericarps convex on the back; with 5 distant, equal, filiform ribs: lateral ribs marginating; furrows of fruit very broad; vittæ 6 in the commissure, 4 in the lateral furrows, and 3 in the dorsal ones, all distinct. Seed adhering.—A perennial, smooth herb; with an oblique root, which is naked at the neck. Stem slender, quite simple, angularly striated, smooth, unless just under the umbel, where it is scabrous, a foot high, bearing 2 or 3 leaves. Leaves pinnate; leaflets sessile, decussate, palmately 3-parted: segments palmately 3-5-cleft; lobules linear, cuspidate. Umbels terminal, small, dense, when in fruit nearly globose; with short, stiff, smooth rays. Involucrum wanting, very rarely of 3-4 leaves; involucels of 1-5 linear-subulate leaves, which are about equal in length to umbellules, and sometimes much shorter. Petals white. Stylopodium small. Carpophore bipartite.

1 E. PYRENA'ICA (Gay, l. c.). ♃. H. Native of the Eastern Pyrenees, in alpine or subalpine pastures. Laserpítium símplex, Lapeyr. abr. p. 152. Ligústicum símplex, Benth. cat. pyr. p. 96. Mèum Pyrenàicum, Gay, in D. C. prod. 4. p. 162.

Pyrenees Endressia. Pl. 1 foot.

Cult. See *Cenolòphium*, p. 313. for culture and propagation.

LXXVI. THA'SPIUM (from the Isle of Thapsia, which gave the name to the Thapsia of the ancients; in allusion to its affinity with that genus). Nutt. gen. amer. 1. p. 196. exclusive of some species. D. C. prod. 4. p. 153.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals elliptic, tapering into a long, inflexed point. Fruit not contracted from the sides, somewhat elliptic; mericarps convex, with 5 winged, nearly equal ribs; furrows striated, each furnished with 1 vitta: and the commissure with 2. Seed terete. —Perennial herbs, natives of North America. Involucra wanting; involucels unilateral, of 3 leaves. This is a very distinct genus from *Smýrnium* and *Zízia;* but it is evidently allied to *Cnídium*, from the fruit, but is distinguished from that genus in the calyx being 5-toothed, in the petals not being emarginate, in the involucels being 3-leaved, and in habit.

§ 1. *Umbels opposite the leaves. Flowers dark purple.*

1 T. ATROPURPU'REUM (Nutt. gen. amer. 1. p. 196.) radical leaves petiolate, cordate, undivided; cauline leaves pinnate, of 3-7 ovate-oblong, cartilaginously toothed, petiolulate leaflets. ♃. H. Native from Carolina to Virginia, on hills; frequent about Philadelphia. Smýrnium atropurpùreum, Lam. dict. 3. p. 667. Ell. sketch. 1. p. 366. Cnídium atropurpùreum, Spreng. in Schultes, syst. 6. p. 418. Flowers greenish while young, but at length becoming dark purple. Fruit small, with the wings exserted, and membranous.

Dark purple-flowered Thaspium. Clt. 1810. Pl. 2 feet.

§ 2. *Umbels terminal. Flowers yellow.*

2 T. BARBINO'DE (Nutt. gen. amer. 1. p. 196.) lower leaves somewhat triternate: superior ones biternate; leaflets ovate-cuneated, acute, unequally and deeply serrated, but entire at the base. ♃. H. Native about Philadelphia, on the shady banks of the Schuylkill. Ligústicum barbinòde, Michx. fl. bor. amer. 1. p. 167. Smýrnium, Muhl. cat. p. 32. Thápsia trifoliàta, Mill. dict. no. 5.? Spreng. in Schultes, syst. 6. p. 615. Umbels dichotomous, terminal. Petals yellow. Fruit elliptic, with 7 wings: the alternating ones larger than the others. Stem pubescent at the joints, the rest glabrous.

Bearded-jointed Thaspium. Fl. June, July. Clt. 1700. Pl. 2 to 3 feet.

3 T. ACTÆIFÒLIUM (Nutt. l. c.) leaves biternate: leaflets oval, equally toothed; umbels somewhat verticillate: lateral ones sterile. ♃. H. Native of Canada, on the banks of the St. Lawrence, near Tadoussach; and of Virginia. Ligústicum actæifòlium, Michx. fl. bor. amer. 1. p. 166. Herb 3 feet high. Leaves of involucels setaceous. Fruit oblong-oval, with 10 rather winged ribs.

Actæa-leaved Thaspium. Fl. Ju. Jul. Clt. 1810. Pl. 3 ft.

Cult. The species of this genus will grow in any common garden soil, but best in peat; and are easily increased by dividing at the root, or by seed.

LXXVII. TROCHISCA'NTHES (from τροχισκος, *trochiskos*, a small wheel, and ανθος, *anthos*, a flower; shape of flowers). Koch, umb. p. 103. f. 95. Gaudin, fl. helv. 2. p. 401. D. C. prod. 4. p. 154. Podopétalum, Gaud. mss.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals on long claws, spatulately obovate, with a triangular inflexed point. Fruit a little compressed from the sides; mericarps with 5 sharp, rather winged, equal ribs: lateral ribs marginating; vittæ 3-4 in the furrows, which are broad, and 8 in the commissure. Carpophore bipartite, Seed rather semi-terete.—Glabrous, perennial herbs. Radical leaf biternate; leaflets large, ovate-lanceolate, unequally serrated. Stem much branched, naked at the apex. Involucra wanting, or of 1 leaf; involucels of 2-5 leaves. Flowers white, those in the disk of the umbel sterile.

1 T. NODIFLO'RUS (Koch, umb. p. 104.). ♃. H. Native of Upper Provence, Dauphiny, Vallais, Piedmont, Hungary, &c. in shady mountain woods. Smýrnium nodiflòrum, All. pedem. 2. p. 25. t. 72. Ligústicum nodiflòrum, Vill. dauph. 2. p. 608. Angélica paniculàta, Lam. dict. 1. p. 172. Imperatòria nodiflòra, Lam. fl. fr. 3. p. 417. Laserpítium verticillàtum, Waldst. et Kit. pl. rar. hung. 2. p. 186. t. 171. is perhaps properly referred to this by Sprengel, but it appears to differ in the form of the petals and fruit.

Knot-flowered Trochiscanthes. Fl. July, Aug. Clt. 1810. Pl. 3 feet.

Cult. See *Tháspium* above for culture and propagation.

LXXVIII. ATHAMA'NTA (some species found upon Mount Athamas, in Sicily). Koch, umb. p. 106. f. 49-50. but not of Scop. D. C. prod. 4. p. 154.—Bùbon and Athamánta, species of Lin. Athamánta species, Spreng.—Libanòtis, Scop. intr. no. 301. Lag. am. nat. 2. p. 100.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals obovate, emarginate, or entire, with a very short unguiculate inflexed point. Fruit attenuated at the neck; transverse section nearly terete, or a little compressed from the sides; mericarps with 5 filiform, wingless, equal ribs: lateral ribs marginating; vittæ 2 or 3 in each furrow. Seed somewhat semi-terete. Carpophore unknown.—Perennial or biennial herbs, usually velvety from villi on the stem, leaves, and fruit.

Leaves triternate or pinnate; leaflets cut or multifid. Involucra of 1 or few leaves; involucels of many leaves. Flowers white.

1 A. cervariæfòlia (D. C. prod. 4. p. 155.) stem suffruticose at the base, caudex-formed; leaves glaucous, glabrous, triternate; leaflets broad, ovate, cuspidately serrated: lateral ones somewhat bifid: terminal ones trifid; involucra of 1 or few leaves. ♃. or ♄. G. Native of Teneriffe. Séseli cervariæfòlia, D. C. cat. hort. monsp. p. 145. Schultes, syst. 6. p. 405. Athamánta máxima, Chois. ined. Flowers sweet-scented. Petals white, oblong, with an inflexed point. Fruit oblong, villous.

Chervil-leaved Spignel. Fl. Ju. Jul. Clt. 1818. Sh. 2 ft.

2 A. Macedónica (Spreng. in Schultes, syst. 6. p. 491.) stem panicled, clothed with soft, velvety villi; leaves almost glabrous; petioles twice trifid, decompound; leaflets ovate, somewhat 3-lobed, mucronately toothed; umbels very numerous, velvety. ♂. F. Native of Macedonia, Atlas, and according to Allioni about Nice. Bùbon Macedónicum, Lin. spec. p. 364. Desf. atl. 1. p. 256. Blackw. icon. 382. Plench. icon. t. 194. Daúcus Macedónicus, Riv. pent. irr. t. 48. A'pium Macedónicum, Moris. hist. sect. 9. t. 9.—Lob. icon. 708. Fruit bottle-shaped, hispid, covered by 10-12 vittæ, having the ribs very slender.—In some parts of the East they use this plant to scent their clothes; the smell is very strong, and rather disagreeable to Europeans. The plant, but especially the seed, is esteemed to be diuretic, emmenogogue, and carminative; the seeds are an ingredient in theriaca.

Macedonian Parsley, or Spignel. Fl. June, Aug. Clt. 1596. Pl. 1 to 2 feet.

3 A. ramosíssima (Port. in Schultes, syst. 6. p. 496.) stem erect, scabrous, much branched; radical leaves and lower cauline ones supra-decompound; leaflets filiform, mucronulate, stiff, glabrous: upper ones ternate; involucrum of many leaves; petals hairy on the outside as well as the fruit. ♃. H. Native of Dalmatia. Host, fl. aust. 1. p. 364. Allied to *A. Creténsis*. Fruit ovate, not bottle-shaped, very hairy. Petals emarginate, very hairy on the outside. Involucra of 8-10 linear leaves.

Much-branched Spignel. Pl. 1 foot.

4 A. Crete'nsis (Lin. spec. p. 352.) stem rather villous; leaves bipinnate; leaflets divided into linear, trifid lobes: lower ones hardly exceeding the rest; involucra of 1 or few leaves; petals hairy on the back. ♂. H. Native of the south and middle of Europe, in exposed situations. The leaves are said to be tripinnate by many authors. The seeds have been occasionally employed as carminatives, and were supposed likewise to be diuretic and emmenogogue; lately they have been little used, except as ingredients in theriaca and mithradate. Haller, however, judges it to be much superior to the common carrot in medicinal efficacy. It was celebrated anciently as a specific in the stone.

Var. a, hirsùta (D. C. prod. 4. p. 155.) leaves clothed with hairs; lobes short. Libanòtis hirsùta, Lam. fl. fr. 3. p. 428. Athamánta Creténsis, Jacq. fl. aust. t. 62. hort. vind. t. 218. Plench, icon. t. 284.—Daúcus Créticus, Cam. epit. 536. with a figure. Blackw. 471.

Var. β, mutellinoìdes (D. C. l. c.) leaves nearly glabrous; lobes slenderer and more elongated.—Athamánta mutellinoìdes, Lam. dict. 1. p. 425. Atham. Mathìoli, D. C. fl. fr. 4. p. 318. exclusive of the synonymes of Jacq. and Math. A. rupéstris, Vill. dauph. 2. p. 648. A. ánnua, Lin. spec. 353.?—Moris. oxon. sect. 9. t. 10.

Cretan Spignel or Candy Carrot. Fl. June, Jul. Clt. 1596. Pl. 1 foot.

5 A. Matthìoli (Wulf. in Jacq. coll. 1. p. 211. icon. rar. 1. t. 57.) stems glabrous, flexuous; leaves glabrous; leaves 3-4 times ternate; leaflets linear-filiform, elongated, divaricate; involucra of 1 or many leaves; petals glabrous. ♃. H. Native of the Alps of Carinthia, Carniola, and in fields about Nice. Libanòtis rupéstris, Scop. carn. no. 315. t. 9. Mèum Matth. ed. Bauh. 1. p. 569. f. 1. Stem glabrous, except under the origin of the leaves, where they are rather puberulous. Perhaps Séseli Túrbith, Lin. is referrible to this plant, and probably A. ánnua, Lin. spec. 353. Leaves very fine like fennel.

Matthioli's Spignel. Fl. Ju. Jul. Clt. 1802. Pl. 1½ foot.

6 A. Sı'cula (Lin. spec. p. 352.) stems hoary from pubescence; leaves triternately decompound, rather villous; leaflets ovate, pinnatifid: segments short, bluntish; petals villous on the outside. ♃. H. Native on Mount Garganus, Apulia, Sicily, and among calcareous rocks, on Mount Atlas. Desf. fl. atl. 1. p. 324. Schultes, syst. 6. p. 491. exclusive of the syn. of Bocconi. Bùbon Gargánicum, Ten. fl. neap. 1. p. 123. t. 25. A. Creténsis, Ucria, ex Guss. prod. fl. sic. 1. p. 328.—Zan. ist. t. 48.—Moris. oxon. sect. 9. t. 9. last figure. Leaves almost like those of *Sisýmbrium Sòphia*.

Sicilian Spignel. Fl. June, July. Clt. 1686. Pl. 2 to 3 ft.

7 A. cane'scens (D. C. prod. 4. p. 155.) plant glabrous at the bottom, and canescent at the top from short crowded down; leaves ternately decompound; leaflets cuneated, cut: lobes linear, bluntish; involucra and involucels of 5 leaves; petals smoothish; fruit ovate, beset with very long, white, spreading hairs, which are rather capitellate at the apex. ⊙. H. Native of the Levant, between Aleppo and Bagdad. Herb half a foot high, sparingly branched. Leaves of involucra and involucels oval-oblong, apiculated. Petals some of them cleft at the apex, and others entire. Immature fruit unknown, and therefore the genus is rather doubtful.

Canescent Spignel. Pl. ½ foot.

† *Species not sufficiently known, and will perhaps, when more fully examined, be removed from the genus altogether.*

8 A. depre'ssa (D. Don, prod. fl. nep. p. 184.) leaves bipinnate, pubescent; leaflets very slender, many-parted: segments linear, mucronate; scapes filiform, assurgent, velvety, exceeding the leaves; umbels simple or compound; involucrum of 5 pinnatifid leaves. ♃. H. Native of Nipaul, in the alpine region of Gosaingsthan. Plant tufted. Root long, simple, fusiform, a finger in thickness. Scapes numerous, 3 inches high.

Depressed Spignel. Pl. ¼ foot.

9 A. gigante'a (D. Don, prod. fl. nep. p. 184.) leaves supradecompound; leaflets ovate, awned, deeply serrated, glabrous; involucra of many leaves; petals bipartite; fruit ovate, pubescent. ♃. H. Native of Nipaul. Root simple, fusiform. Stem furrowed, 3-4 feet high, branched. Petioles and rachis pubescent beneath. Umbels many-rayed, terminal. Petals white.

Giant Spignel. Pl. 3 to 4 feet.

10 A. te'res (D. Don, prod. fl. nep. p. 185.) leaves bipinnate, glabrous; leaflets pinnatifid: segments linear, acute, furrowed above; involucra of 5 short leaves; involucels of many leaves, equal in length to the rays; stem straight, terete, smooth. ♃. H. Native of Nipaul. Stem 2 feet high, simple.

Terete-stemmed Spignel. Pl. 2 feet.

11 A. carvifòlia (Steph. in Schultes, syst. 6. p. 496.) involucrum dimidiate; segments pinnatifid, linear, hoary. ♃. H. Native of Siberia (ex Steph. in herb. Willd.). There are 3 specimens under this name in Willdenow's herbarium, which are very distinct from each other; one of which is *Laserpitium Daúricum*; the second *Rùmia seseloìdes*, and the third is *Rùmia athamathoìdes*. The plant is therefore doubtful.

Caraway-leaved Spignel. Pl. 1 foot?

Cult. These plants will grow in any common garden soil; and are either increased by dividing at the root, or by seed.

LXXIX. LIGU'STICUM (so named from some of the species growing abundantly in Liguria). Koch. umb. p. 104. f. 44-47. but not of Lag. D. C. prod. 4. p. 157.—Ligústicum species of authors.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed, or obsolete. Petals obovate, acute, emarginate, with an inflexed point, on very short claws. Transverse section of fruit nearly terete, or a little compressed from the sides; mericarps with 5 sharp, rather winged, equal ribs: lateral ribs marginating; vittæ many, both in the furrows and commissure. Seed almost semiterete.—Herbs, for the most part perennial. Leaves decompound, or ternately divided. Involucra various; involucels of many leaves. Flowers white.

§ 1. *Margin of calyx evidently 5-toothed: teeth permanent.*

1 L. Scóticum (Lin. spec. p. 359.) stem slightly branched at the upper part, striated, smooth; leaves biternate, opaque; leaflets rhomboid, broad, acute, smooth, serrated; involucra of unequal, partly leafy, entire leaves; leaves of involucel more numerous, lanceolate, rather unequal. ♃. H. Native of Lapland, Norway, &c., North America, and Siberia; Kotzebue's Sound, and Kamtschatka; Scotland on the sea-coast about the Frith of Forth; also on the western coast; very abundant in rocky places; about Dunstonburgh Castle in Northumberland. Smith, engl. bot. t. 1207. Fl. dan. t. 207. Torrey, fl. un. st. 1. p. 313. Cham. et Schlecht. in Linnæa. 1. p. 390. Angélica Scótica, Lam. dict. 1. p. 173. Séseli Scóticum, Riv. pent. irr. p. 59. A'pium ternàtum, Willd. herb. in Rœm. et Schultes, syst. 6. p. 431. Flowers white, with a reddish tinge; anthers red. Fruit oblong, having the commissure furnished with 6 vittæ. Root fusiform, warm, and pungent. The herb is eaten either crude or boiled by the natives of Scotland and its isles. The flavour is highly acrid, and though aromatic, and perhaps not unwholesome, is very nauseous to those who are unaccustomed to such food. L. Scóticum, Lour. coch. p. 183. cultivated in Cochin-china, belongs probably to a distinct genus, from the circumstance of the petals being entire.

Scotch Lovage. Fl. July. Britain. Pl. 1 foot.

§ 2. *Margin of calyx minutely 5-toothed. Involucra of many leaves.*

2 L. Carniólicum (Host, fl. aust. 1. p. 378.) stem erect, branched, striated; radical leaves triternate; leaflets decurrent, pinnate-parted: segments pinnatifid, mucronate; involucra of many leaves, which are toothed at the apex. ♃. H. Native of Carniola, on a mountain called Grosskahlenberg; and of Silesia. Fruit large, nearly 3 lines long, ovate-oblong, having the ribs short and a little winged, and with the furrows broad and furnished with 3 vittæ each. Teeth of calyx very small.

Carniolian Lovage. Pl. 2 to 3 feet?

3 L. ala'tum (Spreng. umb. spec. p. 125.) stem furrowed and winged; leaves supra-decompound; leaflets petiolate, ovate, decurrent, pinnatifid: segments deeply serrated, oblong; involucra of few leaves; leaves of involucels setaceous, about equal in length to the umbellules. ♃. H. Native of Caucasus, in grassy places. Rœm. et Schultes, syst. 6. p. 551. Athamánta alàta, Bieb. fl. taur. 1. p. 214. Cnídium myrrhifòlium, Bieb. suppl. p. 212. Flowers rose-coloured when young, but at length becoming white; anthers red. Margin of calyx short, 5-toothed. The commissure, according to Koch, is furnished with 4-6 vittæ, and the furrows with as many, from which it differs from the genus *Cnídium* and especially from *C. apiifòlium*, which is very like.

Winged-stemmed Lovage. Fl. July, Aug. Clt. 1816. Pl. 4 to 5 feet.

4 L. ferula'ceum (All. pedem. no. 1319. t. 60. f. 1.) stem branched, striated; leaves supra-decompound; segments rather remote, linear, cuspidate; leaves of involucra pinnatifid at the apex. ♂. H. Native of Dauphiny, Piedmont, and Jura, on the lower alps, in open places; and of Dauria, but not of the Pyrenees, because L. ferulàceum of Lapeyr. is Séseli Libanòtis, Laserpítium Daúricum, Jacq. hort. vind. 3. t. 38. Ligústicum Seguièri, Vill. dauph. 2. p. 615. exclusive of the synonymes. Furrows of fruit furnished with 3-4 vittæ each, and the commissure with 8 vittæ. ex Koch, umb. p. 105. Stems usually spotted.

Ferula-like Lovage. Fl. Jul. Aug. Clt. 1775. Pl. 2 to 3 ft.

5 L. cynapiifòlium (Viv. in litt. 1820. ex D. C. prod. 4. p. 158.) stem terete, branched; leaves decompound from the petiole being much branched; leaflets multifid: segments linear, acute; involucra and involucels of many leaves; umbel of many rays; umbellules nearly globose, many-flowered. ♃. H. Native of Corsica, in the fissures of rocks. Habit almost of *Cnídium apioìdes* or *Ligústicum Seguièrii*, but is easily distinguished from them in the involucrum being of many leaves; and from *L. ferulàceum* it is distinguished by the stem being hardly striated, in the leaves of involucels being undivided, and in the umbellules being more crowded with flowers. Mature fruit not seen.

Fool's-parsley-leaved Lovage. Pl. 3 to 4 feet.

6 L. coniifòlium (D. C. prod. 4. p. 158.) stem terete, branched; leaves supra-decompound, glabrous; leaflets pinnatifid: lobes acutely toothed; involucra and involucels of many linear, acute, deflexed leaves, which are as well as the rays of the umbel and upper part of the stem pubescent. ♃. H. Native of Nipaul, on high mountains. Laserpítium coniifòlium, Wall. mss. Plant tall and very showy. Radical leaves 2 feet long, with trifid petioles. Mericarps with 5 wings, and having many vittæ in the furrows.

Hemlock-leaved Lovage. Pl. 4 to 6 feet.

7 L. stria'tum (D. C. prod. 4. p. 158.) stem terete, branched; leaves bipinnate; lobes or leaflets entire, acute, rarely cut; involucra and involucels of 5-6 linear, spreadingly-deflexed leaves, which are glabrous as well as the stems and rays of the umbel. ♃. H. Native of Nipaul, in the Great Valley, in rice-fields. Laserpítium striàtum, Wall. mss., but is referrible to the genus *Ligústicum* from the mericarps being furnished with 5 wings, and in the furrows being furnished with many vittæ, &c.

Striated Lovage. Pl. 3 to 4 feet.

8 L. cuneifòlium (Guss. pl. rar. p. 130. t. 26.) stem striated, branched; leaves shining, tripinnate; leaflets pinnatifid: segments short, cuneiform, trifid, obtuse, awned, approximate; involucra permanent, of many leaves; fruit oval, glabrous. ♃. H. Native of the kingdom of Naples, in Abbruzzo, in open places of valleys. Allied to *L. Pyrenæ'um*.

Wedge-leafletted Lovage. Pl. 1 to 2 feet.

9 L. di'scolor (Ledeb. fl. ross. alt. ill. t. 310. fl. alt. 1. p. 321.) lower leaves ternately bipinnate; lower leaflets petiolate, ternate: upper ones and segments of the lower ones oblong, pinnatifid, or cut, decurrent; involucra of many lanceolate-linear, deciduous leaves; involucels of many linear, permanent leaves. ♃. H. Native of Altaia, near Riddersk, Alexandrowsk, and Belaja at the river Buchtorminsk. L. Peloponnesiàcum, Pall. itin. 2. p. 528.? Root fusiform, stupose, perhaps biennial. Stem solitary, branched, furrowed, glabrous. Leaves pale green above, and pale glaucous beneath. Petioles of radical leaves half a foot long, ternate, and the divisions bipinnate. Rays of umbel variable in length. Calyx with 5 minute teeth. Petals white. Mericarps with 5 rather winged ribs; having the furrows furnished with 3 vittæ, and the commissure with 4-6. It differs from *L. cándicans* of Aiton, in the involucra being of many leaves.

Two-coloured-leaved Lovage. Pl. 4 to 5 feet.

10 L. ca'ndicans (Ait. hort. kew. 1. p. 348. ed. 2. vol. 2. p. 142.) leaves supra-decompound; leaflets cuneiform, cut, glabrous; involucra of 2 rather foliaceous leaves; ribs of fruit membranous, glabrous. ♃. H. Native country and the rest unknown.

Whitish Lovage. Fl. July, Aug. Clt. 1780. Pl. 3 to 4 ft.

§ 3. *Margin of calyx obsolete. Involucra wanting, or of few leaves.*—Silàus species, Koch, in litt. 1828.

11 L. pyrenæ'um (Gouan. ill. 14. t. 7. f. 2. exclusive of the syn. of Seguier) stem branched, striated; leaves supra-decompound, shining; leaflets pinnatifid: segments linear, mucronate, short, divaricate; involucrum of a few caducous leaves. ♃. H. Native of the Pyrenees, in open places. D. C. fl. fr. 4. p. 309. Cnídium Pyrenæ'um, Spreng. umb. in Schultes, syst. 6. p. 416. L. Pyrenàicum, Koch, umb. p. 105. Séseli aristàtum, Ait. hort. kew. 1. p. 359. This plant is generally confused with *L. ferulàceum*, but it is perfectly distinct. It is hardly to be distinguished from *L. Seguièri*, unless in the furrows of the fruit being furnished with many vittæ, and the commissure with 6-8 vittæ.

Pyrenean Lovage. Fl. July, Aug. Clt. 1804. Pl. 3 to 4 ft.

12 L. Seguie'ri (Koch, umb. p. 105.) stem terete, striated; leaves decompound; leaflets pinnatifid: segments remote, linear, rather falcate, cuspidate; involucra wanting or of 1 leaf. ♃. H. Native of the Apennines, Appuanos, Mounts Baldo and Generoso, Corsica, Carniola, &c. Selìnum Seguièri, Lin. fil. suppl. p. 179. Jacq. hort. vind. 1. t. 61. Imperatòria Seguièri, Spreng. umb. spec. p. 65. Schultes, syst. 6. p. 618. Melanoselìnum Seguièri, Sweet. hort. brit. 190. Ligust. Seguièri, Gaudin, fl. helv. 2. p. 398.—Seguier. pl. veron. 2. p. 41. t. 13. Axillary branches somewhat verticillate. Styles elongated, much divaricate. Vittæ 3-4 in each furrow of the fruit, and 4-6 in the commissure.

Seguier's Lovage. Fl. July, Aug. Clt. 1774. Pl. 3 to 4 feet.

13 L. Co'rsicum (Gay, in ann. sc. nat. 26. p. 222.) stem nearly simple, few-leaved, striated; leaves tripinnate; leaflets palmate-parted: lobules small, linear, cuspidate; involucra wanting, or of 1 leaf; rays of umbel muricated; involucels of many linear-subulate, serrulated leaves, which are about equal in length to the umbellules; teeth of calyx obsolete; ribs of fruit scabrous from denticulations. ♃. H. Native of Corsica, on the mountains, at the elevation of 5000 or 6000 feet. Vittæ in the lateral furrows 3, in the dorsal 4, also 4 in the commissure. Habit of *Mèum mutellìnum*, from which it differs in the petals being emarginate, not entire.

Corsican Lovage. Pl. ½ to 1 foot.

14 L. peucedanoi'des (Presl, in herb. Hænke, ex D. C. prod. 4. p. 158.) stem branched, furrowed; leaves decompound; leaflets linear; umbels opposite the leaves; rays angularly winged; involucra wanting, or of few leaves, which are multifid at the apex; involucels wanting, or of few leaves. ♃. H. Native of Chili. The specimen is very like the rest, but varies in the involucra and involucels being sometimes wanting. Calyx obsolete. Petals entire.

Var. β, tenuifòlium (Presl. l. c.) stem and branches thicker; leaves of involucra multifid; of the involucels linear, and longer than the umbellules; fruit ovate; mericarps with 5 ribs, furnished with many vittæ.

Var. γ, longifòlium (Presl, l. c.) segments of leaves very long. ♃. H. Native of Peru. Fruit wanting in the specimen, and therefore it is probably a proper species.

Peucedanum-like Lovage. Pl. ?

15 L. pa'nsil (Bert. herb. ex D. C. prod. 4. p. 669.) plant glabrous, erect, branched; leaves pinnate: leaflets multifid; lobes linear, acute; umbels terminal, or rising from the forks of the branches; involucra wanting, or of 1 many-parted leaf; involucels nearly wanting. ♃. H. Native of Chili, in woods and hedges, at Rancagua and Valparaiso, where it is called *Pansil*. Limb of calyx obsolete. Petals white, emarginate, with an inflexed point. Fruit with winged ribs. Perhaps a species of *Pleurospérmum*.

Pansil Lovage. Pl. 1 to 2 feet?

† *Species not sufficiently known.*

16 L. multi'fidum (Smith, in Rees' cycl. bot. 21. no. 8.) stem branched, fistular; leaves triplicately pinnate; leaflets linear, channelled, acute, decurrent; leaves of involucrum 7-8, lanceolate, with membranous margins; fruit ovate-roundish, with winged, curled ribs. ♃. H. Native of Siberia. Perhaps a species of *Cnídium*.

Multifid-leaved Lovage. Pl. 3 to 4 feet.

17 L. divarica'tum (Led. sem. hort. dorp. 1824. p. 5.) leaves 4-times pinnate; terminal leaflets 3-parted: lateral ones simple, or bipartite; segments linear, cuspidate; involucra of 1 leaf. ♃. H. Native of Altaia. Said to be allied to *L. Fischèri*, Link. Perhaps a species of *Cenolòphium*.

Divaricate Lovage. Pl. ?

18 L. Cy'prium (Spreng. umb. spec. p. 125.) stem terete, much branched, panicled; leaves tripinnate; leaflets cut, bluntish, glabrous; involucra of few leaves. ♃. H. Native of the Island of Cyprus. Athamánta multiflòra, Smith, fl. græc. t. 276. prod. 1. p. 188. The vittæ being unknown, the species is therefore still obscure. It is probably a species of *Cnídium*.

Cyprus Lovage. Pl. 1 foot.

19 L. obtusifòlium (Horn. hort. hafn. 1. p. 270.) stem unknown; leaves bipinnate; leaflets cordate, orbicular, sharply toothed; involucra and involucels of many leaves.—Native of Tangiers. Willd. enum. p. 312. Fruit unknown.

Blunt-leafletted Lovage. Fl. Jul. Aug. Clt. 1824. Pl. 2 ft.

20 L.? Nepale'nse (D. Don, prod. fl. nep. p. 185.) stem terete, striated, glabrous, erect, very simple; leaves septinately pinnate; leaflets ovate, acute, deeply serrated, nerved, cuneated at the base: lower ones tripartite; involucels of many leaves, one half shorter than the umbellules. ♃. H. Native of Nipaul, in Gosaingsthan. Umbels terminal, solitary, of many rays. Calyx 5-toothed. Petals oval-oblong, cuspidate at the apex. Fruit undescribed. Probably a species of *Hymenolæ'na*.

Nipaul Lovage. Pl. ½ foot.

21 L. Gingi'dium (Forst. fl. aust. p. 140.) stem striated; petioles sheathing, loose; leaves pinnate; leaflets rather obliquely cordate, oblong-ovate, obtuse, crenated, nerved. ♃. H. Native of New Zealand, on the mountains. Gingídium montànum, Forst. gen. p. 42. t. 21. Involucra and involucels of 6 lanceolate-subulate leaves. Calyx 5-toothed, permanent. Petals emarginate, with an inflexed point. Fruit ovate, roundish, with 8 stripes.

Chervil Lovage. Pl. 1 to 2 feet?

22 L. aciphy'lla (Spreng. in Schultes, syst. 6. p. 554.) stem sheathed; leaves fan-shaped, multifid; leaflets linear, stiff, quite entire, nerved, pungent; mericarps with 3 ribs. ♃. H. Native of New Zealand. Aciphýlla squarròsa, Forst. gen. p. 136. t. 68. Laserpítium aciphýlla, Lin. fil. suppl. 181. Probably a species of *Cnídium*, or a proper genus.

Pointed-leaved Lovage. Pl. 1 foot.

23 L.? du'bium (H. B. et Kunth, nov. gen. amer. 5. p. 19.) stem branched, terete, striated, fistular; leaves ternately decompound, rather hairy beneath; leaflets sessile, ovate-oblong, acute, sharply crenate-serrated, cuneated at the base. ♃. H. Native of New Spain, in humid places. Flowers white. Fruit un-

known. According to Kunth, this is perhaps a species of *Heráclеum*.

Doubtful Lovage. Pl. 1 foot.

24 L.? Græ'cum (D. C. prod. 4. p. 159.) stem erect, branched; leaves all bipinnate. ♃. H. Native of Greece. Ligústicum Græ'cum folio-apii, Tourn. cor. p. 23. According to the fruit, which is preserved in the herbarium of the museum of Paris, it is a true species of *Ligústicum*. Sium Græ'cum, Lour. and S. Græ'cum, Lin. are very different plants from this.

Greek Lovage. Pl.?

25 L. Cape'nse (D. C. prod. 4. p. 159.) stem erect, branched; leaves bipinnate; leaflets short, thick; involucra and involucels of 3-5 leaves; fruit ovate; calyx obsolete. ♃. G. Native of the Cape of Good Hope. Athamánta Capénsis, Burm. fl. cap. p. 7. In Burmann's herbarium there are specimens of several plants fastened on the same sheet of paper, under the name of *Athamánta Capénsis*, therefore the one which he meant to go under this name is doubtful.

Cape Lovage. Pl. 2 feet.

Cult. See *Athamánta*, p. 316. for culture and propagation.

LXXX. SILA'US (a name used by Pliny for an umbelliferous plant). Besser, in Schultes, syst. 6. p. 34. in a note. Koch, umb. p. 105. D. C. prod. 4. p. 161.—Peucédanum species of Lin.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals obovate-oblong, narrowed into an inflexed point, entire, or rather emarginate, appendiculate at the base, or sessile and truncate. Transverse section of fruit nearly terete. Mericarps with 5 sharp, rather winged equal ribs: lateral ribs marginating; vittæ many in each furrow, and so close together as to appear like a single broad one; and 4-6 in the commissure. Seed somewhat semi-terete.—Glabrous, perennial herbs. Leaves cut into many parts; leaflets linear. Involucra wanting, or of few leaves: involucels of many leaves. Flowers cream-coloured or greenish. This genus is very nearly allied to *Ligústicum*.

1 S. prate'nsis (Bess. enum. pl. vohl. p. 43. no. 1367.) stem angular; leaves supra-decompound; leaflets pinnate-parted: segments rather remote, lanceolate, nerved, a little channelled, cuspidate; involucra obsolete, or of 1-2 leaves. ♃. H. Native of humid meadows, from Europe to Tauria; and Siberia; in Britain, in rather moist meadows and pastures. Peucédanum Silàus, Lin. spec. 354. Smith, engl. bot. 2142. Mart. rust. t. 128. Jacq. aust. t. 15. Hayne, arz. gew. 7. t. 5. Cnídium Silàus, Spreng. umb. prod. 40. Schultes, syst. 6. p. 416. Sium Silàus, Roth, fl. germ. 1. p. 129. Séseli pratense, Riv. pent. irr. t. 58. Crantz, austr. 3. p. 209. t. 6. f. 1. Séseli selinoìdes, Jacq. enum. vind. 227. Ligústicum Silàus, Duby, in D. C. bot. gall. 1. p. 230.—Mor. hist. 3. sect. 9. t. 6. f. 10.—Lob. icon. 738. f. 5.—Petiv. herb. brit. t. 28. f. 5. Root spindle-shaped. Herb smooth, dark green. Leaves bipinnate; leaflets elliptic-lanceolate, entire: either undivided or separated almost to the base into 2 or 3 segments of the same shape and magnitude. Umbels of several unequal rays. Involucra of from 1-3 linear, white-edged leaves, but most frequently none at all. Involucels of several linear leaves. Flowers yellow or greenish white. Fruit roundish-ovate. The whole plant, being fetid, when bruised, is supposed in some parts of Norfolk to give a bad flavour to milk and butter; but cattle certainly do not eat it; except accidentally, or in small quantities, sufficient perhaps to have the effect in question. Where this herb abounds in pastures, it may be found partially cropped, though generally left almost entire.

Meadow Pepper-saxifrage. Fl. Aug. Sept. Brit. Pl. 1 to 2 ft.

2 S. tenuifòlius (D. C. mem. soc. gen. vol. 4.) stem terete, striated; leaves 3 or 4 times pinnate; leaflets pinnatifid or trifid: segments linear, cuspidate, somewhat divaricate; involucrum wanting; fruit cylindrical. ♃. H. Native of Hungary and Teneriffe? Peucédanum tenuifòlium, Desf. hort. par. 1813. p. 120. Poir. dict. 5. p. 228. but not of Thunb. Peucédanum serótinum, Pers. ench. 1. p. 310. Peuced. Mathìoli, Spreng. in Schultes, syst. 6. p. 569. Silàus Mathìoli, Koch, umb. p. 106. Spreng. pug. 2. p. 56. umb. spec. p. 113. This plant is usually to be found in gardens under the name of *Mèum Sibíricum*.

Fine-leaved Pepper-saxifrage. Fl. July, Aug. Clt. 1818. Pl. 2 to 3 feet.

3 S. alpe'stris (Bess. enum. pl. vohl. p. 43. no. 1405.) stem striated; leaves bipinnate or tripinnate, with the ramifications spreading; leaflets pinnate; lower segments 3 or 4-parted: upper ones entire: lobes all entire, linear, cuspidate; involucra almost wanting; leaves of involucels setaceous; fruit ovate-oblong. ♃. H. Native of the south of Podolia, in open fields; and of Altaia, near Schulbinsk, at the river Irtysch. Peucédanum alpéstre, Spreng. umb. spec. p. 56. exclusive of the synonymes. Peuced. Silàus, Bieb. fl. taur. 1. p. 215. Silàus Bessèri, D. C. prod. 4. p. 161. Flowers yellowish. Differs from *S. tenuifòlius* in the fruit being shorter and thicker, nearly ovate, not cylindrical. Compare it with *Peucédanum alpéstre*, Lin. which is not sufficiently known.

Alp Pepper-saxifrage. Fl. Jul. Aug. Clt. 1739. Pl. 1 to 2 ft.

4 S. longifòlius (Led. fl. ross. alt. 1. p. 323.) leaves supra-decompound, with the ramifications rather divaricate; leaflets somewhat tripartite: segments lanceolate or linear, cuspidate; involucra almost wanting; leaves of involucels setaceous. ♃. H. Native of Siberia, in meadows, about the rivers Irtysch and Buchtorminsk. Ligústicum longifòlium, Willd. spec. 1. p. 1428. Athamánta denudàta, Fisch. Angélica Fischèri, Spreng. in Schultes, syst. 6. p. 605. Críthmum Mediterràneum, Bieb. fl. taur. 3. p. 215. Ligústicum Fischèri, Link, enum. 1. p. 276. Cnídium Fischèri, Spreng. syst. 1. p. 888.—Gmel. sib. 1. p. 188. no. 4. t. 41. The Altaian plant differs from the one collected on the banks of the Volga, in the leaves being more profoundly divided, nearly ternate; in the segments being linear, not 3-5-parted; in the lobes being lanceolate; and in the involucra being usually of 1 leaf. Furrows of fruit furnished with 1 vittæ each, but sometimes the outer ones have 2.

Var. β, divaricàtum; segments of leaves longer. ♃. H. Cnídium divaricàtum, Led. ind. sem. hort. dorp.

Long-leaved Pepper-saxifrage. Fl. July, Aug. Clt. 1820. Pl. 2 feet.

5 S. carvifo'lius (Meyer, pflanz. p. 125.) root fusiform; stem furrowed and striated, branched; leaves bipinnate; leaflets of the radical leaves decussate: of the cauline linear, divaricate; involucra and involucels composed of short setaceous leaves; rays of umbel very unequal. ♃. H. Native of Caucasus, on the higher mountains. Bùnium peucedanoìdes, Bieb, fl. taur. 1. p. 208. suppl. 211. D. C. prod. 4. p. 116. Sium peucedanoìdes, Spreng. umb. spec. 41. no. 5. Peucédanum carvifòlia, Bieb. Petals pale yellow. Vittæ solitary in the furrows, according to Besser: but there are 2-3 vittæ in nearly all the furrows, rarely solitary.

Caraway-leaved Pepper-saxifrage. Fl. July, Aug. Clt. 1818. Pl. 1 ft.

6 S.? peucedanoi'des (D. C. prod. 4. p. 161.) root turnip-formed; stem striated, fistular, somewhat trichotomous at the apex; leaves nearly ternate; segments linear, acute, entire, with revolute margins; involucra of 1 leaf; involucels wanting; umbels of 4-5 rays; umbellules 8-10-flowered. ⊙.? H. Native of South America, on temperate mountains about Popayan. Cnídium peucedanoìdes, H. B. et Kunth, nov. gen. amer. 5. p.

15. Peucédanum júnceum, Willd. mss. in Schultes, syst. 6. p. 576. From the yellow entire petals, it comes nearer *Silàus* than *Cnídium*, but the involucel is wanting.

Sulphur-wort-like Pepper-saxifrage. Pl. 2 feet?

Cult. See *Athamánta*, p. 116. for culture and propagation.

LXXXI. WALLRO'THIA (in honour of F. Wallroth, M. D. a German botanist). Spreng. in Schultes, syst. 6. p. 45. exclusive of some species. D. C. coll. diss. 5. p. 49. t. 1. f. A. prod. 4. p. 162.—Ligústicum species, Rœm. D. C. and Lapeyr.—Mèum species of Duby.

Lin. syst. *Pentándria, Monogýnia.* Teeth of calyx 5, ovate-lanceolate, acute (f. 56. *A. b.*). Petals entire, elliptic, acute at the base and apex (f. 56. *A. d.*). Transverse section of fruit nearly terete; mericarps with 5 prominent, equal ribs: lateral ribs marginating. Vittæ 1 in each furrow, and 2 in the commissure.—A smooth perennial herb. Radical leaves decompound; leaflets linear-lanceolate. Involucra of 1-3 unequal leaves; involucels of 5-8 linear-lanceolate leaves. Flowers white. This genus is intermediate between *Mèum* and *Ligústicum*; it differs from the first in the calyx being evidently 5-toothed, and from the last in the petals being entire.

1 W. tenuifo'lia (D. C. prod. 4. p. 162.). ♃. H. Native of the central Pyrenees, among rocks, but rare, as at Port d'Aulus, Estive de Luz, L'hieris, Eaux-bonnes, &c. Ligústicum tenuifòlium, Rœm. in D. C. fl. fr. 4. (1805.) p. 309. Spreng. prod. 41. Ligust. spléndens, Lapeyr. abr. (1813.) p. 156. Wallròthia spléndens, Spreng. in Schultes, syst. 6. p. 557. Mèum tenuifòlium, Duby, in D. C. bot. gall. p. 230. Daúcus Pyrenaicus tenuifolius lucidus, and Ligusticum Pyrenaicum fœniculi folio lucidum, Tourn. herb.

Fine-leaved Wallrothia. Fl. Ju. Jul. Clt. 1825. Pl. 1 ft.

Cult. See *Athamánta*, p. 116. for culture and propagation.

LXXXII. ME'UM (from *μειων, meion*, smaller; in reference to the delicacy of the leaves). Tourn. inst. p. 312. t. 165. Jacq. Pers. Gærtn. Lag. am. nat. p. 100. Koch, umb. p. 103. D. C. coll. mem. 5. p. 49.—Ligústicum species, D. C. fl. fr.—Æthùsa, Athamánta, Ligústicum, and Phellándrium of authors.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals entire, elliptic, acute at the base and apex. Transverse section of fruit nearly terete. Mericarps with 5 prominent, acutely keeled, equal ribs: lateral ribs marginating; vittæ many in the furrows, and 6-8 in the commissure. Seed nearly semi-terete.—Glabrous, perennial herbs. Stems nearly simple, terete, striated. Leaves supra-decompound, or pinnate; leaflets multifid: segments slender, linear, acute. Involucra almost wanting; involucels of many leaves. Flowers white or purple. This genus is distinguished from *Ligústicum* in the calyx being without teeth and in the petals being entire.

1 M. Athama'ntica (Jacq. fl. austr. t. 303.) leaves supra-decompound, divided into numerous, fine, setaceous leaflets or segments; stems leafy, not much branched; involucra of a few linear leaves, which are often 3-cleft at the apex, but often wanting altogether; involucels of more numerous, entire, or cut leaves, somewhat dimidiate. ♃. H. Native of Europe, in mountain pastures; plentiful on the mountains in the north of England; and abundant in the Highlands of Scotland. Smith, engl. bot. 2249. Mèum, Raii syn. 207. Dod. pempt. 305. f. 1. Math. valgr. 1. p. 22. f. 1. Cam. epit. 7. f. 1. Riv. pent. irr. t. 63. Dalech. lugd. 769. f. 1-2. Athamánta Mèum, Lin. spec. 353. Ligústicum capillàceum, Lam. fl. fr. 3. p. 454. Ligústicum Mèum, D. C. fl. fr. 4. p. 310. Crantz, aust. fasc. 3. p. 82. Hayne arz. gew. 7. t. 12. Æthùsa Mèum, Lin. syst. veg. 287. Daúcus Créticus, Trag. hist. 445. f. 1.—Moris. hist. 3. p. 270. sect. 9. t. 2. f. 2. Roots tapering. Stems hollow. Petals sometimes slightly obcordate. The whole plant, but especially the root, is highly aromatic, with a hot biting flavour like lovage, which it communicates to milk and butter, from the cows feeding upon its herbage in spring. A strong infusion of this herb is said to give cheese the taste and odour of the Swiss chapziegar. The seeds, as well as the roots are recommended as carminatives and stomachics. The plant is called *Spignel, Meu* or *Bald-money* in England, and *Highland-miken* in Scotland.

Athamanta-like or Common Bald-money. Fl. May, June. Britain. Pl. 1 to 2 feet.

2 M. mutelli'na (Gærtn. fruct. 1. p. 106. t. 23.) leaves bipinnate or tripinnate; leaflets lanceolate-linear, cut, acute; stem nearly naked, simple; involucra wanting: leaves of involucel lanceolate. ♃. H. Native of middle Europe, in high subalpine pastures. Mutellìna, J. Bauh. hist. 3. p. 2. p. 66. Phellándrium mutellìna, Lin. spec. p. 366. Jacq. austr. t. 56. hort. vind. t. 223. Ligústicum mutellìna, All. pedem. t. 60. f. 1. D. C. fl. fr. 4. p. 310. Æthùsa mutellìna, Lam. fl. fr. p. 1025. Œnánthe purpùrea, Lam. dict. 4. p. 530.—Cam. epit. p. 8. with a figure.—Park. theat. 889. f. 5. Herb and root aromatic. In Switzerland, Haller says, the goodness of the pastures are estimated by the abundance of this plant. The flowers are probably always purple while young.

Mutellina or Swiss Bald-money. Fl. June, Aug. Clt. 1774. Pl. ½ to 1 foot.

Cult. See *Athamánta*, p. 116. for culture and propagation.

LXXXIII. GA'YA (in honour of M. Gay, a distinguished French botanist). Gaud. feuill. vaud. 1825. no. 157. p. 28. fl. helv. 2. p. 389. D. C. coll. diss. 5. p. 49. prod. 4. p. 163. but not of Kunth. Laserpítium, spec. Lin. Hall. and Lam.—Ligústicum spec. All. Spreng. Koch.—Arpítium. Neck. elem. no. 278.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals obovate, more or less emarginate, with a broad inflexed point. Fruit oval, rather compressed; mericarps with 5 elevated, wing-formed ribs, which are contiguous at the base, obtuse: outer ones marginal. Vittæ none. Carpophore bipartite. Seed nearly semi-terete, easily separated from the covering. —Perennial mountain herbs. Leaves all radical, pinnate; leaflets bipinnatifid: lobes linear. Stems naked, simple. Umbels compound. Involucra of few leaves. Flowers equal, fertile, white. This genus differs from *Mèum* in the petals being emarginate, not entire; in the furrows of the fruit being without vittæ, and in the fruit being rather bladdery.

1 G. si'mplex (Gaudin, l. c.) leaves of involucra few (7-10), somewhat trifid. ♃. H. Native of the higher Alps, from Dauphiny to Carinthia. Laserpítium símplex, Lin. mant. p. 56. Jacq. misc. 2. t. 2. Ligústicum símplex, All. pedem. no. 1324. Spreng. in Schultes, syst. 6. p. 553. Vill. dauph. 2. t. 14. Laserpítium lùcidum, Ait. hort. kew. ed. 1. vol. 1. p. 345. ex Spreng. Root branched. Flowers reddish.

Simple-stemmed Gaya. Fl. Jul. Clt. 1775. Pl. ½ foot.

2 G. Pyrena'ica (Gaudin, l. c. in a note) leaves of involucra 1-5, undivided. ♃. H. Native of the higher Pyrenees. Pimpinélla dioíca β, Lapeyr. abr. p. 166. Séseli nànum, L. Dufour, in litt. Séseli montànum, var. Benth. cat. It differs from the first in its more stiff, branched habit, in its glaucous colour, in its 1-leaved stem, in the leaflets and segments being lanceolate, in the ribs of the mericarps being less elevated. Plant small, glabrous. Root thick.

Pyrenean Gaya. Pl. ½ foot.

Cult. These plants should be grown in pots, in a mixture of peat and loam, and placed among other alpine plants. They are increased by seeds.

LXXXIV. CONIOSELI'NUM (a name evidently composed of *Cònium* and *Selìnum*). Fisch. in Hoffm. umb. ed. 2. p. 185. tit. f. 5. Koch, diss. ined. D C. prod. 4. p. 163.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals obcordate or obovate, with an inflexed point. Styles at length diverging, reflexed. Fruit rather compressed from the back, or convex; mericarps with 5 winged ribs; the lateral ribs twice the breadth of the others, and marginal; vittæ unequal, 3 in the lateral furrows, but usually 2 in the dorsal ones, and 4-8 in the commissure. Carpophore bipartite. Seed flat on one side.—Glabrous, biennial herbs. Stems branched, fistular. Leaves bipinnate; leaflets pinnate-parted: segments oblong-linear. Umbels terminal, of many rays. Involucra wanting, or of few leaves. Involucels of 5-7 linear-subulate leaves, which are about equal in length to the umbellules, or longer. This is an ambiguous genus, intermediate between the tribe *Peucedàneæ* and *Seselineæ*; with the first it agrees in the mericarps being winged, and with the last in the mericarps being convex on the back. Flowers white.

1 C. Fische'ri (Wimm. et Grab. ex flora 1828. p. 215.). ♂. H. Native of Siberia, Tartary, Ingria, Silesia, and Savoy, on the mountains; North America between the Coppermine and Mackenzie rivers; Labrador; Straits of De Fuca, on the north-west coast; Kotzebue's Sound. C. Tatáricum, Hoffm. l. c. Perhaps C. I'ngricum or C. negléctum, Fisch. in litt. is not distinct from this. Perhaps Ligústicum Gmelìni, Cham. et Schlecht. in Linnæa. 1. p. 391. and Gmel. sib. 1. p. 195. t. 44. appertains also to this plant. Perhaps all these different names belong to different species, or probably to the same, but they are so much confused that it is impossible to extricate them.

Fischer's Conioselinum. Pl. 1 to 2 feet.

Cult. This plant is only to be increased by seed, which should be sown in the open ground early in spring. A light soil suits it best.

LXXXV. CRI'THMUM (from κριθη, *krithe*, barley; similarity in the seeds). Tourn. inst. p. 317. t. 169. Lin. gen. no. 340. Koch, umb. p. 102. D. C. prod. 4. p. 164. Càchrys species, Spreng.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals roundish, entire, involute, ending in an obovate segment. Transverse section of fruit nearly terete; mericarps with 5 elevated, sharp, rather winged ribs: lateral ribs a little broader than the rest, and marginating; pericarp spongy, with large cells. Seed semi-terete, constituting a free nucleus, which is covered with copious vittæ in every part.—A suffruticose, glabrous, fleshy herb. Petioles sheathing at the base. Leaves bipinnate; leaflets oblong-linear. Umbels compound. Involucra and involucels of many leaves. Flowers white. This genus differs from all others in the present tribe as the genus *Archangélica* does from the rest of the genera in tribe *Angelicæ*, in the seed being a free nucleus, covered with copious vittæ.

1 C. mari'timum (Lin. spec. 354.). 4. H. Native of rocky sea-shores and cliffs; as along the Black Sea, in Tauria; and along the Mediterranean Sea; and of Europe along the shores of the Western Ocean from Spain to Britain; and of the Canary Islands; in Britain, on the rocky sea-shore and cliffs. Smith, engl. bot. 819. Jacq. hort. vind. 2. t. 87. Càchrys marítima, Spreng. in Schultes, syst. 6. p. 442. Créthamus, Cord. hist. 201. f. 1. Sámpire, Petiv. hort. brit. t. 24. f. 8.—Lob. icon. 392. f. 1.—Bauh. hist. 3. p. 2. 194. f. 1. Moris. hist. 3. p. 289. sect. 9. t. 7. f. 1. Root branched, creeping extensively. Herb greenish-glaucous, salt, and pungently aromatic in flavour. Stems ascending. Leaves biternate; leaflets uniform, lanceolate, tapering at the base. Leaves of involucra and involucels ovate, acute, spreading, rather short. Flowers white, with yellowish anthers. Samphire is called *Perce-pierre* and *Saint-pierre* of which our English name appears to be a corruption) in French; *Meerfeuche* in German; and *Finnochio marino* in Italian. The herb makes an old-fashioned English pickle, as those know who read Shakspeare's King Lear. It is sold in the London shops; but there are many plants preferred for the same purpose, as *Salicórnea herbàcea* and *Inùla crithmifòlia*, &c., and is a frequent addition in salads. In taste it is crisp and aromatic, and constitutes a light and wholesome condiment. It is generally gathered in places where it is found wild; and the allusion to the practice by Shakspeare, in his description of Dover Cliffs, is well known. The plant is also used medicinally.

Var. β, Canariénse (Cav. anal. scienc. nat. 1801. vol. 3. p. 35.) leaves more sheathing (ex Cav.), but the difference between the Canary Island plant and the European is hardly discernible.

Sea-side or Common Samphire. Fl. Aug. Brit. Pl. 1 ft.

Cult. Samphire is propagated by parting the roots, or by sowing the seeds in April; but is rather difficult of cultivation. Marshall says "it likes a cool situation; but yet prefers a sandy or a gravelly soil, and plenty of water. Some," he adds, "have found it to do best in pots, set for the morning sun only." J. Braddick placed it in a sheltered dry situation, screened from the morning sun, protected it by litter during winter, and in spring sprinkled the soil with a little powdered barilla. "This I do," he says "to furnish the plant with a supply of soda, since, in its native place of growth, it possesses the power of decomposing sea water, from which it takes the fossil alkali, and rejects the muriatic acid. With this treatment it has continued to flourish at Thames Ditton for some years, producing an ample supply of shoots, which are cut twice in the season, for pickling or to be used in salads.

Tribe VI.

ANGELI'CEÆ (this tribe contains plants agreeing in important characters with the genus *Angélica*) or Orthospérmæ paucijugàtæ tetrápteræ, Koch, umb. p. 98. D. C. prod. 4. p. 164. Fruit compressed from the back, girded by a double dilated winged margin, from the raphe being central or nearly so, hence the fruit is furnished with 2 wings on both sides. Mericarps with 5 ribs: dorsal 3 filiform or winged: lateral 2 always expanded into wings, and always broader than the dorsal ones, even if they also should be winged. Seeds rather convex on the back, and flattish in front.

LXXXVI. LEVI'STICUM (from *levo*, to assuage; said to relieve flatulency). Koch, umb. p. 101. f. 41. D. C. prod. 4. p. 164.—Ligústicum, Lag. am. nat. 2. p. 91. but not of Koch. —Angélica species of Lam. All. and D. C.—Ligústicum species of Lin. and Spreng.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals incurved, roundish, entire, with a short point. Fruit compressed from the back, having 2 wings on each side: the mericarps gaping towards the margin. Mericarps with 5 winged ribs: the wings of the lateral ribs twice the breadth of the others; vittæ 1 in each furrow, and 2-4 in the commissure. Carpophore bipartite. Seed convex on the back, and flattish in front.—A strong, perennial, glabrous, smooth herb. Stems terete. Leaves ternately decompound; leaflets obovate-cuneated, deeply toothed, rather coriaceous. Involucra and involucels of many leaves. Flowers yellow.

1 L. officina'le (Koch, l. c.). 4. H. Native of the Pyrenees, Cevennes, Dauphiny, Liguria, west of Germany, and Transylvania. Ligústicum Levísticum, Lin. spec. p. 359. Schultes, syst. 6. p. 567. Hayn. arz. gew. 7. t. 6. Woodv. med. bot. t. 190. Blackw. icon. t. 275. Angélica paludapifòlia, Lam. dict. 1. p. 173. Angélica Levísticum, All. pedem. no. 1309. Levísticum vulgàre, Moris. hist. sect. 9. t. 3. The

odour of this plant is strong aud peculiar; its taste is warm and aromatic. It abounds with a yellowish, gummy, resinous juice, very much resembling *Opópanax*. Its qualities are supposed to be similar to those of *Angélica* and *Masterwort* in expelling flatulences, and exciting perspiration; therefore chiefly used in hysterical disorders and uterine obstructions. The leaves, eaten as salad, are accounted as emmenagogue. The root, which is not so ungrateful as the leaves, is said to possess similar virtues, and may be employed in powder.

Officinal or Common Lovage. Fl. June, July. Clt. 1596. Pl. 4 to 6 feet.

Cult. This plant will grow in any soil; and is easily increased by dividing at the root.

LXXXVII. SELI'NUM (σελινον, *selinon*, is the Greek name for parsley; similarity in the leaves). Hoffm. umb. 1. p. 150. Koch, umb. 100. f. 22-23. D. C. prod. 4. p. 165.—Mylìnum, Gaudin, fl. helv. 2. p. 344. but not of Pers.—Angélica species of Spreng.—Selìnum species, Lin.—Thysselìnum, Adans. fam. 2. p. 100.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals obovate, emarginate. Fruit compressed from the back, furnished with 2 wings on each side from the raphe being central; mericarps with 5 membranous, winged ribs; wings of the lateral ribs twice the breadth of the others; vittæ 1 in each furrow, but there are often 2 in the outer furrows, and always 2 in the commissure. Carpophore bipartite.—Glabrous perennial herbs. Leaves ternately decompound or tripinnate; leaflets pinnatifid. Umbels compound. Involucra of few leaves; involucels of many leaves. Flowers white.

1 S. carvifòlia (Lin. spec. p. 350.) stem angularly furrowed; rays of umbel glabrous; petals emarginate, with an inflexed point. ♃. H. Native of Europe (Britain only excepted), in humid and stagnant shady places of woods. Jacq. aust. t. 16. D. C. fl. fr. 4. p. 322. Oed. fl. dan. t. 667. S. membranàceum, Vill. cat. strasb. t. 6. S. angulàtum, Lam. fl. fr. 4. p. 419. S. pseùdo-carvifòlia, All. pedem. no. 1306. Angélica carvifòlia, Spreng. in Schultes, syst. 6. p. 606. Laserpítium selinoìdes, Scop. carn. 1. p. 198. Carvifòlia, Bauh. pin. 158. Mylìnum carvifòlium, Gaud. fl. helv. 2. p. 344. Càrum praténse, Park. theat. 910. no. 3. Angélica tenuifòlia, Riv. pent. t. 18. Thysselìnum palústre, Vaill. bot. par. t. 5. f. 2.

Caraway-leaved Milk-parsley. Fl. July, Aug. Clt. 1774. Pl. 2 feet.

2 S. Candóllii (D. C. prod. 4. p. 165.) stem terete; rays of umbel pubescent; petals obcordate, having the middle nerve crested above. ♃. H. Native of Nipaul, on the mountains at Komaon. Angélica? Candóllii, Wall. mss. Leaves ternately decompound; leaflets slender, multifid. Umbels terminal, of many rays. Involucra of many or of few leaves, or wanting, or soon falling off. Petals nearly as in the genus *Ptychòtis*. Fruit as in *S. carvifòlia*, but larger, and more ovate. Seed furrowed on the back.

De Candolle's Milk-parsley. Pl. 2 feet.

3 S. terebi'nthinum (Hook. fl. bor. amer. 1. p. 266. t. 95.) plant glabrous in every part; leaves tripinnate, stiff, glaucous; segments pinnatifid: lobes short, linear, acute; peduncles elongated; involucra wanting; leaves of involucels linear, short; mericarps with 5 broad, undulating ribs. ♃. H. Native of the north-west coast of America, common on the sandy grounds of Wallawallah river. Root fusiform. Rays of umbel very unequal. Fruit rather large, ovate, compressed. The genus to which this plant belongs is truly doubtful. The fruit not corresponding well with any described genus.

Turpentine Milk-parsley. Pl. 1½ foot.

4 S. stella'tum (D. Don, prod. fl. nep. p. 185.) leaves pinnate; leaflets ovate, mucronate, 3-lobed and deeply toothed, glabrous; involucra of 2-3 leaves; rays of umbel pubescent; leaves of involucels large, coloured; fruit glabrous. ♃. H. Native of Nipaul. Astrántia spec. Wall. in litt. Stems branched, erect. Rays of umbel equal. Leaves of involucels elliptic-oblong, membranous, much longer than the umbellules.

Starry Milk-parsley. Pl. 2 feet?

Cult. See *Angélica*, p. 323. for culture and propagation.

LXXXVIII. OSTE'RICUM (meaning unknown to us). Hoffm. umb. p. 162. Koch, umb. 100. D. C. prod. 4. p. 167. —Angélica species, Fisch. Spreng. and Lag.

Lin. syst. *Pentándria. Digýnia.* Calyx with 5 broad teeth. Petals unguiculate, obovate, emarginate, with an inflexed point. Fruit compressed from the back, furnished with 2 wings on both sides from the raphe being central. Mericarps with 3 dorsal elevated filiform ribs, but the 2 lateral ribs are dilated into much broader wings; vittæ 1 in each furrow. Carpophore bipartite. Seed flat.—A perennial herb. Stem furrowed, quite glabrous. Leaves ternately decompound, rough beneath; leaflets rather divaricate, ovate-cordate, unequally toothed. Umbels compound. Involucra of few leaves; involucels of many leaves. Flowers white.

1 O. prate'nse (Hoffm. l. c. p. 164.). ♃. H. Native of Gallicia, in moist low meadows, about Erford and Charkow. Angélica praténsis, Bieb. in Spreng. umb. spec. p. 60. Imperatòria palústris, Bess. fl. gal. 1. p. 214. O. palústre, Besser. in litt. Rchb. icon. t. 402. Selìnum odoràtum, Bernh. ined. Angélica palústris, Bess. cat. hort. crem. 1816. p. 12.

Meadow Ostericum. Fl. Ju. Aug. Clt. 1818. Pl. 3 feet.

Cult. See *Opópanax* above for culture and propagation.

LXXXIX. ANGE'LICA (so named from the supposed angelic virtues of some species). Hoffm. umb. 1. p. 158. Koch, umb. 99. f. 20-21. Gaudin, fl. helv. 2. p. 340. D. C. prod. 4. p. 167.—Angélica species, Lin. Spreng. and Lag.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals lanceolate, entire, acuminated; points straight or incurved. Fruit compressed from the back, furnished with 2 wings on both sides from the raphe being central; mericarps with 3 dorsal, filiform, elevated ribs, and 2 lateral ones which are dilated into membranous wings, more or less broader than the dorsal ones; vittæ 1 in each furrow. Seed nearly semi-terete. Carpophore bipartite, free.—Perennial or biennial herbs. Leaves bipinnate. Umbels terminal. Involucra wanting or of few leaves; involucels of many leaves. Flowers white.

Sect. I. Euange'lica (from *eu*, well, and *angelica*; this section contains what are considered the true species of the genus). D. C. prod. 4. p. 167. Petals with a longish taper point, rarely obcordate. Vittæ one in each furrow, and 2 in the commissure. Stems leafy. Petioles much dilated.

1 A. Razou'lsii (Gouan. ill. 13. t. 6.) stem striated, pubescent at the apex; leaves bipinnate or tripinnate; leaflets lanceolate, serrated, acute, scabrous beneath, decurrent at the base, and sometimes 2-parted; involucra usually of one leaf only; pedicels pubescent. ♃. H. Native of the Pyrenees. D. C. fl. fr. 4. p. 305. and 5. p. 508. A. ebulifòlia, Lapeyr. abr. p. 156. A. Tournefortiàna, Cusson. A. Pyrenàica tenuifòlia, Tourn. herb.—Bocc. mus. t. 99. The vittæ in the commissure is covered by a pericarp. The points of the petals are incurved. The mericarps are ovate, and the stamens are very long. It was first discovered by M. Razouls, an apothecary at Perpignon. Flowers purple before expansion, but afterwards white.

Var. β; leaves of involucels foliaceous, dilated; pedicels of umbellules few and elongated. ♃. H. Native of the Pyrenees, about Querigut. D. C. fl. fr. 5. p. 508.

Razouls's Angelica. Fl. June, Aug. Clt. 1816. Pl. 3 feet.

2 A. monta'na (Schleich. exsic. Koch, umb. 99.) stem striated, pubescent at the apex; leaves tripinnate; leaflets lanceolate or ovate, acuminated, quite glabrous, sharply and mucronately serrated: upper ones decurrent at the base; involucra of 1-3 leaves; pedicels pubescent. ♃. or ♂. H. Native of mountain pastures on the Alps of Jura, Cevennes, and Volhynia. Gaudin, fl. helv. 2. p. 341. A. Razùlii var. β, Lois. fl. gall. ed. 2. vol. 1. p. 202. Imperatòria montàna, D. C. fl. fr. 5. p. 504. Imp. flavéscens, Bess. prim. fl. galic. 1. p. 213. Angel. Razoúlii, All. pedem. no. 310. and Spreng. umb. spec. p. 61. exclusive of the syn. Angel. sylvéstris var. C, C. Vill. dauph. 2. p. 628. Mericarps broad, ovate. Vittæ somewhat superficial. Stamens very long. Points of petals short and nearly straight. Involucra deciduous.

Mountain Angelica. Fl. July. Clt. 1818. Pl. 3 feet.

3 A. sylve'stris (Lin. spec. 361.) stem polished, striated, often purple, with wide spreading branches, pubescent at the apex, as well as the peduncles; leaves bipinnate or tripinnate, rather glaucous; leaflets ovate or ovate-lanceolate, acute, unequally and sharply serrated, never decurrent at the base; involucra of 1-2 leaves. ♃. H. Native of Europe, Siberia, and Caucasus, in watery places, alder cars, and along the banks of rivers, common; plentiful in like situations in Britain. Smith, engl. bot. t. 1128. Woodv. suppl. t. 265. Ger. emac. 999. f. 1. Dodon, pempt. 318. f. 1. Camer. epit. 900. f. 1. Lob. icon. 699. Angélica palústris, Riv. pent. t. 17. Hayne, arz. gew. 7. t. 9. Water Angélica, Petiv. herb. brit. t. 24. t. 10. Imperatòria sylvéstris, D. C. fl. fr. 4. p. 286. Selìnum sylvéstre, Crantz, austr. 177. Selìnum angélica, Roth, germ. 1. p. 133. Selìnum pubéscens, Mœnch, meth. p. 80. Umbels convex, with numerous general and partial downy rays. Flowers white, but more generally flesh-coloured. Points of petals erectish. Vittæ in the commissure superficial. The flavour is more bitter, and less grateful than the *Archangélica*, but the virtues of both are similar. The herb dyes a good yellow.

Wild Angelica. Fl. July. Britain. Pl. 4 to 6 feet.

4 A. lu'cida (Lin. spec. p. 360.) stem terete, glabrous; leaves bipinnate; leaflets equal, ovate, deeply serrated; sheaths dilated; involucra and involucels of 5 leaves each. ♃. H. Native of North America, from Canada to Pennsylvania, in moist shady places. Pursh, fl. amer. sept. 1. p. 193. Jacq. hort. vind. 3. t. 24.—Moris, hist. sect. 9. t. 3. f. 8. Ang. lobàta, Walt. car. p. 115.? ex Torr. The petals are said to be elliptic, pale green, with an inflexed point. By Jacquin the flowers are said to be whitish, or of a pale yellow-colour.

Shining-leaved Angelica. Fl. July, Aug. Clt. 1640. Pl. 2 ft.

5 A. triquina'ta (Michx. fl. bor. amer. 1. p. 167.) stem terete, pubescent above; leaves bipinnate; leaflets on the lower branches of the petiole ternate: all oval and acuminated at both ends, sharply serrated; umbels clothed with velvety pubescence at the time of flowering. ♃. H. Native of North America, on dry hills and in woods. Nutt. gen. amer. 1. p. 186. Torrey, fl. un. st. 1. p. 315. A. hirsùta, Muhl. cat. no. 30. Pastinàca triquinàta, Spreng. umb. spec. 68. t. 6. f. 2. Férula villòsa, Walt. car. no. 115. Pursh, fl. amer. sept. 1. p. 192. exclusive of the synonyme.

Triquinate-leaved Angelica. Fl. July, Aug. Clt. 1810. Pl. 2 feet.

Sect. II. Pseudange'lica (this section is supposed to contain false species of the genus; hence the name). D. C. prod. 4. p. 168.—Angélica species, Spreng. Koch.—Selìnum species, Gouan.—Séseli species, Lin. Petals elliptic, acuminated or mucronated. The fruit is like that of the last section, but differs in there being usually 4 vittæ in the commissure. Rays of umbels very unequal, the central ones very short.

6 A. Pyrenæ'a (Spreng. umb. spec. p. 62.) stem furrowed, simple, almost leafless; radical leaves somewhat bipinnate, glabrous; leaflets erectish, pinnatifid; segments linear, acute; rays of umbel 4-7; involucra of one setaceous leaf. ♃. H. Native of the Pyrenees and Cevennes, in mountain pastures. Séseli Pyrenæ'um, Lin. spec. 374. Selìnum alicástrum, Link. Selìnum Pyrenæ'um Gouan, ill. p. 11. t. 5. D. C. fl. fr. 4. p. 523. De La Chenal, in act. helv. 7. p. 332. t. 12. Selìnum Lachenàlii, Gmel. fl. bad. als. 1. p. 460. t 3.—Moris, hist. sect. 9. t. 9. f. 2. Mericarps ovate, elliptic, with superficial vittæ. Herb rather glaucous. Root flowing with milky juice. From the stem there is often one leaf, having a broad petiole, from the axil of which issues a branch. Involucels of many bristle-shaped leaves.

Pyrenean Angelica. Fl. June, Aug. Clt. 1800. Pl. 1 foot.

† *Species not sufficiently known.*

7 A. integrifòlia (Walt. car. p. 115.) leaflets entire, petiolate. ♃. H. Native of Carolina. The rest unknown.

Entire-leafletted Angelica. Pl.?

8 A. bractea'ta (Roxb. in Beats, trav. voy. append. p. 297.) stem fistular; leaves unequally pinnate; leaflets rather cordate, 3-7-nerved, finely jagged, serrated; bracteas or sheaths broad, nearly orbicular at the base of the petioles, and between the segments; involucra and involucels of 6-10 broad lanceolate leaves each. ♃. H. Native of the Island of St. Helena, where it is called by the inhabitants *common angelica*. Petals white, oval-oblong, incurved. Umbellules globose. Fruit unknown. Perhaps a species of *Archangélica*.

Bracteate Angelica. Pl. 3 to 4 feet?

Cult. Any soil will suit the species of *Angélica*, and they are easily increased by seeds.

XC. ARCHANGE'LICA (from αρχη, *arche*, original, and *angelica*). Hoffm. umb. 1. p. 166. f. tit. 19, 20. Koch, umb. 98. f. 17-19. Gaudin, fl. helv. 2. p. 342. D. C. prod. 4. p. 169.—Angélica species, Lin. Spreng. Lag.

Lin. syst. *Pentándria*, *Digýnia*. Margin of calyx with 5 short teeth. Petals elliptic, entire, acuminated, with an incurved point. Fruit rather compressed from the back, furnished with 2 wings on each side, from the raphe being nearly central. Mericarps with 5 thickish keeled ribs, the 3 dorsal ribs elevated, and the 2 lateral ones dilated into wings, which are twice the breadth of the others. Seed not adhering to its tegument, but distinct from it, and covered by copious vittæ all over. Carpophore bipartite.—Perennial or biennial herbs. Leaves pinnate; leaflets broadly ovate, acute, coarsely toothed: terminal one lobed. Petioles large, sheathing, and rather bladdery. Involucra wanting or nearly so; involucels dimidiate, of many leaves. Flowers white or greenish.

1 A. officina'lis (Hoffm. and Koch, l. c.) stem polished, striated, a little glaucous, branched in the upper part; leaves ternate, then pinnate; leaflets ovate-lanceolate or subcordate, cut, and sharply serrated, partly decurrent: the odd one deeply 3-lobed; petioles dilated and tumid at the base; involucra of a very few linear leaves, or wanting altogether; leaves of involucels linear-lanceolate. ♂. H. Native of Europe, on mountains by river sides, particularly in Lapland, Sweden, Norway, Germany, Carpathian mountains; and from Unalaschka to the Bay of Eschscholtz; and now cultivated every where for the sake of its stalks. In Britain in watery places, rare, apparently a naturalized plant; as about the Tower of London, and on the banks of ditches frequent; in marshes among reeds by the side of the

Thames, between Woolwich and Plumstead, very abundantly; in the county of Durham; and at Broadmere, about 7 miles north-west from Birmingham. Angélica Archangélica, Lin. spec. 360. Oed. fl. dan. t. 206. Nees, off. pfl. 9. t. 14. Hayn. arz. gew. 7. t. 8. Smith, engl. bot. 2561. Woodv. med. bot. t. 60. Angélica officinàlis, Mœnch, meth. p. 81. Angel. satìva, Mill. dict. no. 1. Riv. pent. t. 15. Petiv. herb. brit. t. 24. f. 9. Camer. epit. 899. f. 1.—Ger. emac. 1000. Flowers greenish. The garden *angelica* was formerly cultivated on account of its leaf-stalks, which were blanched, and eaten as celery; now they are used only when candied, being, when so prepared, acceptable to most people, and are not so powerfully aromatic; the young and tender stalks are for this purpose collected in May. Sometimes also the seeds and leaves are used in medicinal preparations. The root, which is the most efficacious part, is used in the aromatic tincture. Of the anti-pestilential virtues of the root, those who wish to be informed will find amusement at least in old Gerarde, p. 1000.

The plant delights in moist situations, or the bank of running water; but will grow freely in any soil or exposure. The plants are raised from seed, and for a bed $4\frac{1}{2}$ feet by 6, sown in drills a foot apart, to be transplanted; half an ounce of seed will be requisite. "Sow in August, or as soon as the seed is ripe, as the plants will come up earlier and stronger than from sowing in the spring. When the plants are advanced from 4 to 6 inches high, transplant them into rows 2 feet apart. They will soon strike root, and advance quickly in strong growth. In the second year these strong erect branchy stalks will be several feet high, producing large umbels of flowers and seed, ripening in autumn, which, as well as the leaves of the plant, are used in medicine. But for candying, the young shoots of the stem and stalks of the leaves are the useful parts; being cut while green and tender in May and June, they are made by the confectioners into the sweet-meat called angelica. In the second year, if seed is not wanted, cut the plants down in May, and the stock will send out side shoots; by repeating this practice every year, the same plant may be long continued."—Abercrombie.

Officinal or Garden-angelica. Fl. June, Sept. Britain. Pl. 4 to 6 feet.

2 A. atropurpu'rea (Hoffm. umb. 169.) stem polished, purple, with a glaucous bloom, branched at the top; leaves ternate, then pinnate; leaflets ovate, acute, deeply serrated, and somewhat lobed: the terminal ones confluent; petioles dilated, and tumid at the base; branches and umbels pubescent; involucra wanting; the involucels of many narrow leaves. ♂. H. Native from Canada to Virginia, in moist meadows. Angélica atropurpùrea, Lin. spec. 360. Lam. dict. 1. p. 173. Torr. fl. un. st. 1. p. 316. Angélica triquinàta, Bigel. fl. bost. p. 68. ex Torr. —Corn. can. 199. with a bad figure.—Moris, hist. sect. 9. t. 3. f. 9. bad. Petals rusty purplish or white. The plant may be used in the same way as the *A. officinàlis*.

Dark-purple-stemmed Archangelica. Fl. July, Aug. Clt. 1759. Pl. 4 to 6 feet.

3 A. decu'rrens (Led. fl. ross. alt. ill. t. 166. fl. alt. 1. p. 316.) stem striated, with a glaucous bloom, furnished with leaves and axillary branches at the base; leaves pinnate or bipinnate: lower leaflets pinnate, upper ones pinnatifid: segments oblong, or ovate-oblong, acuminated, decurrent: odd one 3-lobed; involucra of many narrow leaves. ♃. H. Native of Altaia, every where on the margin of rivulets. Flowers like those of *A. officinàlis*, but varying more to yellow. Habit of *A. officinàlis*, but differs in the leaves being much acuminated, those on the secondary branches of the petiole running down it a great way, and serrated their whole length. Fruit exhaling a heavy smell when rubbed.

Decurrent-leafletted Archangelica. Fl. year. Pl. 6 to 8 ft.

4 A. littora'lis (Agardh, in litt. ex D. C. prod. 4. p. 170.) stem glabrous, terete, striated, hard; leaves bipinnate; leaflets ovate, acute, serrated: odd one 3-lobed; sheaths large; leaves of involucels rather scabrous, one-half shorter than the umbellules. ♃. H. Native of the north of Europe, on the sea shore. Archangélica spùria or A. littoràlis, Wahl. carp. p. 84. A. màjor, Lag. gen. nov. et spec. p. 13. ?—Dodon. pempt. 318. f. 1? Flowers whitish. Stem hard and acrid, not edible.

Sea-shore Archangelica. Pl. 4 to 6 feet.

5 A. Gmeli'ni (D. C. prod. 4. p. 170.) stem glabrous, terete, striated; leaves ternate; leaflets tripartite: lobes ovate, serrated, cuneated at the base; sheaths middle-sized; leaves of involucels about equal in length to the umbellules. ♃. H. Native of Kamtschatka and Kotzebue's Sound. Angélica Gmelìni, Wormsk. ex Fisch. in litt. A'pium ternàtum, Pall. in Spreng. syst. 1. p. 890. The plant is used for culinary purposes by the Russians in Kamtschatka. Fruit like those of *A. officinàlis*, but more oblong, and the vittæ are fewer. There is a dwarfer variety of this found in Kotzebue's Sound.

Gmelin's Archangelica. Pl. $1\frac{1}{2}$ foot.

Cult. The species are of easy cultivation; and are only to be increased by seed.

Tribe VII.

PEUCEDA'NEÆ (so named from the plants agreeing with the genus *Peucédanum* in many points), or Orthospérmæ paucijugàtæ dipteræ.—Selíneæ, Koch, umb. p. 88. Fruit flatly or lenticularly compressed from the back, girded by an entire dilated smooth winged flattened or rather convex margin. Mericarps with 5 filiform ribs, which are rarely winged; lateral ones contiguous to the margin, or running into it; raphe marginal, hence the fruit is only furnished with one wing on each side, not as in tribe *Angeliceæ*, furnished with 2 wings on each side from the raphe being central. Seed flattened or convex on the back.

XCI. OPO'PANAX (from *οπος*, *opos*, juice, *παν*, *pan*, all, and *ακος*, *akos*, a remedy; that is to say, a plant the juice of which is supposed to cure all diseases). Koch, umb. 96. D. C. prod. 4. p. 170.—Pastinàca and Laserpítium species.—Férula species, Spreng. Lag.

Lin. syst. *Pentándria*, *Digýnia*. Margin of calyx obsolete. Petals roundish, entire, involute, with an acutish point. Stylopodium broad, thick. Styles very short. Fruit flatly compressed from the back, girded by a dilated convex margin. Mericarps with 3 dorsal filiform slender ribs; the lateral ones absent or not distinct from the margins; vittæ 3 in each furrow, and 6-10 in the commissure. Seed flat.—A perennial herb. Root thick. Stem rough. Leaves bipinnate; leaflets unequally cordate, crenated, obtuse. Umbels composed of many rays. Involucra and involucels of few leaves. Flowers yellow.

1 O. Chirònium (Koch, l. c.) ♃. H. Native of the south of France, in open situations; also of Italy, Sicily, Croatia, and Greece. Nees, off. pfl. 17. t. 11. Laserpítium Chirònium, Lin. spec. p. 376. Pastinàca Opópanax, Lin. spec. 376. Gouan. ill. t. 14. Waldst. et Kit. hung. 3. t. 211. Smith, fl. græc. t. 288. Woodv. med. bot. t. 113. Selìnum Opópanax, Crantz, austr. p. 53. Férula Opópanax, Spreng. umb. spec. 77. Schultes, syst. 6. p. 597. Pastinàca altíssima, Lam. fl. fr. 3. p. 465.—Lob. icon. t. 702.—Moris, hist. 3. p. 315. sect. 9. t. 17. f. 2. Sheaths at the flowering branches spathaceous, and sometimes destitute of leaves. Leaves hairy, especially beneath. Although the plant is a native of the south of Europe, the gum-resin, which is said to be obtained by wounding the stalk or root, is brought from the Levant and the East Indies, sometimes in round drops or tears, but more commonly in irregular lumps, of a reddish yellow-colour on the outside, with specks of white;

inwardly of a paler colour, and frequently variegated with large white pieces. It is supposed to be an emmenagogue, but is seldom used.

Chiron's or Common Opopanax. Fl. June, July. Clt. 1640. Pl. 6 feet.

Cult. This is a plant of easy culture; and may be increased either by seeds or dividing at the root.

XCII. FE'RULA (from *ferio*, to strike; stems used as rods). Tourn. inst. 321. t. 170. Lin. gen. no. 343. Spreng. umb. prod. p. 13. exclusive of some species.—Férula and Ferulàgo, Koch, umb. p. 96. and p. 97.

Lin. syst. *Pentándria*, *Digýnia*. Margin of calyx with 5 short teeth. Petals ovate, entire, acuminated, with the points ascending or incurved. Fruit flatly compressed from the back, girded by a flattened dilated margin. Mericarps with 3 dorsal filiform ribs, and 2 lateral obsolete ones, which are lost in the dilated margin. Vittæ 3 or more in the dorsal furrows, and 4 or more in the commissure. Seed flat. Carpophore bipartite. —Herbs, with thick roots, tall stems, and supra-decompound leaves: leaflets usually cleft into linear segments. Umbels of many rays: lateral ones usually opposite or verticillate. Involucra variable. Flowers yellow. Stems in many of the larger species filled with medulla, interspersed with fibres, as the stems of monocotyledonous plants.

Sect. I. Ferula'go (an alteration from the generic name). Koch, umb. 97. Dorsal and commissural vittæ numerous, from 30 to 60. Involucra constantly of 4-8 leaves. Stems usually striated or angular.

1 F. sylva'tica (Bess. cont. enum. pl. vohl. et pod. p. 44. no. 1368.) stem terete, striated, rather angular; leaves pinnate, with 10-20 pairs of opposite bipinnate-parted leaflets; lobes or segments linear, setaceous, cuspidate; leaves of involucra ovate-lanceolate, deflexed. ♃. H. Native of Volhynia, Caucasus, Podolia, and at the river Don, in woods and meadows. Peucédanum officinàle, Bess. prim. fl. galic. et cat. hort. crem. 1816. Férula nodiflòra, Rochel. F. myriophýlla, Bieb. mss. Ferulàgo sylvática, Rchb. icon. bot. 4. p. 371. Leaves a foot or a foot and a half long.

Wood Giant-fennel. Pl. 6 feet.

2 F. pauci'juga (D. C. prod. 4. p. 171.) stem striated, angular; leaves pinnate, with 4-5 pairs of opposite leaflets; leaflets bipinnatifid: lobes or segments linear; involucra of 2-5 erect leaves, which are cuspidate at the apex, and membranously dilated at the base. ♃. H. Native of Persia, at the foot of the mountains about Badala, where it was gathered by Szowits. Allied to *F. sylvática*, but differs in the stem being more angular, and in the leaves being 3-4 inches long, and in the leaflets being only 4-5 pairs. Umbel terminal, of 12-14 very unequal rays. Herb glabrous, a foot and a half high.

Few-paired-leaved Giant-fennel. Pl. $1\frac{1}{2}$ foot.

3 F. Ferula'go (Lin. spec. p. 356.) stem terete, striated; leaves supra-decompound; leaflets pinnatifid, divaricate: segments linear, cuspidate; leaves of involucra numerous, oblong-lanceolate, reflexed. ♃. H. Native on hills and exposed places in the islands of the Mediterranean, and the adjacent region; and of Transylvania and Gallicia. Spreng. umb. prod. p. 82. F. nodiflòra, Jacq. austr. append. t. 5. and probably of all other authors.—F. latiore folio, Moris, ox. sect. 9. t. 15. Lob. icon. t. 779. Dodon. pempt. t. 321. f. 2.

Ferulago or Broad-leaved Giant-fennel. Fl. June, July. Pl. 6 to 8 feet.

4 F. genicula'ta (Guss. prod. fl. sic. 1. p. 366.) stem terete, a little striated, gibbous at the nodi; leaves supra-decompound; leaflets decussate: segments linear, flat, acute, stiff, rather awned; floriferous branches alternate; leaves of involucra and involucels ovate-lanceolate, short; fruit oblong-elliptic, with acute prominent ribs. ♃. H. Native of Sicily and the kingdom of Naples, on dry calcareous hills. F. rígida, Tenore, fl. neap. append. 4. p. 15. exclusive of the synonymes. Bùbon rígidus, Ucria ex Guss.—Bocc. mus. 2. t. 76.?

Geniculate-leaved Giant-fennel. Pl. 2 to 3 feet.

5 F. thyrsiflòra (Sibth and Smith, fl. græc. t. 280. prod. no. 664.) stem angular and furrowed at the top; floriferous branches terminal, aggregate, compound; leaves supra-decompound; leaflets linear, elongated, roughish; leaves of involucra 4-6, linear-lanceolate. ♃. H. Native of Candia, on rocks. Ferulàgo thyrsiflòra, Koch, umb. p. 98. Vittæ above 30 in the commissure, according to Koch, but in a specimen examined there are only from 20 to 25.

Thyrse-flowered Giant-fennel. Fl. June, July. Clt. 1825. Pl. 4 to 6 feet.

6 F. sulca'ta (Desf. atl. 1. p. 352. t. 67.) stem angular and furrowed; leaves supra-decompound; leaflets pinnatifid: lobes linear, acuminated; leaves of involucra many, oblong-linear, reflexed. ♃. H. Native of Italy, Naples, Sicily, Mauritania, and Portugal, on hills. F. nodiflòra, Spreng. umb. spec. p. 84. but the figure of F. nodiflòra in fl. græc. is destitute of involucra, and therefore does not belong to this plant; therefore the plant of Linnæus is truly doubtful. F. Barrelièri, Tenore, in herb. Merat. Ferulàgo nodiflòra, Koch, umb. p. 98. Ligústicum lùteum, Poir. voy. barb. 2. p. 136. ex Poir. suppl. 3. p. 481. Peucédanum Lusitánicum and rupéstre, Willd. herb. ex Spreng. syst. 1. p. 914. Vittæ 60 in the commissure, ex Koch.

Var. β, *campéstris* (Bess. in litt. ex Spreng. syst. 1. p. 914.) segments of leaves linear-elongated. ♃. H. Native of Tauria.

Furrowed-stemmed Giant-fennel. Fl. June, July. Clt. 1596. Pl. 3 feet.

7 F. stri'cta (Spreng. in Schultes, syst. 6. p. 592.) stem straight, stiff, furrowed; leaves ternately supra-decompound, straight; leaflets triternate, triquetrous, filiform, glabrous; leaves of involucra ovate-oblong. ♃. G. Native of the Cape of Good Hope.

Straight Giant-fennel. Fl. June, July. Clt. 1818. Pl. 2 feet.

Sect. II. Ferula ria (an alteration from the generic name). D. C. prod. 4. p. 172.—Férula, Koch, umb. p. 96. Vittæ 3 in each of the dorsal furrows, and 4 in the commissure. Involucra wanting. Stems terete.

* *Stem leafy.*

8 F. commu'nis (Lin. spec. p. 355) stem terete, branched; leaves supra-decompound, green; leaflets linear-setaceous, flaccid; central umbel nearly sessile: lateral ones male, pedunculate; involucra wanting; sheaths of upper leaves very large. ♃. H. Native on hills in the region of the Mediterranean, from Portugal to Greece, and of Mauritania. D. C. fl. fr. 3. p. 343. F. nodiflòra, Lin. spec. 356? Smith, fl. græc. t. 279.—Dodon. pempt. p. 321. f. 1. Lob. icon. t. 778. f. 2.—F. fémina, Plum. Tourn. Moris, umb. 35. t. 2. hist. 3. p. 309. sect. 9. t. 15. f. 3. Lateral umbels usually opposite, rising from the axils of the sheathing petioles under the central umbel. Fruit 5 lines long, and 3 lines broad. There issues from the stem when cut a yellowish fetid juice, which hardens on the surface of the wound. The dry dead stem is full of white pith, which easily takes fire, and the Sicilians use it for tinder. Hence the fable of Prometheus. In Apulia, where the plant grows in great plenty, it is grateful to buffaloes, which form the chief part of the subsistence of many farmers there.

Common Giant-fennel. Fl. June, July. Clt. 1597. Pl. 8 to 12 feet.

9 F. glau'ca (Lin. spec. p. 588.) stem terete, branched; leaves supra-decompound, glaucous beneath; leaflets linear, elongated, flat; involucra wanting; petioles of upper leaves dilated; central umbel pedunculate; lateral ones male, on longer peduncles. ♃. H. Native of the south of France, at Merival, near Montpelier in the spot mentioned by Lobel; also of Provence, Italy, Sicily, Greece, &c. F. fòlio glaûco, Bauh. hist. 3. p. 2. p. 45. with a figure. Férula et Ferulàgo, Lob. adv. p. 348. F. commùnis, Gouan. hort. monsp. p. 140. F. glaûca, D. C. fl. fr. suppl. p. 514. Schultes, syst. 6. p. 588. Leaves of involucra many, linear-setaceous, caducous, ex Spreng. but in the plants examined there has been no involucra seen; therefore Sprengel's plant is probably distinct from this.

Glaucous Giant-fennel. Fl. June, July. Clt. 1586. Pl. 6 to 8 feet.

10 F. rigi'dula (D. C. prod. 4. p. 172.) stem terete, branched, and is, as well as the petioles, quite glabrous; leaves bipinnate; leaflets pinnatifid: lobes short, few, acute, channelled, stiffish, hardly puberulous; umbels rather panicled, without any involucra. ♃. H. Native of Persia, on rocks among the mountains about Seidkhodz. Very like *F. Cáspica* in the inflorescence and fruit, but differs in the primary pairs of leaves being an inch and a half distance from each other, and the secondary pairs are more elongated; leaflets fewer; lobes fewer, stiffer, and rather fleshy. Sheaths larger, and rather glaucous.

Stiffish Giant-fennel. Pl. 3 feet?

11 F. Ca'spica (Bieb. fl. taur. suppl. no. 551.) stem terete, branched; leaves triplicately pinnate: leaflets pinnatifid, soft, approximate; segments very short; umbels somewhat panicled; the peduncles of the lateral umbels furnished each with a subulate ligula at the base; involucra none. ♃. H. Native of arid fields from Odessa to Sarepta; and of Caucasus, near Kisliar. Spreng. umb. spec. p. 81. F. cachroìdes, Fisch. in litt. 1822. There are varieties of this with either glabrous or pubescent leaves, according to Bieb. The habit is like that of *Càchrys Odontálgica*. Sheaths cucullate: upper ones almost destitute of leaves. Fruit oval, glabrous, 3 lines long, 1½ line broad. Commissure furnished with 4 vittæ. Umbel-bearing branches alternate: lower ones often opposite, and upper ones in whorles. Perhaps a species of *Peucédanum*, according to Besser.

Caspian Giant-fennel. Fl. June, July. Clt. 1819. Pl. 2 to 3 feet.

12 F. orienta'lis (Lin. spec. p. 356.) stem terete, branched; leaves 5 times pinnate; leaflets multifid, setaceous, apparently puberulous when examined by a lens; sheaths large, cucullate; involucra wanting. ♃. H. Native of Asia Minor, Greece, Caucasus on Mount Beschbarmak, and perhaps of Numidia. Lam. dict. 2. p. 455. Spreng. umb. spec. p. 89.? Tourn. trav. 2. t. 379. Branches of root thick. Leaves a foot and a half long. Upper sheaths 3 inches long, and an inch broad. Sprengel refers to this the Fashook of Jackson's account of Morocco, t. 7. Steven says it is the same as F. peucedanifòlia, Willd. herb., but Pallas's figure, which is cited for it, is very different from our plant.

Eastern Giant-fennel. Fl. July, Aug. Clt. 1759. Pl. 3 to 4 feet.

13 F. Pe'rsica (Willd. spec. 1. p. 1413.) stem terete, glaucous; leaves ternately supra-decompound; leaflets rather remote or decurrently pinnate: segments linear-lanceolate, dilated, and cut at the apex; primordial umbel sessile; involucra and involucels wanting. ♃. H. Native of Persia; and of Caucasus, on hills near Baku. Andr. bot. reg. 558. Sims, bot. mag. 2096. F. assafœ'tida, Mart. in Mill. dict. no. 9. exclusive of the synonyme of Kœmf. Woodv. med. bot. 22. t. 8. Plench. icon. t. 203. Assafœ'tida, Hoppe, in phil. trans. 1785. p. 36. t. 3. and 4. The plant smells very strong of assafœtida, and there is a yellow gummy juice very like it flows from the plant, which in all probability has the same virtues as that of the true assafœtida, *F. assafœ'tida*. Plant of a yellowish hue.

Persian Assafœtida. Fl. June, July. Clt. 1782. Pl. 3 to 6 ft.

14 F. Tingita'na (Lin. spec. p. 355.) stem terete, branched; leaves supra-decompound, shining; leaflets or segments oblong-lanceolate, deeply toothed; upper petioles large, sheathing; terminal umbels on short peduncles: lateral umbels few, male, on longer peduncles; involucra none. ♃. H. Native of Spain and Barbary, and in fields about Tangiers. Rivin. pentap. 3. t. 10. Herm. par. t. 165. Moris. ox. sect. 9. t. 15. last figure. Desf. fl. atl. 1. p. 251. Fruit 6 lines long, and 3 lines broad. This plant is easily distinguished from the rest, in the leaflets being broader, and shining.

Tangier Giant-fennel. Fl. June, July. Clt. 1680. Pl. 6 to 8 feet.

15 T. nu'da (Spreng. umb. spec. 81. t. 7. f. 15.) stem terete, striated, branched; leaves ternately bipinnatifid, glaucous; segments obtuse, rather tridentate; involucra and involucels none. ♃. H. Native of Siberia. Petioles sheathing at the base, glaucous. Branches spreading. Stem about the thickness of a goose quill, girded by fibres at the base, just at the neck.

Naked Giant-fennel. Fl. Ju. July. Clt. 1821. Pl. 1 to 2 ft.

16 F. Tolucce'nsis (H. B. et Kunth, nov. gen. et spec. 5. p. 12. t. 418.) stem terete, fistular; leaves quadripinnate; leaflets or segments linear, acute, flat; involucrum of one leaf; involucels of 3-7 linear leaves, which exceed the fruit. ♃. F. Native of Mexico, in cold places near the town of Tolucco. Herb glabrous, a foot high, a little more. Rays of umbel unequal. Leaf of involucrum linear, shorter than the rays of the umbel. Leaves of involucels 5-6, very unequal, the longer ones exceeding the umbellules. Flowers many, abortive. Vittæ 4 in the commissure, and 3 in the furrows.

Tolucco Giant-fennel. Pl. 1½ foot.

17 F. petiola'ris (D. C. prod. 4. p. 173.) plant quite glabrous; stems terete, branched, leafy at the base; petioles biternate, having the ultimate divisions very long, and cylindrically conical, acute, bearing no foliaceous segments; upper sheaths small, undivided, acuminated; involucra and involucels none. ♃. H. Native of Persia, among stones on the tops of the mountains about Seidkhodz, where it was collected by Szowits. The species is very remarkable in the absence of foliaceous leaflets, and therefore the leaves are reduced to the naked petioles. Ultimate lobes of petioles 7-8 inches long, usually knotted at the third part of their length, as in *Júncus articulàtus*, the knots indicating the places of the abortive branches. Umbels few-flowered. Young fruit oblong, glaucous.

Petiolar Giant-fennel. Pl. 2 to 4 feet?

18 F. seseloi'des (Meyer, pflanz. p. 126.) glabrous, glaucescent; stem rather angular, leafy, branched; lower leaves bipinnate: leaflets pinnatifid: lobes linear; sheaths narrow: upper sheaths leafless, acuminated; umbels all fertile, pedunculate; involucra almost wanting; leaves of involucel setaceous; vittæ 1-3 in the furrows. ♃. H. Native of Caucasus, on Mount Beschbarmak. Leaves of *Séseli montànum*; but the petals are yellow like other species of *Férula*. Margin of calyx obsolete. Fruit nearly like *Peucédanum*.

Seseli-like Giant-fennel. Pl. 2 to 3 feet?

* * *Stems almost naked.*

19 F. A'ssa-fœ'tida (Lin. mat. med. 79.) stem terete, simple, furnished with leafless sheaths; radical leaves pinnate, having 1 or 2 pinnatifidly sinuated leaflets on each side: lobes oblong, obtuse; involucra wanting. ♃. H. Native of Persia, in the provinces of Khorassan, Laar, and Fars. A'ssa-fœ'tida, Kœmpf. amœn. p. 535. and p. 536. with a figure. Stem

5-6 feet high. According to the testimony of Kœmpfer, this is the plant from which the real assafœtida is obtained. It is the concrete juice of the root, and is procured by the peasants who live in the neighbourhood of the mountains in the provinces of Khorassaan and Laar in Persia. When the leaves begin to decay the oldest plants are selected, not less than 4 years' standing. The earth is partly cleared away, so as to expose the upper part of the root. The leaves and stem are twisted off, and used as a covering to screen it from the sun. In this state the root is left 40 days, when the covering being removed, the top of the root is cut off transversely. It is then screened again 48 hours, when the juice is scraped off, and exposed to the sun to harden. This done, a second section is made; the screen again employed, and the juice obtained a second time as before. Thus the *assa-fœtida* is 8 times repeatedly collected from the same root; but after a third section it remains 8 days to recover a sufficient stock of juice.

Assafœtida is well known by its peculiar nauseous fetid smell, the strength of which is the surest test of its goodness. This odour is extremely volatile, and of course the drug loses much of its efficacy in keeping. It comes in large irregular masses, composed of various shining little lumps or grains, partly whitish, partly brownish or reddish, and partly of a violet hue; those are accounted the best which are clear, of a pale reddish-colour, and variegated with many fine white tears. It is a gummy resin, but has the gum in largest quantity. It is the most efficacious of the fetid gums, and is commonly used in hysteria hypochondriasis, some symptoms of dyspepsia, amenorrhœa and chlorosis, flatulent cholics, and most diseases termed nervous; it is thought to be the most powerful remedy we possess for those peculiar convulsive and spasmodic affections, which often recur in hysterics. It is recommended as an emmenagogue, anthelmintic, expectorant, antiasthmatic, and anodyne. Its action is quick and penetrating.

Assa-fœtida. Fl. July, Aug. Pl. 6 to 7 feet.

20 F. Szowitsia'na (D. C. prod. 4. p. 173.) stem terete, nearly naked, branched, glabrous; leaves tripinnate, clothed with velvety pubescence; leaflets deeply toothed, obtuse; umbels somewhat panicled, without involucra; fruit oval-obovate, flat, longer than the pedicels. ♃. H. Native of Persia, at Seidkhodzi, in gravelly and stony places, where it was collected by Szowits. Neck of root appearing hairy from numerous erect fibres. Petioles of leaves trifid. Umbels terminal, on short peduncles. Fruit the size of *F. communis.*

Szowits's Giant-fennel. Pl. 5 to 6 feet.

21 F. pube'scens (Pall. ex Willd. rel. in Schultes, syst. 6. p. 598.) stem pubescent, panicled, nearly leafless; radical leaves clothed with hoary pubescence, ternately tripinnate; leaflets jagged: lobes linear, tripartite, obtuse; sheaths opposite, small; involucra and involucels minute and caducous. ♃. H. Native of Siberia.

Pubescent Giant-fennel. Fl. July, Aug. Clt. 1820. Pl. 1 to 2 feet.

22 F. pu'mila (Pall. ex Willd. rel. in Schultes, syst. 6. p. 598.) stem smooth, panicled, leafless; sheaths naked; radical leaves pubescent, ternately tripinnate; leaflets pinnatifid; lobes decussate, bluntish. ♃. H. Native of Siberia.

Dwarf Giant-fennel. Pl. 1 foot.

23 F. Arme'na (D. C. prod. 4. p. 174.) glabrous; petioles ternate at the base, having the divisions bipinnate; leaflets short, divided into thick, oblong, obtuse, aggregate, somewhat whorled lobes; stem naked, terete; leaves of involucra and involucels short, oblong; fruit elliptic. ♃. H. Native of Armenia. Oreoselìnum Armènium Seseleos Massiliensis folio, Tourn. herb. Upper leaves reduced to short leafless sheaths.

Armenian Giant-fennel. Pl.?

† *Little known species.*

24 F. brevifòlia (Link, in Schultes, syst. 6. p. 592.) stem terete, glabrous; leaves supra-decompound; leaflets linear, channelled, divaricate, flaccid, cuspidate, elongated; involucra wanting; primordial umbels sessile. ♃. H. Native of Portugal.

Short-leaved Giant-fennel. Pl.?

25 F. capilla'ris (Link, in Spreng. umb. spec. 85.) stem terete, glabrous; leaves triternate; leaflets filiform, capillary, loose; sheaths of petioles almost wanting; umbels axillary; involucra of a few setaceous leaves. ♃. H. Native of Portugal. Narthècium, Dalech. lugd. p. 754. Férula tenuiori-fòlio, Mor. ox. sect. 9. t. 15.

Capillary Giant-fennel. Fl. June, July. Clt. 1820. Pl. 1 to 2 feet.

26 F. peucedanifòlia (Willd. herb. in Schultes, syst. 6. p. 592.) stem kneed, branched, leafy; leaves tri-ternate, stiff; leaflets trifidly pinnatifid, linear-subulate, elongated; involucra wanting; umbellules rather capitate. ♃. H. Native of Siberia, at the Volga. F. nodiflòra, Pall. itin. app. p. 39. t. N. ed. gall. t. 56. F. Sibírica, Willd. spec. 1. p. 1411. Leaflets very long, nearly terete. Fruit unknown. The herbarium of Willdenow is said not to contain this plant.

Sulphur-wort-leaved Giant-fennel. Pl. 5 to 6 feet.

27 F. nudicau'lis (Spreng. neu endt. 2. p. 149. but not of Nutt.) stem naked, furrowed, glabrous; radical leaves bipinnate; leaflets deeply serrated, mucronate; sheaths of upper leaves abortive; leaves of involucrum linear-lanceolate. ♃. H. Native of Sicily, on the Nebrodes, in the higher pastures. Laserpítium resinòsum, Presl, sic. p. 136. Ligústicum resinòsum, Guss. ind. sem. 1826. prod. 1. p. 356. Fruit glaucous, compressed, marginated.

Naked-stemmed Giant-fennel. Pl. 2 to 3 feet?

28 F. fœnicula'cea (Nutt. gen. amer. 1. p. 183.) plant pubescent; stem short, naked, furrowed, glabrous; radical leaves pubescent, supra-decompound; leaflets linear, very narrow, acute, short: ultimate ones trifid; involucra wanting; involucels unilateral, digitate, with linear segments. ♃. H. Native of North America, on the plains of the Missouri; and on the north-west coast near Fort Vancouver, and barren sandy grounds on the Columbia river; low hills near the source of the Wallawalla river, and on the Saskatchawan at Carlton House. Pastinàca fœniculàcea, Spreng. in Schultes, syst. 6. p. 587. Flowers yellow. Herb smelling of fennel. Fruit furnished with 5 stripes, 3 of which are conspicuous. Umbel solitary, terminal. Sprengel refers to this Lomàtium villòsum, Rafin, in journ. phys. 1819. aug. 1. p. 101. and the flowers are said to be white by the author, but according to Nuttall they are yellow; and it is therefore also the Cogswéllia villòsa, Schultes, syst. 6. p. 588.

Fennel-scented Giant-fennel. Fl. July, Aug. Clt. 1820. Pl. 1 to 2 feet.

29 F. Canade'nsis (Lin. spec. p. 356.) segments of leaves branched, shining, linear.—Native of Canada. Lin. hort. ups. p. 61. Gron. virg. p. 147. This is a very obscure plant, and probably the same as *Angélica lùcida.*

Canadian Giant-fennel. Pl. 2 feet.

30 F. Nutta'llii (D. C. prod. 4. p. 174.) plant small, almost stemless, glabrous; leaves supra-decompound; leaflets linear, short, acute; scapes radical; rays of umbel elongated; involucra wanting; involucels unilateral, digitate, with linear segments. ♃. H. Native of North America, on the plains of the Columbia; banks of streams among stones at the Great Falls of the same river. F. nudicaúlis, Nutt. gen. amer. 1. p. 183. but not of Spreng. Smýrnium nudicaúle, Pursh, fl. bor. amer. 1. p. 196.

Pastinàca nudicaúle, Spreng. in Schultes, syst. 6. p. 587. Root fusiform. Plant having the odour of fennel, but more aromatic. This plant differs from the genera *Férula*, *Pastinàca*, and *Smýrnium*, in the flowers being white, not yellow, as in those genera.

Nuttall's Giant-fennel. Fl. July, Aug. Clt. 1817. Pl. 1½ to 2 feet?

31 F.? Palme'lla (Hook. in fl. amer. bor. amer. 1. p. 268.) plant glabrous, nearly stemless; leaves bipinnatifid, on longish petioles, glaucous; leaflets linear, bluntish: lower ones often again pinnatifid; peduncles rather shorter than the leaves; involucrum none; involucel unilateral, dimidiate, palmate, with the disk floriferous. ♃. H. Native of North America, about Carlton House on the Saskatchawan. Root large, thick, rather fusiform. The involucels are very remarkable, truly palmate, gradually tapering into the broad petiole or ray, and bearing a small umbellule of white flowers on the disk.

Palmella Giant-fennel. Pl. ½ foot.

32 F. affi'nis (Bess. cat. hort. crem. 1816. p. 57.) Native near Odessa. This species is not described.

Allied Giant-fennel. Pl. 2 to 3 feet.

Cult. Any common garden soil answers the species of *Férula;* and they are only to be increased by seeds.

XCIII. DORE'MA (from δορημα, *dorema*, a gift or benefit; not that the plant is considered pre-eminently deserving that title, but that the name is also agreeable to the ear). D. Don, in Lin. trans. vol. 16. p. 601.

Lin. syst. *Pentándria, Digýnia.* Flowers sessile, immersed in wool. Margin of calyx 5-toothed. Petals ovate, with an inflexed point. Disk epigynous, cup-shaped, fleshy: with a plicate, rather lobulate margin. Style complanate, recurved at the apex. Stigmas truncate. Fruit elliptic, much compressed from the back, girded by a complanate broadish margin; raphe very narrow, usually closed. Mericarps 5-ribbed; the 3 intermediate ribs distinct, filiform, at equal distances: lateral 2 confluent with the margins; vittæ prominent, one in each furrow, and 4 in the commissure, which is flat. Carpophore bipartite, filiform. Seed flat.—A robust, greenish, glaucous, Persian herb, with a perennial root, and clothed with glandular down, almost with the habit of *Opópanax Chirònium*. Leaves large, petiolate, somewhat bipinnate, 2 feet long; pinnæ usually 3 pairs, each pair rather remote: lower leaflets distinct; superior ones confluent, deeply pinnatifid: segments oblong, mucronate, quite entire, or rarely a little lobed, coriaceous, veined beneath, 1-5 inches long, and half an inch to 2 inches broad. Petioles and rachis terete, ribbed, pubescent, very much dilated at the base, and sheathing a little, with the upper margin winged and stipulaceous. Umbels proliferous, racemose; umbellules globose, on short peduncles, usually disposed in a spicate manner. Peduncles terete, woolly. Involucra and involucels wanting. Petals white. Stamens and styles yellow. Ovarium densely woolly. Fruit naked.

1 D. Ammoni'acum (D. Don, l. c.) ♃. H. Native of the south of Persia, in the vicinity of Jezud Khast, a town of Irak El Ajam, the ancient Parthia, about 42 miles south of Ispahan. To discriminate and characterize those plants which more immediately administer to the wants and comforts of man, is one of the chief objects of practical botany; but it is a task replete with difficulties; the countries whence many of the substances are derived, particularly those belonging to the Materia Medica, being generally remote, and often inaccessible to travellers. Although the gum Ammoniacum has held a place in the Materia Medica from a very early period, yet the plant from which it is obtained has hitherto remained almost totally unknown; and the same may be said of the analogous gum Galbanum, and many other articles derived from the vegetable kingdom, enumerated in the Pharmacopœia. It is true Dioscorides and Pliny mention the plant which yields the gum Ammoniacum, the former under the appellation of Agasyllis, and the latter under that of Metopium, and give Libya as its native country; but if the gum was anciently imported thence, it must have been the produce of a different plant than ours; and probably identical with the species of *Férula*, represented by Jackson in his account of Morocco, as the gum now comes to Europe by way of the Levant and India. Dioscorides, whose opinion is adopted by all subsequent writers, derives the name Ammoniacum from Ammon or Hammon, the Jupiter of the Lybians, whose temple was situated in the desert of Cyrene, near to which the plant was said to grow. But it appears that Dioscorides was altogether mistaken as to its native country; and that the name Ammoniacum or Armoniacum, as it is indifferently written, is really a corruption of Armeniacum; for it is now ascertained beyond all doubt, that the plant is a native of Persia, and that the gum must have been anciently brought to Europe by way of Armenia; and we sometimes find the name of the apricot written Malum Armoniacum. Willdenow, having sown some seeds picked from the gum-Ammoniacum, a species of Heracleum came up, which he called Heracleum gummíferum, but this appears to be identical with Heracleum Pyrenàicum; but as the plant possesses no smell analogous to Ammoniacum, and affords no gummy substance whatever, it is probable it was only an accidental weed.

The materials from which the description was drawn were procured by Lieut.-Colonel Wright, of the royal engineers, in the district where the gum Ammoniacum was collected, which is given above, and presented by him along with other dried plants to the Linnæan Society. Every part of the specimen is covered with drops of a gum possessing all the properties of Ammoniacum; and this circumstance alone, independent of any other evidence, would seem sufficient to remove all doubt on the subject; besides the specimen has been compared with the portions of inflorescence and fruit, which are found abundantly intermixed with the gum in the shops, and they are found to agree in every particular. The name applied to the plant by Dioscorides is already pre-occupied by another genus of *Umbelliferæ*, and that of Pliny is scarcely unexceptionable, as originating in a mistake, Metòpium having been used by some ancient authors to denote the Gálbanum, and by others the gum-Arabic tree; but most writers seem to agree in considering it the appellation of an ointment, or some oleaginous substance, rather than of a plant. The name *Dorèma* has been given to avoid confusion.

The first volume of the Dictionnaire Universel de Matière Médicale, by Merat and De Lens, published at Paris in 1829, contains some valuable notices on the Ammoniacum plant, from which it appears that the plant was already known to Mr. Brown, and had been determined by him to constitute a new genus. We also learn from the same work that M. Fontanier, a geologist sent into the Levant by the French government, had visited the district where the plant grows spontaneously, and transmitted a drawing, together with specimens of the herb and gum, to the museum of natural history at Paris. M. Fontanier was informed that the plant grows likewise in Khorassan.

In the appendix to the first volume of the transactions of the Medical Society of Calcutta, p. 369. is an extract of a letter addressed to Dr. Wallich by Lieut.-Colonel Kennett, accompanied by a rude figure of the plant, which yields the gum-Ammoniacum, of which the following is a copy: "I have the pleasure to forward you a drawing and description of Oshac, a Persian plant that produces the gum Ammoniac. It was procured by Capt. Hart, of the 5th battalion Bombay native regiment, whilst on sick certificate in Persia; and understanding it was a desideratum in botany, he has requested me to send it to you in his name. It is to be regretted that Capt. Hart did not know enough of botany to give a particular description of the plant,

flower, and seed; but he brought away a root, with a piece of the stem, and some dry leaves attached; and which I have forwarded in a box to your address. You will observe the account of the plant is dated in July, 1822, though I only received it a short time ago.

"Description of the Oshac or gum-Ammoniac plant, by Capt. Hart.

"'It having been intimated to me while at Bushire by the Resident, Capt. Bruce, that the plant which produces the gum-Ammoniac, called by the Persians Oshak, would be acceptable to botanists, as it was but imperfectly known, I procured the accompanying piece of stem, leaf, and flower, and took a drawing of one of the finest plants. Its height was 7 feet 2 inches, and the circumference of the lower part of the stem 4 inches. It grows principally on the plains between Yerdekaust and Kumisha, in the province of Irauk, without cultivation. The gum is so abundant, that upon the slightest puncture being made, it instantly oozes forth, even at the ends of the leaves. When the plant has attained perfection, innumerable beetles, armed with an anterior and posterior probe of half an inch in length, pierce it in all directions; it soon becomes dry, and is then picked off, and sent via Bushire to India and various parts of the world; and is an article of considerable export. I am of opinion it might be cultivated with success in many parts of Kattywar, and the experiment might be worth the consideration of government. The gum might easily be procured by artificial means, which would answer the purpose equally well.

"'From the part of the stem attached to the roots of the specimen I sent you, a considerable portion of the gum will be seen exuded, in which respect it resembles the *Assafœtida* plant, which abounds in the mountains in the south of Persia, particularly in the province of Fars.'"

The gum is collected about the middle of June; a tenth is remitted as tribute to the government; the rest is sent to Bushire on the Persian Gulf. Part of that imported to this country comes from the Levant; but the largest quantity and the best comes by way of India.

According to Major Willock, who has visited the districts where the plant grows wild, the Ooshāk or gum-Ammoniac plant grows in great abundance over the arid plains in the vicinity of the town of Jezud Khāst, on the borders of the provinces of Fars and Irak, a district appertaining to the government of Ispahan. The white juice which forms the gum pervades the whole plant, but exudes chiefly from the principal stems. It either remains on them in lumps, or, falling to the ground, is gathered by the villagers in the autumn, and is sold by them. The Ooshāk plant is to be met with nowhere but in the province of Irak, growing in very dry plains, gravelly soils, and exposed to an ardent sun.

Ammoniac has a nauseous taste, followed by a bitter one; and a peculiar smell, somewhat like that of Galbanum, but more grateful; it softens in the mouth, and acquires a white colour upon being chewed. It softens by heat, but is not fusible; when thrown upon live coals it burns away in flame. Such tears as are large, dry, free from small stones, seeds or other impurities, should be picked out, and preferred for internal use; the coarser kind is purified in solution, colature, and careful inspissation; but unless this be artfully managed, the gum will lose a considerable deal of its more volatile parts. These are often vended in the shops under the name of stained gum-Ammoniacum, a composition of ingredients much inferior in virtue.

The general action of gum-Ammoniac is stimulant. On many occasions, in doses from 10-30 grains, it proves a valuable antispasmodic, deobstruent or expectorant. In large doses it purges gently, excites perspiration, and increases the flow of urine. It is used with advantage to promote expectoration in some pulmonary diseases, especially asthma and chronic catarrh; in dropsical affection to augment the flow of urine, and to support the salivation in small pox. In long and obstinate cholics, proceeding from viscid matter lodged in the intestines, this gummy resin has produced good effects, after purges and the common carminatives had been used in vain. Externally it is supposed to soften and ripen hard tumours, is often applied as discutient in white swellings of the knee, and other indolent tumours. A solution of it in vinegar has been recommended by some for resolving even schirrous swellings. It is exhibited internally combined with vinegar, vinegar of squills, assafœtida, &c. and in pills, with bitter extracts, myrrh, assafœtida; externally, dissolved in vinegar, combined with turpentine, common plaster, &c.

Ammoniac. Fl. June, July. Clt. 1831. Pl. 4 to 7 feet.

Cult. See *Férula* for culture and propagation, p. 328.

XCIV. ERIOSYNA'PHE (from *εριον*, *erion*, wool, and *συναφη*, *synaphe*, connection; in reference to the commissure, which is the connection of the two mericarps that compose the fruit, and which is clothed with wool-like down in the hollows between the nerves). D. C. coll. mem. 5. p. 50. t. 1. f. 9. prod. 4. p. 175.—Férula species, Fisch.

Lin. syst. *Pentándria*, *Digýnia*. Limb of calyx with 5 short blunt teeth. Petals ovate, entire, acuminated; points short, incurved. Fruit compressed from the back, girded by a thickish margin. Mericarps with 3 dorsal filiform ribs, but the 2 lateral ones are lost in the thickish margin, which is spongy inside; furrows between the ribs broad, and furnished with 2-3 striæ, and bearing 2-3 small vittæ; commissure without vittæ, marked by a middle nerve and 2 marginal ones, tomentose, and rather concave between the nerves. Seed complanate.—A perennial glabrous herb, with the habit of *Férula*. Leaves decompound: leaflets long, linear. Involucra and involucels none. Flowers yellow. This genus is very nearly allied to *Férula*, but the singularity of the commissure of the fruit distinguishes it from all other umbelliferous genera.

1 E. longifòlia (D. C. l. c.) ♃. H. Native of Siberia, in the region of the Volga at Sarepta. Férula cachroïdes, Cat. hort. orl. 1811. Férula longifòlia, Fisch. cat. hort. gor. 1812. p. 46. Stem terete, branched. Leaves glaucescent: leaflets an inch or more long. Upper petioles narrow, sheathing, awned at the apex. Umbels of many rays.

Long-leaved Eriosynaphe. Fl. July, Aug. Clt. 1820. Pl. 4 to 5 feet.

Cult. See *Férula*, p. 328. for culture and propagation.

XCV. PALI'MBIA (meaning unknown to us). Bess. enum. pl. vohl. p. 94. Koch, in litt. D. C. prod. 4. p. 175.—Peucédanum species, Pall. Sìson species of Lin. fil. and Bieb.—Sìler or Agasýllis species, Spreng.—Sìum species, Lam.

Lin. syst. *Pentándria*, *Digýnia*. Margin of calyx obsolete. Petals elliptic, with an inflexed acute point. Fruit oblong or oval: the transverse section elliptic. Mericarps compressed from the back, having 5 filiform bluntish ribs: the 2 marginal ones rather the broadest; furrows between the ribs furnished with 3 vittæ each; commissure bearing 2 broad marks. Seed oblong, with many stripes, free from the pericarp.—Glabrous perennial herbs. Leaves tripinnate; leaflets multifid. Stem terete, branched. Involucra of few leaves or wanting. Flowers cream-coloured. This genus differs from *Peucédanum*, in the furrows of the fruit being furnished with 3 vittæ each, instead of one.

1 P. sa'lsa (Bess. enum. pl. vohl. 55. no. 1484.) stem terete, branched, naked; radical leaves tripinnate; leaflets many-

parted: segments linear, somewhat verticillate; umbels panicled; involucra and involucels of 3-5 leaves; fruit oblong. ♃. H. Native of Bessarabia, Tauria, east of Russia in the region of the Volga, in arid salt fields. Peucédanum redivìvum, Pall. act. petrop. 1779. p. 252. t. 8. Sìson sálsum, Lin. fil. suppl. p. 181. Bieb. fl. taur. et suppl. no. 564. Sìson verticillàtus, Pall. itin. ex Bieb. Sium nudicaúle, Lam. dict. 1. p. 407. Agasýllis sálsa, Spreng. prod. umb. p. 22. Sìler sálsum, Spreng. umb. spec. 90. Schultes, syst. 6. p. 451. According to Ledebour, fl. alt. 1. p. 344. the furrows of the fruit contain 4 vittæ each, and the commissure many.

Salt-field Palimbia. Fl. June, July. Clt. 1804. Pl. 1 foot.

2 P. ramosíssima (D. C. prod. 4. p. 176.) stem terete, much branched, sparingly leafy; leaves biternate: leaflets few, oblong, acutely cut; involucrum wanting; involucels of few leaves; fruit oblong. ♃. F. Native of the East Indies, on the Pandua mountains on the confines of the province of Silhet. Selìnum? ramosíssimum, Wall. mss. Root long, cylindrical, simple. Stem 2 feet high. Upper leaves reduced to the petioles. Fruit much flattened from the back; furrows furnished each with 2-3 obscure vittæ; commissure covered with a pellicle, and therefore appearing without vittæ at first sight.

Much-branched Palimbia. Pl. 2 to 3 feet?

3 P. Chabræ'i (D. C. prod. 4. p. 176.) stem striated, leafy; leaves pinnate; leaflets decussate, 3-5-parted: segments linear, acute; involucrum wanting; rays of umbel unequal; involucels of 3-4 linear-subulate leaves; fruit oval. ♃. H. Native of France, particularly in the eastern parts, Switzerland, Austria, Iberia, Sicily, &c. in shady bushy places. Selìnum Chabræ'i, Jacq. austr. t. 72. Selìnum carvifòlia, Crantz, austr. p. 162. t. 3. f. 2. Peucédanum carvifòlium, Vill. dauph. 2. p 630. Imperatòria Chabræ'i, Spreng. umb. spec. 64. exclusive of the synonymes. Oreoselìnum Chabræ'i, Bieb. fl. taur. p. 209. Selìnum palústre, Thuil. fl. par. p. 139. Selìnum lactéscens, Lam. fl. fr. 3. p. 418. Ligústicum decussàtum, Mœnch, meth. p. 81. Peuced. mìnus, All. ex Balb. Peuced. Chabræ'i, Gaud. fl. helv. 2. p. 330. Palímbia carvifòlia, Koch, in litt.—Chabr. sciagr. p. 389. f. 2. Flowers greenish-yellow. Vittæ 2-3 in each furrow, and 4-6 in the commissure. Fruit nearly like that of *Férula*. Habit of *Peucédanum*, but the vittæ is that of the present genus, ex Koch, in litt. and umb. p. 93. no. 5. but according to Besser, in litt. the vittæ vary from 1-3 in the furrows, and therefore this plant comes near to *Peucédanum*.

Var. β, Podólica (D. C. prod. 4. p. 176.) stem angularly furrowed; sheaths elongated, loose; leaves broader. ♃. H. Native of Podolia. Oreoselìnum Podólicum, Bess. enum. p. 12. no. 330. fl. gall. 2. p. 392. Bieb. suppl. p. 210.

Chabræus's Palimbia. Fl. July, Aug. Clt. 1791. Pl. 2 feet.

Cult. See *Peucédanum*, p. 335. for culture and propagation.

XCVI. PEUCE'DANUM (πευκεδανον of Theophrastus and Dioscorides; said to be from πευκη, *peuke*, a pine, and δανος, *danos*, parched; the plant was so called on account of its strong smell, which resembles resin). Koch, umb. 92. f. 28. and f. 29. D. C. prod. 4. p. 176.—Peucédanum, Selìnum, and Férula, &c. of authors.—Oreoselìnum and Thysselìnum, Hoffm. umb. p. 153. and 154.—Oreoselinum and Peucédanum, Lag. am. nat. 2. p. 90.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals obovate, emarginate or entire, with an inflexed point. Fruit flattened from the back or lenticularly compressed, girded by a dilated complanate margin. Mericarps having the ribs at equal distances, the 3 intermediate ones filiform, but the 2 lateral ones are more obsolete, and contiguous to the dilated margin, or lost in it. Vittæ one in each furrow, but sometimes 2, and usually 2 in the commissure. Carpophore bipartite. Seed flat in front.—Usually glabrous perennial herbs. Leaves simply pinnate, or many times pinnate, or ternately divided. Umbels compound, terminal. Involucra variable; involucels of many leaves. Flowers white or yellow or greenish yellow. According to Besser, the species with obcordate petals narrowed at the base are distinguished from the species with ovate petals, which are broadest at the base, and entire or a little emarginate at the apex. The first constitutes *Oreoselìnum*, and the second the true species of *Peucédanum*.

Sect. I. Eupeuce'danum (from *eu*, well, and *Peucédanum*; this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 176.—Peucedana legítima, Koch, l. c.—Peucédanum, Gærtn. fr. 1. t. 21. Spreng. syst. 1. p. 1082. Margin of mericarps narrow. Vittæ 2-4 in the commissure. Dorsal ribs of mericarps 5, the outer 2 more remote than the rest. Involucra usually wanting or of few leaves, rarely of 5-8 leaves.

* *Flowers yellow.*

1 P. paniculà'tum (Lois. fl. gall. p. 722.) stem terete, striated, branched at the top; leaves 5 times ternate or trichotomous: segments linear; leaves of involucra 1-2, setaceous, caducous; involucels of many leaves. ♃. H. Native of Corsica. D. C. fl. fr. 5. p. 513. Schultes, syst. 6. p. 565. Umbels numèrous, disposed in a panicle. Flowers yellow. Fruit unknown. This is a different plant from the Selìnum paniculàtum of Spreng.

Panicled Sulphur-wort. Fl. May, June. Clt. 1818. Pl. 3 to 4 feet.

2 P. officina'le (Lin. spec. p. 353.) stem terete, branched; leaves 5 times tripartite: segments linear, acute, flaccid; involucrum of 3 setaceous leaves, deciduous; pedicels much longer than the fruit. ♃. H. Native of Europe, in humid meadows and shady places. In Britain in salt marshes, very rare; as in ditches near Shoreham, Sussex; and at Walton near Harwich, Essex. About a quarter of a mile below Faversham, by the river side. Smith, engl. bot. t. 1767. Hayne, arz. gew. 7. t. 4. P. altíssimum, Desf. cat. hort. par. p. 119. P. Alsáticum, Poir. dict. 5. p. 227. Selìnum Peucédanum, Sowerby, engl. bot. t. 1767. P. màjus Itálicum, Bauh. pin. 149. Moris, oxon. sect. 9. t. 15. f. 1.—Bauh. hist. 3. p. 2. 36. f. 1.—Trag. hist. p. 880. p. 881. Hog's-fennel, Petiv. herb. brit. t. 24. f. 7. Herb smooth, with a resinous juice, and a strong sulphureous smell. In England, Gerarde says, it is called *Horestrange* and *Horestrong* (or *Harestrang*, from the German *Haarstrang*), *Sow-fennel* or *Hog's-fennel*, *Sulphur-wort*, and *Brimstone-wort*. The root wounded in spring yields a considerable quantity of a yellow juice, which dries into a gummy resin, and retains the strong scent of the root. Many stimulating qualities have been attributed to the root, but it should seem to be rather dangerous for internal use.

Var. β, Itálicum (Mill. dict. no. 2.) segments of leaves or leaflets very narrow, filiform. ♃. H. Native of the south of Europe. Lob. icon. t. 781. Leaves of involucra 3-4, as in the species. Leaves almost like those of *P. longifòlium*. Perhaps a proper species or a variety of *P. longifòlium* or *P. Morisòni*, but very distinct from *P. Parisiénse*. It grows on low mountains, and also in valleys by the sides of rivers in Italy. It is altogether a larger plant than the species.

Officinal or Sea Sulphur-wort. Fl. July, Sept. Britain. Pl. 3 to 4 feet.

3 P. Ledebou'ri; stem terete, branched; leaves 5 times tripartite; segments linear, with roughish cartilaginously serrated margins; involucra of few leaves, caducous; pedicels exceeding the fruit. ♃. H. Native of Siberia, every where in open situ-

ations, particularly on rocks. P. officinàle, Ledeb. fl. alt. 1. p. 304. Bieb. fl. taur. 1. p. 215. in a note, 2. p. 214. no. 538. Segments of leaves covered with copious pellucid dots. Involucra for the most part of 3 leaves: of these 1 is lanceolate, the other lanceolate-linear, and the third filiform, 2 are caducous, and the third permanent. This species differs from *P. officinàle* in the margins of the leaves being cartilaginously serrated, and in the fruit being smaller, &c.

Var. β; leaves biternate; leaflets 5-6 inches long; rays of umbel and umbellules elongated and divaricated.

Ledebour's Sulphur-wort. Fl. June, July. Pl. 3 to 4 feet.

4 P. ELA'TUM (Led. fl. ross. alt. ill. t. 305,) stem terete; leaves glabrous, 3 or 4 times pinnate; pinnulæ pinnate; leaflets pinnatifid or cut or entire: lobes linear, acuminated, with smooth margins; primordial umbel nearly sessile; involucrum wanting; involucels short. ♃. H. Native of Altaia, every where in exposed places on the declivities of mountains. Primary and secondary ramifications of the leaves opposite, but the pinnulæ are alternate. Petals deep yellow: those of the male flowers ovate-oblong, attenuated: those of the hermaphrodite flowers obovate, all having inflexed points. Vittæ almost the length of the mericarps, 1 in each furrow, and 2 in the commissure.

Tall Sulphur-wort. Fl. May, June. Pl. 5 feet.

5 P. LONGIFÒLIUM (Waldst. et Kit. pl. rar. hung. 3. t. 251.) stem terete, branched a little; leaves 5 times tripartite; leaflets triquetrously setaceous, channelled, elongated; involucra wanting or of one leaf; fruit with very narrow wings. ♃. H. Native of Hungary, on calcareous rocks. Schultes, syst. 6. p. 567. Host, fl. austr. 1. p. 366. Petioles of radical leaves terete. Flowers yellow. Fruit with 5 ribs, and 4 vittæ on the back; and the commissure with 2 vittæ.

Long-leaved Sulphur-wort. Fl. June, July. Clt. 1823. Pl. 4 to 5 feet.

6 P. RUTHE'NICUM (Bieb. fl. taur. and suppl. no. 539.) stem terete; leaves triternately divided: segments or leaflets acute, 1-nerved, very long; involucra nearly wanting; pedicels length of fruit. ♃. H. Native of Caucasus, Tauria, and the south of Russia. P. Taúricum, Spreng. umb. spec. p. 53. Férula Ruthénica, Spreng. umb. prod. 14. pug. 1. p. 27. This species differs from *P. officinàle* in the leaves being less divided, in the segments or leaflets being longer, and in the pedicels being one-half shorter.

Var. β, Taúricum (Bieb. fl. taur. p. 540.) leaves 5 times tripartite; segments or leaflets linear, acute, short. ♃. H. Native of Tauria and Caucasus, in mountain meadows.

Russian Sulphur-wort. Fl. May, June. Clt. 1818. Pl. 3 to 4 feet.

7 P. MORISÒNI (Bess. in Schultes, syst. 6. p. 567. in a note,) stem unknown; leaves triternately divided: leaflets linear, acute, long, stiff, 3-5-nerved; involucra wanting; involucels of many setaceous leaves. ♃. H. Native of Siberia. Ligústicum longifòlium, Willd. spec. 1. p. 1428. Peucédanum, Mor. oxon. 3. sect. 9. t. 15. f. 1. Vittæ 2 in the commissure, but usually 4, ex Koch, umb. 93.

Morison's Sulphur-wort. Pl. 3 to 4 feet.

8 P. BESSERIA'NUM (D. C. prod. 4. p. 177.) stem terete, a little branched; leaves triternate; leaflets linear, nerved, divaricate; involucrum nearly wanting; involucels of a few very short leaves. ♃. H. Native on hills about Odessa. Férula Besseriàna, Spreng. in litt. Peucédanum species, Bess. in litt. Herb and leaves nearly as in *P. Parisiénse*, but the flowers are yellow, and commissure is furnished with 4, not with 2 vittæ. Teeth of calyx short, not as in *P. officinàle* subulate. Rays of umbel nearly equal. Fructiferous pedicels 3-6 lines long, not as in *P. officinàle* an inch long.

Besser's Sulphur-wort. Pl. 3 to 4 feet.

9 P. ARENA'RIUM (Waldst. et Kit. pl. rar. hung. 1. t. 20.) stem terete, striated, branched; leaves tripinnate; leaflets linear, obtuse, stiffish, short; involucra nearly wanting; rays of umbel few, unequal; leaves of involucels linear-subulate. ♃. H. Native of Hungary, in sandy places; and of Transylvania, in calcareous places; and of the south of Podolia. Spreng. umb. spec. 51. Schultes, syst. 6. p. 568. Bess. cont. p. 43. Allied to *Palimbia Chabræ'i.* Vittæ one in each furrow, and 4 in the commissure, ex Koch, umb. 93.

Sand Sulphur-wort. Fl. June, July. Clt. 1816. Pl. 2 to 3 ft.

10 P. SIBI'RICUM (Willd. spec. 1. p. 1406. Koch, umb. p. 93.) stems terete, almost without leaves; cauline sheaths large, pruinosely glaucous; radical leaves on long petioles, triply pinnate, stiff, shining; leaflets linear, cuspidate, with serrulated margins; involucrum almost wanting; central umbel sessile: lateral ones pedunculate. ♃. H. Native of Croatia, Bessarabia, Caucasus, and Siberia. Férula Tatárica, Fisch. in litt. Spreng. umb. prod. 14. exclusive of the synonymes. Bieb. suppl. p. 219. Férula Sibírica, Spreng. in Schultes, syst. 6. p. 592. Vittæ 1 in each furrow, but sometimes 2 in the lateral furrows, and always 4 in the commissure; lateral vittæ usually incomplete, and sometimes wanting in the same specimen. Habit and flowers like *P. arenàrium.* The plant from Croatia is probably different from that of Siberia.

Siberian Sulphur-wort. Fl. June, July. Clt. 1804. Pl. 3 to 4 feet.

11 P. DISSE'CTUM (Led. fl. ross. alt. ill. t. 181. fl. alt. 1. p. 306.) stem terete, leafy; superior branches in whorles; sheaths spreading; leaves pubescent, 4 times pinnate; pinnulæ opposite, petiolate, pinnate; leaflets pinnatifid or entire: segments oblong, rather bifid; primordial umbels nearly sessile; involucra and involucels very minute. ♃. H. Native of Altaia, on hills at the river Talowka, near Buchtorminsk. Involucrum of one or few minute setaceous leaves. Petals golden yellow, ovate, acute, inflexed. Ribs of fruit filiform. Vittæ 1 in each furrow, and 2 in the commissure.

Dissected-leaved Sulphur-wort. Fl. June. Pl. 4 feet.

12 P. CANE'SCENS (Led. fl. ross. alt. ill. t. 105. fl. alt. 1. p. 307.) stem terete, leafy; intermediate branches opposite and tern; sheaths closely adpressed; leaves clothed with hoary pubescence, 3 times pinnate; pinnulæ opposite, petiolate, pinnate; lower segments pinnatifid: upper ones confluent: lobes broad-ovate, tridentate or entire, acute; involucrum wanting or of one leaf; involucels of many short leaves. ♃. H. Native of Altaia, on rocks on Mount Arkaul. Leaves of involucels many, lanceolate, acute, with a yellow keel, and white margins. Flowers deep yellow. Petals ovate, acuminated, inflexed. Fruit not seen.

Canescent Sulphur-wort. Fl. May, June. Pl. 1 to 2 feet.

13 P. GRA'CILE (Ledeb. fl. ross. alt. ill. t. 306. fl. alt. 1. p. 308.) stem leafless, branched; branches scattered; radical leaves clothed with hoary pubescence, but at length becoming glabrous, bipinnate; pinnulæ opposite, pinnate; leaflets nearly opposite, rather trifid; sheaths leafless, stem-clasping, chartaceous, permanent. ♃. H. Native of Altaia, in dry saltish open places in the Kirghisean-steppe, between Buchtorminsk and the lake called Noor-Saisan. Root thick. Involucra and involucels wanting, or of one or two leaves, which are formed from the pedicels becoming abortive and leaf-like. Flowers polygamous, those in the terminal umbels hermaphrodite and fertile; and those in the lateral umbels male. Vittæ 1 in each furrow, and 4 in the commissure. Petals golden yellow, obovate, acute, inflexed. Habit of a species of *Férula*, and probably the same as Férula pùmila, Pall. ex Schultes, syst. 6. p. 598.

Var. β, microcárpum (D. C. prod. 4. p. 309.) seed one-half smaller than in the species.

Slender Sulphur-wort. Fl. May. Pl. 1 to 2 feet.

14 P. dubium (Led. fl. alt. 1. p. 310.) stem leafless, branched; branches scattered: upper branches nearly opposite; leaves unknown; sheaths leafless, stem-clasping, chartaceous, permanent; fruit orbicularly elliptic. ♃. H. Native of Altaia, in exposed dry sterile places, at the river Tschuja. Habit more robust than that of the preceding species, and the stems more branched and more flexuous. Umbels polygamous. Involucra and involucels wanting, unless they are caducous. Vittæ 1 in each furrow, and 4 in the commissure.

Doubtful Sulphur-wort. Pl. 2 to 3 feet.

15 P. Soongaricum; stem leafless from the base to the apex, branched; upper branches disposed in whorles; radical leaves clothed with hoary pubescence, 4 or 5 times pinnate; pinnulæ opposite, pinnate-parted: segments obovate, cut; lobes acute; involucels very minute. ♃. H. Native of the Soongarian desert, between the river Irtysch and the mountains of Dolen-Kara, in saltish places. P. paniculàtum, Led. fl. ross. alt. ill. t. 199. fl. alt. 1. p. 311. Involucrum wanting, unless it be caducous. Umbellules usually proliferous, hermaphrodite and male on the same specimen. Involucels wanting to the hermaphrodite umbellules, unless they are caducous; but usually of many lanceolate-linear acute leaves to the male umbellules. Flowers yellow; petals ovate-oblong. Vittæ 1 in each furrow, and 2 in the commissure. Perhaps the same as Férula Soongárica, Pall. ex Schultes, syst. 6. p. 598. The stem yields a gum which has a taste between gum-Ammoniac and parsley. Habit exactly of *Férula*.

Soongarian Sulphur-wort. Fl. May, June. Pl. 3 to 4 feet.

16 P. aureum (Ait. hort. kew. 1. p. 341.) stem terete; leaves ternately supra-decompound, flaccid; leaflets pinnatifid, slender: segments linear, acute; leaves of involucrum 1-3, linear, acute; rays of umbel 40-50; fruit puberulous when young. ♂. F. Native of Teneriffe, and the Grand Canary Island, in mountain pastures. Ker, bot. reg. 559. Spreng. umb. spec. p. 58. Schultes, syst. 6. p. 570. Férula aúrea, Link, in Buch. can. p. 152. Flowers golden yellow. Fruit, according to Sprengel and the bot. reg., oval, compressed from the back, with 5 ribs and 4 vittæ, and crowned by the styles.

Golden-flowered Sulphur-wort. Fl. June. Clt. 1779. Pl. 3 to 4 feet.

17 P. capillaceum (Thunb. prod. p. 50. fl. cap. p. 257.) stem terete, striated, naked, nearly simple; radical leaves 5 times trichotomous: segments subulate, furrowed above, stiff; involucra and involucels of 5-6 lanceolate-subulate leaves. ♃. F. Native of the Cape of Good Hope, on the mountains. Sieb. pl. exsic. no. 212. Flowers yellow, according to Thunberg. Fruit ovate, compressed, marginately winged, having 3 elevated ribs on each side, ex Thunb.

Capillary-leaved Sulphur-wort. Pl. 1 foot.

18 P. tenuifòlium (Thunb. prod. 50. fl. cap. 257. but not of Poir.) stem striated, terete, a little branched; leaves bipinnatifid: segments lanceolate and alternate, marginated: sheaths broad, stipula-formed at the base of the petioles; involucra and involucels of 6 leaves. ♃. F. Native of the Cape of Good Hope, on the mountains. Spreng. umb. spec. p. 59. Fruit ovate, marginating, winged on the back, with 5 ribs, ex Thunb.

Fine-leaved Sulphur-wort. Pl. 2 to 3 feet.

19 P. virgatum (Cham. et Schlecht. in Linnæa. 1. p. 392.) stem terete, shrubby; leaves stiff, pinnate; leaflets lanceolate, quite entire, mucronate, with revolute margins; involucra and involucels of many short leaves. ♄. G. Native of the Cape of Good Hope, on the mountains. Burchell, cat. pl. afr. austr. no. 2869. The whole plant is quite glabrous and coriaceous. Petals ovate, yellow, entire at the apex, or hardly emarginate. Fruit said to be elliptic, with 5 ribs on the back, having a complanate margin.

Twiggy Sulphur-wort. Shrub.

* * *Flowers cream-coloured.*

20 P. Schottii (Bess. in litt. ex D. C. prod. 4. p. 178.) stem terete, a little branched; leaves pinnate-parted: segments linear, acute, entire or divided; involucra and involucels none. ♃. H. Native of Volhynia and Podolia. Imperatòria Chabræi, Bess. fl. gall. Very like *Palimbia Chabræi*, but differs in the lobes of the leaves being more diverging, in the rays of the umbels being quite smooth, in the involucels being wanting, and in the furrows being furnished with one vittæ each.

Schott's Sulphur-wort. Pl. 2 to 3 feet.

21 P. Orientale; stem terete, branched, fistular; leaves pinnate; leaflets bipinnatifid; lobes linear-oblong, acute; involucrum wanting; involucels of a few leaves. ♃. H. Native of Nipaul, on the Himalaya at Gosaingsthan. P. disséctum, D. C. prod. 4. p. 178. but not of Led. Selìnum? disséctum, Wall. mss. Habit of *Æthùsa* or *Thysselìnum*. Fruit nearly orbicular, with a narrow margin. Vittæ all evident, solitary in the furrows, and twin in the commissure. Flowers cream-coloured or greenish, according to the dried specimen.

Eastern Sulphur-wort. Pl. 1 to 2 feet.

* * * *Flowers white.*

22 P. Parisiense (D. C. fl. fr. 4. p. 336.) stem terete, a little branched; leaves 3 or 4 times 3-parted: leaflets linear, nerved, divaricate; involucra of 8-10 linear-subulate leaves; leaves of the involucels setaceous. ♃. H. Native about Paris, in dry fields; and of Occitania. Jaum, pl. fasc. 3. p. 296. P. officinàle, Thuil. fl. par. 140. but not of Lin. P. Gállicum, Pers. ench. 1. p. 310. P. Gállicum var. *α*, Spreng. in Schultes, syst. 6. p. 565. exclusive of var. *β*. Fruit oblong, ex Spreng. Commissure furnished with 2 vittæ, ex Koch. Flowers white.

Parisian Sulphur-wort. Fl. May, July. Clt. 1800. Pl. 4 to 5 feet.

23 P. glaucum (D. C. prod. 4. p. 179.) stem terete, branched; leaves biternate; leaflets broad-linear, elongated, acuminated, with a few awned serratures; involucra and involucels wanting; fruit with membranous wings. ♃. H. Native of Nipaul, and at Deyra-Dhoon. Selìnum? glaúcum, Wall. mss. Flowers white, but rose coloured in a dried state. The fruit is nearly like that of section 4, but the involucra are wanting. Commissure furnished with 2 curved vittæ.

Glaucous Sulphur-wort. Pl. 2 to 3 feet.

24 P. vaginatum (Led. fl. ross. alt. ill. t. 808. fl. alt. 1. p. 312.) root creeping; stem simple; leaves pinnate; pinnæ opposite, pinnate; leaflets alternate, pinnate-parted, or tripartite, or entire: segments linear, acute; sheaths membranous; involucrum wanting; leaves of involucels linear, length of umbellules. ♃. H. Native of Altaia, in meadows at the rivers Irtysch, and Koksun. Flowers white; petals tapering into an inflexed point. Vittæ 2 in each furrow, and 4 in the commissure. Stylopodium and styles purple. Margin of mericarps broad.

Var. β, pùmilum (Led. fl. alt. 1. c.) differs from the species in the stems being only 3 inches high, furnished with leaves at the root; mericarps nearly one-half smaller.

Sheathed Sulphur-wort. Pl. $\frac{1}{2}$ to 1 foot.

Sect. II. Thysselìnum (from *θυω*, *thyo*, to burn incense, and *σελινον*, *selinon*, parsley; acrid juice of the plants). Hoffm. umb. p. 153. Spreng. umb. spec. p. 70. Gaudin. fl. helv. 2. p. 331. D. C. prod. 4. p. 179.—Thyoselìnum, Riv. pent. t. 19, 20. Spreng. syst. 1. p. 895. Margin of mericarps narrow. Vittæ in the commissure 2, covered by an indusium. Universal involucra of many leaves. Flowers white. Perhaps this section may constitute a proper genus.

25 P. SYLVE'STRE (D. C. prod. 4. p. 179.) stem terete, furrowed; leaves bipinnate or tripinnate: leaflets pinnatifid: segments linear-lanceolate, bluntish; involucra and involucels of many leaves; fruit lanceolate-elliptic. ♃. H. Native of the north and east of Europe, in marshes and meadows. Selìnum sylvéstre, Lin. hort. ups. p. 59. Oed. fl. dan. t. 412. D. C. fl. fr. 4. p. 319. Thysselìnum, Riv. pent. irr. t. 19 and 20. Thysselìnum palústre, Hoffm. umb. p. 154. Spreng. in Schultes, syst. 6. p. 463. exclusive of the synonyme of Lin. Peucédanum palústre, Mœnch, meth. 82. Koch, umb. p. 94. Athamántha flexuòsa, Juss. hort. par. Athamántha Pisàna, Savi, in Ust. ann. 21. p. 7. Selìnum Cantabrigiénse, Fisch. Selìnum Schiweréckii and Selìnum intermèdium, Bess. prim. fl. gall. 1. p. 205. Thysselìnum palústre and Thyss. Plìnii, Spreng. syst. 2. p. 895. most probably appertains to this plant. Fruit brownish purple, 2 lines long. Root with many necks. Flowers white.

Wild Sulphur-wort. Fl. July, Aug. Clt. 1800. Pl. 2 to 3 feet.

26 P. BAICALE'NSE (Koch, umb. p. 94.) stem furrowed at the top, much branched; leaves bipinnate; leaflets pinnatifid: segments linear, acute; leaves of involucra many, rather toothed; leaves of involucels cohering at the base, exceeding the umbellules. ♃. H. Native of Siberia, about Lake Baical; and of Hungary. P. terebinthinàceum, Fisch. in litt. Selìnum terebinthinàceum, Trev. nov. act. soc. nat. cur. 13. p. 166. S. collìnum, Kit. in Willd. herb. The Hungarian plant is the same as the Siberian one.

Baical Sulphur-wort. Fl. June, Aug. Clt. 1820. Pl. 2 to 3 feet.

SECT. III. CERVA'RIA (from *cervus*, a stag; the *P. cervària* is said to be much sought after by stags). D. C. in Dub. bot. gall. prod. 4. p. 179.—Cervària, Gærtn. fr. t. 21. f. 10. Gaudin. fl. helv. 2. p. 324. Margin of mericarps narrow. Commissural vittæ 2, superficial. Dorsal ribs 5, approximate. Vittæ solitary in the furrows. Involucra of many leaves.

27 P. ALSA'TICUM (Lin. spec. 354. but not of Poir.) stem angularly furrowed, branched; leaves tripinnate; leaflets pinnatifid: segments oblong, mucronate, with serrulately scabrous margins; involucra and involucels of many lanceolate-linear leaves, which are subulate at the apex; fruit elliptic-oblong. ♃. H. Native of the Pyrenees, Provence, Alsatia, Switzerland, Austria, Transylvania, Tauria, and Siberia, in woods and meadows. Jacq. fl. aust. t. 70. D. C. fl. fr. 4. p. 337. Led. fl. alt. 1. p. 312. Daúcus Alsáticus, C. Bauh. prod. p. 77. Selìnum Alsáticum, Crantz. austr. p. 59. Cnídium Alsáticum, Spreng. in Schultes, syst. 6. p. 417. Cervària Alsática, Gaudin. fl. helv. 2. p. 327. Petals pale yellow.

Var. β, *albiflòrum* (D. C. prod. 4. p. 179.) stem more angular; flowers white. ♃. H. Native of Italy, Austria, and Vallais. Selìnum Venètum, Spreng. umb. spec. 73. Schultes, syst. 6. p. 561. Selìnum Austrìacum, Bertol. Selìnum Alsáticum, Crantz.

Alsatian Sulphur-wort. Fl. July. Clt. 1774. Pl. 3 to 5 ft.

28 P. CERVA'RIA (Cusson, ex Lapeyr. abr. p. 149. Koch, umb. 94.) stem terete, nearly simple; leaves bipinnate, glaucous; leaflets ovate, auriculated on the outside at the base, toothed: teeth mucronate; involucra of many leaves; fruit oval. ♃. H. Native of middle Europe, from the Pyrenees to Austria.—Clus. hist. t. 193. f. 2. Athamántha Cervària, Lin. spec. p. 352. Jacq. austr. 69. Bertol. amœn. p. 139. Selìnum Cervària, Lin. spec. ed. 1. p. 1194. Crantz, austr. t. 3. f. 1. Selìnum glaúcum, Lam. fl. fr. 3. p. 419. Cervària rígida, Mœnch, meth. 98. Cervària Rivìni, Gærtn. fr. t. 21. f. 10. Cervària glaúca, Gaudin, fl. helv. 2. p. 324. Ligústicum Cervària, Spreng. syst. 1. p. 907.—Plench. icon. t. 185. Corolla white, with a purplish outside. The plant is recommended in the gout; and in Styria they use it in intermittent fevers.

Var. β, *latifòlium* (Viv. ital. fragm. 1. p. 18. t. 22.) leaves broader and less glaucous. ♃. H. Native in rather boggy places.

Var. γ *? dissèctum* (D. C. prod. 4. p. 180.) leaflets pinnatifid; lobes 3-5-cleft. ♃. H. Cervària læ'vis, Gaudin, l. c. in a note. Perhaps P. oreoselìnum, var.

Stag's Sulphur-wort. Fl. July, Aug. Clt. 1597. Pl. 4 to 5 feet.

29 P. CERVARIÆFÒLIUM (Meyer, verz. pflanz. p. 126.) plant glabrous, glaucescent; stem fistular, terete; leaves bipinnate and tripinnate; leaflets membranous, ovate, or a little cordate, cut, mucronately toothed; petioles nearly terete, fistular; sheaths narrow; leaves of both involucra and involucels setaceous; mericarps puberulous, with narrow margins; the 3 dorsal ribs sharp. ♃. H. Native of Caucasus, on the Talusch mountains. Allied to *P. Alsáticum*, *P. cervària*, and *Imperatòria Caucásica*, but sufficiently distinct from all. Flowers greenish or dirty red.

Cervaria-leaved Sulphur-wort. Pl. 3 to 5 feet.

30 P. OREOSELI'NUM (Cusson, ex Lapeyr. abr. p. 149.) stem terete, striated; leaves tripinnate; petioles bent back; leaflets remote, ovate, deeply pinnatifid, divaricate, shining: teeth rather mutic; fruit oval-orbicular. ♃. H. Native of middle Europe and Caucasus, in open exposed places of hills. Athamántha oreoselìnum, Lin. spec. 352. Jacq. aust. 1. t. 68. Hayn. arz. gew. 7. t. 3. Selìnum oreoselìnum, Scop. carn. no. 330. Oreoselìnum nìgrum, Delarb. auv. 1. p. 428. Oreoselìnum legítimum, Bieb. suppl. 210. Cervària oreoselìnum, Gaudin, fl. helv. 2. p. 324. Peuced. oreoselìnum, Mœnch, meth. 82. Koch, umb. 94.—Dod. pempt. 696. with a figure. The plant is gratefully aromatic, and deserves to be better known. Flowers white, with a tinge of blush.

Var. β, *angulàtum* (D. C. prod. 4. p. 180.) stem angularly furrowed, pubescent. ♃. H. Native of the Central Pyrenees. Selìnum oreoselìnum β, D. C. fl. fr. suppl. no. 3485. p. 511. Perhaps a proper species.

Mountain-parsley. Fl. July, Aug. Clt. 1810. Pl. 3½ feet.

SECT. IV. SELINOI'DES (containing plants having the habit of *Selìnum*). D. C. prod. 4. p. 180.—Peucédanum, sect. 4. a. Koch, umb. 94.—Oreoselìnum species, Hoffm. Bieb.—Selìnum species, Gaudin, fl. helv. 2. p. 333. Margin of mericarps diaphanous, very broad. Commissural vittæ 2, rarely 4, superficial. Dorsal ribs of mericarps 5, and with 1 vittæ in each furrow between the ribs. Involucra and involucels of many leaves.

31 P. AUSTRI'ACUM (Koch, umb. p. 94.) stem sulcately striated; leaves tripinnate; leaflets ovate, cuneated at the base, coarsely toothed, pinnatifid: teeth bluntish, mucronate; leaves of involucra linear. ♃. H. Native of Austria, Pannonia, Upper Italy, and probably of France. Selìnum Austrìacum, Jacq. aust. t. 71. vind. 49. Selìnum argénteum, Crantz, austr. 174. t. 4. f. 2. Selìnum nìgrum, Lam. fl. fr. 3. p. 420. Oreoselìnum Austrìacum, Hoffm. umb. p. 155. Vittæ usually 4 in the commissure, and often 2 in the outer furrows, ex Koch, in litt. *P. montànum*, *involucràtum*, and *Rablénse*, are probably only varieties of this species. Besser makes *P. Austrìacum* and *montànum* one species and *P. involucràtum* and *Rablénse* another. The petioles of the radical leaves are divided into 3 branches.

Austrian Sulphur-wort. Fl. Jul. Aug. Clt. 1804. Pl. 2 to 3 ft.

32 P. MONTA'NUM (Koch, umb. 94.) stem deeply furrowed, branched, and corymbose in the upper part, smooth, hollow; leaves thrice pinnate; leaflets pinnatifid, with elliptic-lanceolate segments; leaves of involucrum lanceolate, pointed, dependent,

entire, or 2-3-cleft, rarely pinnatifid; rays of umbel rough; ribs of fruit broad, obtuse. ♃. H. Native of England, Switzerland, and France, in boggy meadows. Selìnum montànum, Schleich. pl. exsic. Willd. enum. p. 306. Selìnum palústre, Lin. spec. p. 350. Smith, engl. bot. t. 229. Fl. dan. 257. Crantz, fl. austr. fasc. 3. p. 39. t. 4. f. 1.? D. C. fl. fr. 4. p. 320. Selìnum nígricans, Gaudin. fl. helv. 2. p. 333. Selìnum Austrìacum, Hall. fil. in Rœm. 1. f. 2. p. 4. Selìnum polymórphum, Spreng. pug. 2. p. 50. Schultes, syst. 6. p. 559. Root tapering, simple. Flowers white. There are several barren or abortive flowers in each partial umbel. Leaves dark green. The root is said to serve the Russians for ginger; and the whole herb abounds with a white, bitter, fetid juice, of the consistence of cream, which soon dries to a brown acrid resin. The milky exudation is the only character by which Tournefort distinguishes his *Thyoselìnum* from his *Oreoselìnum*.

Mountain Milk-parsley or Sulphur-wort. Fl. July. Britain. Pl. 4 to 5 feet.

33 P. alpe'stre (Lin. spec. 353.) stem terete, furrowed, branched; leaves thrice or 4-times ternate; leaflets linear, acute; involucrum of many reflexed leaves; umbels of many rays; involucels of many linear, acute leaves, rather shorter than the umbellules. ♃. H. Native country unknown. P. álbum, Desf. hort. par. cat. 119. Horn. hort. hafn. 1. p. 276. P. mìnus, Poir. suppl. 5. p. 228.? but not of others. The leaves agree with those of *P. montànum*. Flowers yellow.

Alp Sulphur-wort. Fl. June, July. Clt. 1739. Pl. 2 to 3 ft.

34 P. Wallichia'num (D. C. prod. 4. p. 181.) stem terete, branched: leaves supra-decompound; leaflets linear, cuspidate, smooth; involucra and involucels composed of cut leaves; ribs of fruit elevated; vittæ in the commissure 4. ♃. H. Native of the East Indies, at Sirinagur; and of Nipaul at Kamaon and Gosaingsthan. Selìnum tenuifòlium, Wall. mss. Leaves, habit, and involucrum like those of *P. involucràtum*. Ribs of fruit more elevated than in the rest of the species of the present genus, and nearly as in *Selìnum* exserted, but the commissure is broad, as in the other species of the genus.

Wallich's Sulphur-wort. Pl. 2 to 3 feet.

35 P. involucra'tum (Koch, umb. p. 94.) stem furrowed, angular, branched; leaves supra-decompound; leaflets linear, cuspidate, with scabrous margins; leaves of involucra cut; leaves of involucels lanceolate, with white membranous margins; umbels somewhat proliferous. ♃. H. Native of the Alps of Piedmont, near Fenestrelle. Selìnum peucedanoìdes, Desf. cat. hort. par. 1813. p. 142. Spreng. umb. spec. 75. Horn. hort. hafn. add. p. 960. Oreoselìnum peucedanoìdes, Hoffm. umb. p. 155. S. argénteum, All. pedem. no. 1304. but not of Crantz. Flowers white.

Involucrated Sulphur-wort. Fl. July, Aug. Clt. 1810. Pl. 2 to 3 feet.

36 P. Rable'nse (Koch, umb. p. 94.) stem sulcately striated; leaves supra-decompound; leaflets linear, cuspidate; involucra of many linear-subulate quite entire leaves; fruit elliptic, broadly margined. ♃. H. Native of Carinthia, in the valley of Rablensi; and on the mountains in the Alps of Bormio and of Generoso; and of Zealand, on the sea-shore. Férula Rablénsis, Wulf. in Jacq. coll. 4. p. 312. Selìnum lineàre, Schum. seel. 1. p. 95. Horn. fl. dan. t. 1330. Selìnum élegans, Balb. hort. taur. fasc. 1. p. 23. t. 4. Oreoselìnum Rablénse, Hoffm. umb. 155. Selìnum Rablénse, Gaudin, fl. helv. 2. p. 335. Flowers white.

Var. β, *Bellárdi* (D. C. prod. 4. p. 181.) leaflets longer than in the species; involucrum of few leaves. ♃. H. Native of Piedmont. Selinum Bellárdi, Balb. herb. cat. taur. 1821. p. 51.

Rablensi Sulphur-wort. Fl. Jul. Aug. Clt. 1817. Pl. 1 to 2 ft.

37 P. latifòlium (D. C. prod. 4. p. 181.) stem terete, striated; leaves pinnate, rather coriaceous; leaflets ovate-oblong, cartilaginously serrated, cut at the base; upper sheaths large, leafless; fruit elliptic, broadly margined. ♃. H. Native of grassy places at the river Volga, and of Caucasus. Selìnum latifòlium, Bieb. suppl. 211. Angélica lævigàta, Fisch. cat. hort. gor. 1812. Involucrum of many leaves. Teeth of calyx very short. Nearly as in *Imperatòria*.

Broad-leaved Sulphur-wort. Fl. July, Aug. Clt. 1816. Pl. 2 feet.

38 P. selinoi'des (D. C. prod. 4. p. 181.) stem terete, smooth; leaves tripinnate; leaflets rather remote, cuneated, pinnatifid: with lanceolate, acute segments; leaves of involucra membranous, cut a little. ♂. H. Native of Siberia. Selìnum Sibíricum, Retz. obs. 2. p. 15. Spreng. umb. spec. 71. Flowers white. Vittæ of fruit 4, parallel, and 2 superficial ones in the commissure, ex Spreng. Habit almost of *Gàya símplex*.

Selinum-like Sulphur-wort. Pl. 2 to 3 feet.

39 P. polyphy'llum (Ledeb. fl. ross. alt. ill. t. 309. fl. alt. 1. p. 314.) stem sulcately striated, branched; radical leaves numerous, bipinnate; leaflets pinnatifid, trifid, or entire: segments oblong or linear, acute, with smooth margins; leaves of involucrum lanceolate, with membranous margins, deciduous. ♃. H. Native of Altaia, on dry rocks at the rivers Tscharysch and Kerlyk, near Riddersk, Loktewsk, and elsewhere; on sandy hills, about Schulbinsk at the river Irtysch. Involucels of many leaves, like those of the involucrum. Flowers white; outer petals deeply emarginate, with an inflexed point. Mericarps with rather prominent ribs, girded by a broad margin. Vittæ 2 in the commissure, and 1 in each furrow: the outer ones as broad as the furrows.

Var. a, pubéscens (Led. fl. alt. 1. p. 315) segments of leaflets short, oblong, crowded, covered with fine down or thick short hairs; stem at most 2 feet high. ♃. H. Native on dry rocks, at the rivers Tscharysch, and Kerlyk.

Var. β, *glàbrum* (Led. l. c.) segments of leaflets longer, oblong-linear, more remote, glabrous; stem 3 feet high, or more. ♃. H. Native in sandy places, near Schulbinsk and Loktewsk.

Var. γ, *lineàre* (Led. l. c.) segments of leaflets elongated, linear, rather falcate, remote, glabrous; stem about 2 feet high. ♃. H. On rocks about Riddersk.

Many-leaved Sulphur-wort. Fl. June. Pl. 2 to 3 feet.

Sect. V. Angelicoi'des (containing plants having the habit of *Angélica*). D. C. prod. 4. p. 181.—Imperatòria, Koch, umb. 95. Margin of mericarps dilated. Commissural vittæ 2, superficial. Dorsal ribs 5, at equal distances. Vittæ 1 in each furrow. Involucrum wanting. Involucels of many leaves. Perhaps a species of *Imperatòria*, but differs in the calyx being 5-toothed.

40 P. verticilla're (Koch, umb. 95. in add.) stem terete, glaucous; floriferous branches verticillate; leaves bipinnate or tripinnate; leaflets ovate, toothed, acute: lateral ones unequal at the base: terminal one cordate. ♃. H. Native of Piedmont, near Torton (ex All. pedem. no. 1311. exclusive of the synonyme of Lam.); and probably of Italy (ex J. Bauh. hist. 3. p. 2. p. 167. f. 1.). Angélica verticillàris, Lin. mant. p. 217. Jacq. hort. vind. t. 130. Imperatòria verticillàris, D. C. fl. fr. 4. p. 287. Koch, umb. 95. Flowers greenish-yellow. Habit of *Imperatòria* or *Angélica*.

Whorled-branched Sulphur-wort. Fl. July. Clt. 1683. Pl. 4 to 6 feet.

† *Species not sufficiently known.*

41 P. Isete'nse (Spreng. umb. spec. p. 57. and in Schultes, syst. 6. p. 569.) stem angular, much branched; leaves ternately decompound; leaflets trifid and pinnatifid; segments lanceolate, cuspidate, veiny; umbels axillary; involucra and involucels of

many leaves. ♃. H. Native of Siberia, on the mountains.—Gmel. sib. 1. p. 190. t. 42. Root thick, fusiform. Habit of *Trínia*. Flowers cream-coloured. Fruit oval, a little winged. This species probably appertains to sect. *Thysselìnum*.

Isetsk Sulphur-wort. Fl. Ju. Jul. Clt. 1824. Pl. 2 to 3 ft.

42 P. Cre'ticum (Lin. spec. 354. ?) stem terete, knotted at the origin of the leaves; leaves glaucous, pinnate; leaflets multifid: segments linear; umbel of 8-10 rays; involucra of many short, reflexed leaves; fruit oblong, glabrous. ♃. H. Native of Candia. Ligústicum Créticum, fœniculi folio, caule nodoso, Tourn. cor. ex herb. Juss. The cut in Bauh. hist. 3. p. 2. p. 57 and 58. f. 1. agrees well with this plant, but the figure of P. Alp, exot. p. 328. cited by Linnæus, is very different from it.

Cretan Sulphur-wort. Pl. ?

43 P. microphy'llum (Smith, in Rees' cycl. no. 11.) leaves tripinnate; leaflets 3-lobed, fleshy; involucrum hardly any. ♃. H. Native of Siberia, in salt deserts about the Volga. Peucédanum salìnum, Pall. in Spreng. syst. 1. p. 910. Athamántha tenuifòlia, Willd. herb. ex Spreng. Involucrum of 1 setaceous leaf, which is also sometimes absent. Fruit unknown. A doubtful species.

Small-leaved Sulphur-wort. Pl. 2 to 3 feet?

44 P. Japónicum (Thunb. fl. jap. p. 117.) stem terete, flexuous, branched; leaves 5-times 3-parted; leaflets cuneiform, trifid; petioles broad, sheathing. ♃. H. Native of Japan, on the sea-shore. Sam-Bofu, Kœmpf. amœn. exot. p. 825. The whole plant is glabrous, and hardly a foot high. Mericarps compressed, ovate, scarcely winged.

Japan Sulphur-wort. Pl. 1 foot.

45 P. terna'tum (Nutt. gen. amer. 1. p. 182.) stem striated, few-leaved; leaves on long petioles, ternate; leaflets long, linear, acute, quite entire, attenuated at the base; involucrum almost wanting; involucels very short, 5-6-leaved; fruit oblong, elliptic, winged. ♃. H. Native of Carolina, in woods by the sides of marshes. Flowers unknown. Calyx entire. Margin of calyx thick. Probably a species of *Pastinàca*.

Ternate-leaved Sulphur-wort. Pl. 3 feet.

46 P. verticilla'tum (Rafin. fl. lud. p. 81.) leaves decompound; leaflets filiform: lower ones in whorls. ♃. H. Native of Louisiana, in humid places. Rob. trav. louis. 3. p. 461.

Whorled-leaved Sulphur-wort. Pl. 2 to 3 feet?

47 P. rupe'stre (Hoffmans. and Willd. in Schultes. syst. 6. p. 572.) leaves supra-decompound; leaflets linear, very narrow, tripartite; involucra and involucels of many leaves; umbellules usually 5-flowered. ♃. H. Native of Portugal. The rest unknown.

Rock Sulphur-wort. Fl. Jul. Aug. Clt. 1818. Pl. 2 to 3 ft.

48 P.? genicula'tum (Forst. fl. ins. aust. p. 136.) plant glabrous, branched, prostrate; stem terete, striated; leaves alternate, cuneated at the base, quite entire, semi-orbicular at the apex, and crenated; petioles shortly and bluntly auriculated at the base; umbels pedunculate, of 2-3 rays; involucrum of 2-3 leaves; umbellules many-flowered; petals inflexedly cordate at the apex. ♃. H. Native of New Zealand. Bowlèsia geniculàta, Spreng. umb. spec. 14. t. 5. f. 11. But it certainly is not a species of *Bowlèsia*, from the calyx being without teeth.

Kneed Sulphur-wort. Pl. prostrate.

49 P. Sprenge'lii (D. C. prod. 4. p. 182.) stem terete, branched; leaves bipinnate, lanceolate; leaflets pinnatifid, sessile: segments lanceolate, mucronate, veiny, with serrulately scabrous margins; floriferous branches panicled. ♃. H. Native country unknown. Selìnum paniculàtum, Spreng. pug. 2. p. 50. syst. 1. p. 909. Flowers yellow. Fruit with 3-winged margins, having the ribs obsolete, and the furrows plano-convex.

Sprengel's Sulphur-wort. Pl. 2 to 3 feet?

Cult. Any common garden soil will suit the species of *Peucédanum*; and they are easily increased by seeds.

XCVII. IMPERATO'RIA (so named from its supposed imperial virtues in medicine). Lin. gen. no. 352. Lag. am. nat. 2. p. 90. Koch, umb. p. 95. in add. D. C. prod. 4. p. 183.—Imperatòria species, Sprengel.—Peucédanum species, Koch.—Angélica species, Hoffm.

Lin. syst. *Pentándria, Digýnia.* All as in *Peucédanum*, but the margin of the calyx is obsolete.—Glabrous, perennial herbs. Stems terete, striated. Leaves biternate or triternate; leaflets ovate or oblong, serrated. Umbels large, compound. Involucra wanting; involucels of few leaves. Flowers white. Plants with the habit of *Angélica*.

1 I. Ostru'thium (Lin. spec. 372.) lower leaves biternate: upper ones less compound; leaflets broad, smooth, rough edged, finely and sharply serrated, partly cut or lobed, sometimes 3-cleft; sheaths of leaves dilated. ♃. H. Native of Europe and Newfoundland, in rather moist meadows and in woods; in Scotland, on the banks of the Clyde in several places, and in the Isle of Bute, near Mount Stuart. Professor Hooker mentions several stations in Scotland, chiefly about ancient residences, indicating its being a naturalised plant. Smith, engl. bot. t. 1380. Woodv. med. bot. t. 35. Lob. icon. 700. f. 1. Hayn. arz. gew. 7. t. 15. Lam. ill. t. 199. f. 1. Angélica officinàlis, Bernh. Selìnum Imperatòria, Crantz, aust. 1746. Peucédanum Ostrùthium, Koch, umb. 95. Nees. off. pfl. t. 7. Imperatòria, Rivin. pent. irr. t. 7. Ger. emac. 1001. f. 1. Mor. oxon. 3. p. 278. sect. 9. t. 4. f. 1. I. màjor, Bauh. pin. p. 156. Gaud. prod. t. 55. Laserpítium Germánicum, Fuchs. hist. 763. with a figure. Astrántia, Dod. pempt. 320. with a figure. Clus. hist. vol. 2. p. 194. with a figure. Smýrnion, Trag. hist. 433. with a figure. Flowers white or pale flesh-coloured. Root fleshy, tuberous, somewhat creeping, of an aromatic and acrid quality; long supposed a sovereign counter-poison, and celebrated as a powerful external as well as internal remedy in numerous disorders. It is said to be a sudorific, diuretic, and sialogogue; recommended in dropsy and debilities of the stomach and bowels; an infusion of it in wine is said to have cured quartans that have resisted the bark. When chewed it excites a copious flow of saliva, with a warm and not disagreeable sensation in the gums, and frequently cures the rheumatic toothache. The mericarps are broadly winged. The plant is cultivated in several places for the London market.

Var. β, *triternàta*; leaflets 3-parted, or nearly ternate. ♃. H. Native in the region of the Mediterranean. Imperatòria triternàta, Viv. in litt.

Sparrow or Common, or Great Masterwort. Fl. June, July. Britain. Pl. 1 to 2 feet.

2 I. angustifòlia (Bell. in Horn. hort. hafn. 1. p. 286.) leaves biternate; leaflets oblong, attenuated at the base, acuminated at the apex, deeply serrated; sheaths dilated. ♃. H. Native of Piedmont, in the Alps of Tenda, near Limon. Schultes, syst. 6. p. 609. Peucédanum Imperatoroìdes, Link, enum. 1. p. 269. Angélica angustifòlia, Hoffm. umb. 161. Imperatòria mìnor, Mor. oxon. sect. 9. t. 4. Lob. icon. t. 700. f. 1. Flowers white.

Narrow-leaved Master-wort. Fl. June, July. Clt. 1819. Pl. 1 to 2 feet.

3 I. Cauca'sica (Spreng. prod. umb. 17. and in Schultes, syst. 6. p. 609.) leaves biternate; leaflets ovate, cuneated, deeply lobed: middle one petiolate, somewhat 3-lobed; involucra usually of 1 leaf; involucels unilateral, of 3 leaves, pendulous. ♃. H. Native of Caucasus and Iberia, in woods. Selìnum Caucásicum, Bieb. fl. cauc. 1. p. 213. Stev. mem. soc. mosc. 3. p. 259. Oreoselìnum Caucásicum, Bieb. suppl. 209. The

plant has the appearance of a species of *Ligústicum*. Fruit winged, as in *Peucédanum*, sect. iv. but the calycine teeth are obsolete, and the involucrum is wanting, as in the other species of *Imperatòria*.

Caucasian Masterwort. Pl. 1 to 2 feet.

4 I. Mexica'na (Hort. Chelsea). ♃. H. Native of Mexico. A broad-leaved species, received by Mr. Anderson, of the Chelsea Botanic Garden, from Mr. Otto, of the Botanic Garden at Berlin, in the year 1818, but it has not yet flowered. It may prove hereafter to belong to a distinct genus.

Mexican Masterwort. Clt. 1818. Pl. 3 to 4 feet.

Cult. Plants of easy culture; and may be either increased by dividing the roots or by seed.

XCVIII. CALLI'SACE (from καλλος, *kallos*, beauty, and σακος, *sakos*, a buckler; fruit). Fisch. in Hoffm. umb. ed. 2. p. 170. exclusive of some species. D. C. prod. 4. p. 184. Koch, in litt.

Lin. syst. *Pentándria, Digýnia*. Margin of calyx somewhat 5-toothed or nearly obsolete. Petals oval, acuminated, incurved. Fruit compressed on the back, winged on the margin, nearly orbicular, emarginate at the base. Mericarps with 3 blunt, dorsal, nerve-formed ribs; the 2 lateral ribs expanded into wings, which cover the whole surface of the fruit. Vittæ 1 in each dorsal furrow, which are narrow, and 1 on each side of the commissure at the margins. Parts of carpophore adnate to the mericarps. Seed complanate.—A perennial herb, with the habit of *Angélica* or *Ostéricum*. Sheaths of leaves large: upper ones leafless. Umbels pubescent, of many rays. Involucra none, or of few leaves. Umbellules dense, many-flowered. Involucels of many setaceous leaves. Flowers white. This is an intermediate genus between *Angélica* and *Imperatòria*.

1 C. Dahu'rica (Fisch. in litt. D. C. prod. 4. p. 184.). ♃. H. Native of Dahuria, near Nertschinsky-Sawod. Thysselìnum Dahùricum, Spreng. syst. 1. p. 894. Habit of *Ostéricum praténsis*, but more branched, firmer, and thicker in the stem. Habit also of *Angélica Razoúlsii*, but the leaves are more deeply serrated, the sheaths larger and inflated, and the involucrum composed of one or two leaves.

Dahurian Callisace. Fl. Jul. Aug. Clt. 1816. Pl. 2 to 3 ft.

Cult. See *Imperatòria* above for culture and propagation.

XCIX. BU'BON (from βουβων, *boubon*, the groin, or a tumour in that part, or elsewhere, which this herb was supposed to cure). Koch, umb. 95. D. C. prod. 4. p. 184. but not of Spreng.—Bùbon species, Spreng. in Schultes, syst.—Agasýllis species, Spreng. prod.—Galbanóphora, Neck. elem. no. 292.

Lin. syst. *Pentándria, Digýnia*. Margin of calyx obsolete. Petals obovate, entire, with an acute involute point. Fruit lenticularly compressed from the back, girded by a dilated complanate margin. Mericarps with 5 ribs at equal distances: the 3 intermediate ones filiform: and the 2 lateral ones lost in the complanate margins. Vittæ covering the whole seed, 4 on the back and 2 in the commissure. Carpophore bipartite. Seed rather convex, flattish in front.—Quite smooth shrubs, natives of the Cape of Good Hope, abounding in a gummy, resinous, sweet-scented juice. Stems terete. Leaves biternate, glaucous, stiffish; leaflets toothed or pinnatifid; petioles sheathing. Umbels compound, of many rays. Involucra and involucels of many linear leaves. Flowers greenish yellow.

1 B. Ga'lbanum (Lin. spec. p. 364.) leaflets cuneated, rhomboid, deeply toothed at the apex: terminal ones 3-lobed. ♄. G. Native of the Cape of Good Hope, on hills. Jacq. vind. 3. t. 36. Thunb. fl. cap. 253. Berg. cap. 77. Woodv. med. bot. 34. t. 12. Sims, bot. mag. 2489. Selìnum Gálbanum, Spreng. in Schultes, syst. 6. p. 563. Agasýllis Gálbanum, Spreng, prod. 22. Pluk. alm. t. 12. f. 2. Herm. par. 163. with a figure. Dorsal vittæ of fruit under a thick pericarp. Stem with purplish bark, covered with whitish powder. This was formerly supposed to be the plant which yielded the drug called gum galbanum; but it has lately been discovered to be the produce of quite a different plant, a native of Persia, now called *Gálbanum officinàle*.

Galbanum Bubon. Fl. Jul. Aug. Clt. 1596. Sh. 4 to 10 ft.

2 B. gummi'ferum (Lin. spec. 364.) leaflets cuneated at the base, pinnatifid: segments lanceolate, acute. ♄. G. Native of the south of Africa. Selìnum gummíferum, Spreng. in Schultes, syst. 6. p. 564.—Comm. hort. amst. 2. p. 115. t. 58. Like the preceding, but differs in the leaves being more finely divided. Dorsal vittæ of fruit superficial.

Gum-bearing Bubon. Fl. Jul. Clt. 1731. Pl. 2 to 6 feet.

3 B. læviga'tum (Ait. hort. kew. ed. 1. vol. 1. p. 352. ed. 2. vol. 2. p. 146.) leaves bipinnate; leaflets lanceolate, bluntly and obsoletely crenated; fruit glabrous. ♄. G. Native of the south of Africa. Férula lævigàta, Spreng. umb. spec. p. 88. Flowers yellow. Fruit thick, solid, with 3 dorsal obtuse ribs (ex Spreng.). Leaves glaucous.

Smooth Bubon. Fl. Mar. Dec. Clt. 1774. Sh. 4 to 10 ft.

Cult. A mixture of loam, peat, and sand is a good soil for these shrubs; but they can only be propagated by seed.

C. ANE'THUM (ανηθον, *anethon*, of Theophrastus and Dioscorides, from ανω, *ano*, upwards, and θεω, *theo*, to run; from the quick growth of the plant). Tourn. inst. p. 317. t. 69. Gærtn. fr. 91. t. 21. Hoffm. umb. 1. p. 117. t. 1. f. 13. Lag. am. nat. 2. p. 91. Koch, umb. p. 91.—Anèthum species, Lin. —Pastinàca species, Spreng.

Lin. syst. *Pentándria, Digýnia*. Margin of calyx obsolete. Petals roundish, entire, involute, with a somewhat quadrate retuse point. Fruit lenticularly compressed from the back, girded by a complanate margin. Ribs of mericarps filiform, at equal distances: the 3 intermediate ones acutely keeled: and the 2 lateral ones more obsolete, and running into the flattened margin. Vittæ broad, solitary in the furrows, and filling them, but twin in the commissure. Seed rather convex, flattish in front. —Annual, erect, glabrous herbs. Leaves decompound, with linear-setaceous lobes. Involucra and involucels wanting. Flowers yellow, nearly like those of *Pastinàca*.

1 A. se'getum (Lin. mant. 219.) fruit oval, nearly destitute of the membranous margins. ☉. H. Native of France, Portugal, Sardinia, Greece, Persia, &c. Jacq. hort. vind. t. 132. D'Urv. enum. p. 33. Brot. fl. lus. 1. p. 465. Mèum ségetum, Guss. prod. fl. sic. 1. p. 346. Anèthum gravèolens, Ucria, ex Guss. A. pusíllum, Hortul. Perhaps only a variety of the following, according to Brotero; but it differs from it in the mericarps being almost without a margin, and in being rather more convex on the back, and therefore holds an intermediate station between *Anèthum* and *Fœnículum*.

Corn-field Dill. Fl. June, Jul. Clt. 1796. Pl. ½ to 1 foot.

2 A. grave'olens (Lin. spec. 377.) fruit elliptic, girded by a flat, dilated margin. ♂. H. Native of the south of Europe, Egypt, and about Astrachan, in corn-fields; and in meadows towards the Caspian sea, between Sallian and Lenkeran; also of the Cape of Good Hope and the Island of Timor; of South America, about Buenos Ayres. Fl. dan. 1572. Brot. fl. lus. 1. p. 464. Hayn. arz. gew. 7. t. 17. Woodv. med. bot. 159. Plench. icon. 215. Blackw. 545. Pastinàca Anèthum, Spreng. in Schultes, syst. 6. p. 587. Anèthum mìnus, Gouan. ill. p. 20. Selìnum Anèthum, Roth. fl. germ. 1. p. 143. Fœnículum vulgàre, Hook. in Beech. bot.—Riv. pent. t. 13.—Mor. umb. t. 1. f. 22.—Fuchs. hist. p. 30. Lob. icon. 776. The common dill is a plant of upright growth, somewhat similar to fennel,

but smaller and more glaucous; it has finely divided leaves, and a slender single stem. The whole plant is powerfully aromatic. The leaves are used to heighten the relish of some vegetable pickles, particularly cucumbers; and also occasionally in soups and sauces. The whole herb is also used in medicinal preparations. Dill is raised from seed, of which half an ounce is sufficient for a bed 3 feet by 4 feet. Sow annually in February, March, or April, or occasionally in autumn, as soon as the seed is ripe, to come up stronger in the spring, in any open compartment, either in drills, 6 or 12 inches apart, or broad-cast thinly, and raked in evenly. The plants should remain where raised, and may be thinned moderately, should they rise too thick. They will shoot up in stalks, with leaves and seed umbels in summer and autumn, for use in proper season. Leave some plants when raised for seed; they will furnish plenty in the autumn. The bruised herb is anodyne and resolvent. The seeds are aromatic, and contain an etherial oil, and useful, therefore, in flatulencies; the essential oil is also good in the colic. A distilled water, drawn off to the quantity of a gallon to a pound of seeds, was ordered in the London Pharmacopæia, and occasionally made the basis of carminative draughts, and juleps; its flavour is more agreeable than that of the seeds in substance. Along with the water arises a considerable quantity of essential oil, which is given from 1 to 3 or 4 drops, or more, as a carminative. This, however, is now altogether disused.

Strong-scented or Common Dill. Fl. June, July. Clt. 1573. Pl. 2 feet.

3 A. SO'WA (Roxb. hort. beng. p. 22.) fruit oblong, nearly destitute of a membranous margin. ⊙. H. Native of the East Indies, where it is called *Sowa*, and where it is cultivated for its use in medicine. Fleming. ind. med. in soc. asiat. 11. p. 156. ex Schultes, syst. 6. p. 628. Herb very like the preceding. Rays of umbel 5-16. Fruit flat, 3-ribbed, almost wingless.

Sowa Dill. Fl. June, July. Clt. 1810. Pl. 1 foot.

† *Species not sufficiently known.*

4 A. CYMBOCA'RPUM (D. C. prod. 4. p. 186.) fruit elliptic, puberulous on the outside, when examined by a lens, with a very narrow margin. ⊙. H. Native of Persia, about Seidkhodzi, where it was collected by Szowits. Plant small, glabrous. Root slender, simple. Leaves many-parted: lobes linear. Umbels pedunculate, opposite the leaves, 3-6-rayed, without involucra. Umbellule 6-7-flowered, surrounded by an involucel. Flowers unknown, but probably yellow, as the other species. Fruit appearing turgid at first sight, ellipsoid, but empty inside, from the mericarps being thin and concave. Carpophore filiform, bipartite. Mericarps of the same structure as the other species of the genus.

Boat-fruited Dill. Pl. 1 foot.

5 A.? ERYTHRÆ'UM (D. C. prod. 4. p. 186.) fruit elliptic, glabrous, hardly marginate; mericarps flattish; involucra and involucels of 4 or 5 leaves. ⊙.? H. Native of Persia, in gravelly places, at the foot of Mount Avrin, in the district of Khoi, in the province of Aderbeijan, where it was collected by Szowits. Herb glabrous. Stem terete, purplish. Leaves small, multifid, with small obtuse lobes. Umbels on long peduncles, 7-12-rayed. Involucra of 5-7 leaves. Umbellules 12-15-flowered; involucels of 5-7 short leaves. Petals white, ovate, acute. Mericarps sometimes flat, and sometimes rather concave, fuscous on the outside, and purplish inside. Very like *A. ségetum*.

Red-stemmed Dill. Pl. 1 foot.

Cult. All the species grow very well in the open border, where the seeds should be sown.

CI. CO'RTIA (in honour of Bonav. Corti, who was the first to discover the motion of molecules in the cells of plants). D. C. prod. 4. p. 186.—Schúltzia species, Wall.

LIN. SYST. *Pentándria, Digýnia.* Teeth of calyx elongated, acute. Petals lanceolate, acuminated, entire. Stylopodium conical; styles diverging. Fruit elliptic, rather retuse at both ends; mericarps flattish, 5-ribbed: ribs winged: lateral ribs the broadest; vittæ 1 in each furrow, and 2 in the commissure, which is broad and flat. Seed flattish.—A nearly stemless herb. Leaves petiolate, pinnate; leaflets divided into short, capillary segments. Scapes, some of them thick and stem-formed, bearing an involucrum, composed of 2-3 multifid leaves; others are elongated, and bearing an umbel, which is usually of few rays. Involucels of 5-7 linear, entire, or 2-3-cleft acute leaves. This genus differs from *Schúltzia* in the calyx being 5-toothed, and in the fruit being compressed from the back, not from the sides. evidently 5-winged.

1 LINDLE'II (D. C. prod. 4. p. 187.). ⊙. H. Native of Nipaul, at Gosaingsthan. Schúltzia Lindlèii, Wall. mss. Habit almost of *Caldàsia*.

Lindley's Cortia. Pl. 1 foot?

Cult. Sow the seeds in the open border in spring, in a warm sheltered situation.

CII. CAPNOPHY'LLUM (from *καπνος, kapnos*, the Greek name for fumitory, and *φυλλον, phyllon*, a leaf; resemblance in leaves to those of fumitory). Gærtn. fruct. 2. p. 32. t. 85. Koch, umb. p. 95. no. 24. in add.—Cònium species, Auct.—Rùmia, Link. but not of Gærtn.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals oblong, somewhat emarginate, tapering into an inflexed point. Fruit lenticularly compressed, girded by a complanate, dilated margin. Mericarps having the 3 intermediate ribs thickish, keeled, rather flexuous or tubercled: the 2 lateral ribs lost in the dilated margins. Vittæ solitary in the furrows, and twin in the commissure. Seed rather convex, but flat in front.—Annual herbs, natives of the Cape of Good Hope, with leaves almost like those of fumitory, whence the name. Leaves hoary, multifidly decompound, with linear, cuneated segments. Umbels opposite the leaves, or nearly terminal. Involucra and involucels composed of 3-6 leaves, with membranous edges. Flowers white.

1 C. AFRICA'NUM (Koch, l. c.) umbels of 2-5 rays; involucra and involucels of 3 leaves; central flower of each umbellule fertile and nearly sessile, the rest nearly all pedicellate and sterile. ⊙. H. Native of the Cape of Good Hope, in sandy places. Cònium Africànum, Lin. mant. p. 352. Burch. cat. pl. afr. no. 362. Burm. pl. cap. p. 7. Thunb. fl. cap. 257. Koch, umb. 95. Rùmia Capénsis, Link. enum. hort. berol. 1. p. 271.

African Capnophyllum. Pl. 1 foot.

2 C. JACQUI'NI (D. C. prod. 4. p. 187.) umbels of 9-10 rays; involucrum of 5-6 leaves; umbellules containing many fertile flowers. ⊙. H. Native of the Cape of Good Hope. Cònium Africànum, Jacq. hort. vind. t. 194. Cicùta Africàna, Lam. dict. 2. p. 4. Cònium rugòsum, Thunb. fl. cap. p. 258. Leaves thicker than those of the first species.

Jacquin's Capnophyllum. Fl. June, Sept. Clt. 1759. Pl. 1 foot.

Cult. Sow the seeds in a warm sheltered situation in spring.

CIII. TIEDEMA'NNIA (in honour of Professor Tiedemann, of Heidelberg, a vegetable physiologist). D. C. coll. diss. 5. p. 51. t. 12. prod. 4. p. 187.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx 5-toothed (f. 64. *a*.). Petals acuminated, reflexed (Ell.); anthers erect, adnate to the sides of the filaments (Ell.). Fruit flatly com-

pressed (f. 64. *c.*) from the back. Mericarps with 5 filiform, rather keeled ribs, at equal distances, approximate: lateral ribs dilated into a membranous margin (f. 64. *c.*), broader than the fruit. Vittæ solitary in the furrows, and filling them, and twin in the commissure. Carpophore bipartite. Seed flat.—Glabrous herbs, natives of North America, in marshes. Stems terete. Leaves reduced to the petioles, which are terete, acute, fistular, and jointed, without any leaflets. Involucra and involucels of 4-5 subulate leaves. Flowers white.—Habit of *Sium*, *Œnánthe*, and *Ottòa*, but the fruit is that of *Anèthum*, and the anthers are very different from those of all other umbelliferous plants.

1 T. teretifo'lia (D. C. prod. 4. p. 187.). ⊙? H. Native of Carolina. Œnánthe filiformis, Walt. car. p. 113. but not of Lam. Œnánthe Caroliniénsis, Pers. ench. 1. p. 318. Pursh, fl. bor. amer. 1. p. 194. Sium teretifòlium, Ell. sketch. 1. p. 354. (fig. 64.)

Terete-leaved Tiedemannia. Pl. 1 foot.

Cult. Sow the seeds of this plant in a pot filled with peat, and place a pan of water under it.

FIG. 64.

CIV. ARCHEMO'RA (from Archemorus, in mythology, son of Lycurgus, slain by an adder; in reference to the poisonous quality of the plants). D. C. coll. diss. 5. p. 52. prod. 4. p. 188.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals obcordate, with an inflexed point. Fruit compressed from the back, flat, oval, or obovate. Mericarps with 5 filiform, rather keeled ribs at equal distances, approximate; lateral ones dilated into a membranous margin, which is almost broader than the seeds. Vittæ solitary in the furrows, and filling them; but twin in the commissure. Carpophore bipartite. Seed flat.—Marsh herbs, natives of North America. Leaves pinnate. Involucrum wanting, or of few leaves; involucels of many leaves. Flowers white. Habit of *Œnánthe* or *Sium*. Fruit of *Pastinàca*.

1 A. ambi'gua (D. C. prod. 4. p. 188.) stem smooth; leaves pinnate: with 3-5 pairs of linear, sessile, undivided, acute leaves; involucrum wanting: involucels of 3-5 subulate leaves; fruit oval. ♃. B. H. Native of New Jersey, and about Philadelphia, in marshes. Œnánthe ambígua, Nutt. gen. amer. 1. p. 189. Pastinàca ambígua, Torr. fl. un. st. 1. p. 315. Sium longifòlium, Pursh, fl. amer. sept. 1. p. 194. Habit almost of *Œnánthe peucedanifòlia*, ex Nutt. Hardly distinct from the following. This is a truly poisonous herb.

Ambiguous Archemora. Pl. 6 to 10 feet.

2 A. ri'gida (D. C. prod. 4. p. 188.) stem striated; leaves pinnate; leaflets sessile, oblong-lanceolate, marginate, almost entire; involucrum wanting; involucels of 6-8 subulate leaves; fruit oval. ♃. B. H. Native of New Jersey, Pennsylvania, Maryland, and Carolina, in bogs and marshes. Sium rígidus, Lin. spec. p. 362. Sison marginàtum, Michx. fl. bor. amer. 1. p. 168. Œnánthe rígida, Nutt. gen. amer. 1. p. 189. Pastinàca rígida, Spreng. in Schultes, syst. 6. p. 586. Torr. fl. un. st. 1. p. 314. This plant is very poisonous, according to Barton, comp. fl. phil. 1. p. 142.

Stiff Archemora. Fl. July, Aug. Clt. 1774. Pl. 2 to 3 ft.

3 A. tricuspida'ta (D. C. prod. 4. p. 188.) leaves pinnate; lower leaflets lanceolate: upper ones obovate, tridentate; involucrum caducous. ♃. B. H. Native of Carolina, in humid places. Sium tricuspidàtum, Ell. sketch. 1. p. 354. Sium rigídius, Walt. car. 114. According to Elliot, this is very like the preceding species.

Tricuspidate-leafletted Archemora. Pl. 2 feet?

4 A. denticula'ta (D. C. prod. 4. p. 188.) leaves pinnate; with usually 3 pairs of oval, denticulated, acute leaflets; involucra of 2 leaves, rarely wanting. ♃. B. H. Native of Georgia, in humid places, and along the sides of water. Stem 3-4 feet high.

Denticulated-leaved Archemora. Pl. 3 to 4 feet.

Cult. The species of *Archemòra* grow best in peat earth, in a moist situation; and they will be easily increased by dividing at the root.

CV. PASTINA'CA (from *pastinum*, a dibble; in reference to the form of the root). Tourn. inst. 319. t. 170. Lin. gen. no. 362. Lag. am. nat. 2. p. 92. Kunth, umb. p. 90. f. 26 and 27. D. C. prod. 4. p. 188.—Pastinàca and Malabaíla, Hoffm. umb. p. 122 and 125.—Pastinàca species, Spreng.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete, or minutely denticulated. Petals roundish, entire, involute: with a broad, retuse point. Fruit compressed from the back, girded by a dilated, complanate margin. Ribs of mericarps very slender: the 3 dorsal ones at equal distances: and the 2 lateral ones contiguous to the dilated margin. Vittæ linear, acute, hardly shorter than the ribs, solitary in the furrows, but twin or more in the commissure. Carpophore bipartite. Seed flat.—Herbs with fusiform, usually fleshy roots. Leaves pinnate; leaflets toothed, cut, or lobed. Umbels compound. Involucra and involucels none, or of very few leaves. Flowers yellow.

1 P. sati'va (Lin. spec. 376.) stem furrowed; leaves pinnate, downy beneath; leaflets ovate, serrated, and cut: the terminal one 3-lobed; involucra and involucels generally wanting, but there is occasionally a solitary leaf under the general as well as partial umbels; teeth of calyx obsolete; fruit oval; commissure of fruit furnished with 2 vittæ. ♂. H. Native of Europe, even to Caucasus, in meadows. In Britain, about the borders of fields, on hillocks and dry banks in a chalky soil. North America, on the banks of the Saskatchawan and Red river. South America, about Buenos Ayres. Hoffm. umb. 123. t. 1. f. 11. Hayn. arz. gew. 7. t. 16. Smith, engl. bot. t. 556. Mart. fl. rust. 83. Lam. ill. t. 206. Selìnum Pastinàca, Crantz, aust. 161. Anèthum Pastinàca, Wib. werth. p. 911. P. opàca, Horn. hort. hafn. add. p. 961. P. sylvéstris, Huds. 125. P. sylvéstris, latifòlia, Raii, syn. 206. Mor. oxon. 3. p. 314. sect. 9. t. 16. f. 2. Pastinàca, Trag. hist. 439. f. 440. Riv. pent. irr. t. 6. Sìser sylvéstre, Fuchs, hist. 753. with a figure. Root spindle-shaped, white, aromatic, mucilaginous, and sweet, with a degree of acrimony, which it loses by cultivation, becoming var. *β*, the eatable garden parsnip. Flowers yellow: the innermost ones of the umbel frequently abortive. The leaves are sometimes downy on both surfaces.

Var. β, edùlis (D. C. prod. 4. p. 189.) leaves glabrous on both surfaces, shining above; root thick, fleshy. ♂. H. P. doméstica, Math. valgr. 2. p. 106. with a figure. Lob. icon. 709. Blackw. 379. Cam. epit. 507. with a figure. P. satìva, Mill. dict. no. 2.

The garden parsnip, is called *Panais*, in French, *Pastinake* in German, and *Pastinaca* in Italian. It has smooth leaves, of a light yellowish green colour, in which it differs from the wild plant, the leaves of which are downy and dark green; the roots also are thick and fleshy, and have a milder taste; it does not differ so much from the native plant, as the cultivated does from the native carrot.

Use.—The parsnip has long been an inmate of the garden, and was formerly much used. In Catholic times it was a famous

Lent root, being eaten with salted fish. "In the north of Scotland," Mr. Neill observes, "parsnips are often beat up with potatoes and a little butter; of this excellent mess the children of the peasantry are very fond, and they do not fail to thrive upon it. In the north of Ireland a pleasant table beverage is prepared from the roots, brewed along with hops. Parsnip wine is also made in some places; and they afford an excellent ardent spirit when distilled after a similar preparatory process to that bestowed on potatoes, destined for that purpose." The following are the varieties:—

1 *Common parsnip, large swelling parsnip, swelling parsnip.*—The leaves are long; roots generally from 20-30 inches long, and from 3-4 in diameter.

2 *Guernsey parsnip, Jersey parsnip, panais long* of the French, *panais coqune* of Guernsey.—The leaves are somewhat stronger and taller than those of the common sort. The roots are also larger and more perfect, about 3 or 4 feet long.

3 *Hollow-crowned parsnip, hollow-headed parsnip, panais Lisbonaise* of Guernsey.—In this variety the leaves are shorter and not so numerous as in the common parsnip; the roots are oblong, about 18 inches long, more swollen at the top, and not tapering gradually, but ending rather abruptly, about 4 inches in diameter at the shoulder.

4 *Turnip-rooted parsnip, panais rond, Siam parsnip.*—The leaves of this sort are few, and do not exceed 12 or 13 inches; the roots are from 4-6 inches in diameter, funnel-shaped, tapering very abruptly, with a strong tap-root, the whole being from 12-15 inches long. The shoulder is broad, and grows above the surface of the soil. The flavour of this parsnip is superior, and when dressed is of a yellower colour than the other varieties.

Soil.—The soil most proper for the parsnip should be light, free from stones, and deep. It should be dug or trenched before sowing, at least 2 spits deep; and the manure should either be perfectly decomposed, or if recent, deposited at the bottom of the trench.

Seed estimate and sowing.—Sow in the end of February, or in March, but not later than April, and for a seed-bed 5 feet by 20, the plants to remain thinned to 8 inches' distance, half an ounce of seed is the usual proportion. Having prepared either beds 4 or 5 feet wide, or one continued plot, sow broadcast, moderately thin, and rake the seed well into the ground.

Culture.—When the plants are about 1-2 or 3 inches high, in May or June, let them be thinned and cleared from weeds, either by hand or by small hoeing, thinning them from 8 to 12 inches' distance. Keep them afterwards clean from weeds, till the leaves cover the ground, after which no further culture will be required. The roots will be pretty large by the end of September, from which time a few may be drawn for present use: but the parsnip is far best at full maturity, about the close of October, indicated by the decay of the leaf. The root will remain good for use till April and May following.

Preserving during winter.—The parsnip is not so liable as the carrot to be hurt by frost if left in the ground. But it would be proper in the beginning of November, when the leaves decay, to dig up a portion of the roots, and to cut the tops off close, laying them in sand, under cover, ready for use in hard frosty weather. The rest will keep good in the ground till they begin to shoot in the spring: then in February or March dig them up; cut the tops off; and, preserved in sand, the roots will remain sound till about the end of April.

To save seed.—Transplant some of the best roots in February, 2 feet asunder, inserted over the crowns; they will shoot up in strong stalks, and produce large umbels of seeds, ripening in autumn.

Field culture of the parsnip.—The parsnip has been partially introduced of late years as a field plant, and is nearly equal to the carrot in its product of nutritive and saccharine matter. Its culture as a field plant has chiefly been confined to the island of Jersey, where it attains a large size, and is much esteemed for fattening cattle and pigs. It is considered rather more hardy than the carrot, and its produce is said to be greater. It may be sown either in autumn or spring, and its seeds admit of drilling by machinery. The plants, when they come up, are more easily recognised than carrots, and therefore their culture is on the whole more simple, less dependent on manual labour, and therefore more suited to farming. For the rest their culture is the same as that of the carrot. The variety best suited for the field is the *Large Jersey*, the seed of which should be procured from the island, as that of the garden parsnip sold by seedsmen never attains the same size. The quantity of seed required for sowing in drills is from 4 to 5 lbs. per acre, and for broad-cast 6 or 8 lbs. It must always be new, as two year old seed does not come up freely. It may or may not be prepared by steeping, but it requires no earth or sand intermixed with it, as it passes freely through the same drill that will sow tares or pease. The time of sowing is generally about the middle of February; but some sow in September, in which case the seed does not vegetate till early in spring. This last method is obviously against the culture of the soil, which must thus remain a year in a consolidated state. The manner of sowing is generally in drills 15 or 18 inches distant; but some sow broad-cast and harrow in the seed; and in Jersey, parsnips and beans are generally cultivated together. The beans are first dibbled in, and afterwards the parsnip seed scattered over the surface and harrowed. It is acknowledged that a good crop of both plants is never obtained; and therefore, though this mode may be found to answer in the mild climate of Jersey, it is not to be imitated in other places. Drills or broadcast, without any intermixture of plants, are the only adviseable modes. The after culture of the parsnip is the same as that for the carrot, with this difference, that the parsnip, when sown broad-cast, is generally thinned out to 12 inches at an average, plant from plant, and when in rows 18 inches apart, to 9 inches in the row. The produce of the parsnip is said to be greater than that of the carrot, and the economical application the same. In the fattening of cattle it is found equal if not superior, performing the business with as much expedition, and affording meat of exquisite flavour, and a highly juicy quality. The animals eat it with much greediness. It is reckoned that thirty perches, where the crop is good, will be sufficient to fatten an ox 3 or 4 years old, when perfectly lean, in the course of 3 months. They are given in the proportion of about 30 pounds weight morning, noon, and night; the large ones being split in 3 or 4 pieces, and a little hay supplied in the intervals of those periods. And when given to milch cows with a little hay in the winter season, the butter is found to be of as fine a colour and as excellent a flavour as when feeding in the best pastures. Indeed, the result of experiment has shown that not only in neat cattle, but in the fattening of hogs and poultry, the animals become fat much sooner, and are more bulky than when fed with any other root or vegetable; and that, besides, the meat is more sweet and delicious. The parsnip leaves being more bulky than those of carrots may be mown off before taking up the roots, and given to cows, oxen, or horses, by whom they will be greedily eaten. Their produce in nutritive matter is 99 parts in 1000, of which 9 are mucilage and 90 sugar. Gerarde says, that a very good bread was made from them in his time. They afford as much spirit as the carrot. The parsnip being more hardy and luxuriant than the carrot, is less liable to the mildew and worms; but equally so to become forked if the soil be not deep and well pulverised, and if the manure be not minutely divided and equally distributed.

Cultivated or Garden Parsnip. Fl. Jul. Brit. Pl. 3 to 4 ft.

2 P. latifo'lia (D. C. mem. soc. vol. 4. prod. 4. p. 189.) stem terete, striated, pubescent, as well as the petioles and leaves on the under surface; leaves pinnate; leaflets of the lower leaves large, and dilated at the base, and rather cut; of the cauline leaves ovate; involucra and involucels wanting; teeth of calyx obsolete; fruit oval: having the commissure furnished with 2 vittæ. ♃. H. Native of Corsica, where it was gathered by Soleirol. It differs from *P. satìva* in the stem being terete, not furrowed; and from *P. divaricàta* in the fruit being oval, not orbicular, in the commissure being furnished with 2 vittæ, not with 4-6; and from the other species in the leaflets of the radical leaves being large.

Var. α, *velutìna* (D. C. prod. 4. p. 189.) leaves clothed with velvety pubescence on both surfaces. ♃. H. Native of Corsica, at St. Florent. P. Kòchii, var. latifòlia, Duby, in D. C. bot. gall. 1. p. 220.

Var. β, *glabràta* (D. C. prod. 4. p. 189.) leaves glabrous above, hardly pubescent beneath. ♃. H. Native country unknown, but cultivated in the botanic garden at Geneva.

Broad-leaved Parsnip. Fl. Ju. Jul. Clt. 1830. Sh. 3 to 4 ft.

3 P. divarica'ta (Desf. cat. hort. par. 1815. p. 139.) stem terete, striated; leaves pinnate, clothed with short pubescence on both surfaces; radical leaves with 9-11 leaflets: cauline ones with 3-5; leaflets ovate, cuneated at the base, or cordate, undivided, sharply serrated: teeth mucronate; terminal leaflet larger and somewhat 3-lobed; involucra and involucels wanting; fruit nearly orbicular. ♃. H. Native of Corsica, at Bastia. P. gravèolens, Salzm. exsic. Koch, umb. 91. but not of Bieb. P. satìva, Thom. exsic. P. velutìna, Koch, in litt. P. Kòchii, var. Duby, in bot. gall. 1. p. 230. Vittæ 4-6 in the commissure, usually interrupted, 2 of which are generally larger than the rest.

Divaricate Parsnip. Pl. 3 to 4 feet.

4 P. lu'cida (Lin. mant. 58.) stem furrowed, much branched; leaves glabrous, stiff, crenated, reticulated beneath: radical ones cordate, usually lobed; cauline leaves ternate or quinate; leaflets attenuated at the base: upper ones ovate-rhomboid; umbels numerous, rather panicled; involucra of 1 leaf; fruit orbicular. ♂. H. Native of Balearic Islands. Gouan. ill. 19. t. 11, 12. Jacq. hort. vind. t. 199. Root thick, milky. Stem when cut yielding a whitish, fetid, rue-like, tenaceous gum. Flowers yellow.

Shining Parsnip. Fl. June, Jul. Clt. 1771. Pl. 3 to 4 ft.

5 P. umbròsa (Stev. in litt. ex D. C. prod. 4. p. 189.) stem furrowed, angular; leaves pinnate, pubescent on the nerves and petioles; leaflets oval-oblong, serrate-toothed: terminal leaflet somewhat 3-lobed; umbels numerous, rather panicled; involucels dimidiate; fruit oval. ♃. H. Native of Tauria. This species was formerly confused with *P. gravèolens*, but is truly distinct from it.

Shady Parsnip. Pl. 2 to 3 feet.

6 P. stenoca'rpa (D. C. prod. 4. p. 189.) stem striated, glabrous; leaves smoothish, pinnate; leaflets decurrent, oblong-linear, cut, and toothed: involucra wanting; involucels of few leaves; fruit oblong.—Native of Siberia. Umbels and umbellules of many rays. Fruit 3 lines long and a line broad, quite glabrous; lateral ribs not expanded into wings, but all filiform, as well as the vittæ. Vittæ twin in the commissure, solitary in the dorsal furrows, and often wanting in the lateral furrows.

Narrow-fruited Parsnip. Pl. 2 to 3 feet?

7 P. grave'olens (Bieb. fl. taur. 1. p. 237.) stem furrowed; leaves pinnate, hoary from short down; leaflets ovate, lobed, and toothed; involucels dimidiate; fruit oval. ♃. H. Native of Caucasus, at Sarepta, and of Tauria and Podolia. Schultes, syst. 6. p. 584. Malabaíla gravèolens, Hoffm. umb. p. 126. and 209. t. 1. B. f. 6. Heracleum gravèolens, Spreng. umb. tent. 1. p. 12.

Strong-scented Parsnip. Fl. Jul. Aug. Clt. 1817. Pl. 2 ft.

8 P. Se'kakul (Russ. besch. alep. p. 157.) stem terete, downy, branched; leaves pinnate, puberulous; leaflets pinnatifid, cut, bluntly and unequally toothed; peduncles villous; involucra none; involucels of 1-2 leaves; fruit ovate-orbicular. ♂. H. Native of Syria, about Aleppo; and of Egypt, near Alexandria. Heracleum pùmilum, Viv. in litt. Tordýlium suavèolens, Delille, ill. fl. ægypt. no. 323. Pastinàca dissécta, Vent. cels. t. 78. Sécacul, Rauw. reis. 1. p. 746. ex Vent. J. Bauh. hist. 3. p. 66. with a figure.—Moris, oxon. sect. 9. t. 4. ultimate figure, and therefore Tordýlium Sékakul, Mill. dict. no. 5. Root grey on the outside and white inside, edible. According to Olivier this species of parsnip is cultivated in the Levant under the name of *Sekakul*.

Sekakul Parsnip. Pl. 1 to 2 feet.

9 P. pimpinelloi'des (Bieb. fl. taur. 1. p. 237. suppl. 247.) stem angular, branched; leaves pinnate, pubescent; leaflets rather trifid, cut: segments cuneated, deeply serrated: lower ones reflexed: upper ones linear-lanceolate; involucra of 1-3 leaves; involucels of 4-5 leaves, dimidiate, deciduous; fruit orbicular. ♂. H. Native of Caucasus and Iberia, in grassy places; and of Persia, near Seidkhodzi, in sandy places. Buxb. cent. 3. t. 27. Mill. fig. t. 266. Malabaíla pimpinellifòlia, Hoffm. umb. 126. and 209. t. 1. f. 6. a. b. Heraclèum pimpinellifòlium, Spreng. tent. 12.

Pimpinella-like Parsnip. Fl. Jul. Aug. Clt. 1818. Pl. 2 ft.

10 P. obtusifo'lia (D. C. prod. 4. p. 190.) plant glabrous; stem terete, a little branched; leaves pinnate and ternate; leaflets pinnatifid, thick: lobes obovate, obtuse, quite entire; involucra of a few very short leaves; fruit obovate. ♃. H. Native of Spain, and on the shore of the Euxine sea. Peucédanum obtusifòlium, Sibth. and Smith, fl. græc. t. 277. prod. 1. p. 189. and in Rees' cycl. no. 10. Petals cream-coloured. Fruit with rather tumid margins. Nearly allied to *P. pimpinellifòlia*.

Obtuse-leaved Parsnip. Pl. 1 to 2 feet.

Cult. The species are only to be increased by seed, which should be sown in spring in the open ground.

CVI. LEIO'TULUS (from λειος, *leios*, smooth, and *ους ωτος*, *ous otos*, an ear; in allusion to the smooth dilated margin of the fruit). Ehrenb. in Linnæa. 1829. p. 399. D. C. prod. 4. p. 669.

Lin. syst. *Pentándria, Digýnia.* Teeth of calyx obsolete. Petals roundish, entire, involute, with a broad retuse segment. Fruit flatly compressed, having a smooth thickened dilated margin: and 3 intermediate approximate ribs, and 2 very remote lateral ones; vittæ filiform, solitary in the furrows, and distant in the commissure.—Herb a span high. Leaves bipinnatifid. Involucrum wanting. Involucels of a few very fine entire leaves, but often wanting altogether. Flowers yellow.

1 L. Alexandri'nus (Ehrenb. l. c.)—Native of Egypt, near Alexandria, on hills towards Rosetta.

Alexandrian Leiotulus. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

Cult. Sow the seeds in a warm sheltered situation in the open ground.

CVII. ASTYDA'MIA (a mythological name, daughter of Oceanus; the plant grows on the borders of the ocean, in the Canary Islands). D. C. coll. diss. 5. p. 53. t. 1. f. D. prod. 4. p. 190.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 6-toothed. Petals obovate, entire, with an inflexed acumen. Stylopodium thick; styles very short. Fruit compressed from the back, girded by a thick, dilated margin; mericarps rather spongy, furnished with 3 crested, approximate, short ribs on the back:

the 2 lateral ribs lost in the margin. Dorsal vittæ very few, and the commissural ones are either wanting or covered. Seed unknown.—A smooth, fleshy subshrub. Leaves pinnate; leaflets cuneated, deeply toothed at the apex: ultimate ones confluent. Umbels compound. Involucra and involucels of many leaves. Flowers yellow. It differs from *Críthmum* and *Bupleùrum* in the fruit being compressed from the back, and in the calyx being 5-toothed; and from *Heraclèum* in the vittæ not being club-shaped, and in the petals being entire; and from *Laserpítium* in the ribs being hardly elevated, and in the petals being entire; and from *Pastinàca*, to which it is most nearly allied, in the fruit being rather fungous and a little crested, with the margins hardly flattened.

1 A. Canarie'nse (D. C. prod. 4. p. 190.). ♄. G. Native of Teneriffe, on rocks by the sea-side. Críthmum latifòlium, Lin. fil. suppl. p. 180. Tenòria Canariénsis, Spreng. umb. spec. p. 20. t. 6. f. 13. and in Schultes, syst. 6. p. 377. exclusive of the synonyme of Cav. Laserpítium crithmifòlium, Link, in Buch. can. p. 151. Heráceum Canariénse, Choisy, in herb. D. C. Root thick. Stem terete, sparingly branched, a foot high. Leaves rather glaucous; petioles sheathing. Upper leaves reduced almost to the petioles. Umbels 15-rayed; umbellules 10-12-rayed. Involucra of 5-7 oblong, rather concave leaves.

Canary-island Astydamia. Fl. Jul. Clt. 1780. Sh. 1½ ft.

Cult. This plant will require the same treatment as is recommended for *Críthmum*, p. 321.; but it will require shelter in winter.

CVIII. SYMPHYOLO'MA (from *συμφυω*, *symphuo*, to glue together, and *λωμα*, *loma*, a fringe; the margins of the mericarps are closely joined together). Meyer, verz. pflanz. p. 127.

Lin. syst. *Pentándria Digýnia.* Margin of calyx obsolete. Petals equal, emarginate, with an inflexed point. Stylopodium without a margin. Styles reflexed. Fruit elliptic, compressed from the back, flat, with rounded margins; mericarps closely joined together at the margins; with 5 filiform ribs: the 3 dorsal ones at equal distances: and the lateral ones more remote and almost marginating. Vittæ wanting or obsolete. Seed complanate. Carpophore wanting.—A humble herb. Leaves with 3-5, nearly orbicular leaflets. Involucra none. Petals red. Fruit very singular in its structure, by the mericarps being closely joined at the margins.

1 S. grave'olens (Meyer, l. c.). ♃.? H. Native of the Alps of Tafandagh, in Eastern Caucasus, among fragments of schist.

Strong-scented Symphyoloma. Pl. humble.

Cult. See *Pastinàca* above for culture and propagation.

CIX. HERACLE'UM (Heracles, Hercules; sacred to him). Lin. gen. p. 345. Lam. ill. t. 200. Lag. am. nat. 2. p. 92. Koch, umb. 89.—Heraclèum, Spondýlium, and Wéndia, Hoffm.—Spondýlium, Tourn. inst. p. 319. t. 170.—Heraclèum species, Spreng.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-toothed. Petals obovate, emarginate, with an inflexed point: outer ones usually radiating and bifid. Fruit flatly compressed from the back, girded by a flat, dilated margin. Mericarps with slender ribs: the 3 dorsal ones at equal distances: and the 2 lateral ones remote from the others, contiguous to the dilated margin. Vittæ solitary in the furrows, and usually twin in the commissure, all flat: dorsal ones 4.—Strong, coarse, robust herbs, with broad, pinnate, ternate, or lobed leaves; petioles large and sheathing. Umbels of many rays. Involucra caducous, usually of few leaves; involucels of many leaves. The species are extremely intricate, and difficult to define.

Sect. I. Tetrate'nium (from *τετρα*, *tetra*, four, and *ταινια*, *tainia*, vitta; in reference to the commissure being furnished with 4 vittæ). D. C. prod. 4. p. 191. Commissure furnished with 4 vittæ. Flowers not radiating, cream-coloured.

1 H. Nepale'nsis (D. Don, prod. fl. nep. p. 185.) stem furrowed, rather hairy; lower leaves having the petioles twice trifid, biternate: with tripartite leaflets; upper leaves ternate: with rather 3-lobed leaflets; leaflets all ovate, acute, and equally serrated, rather hairy above, and pubescent along the nerves beneath; fruit elliptic; commissure furnished with 4 vittæ. ♃. H. Native of Nipaul. Flowers equal, yellowish. Knees of stems bearded with white wool.

Nipaul Cow-parsnip. Pl. 3 to 4 feet.

2 H. obtusifòlium (Wall. mss. ex D. C. prod. 4. p. 191.) stem striated, pubescent; leaves ternate or 3-lobed, roundish-cordate; leaflets or lobes obtuse, with a few coarse teeth, rather hairy above, and beset with whitish pubescence beneath; umbels of many rays; fruit obovate; commissure furnished with 4 vittæ. ♃. H. Native of Nipaul. Dorsal vittæ linear. Flowers not radiating, cream-coloured.

Obtuse-leaved Cow-parsnip. Pl. 3 to 4 feet.

3 H. ri'gens (Wall. mss. ex D. C. prod. 4. p. 191.) stem striated, pubescent; leaves ternate, with the petioles rather hairy; leaflets petiolate, orbicular, rather cordate at the base, toothed, scabrous from hairs above, pubescent beneath; upper leaves bluntly trifid; fruit obovate-elliptic; commissure furnished with 4 vittæ. ♃. H. Native of the East Indies. Cònium rígens, Heyne, ex Wall. Leaves of involucels lanceolate, striated, puberulous on the outside. Flowers not radiating, cream-coloured. Dorsal vittæ of fruit linear.

Stiff Cow-parsnip. Pl. 2 to 4 feet?

Sect. II. Euheracle'um (from *eu*, well, and *Heraclèum*; this section contains what are considered the true species of the genus). D. C. prod. 4. p. 191.—Heraclèum, Hoffm. umb. p. 141. D. C. prod. 4. p. 191. Commissure of fruit furnished with 2 vittæ. Umbels equal or radiating. Petals greenish-yellow.

4 H. flave'scens (Baumg. fl. trans. 1. p. 214.) leaves pinnate, rough from hairs; leaflets ovate or oblong; flowers yellowish, not radiating; commissure furnished with 2 vittæ. ♃. H. Native from Dauphiny to Siberia, in the grassy parts of mountains. Jacq. aust. 2. t. 173.

Var. α, *latifòlium* (D. C. prod. 4. p. 191.) leaflets lobed or palmately-parted, unequally crenate-serrated; flowers uniform, not radiating; fruit orbicularly oval, glabrous, emarginate at the apex. ♃. H. Native of Tauria, Caucasus, Siberia, Dahuria, and many other parts of Russia, in rather humid meadows. H. Sibíricum, Lin. mant. 354. Bieb. fl. taur. and suppl. no. 558. Hoffm. umb. 143. t. 1. B. f. 1. Schult. syst. 6. p. 475. H. Austrìacum, Pall. ind. taur. Spondýlium confórme, Mœnch, meth. p. 83.—Gmel. sib. 1. t. 50. From this plant a spirit is drawn at Kamtschatka, called raka, as related in Cook's voy. 3. p. 337. where the process of making the spirit is described. It is used also as food.

Var. β, *angustifòlium* (D. C. prod. 4. p. 191.) leaflets oblong, lanceolate, or linear, sinuately toothed, ultimate ones confluent. ♃. H. Native of Dauphiny, Vallais, Austria, Russia, &c. in waste, grassy fields. H. angustifòlium, Lin. mant. 56. Jacq. fl. aust. t. 173. H. Sibíricum of Lin. has been raised from the seeds of *H. angustifòlium*.

Yellowish Cow-parsnip. Fl. Ju. Jul. Clt. 1789. Pl. 4 to 6 ft.

5 H. Orsi'ni (Guss. pl. rar. p. 133. t. 27.) stem furrowed, muricated, almost simple; leaves simple, cordate, glabrous on both surfaces, rather coriaceous, obscurely lobed, and tripartite,

crenate-serrated; lobes acuminated; flowers rather radiating; involucra almost wanting; leaves of involucels linear; fruit obovate. ♃. H. Native of Abruzzo, in gravelly parts of mountains. Habit of *H. alpìnum*, but the flowers are greenish. Commissure of fruit furnished with 2 vittæ.

Orsin's Cow-parsnip. Pl. 2 to 3 feet.

6 H. AU'REUM (Sibth. and Smith, fl. græc. t. 282. prod. 1. p. 192.) stem much branched; leaves pinnate; leaflets lobed, cut, pubescent: of the radical ones roundish; umbels usually of 3 rays; flowers radiating; fruit orbicular; involucra and involucels almost wanting; vittæ semi-circular. ♂. H. Native on Mount Parnassus. Habit of *Pastinàca satìva*; but the petals are obcordate, with an inflexed mucrone. Flowers golden yellow. Vittæ linear.

Golden-flowered Cow-parsnip. Pl. 1 to 2 feet.

SECT. III. SPONDY'LIUM (*σπονδυλος, spondylos*, vertebra; resemblance in the articulations of the stem). Hoffm. umb. p. 129. D. C. prod. 4. p. 192. Commissure of fruit furnished with 2 vittæ. Umbels of many rays, radiating. Petals white.

7 H. LONGIFÒLIUM (Jacq. aust. t. 174.) leaves scabrous, pinnate, or pinnatifid from the coalition of the leaflets; leaflets or lobes elongated, deeply crenated; leaves of involucels linear-setaceous; fruit glabrous, cuneiform. ♃. H. Native of Austria, in alpine meadows. Host. fl. austr. 1. p. 374. An intermediate species between *H. flavéscens* and *Spondýlium*. Petals at first green, but at length becoming white, obcordate: outer ones radiating a little. Fruit larger and much more cuneated than in the above-mentioned species.

Long-leaved Cow-parsnip. Fl. May, Ju. Clt. 1800. Pl. 6 ft.

8 H. PALMATI'LOBUM (D. C. prod. 4. p. 192.) upper cauline leaves 5-parted from the top of the sheath, or 3-parted; outer lobes bipartite, all elongated, coarsely toothed, glabrous above, but roughish beneath; leaves of involucels linear-setaceous; fruit glabrous in all states, obovate. ♃. H. Native country unknown. Flowers white, radiating a little. It differs from *H. Spondýlium* in the leaves being palmate-parted, not pinnate-parted, less rough, and in the fruit being more obovate. Probably *H. élegans* of many authors is the same as this species.

Palmate-lobed-leaved Cow-parsnip. Pl. 4 to 5 feet.

9 H. SPONDY'LIUM (Lin. spec. 1. p. 358.) leaves ternate, pinnate, or pinnatifid from the coalition of the leaflets, scabrous; leaflets pinnatifid, cut, and serrated; leaves of involucels lanceolate, membranous, finely fringed, with long taper points; fruit orbicular, glabrous. ♂. H. Native of Europe, and probably of Siberia, in hedges, the borders of fields, and rather moist meadows, very common; plentiful in some parts of Britain. Smith, engl. bot. t. 939. Hayn. arz. gew. 7. t. 10. H. proteifórme, Crantz, aust. 3. p. 11. H. bránca ursìna, All. pedem. no. 1291. Spondýlium Raii, syn. 205. Ger. emac. 1009. with a figure. Camer. epit. 548. with a figure. Riv. pent. irr. t. 4. and of many other old authors. Spondýlium bránca, Scop. carn. no. 335. Spondýlium bránca ursìna, Hoffm. umb. 132. t. 1. f. 11.—Acánthus Germánica, Fuchs, hist. 53. with a figure. Cow-parsnip. Petiv. herb. brit. t. 24. f. 1. Root taper-shaped, whitish, aromatic, sweetish, and rather mucilaginous. Stem rough, with white hairs. Flowers more or less radiant, white or reddish. The whole plant is wholesome and nourishing food for cattle; and is gathered in Sussex for fattening hogs, being known by the name of *hog-weed*. The seeds are strong-scented, and are accounted diuretic and stomachic. Linnæus says the plant is used in Scania against dysentery. Gmelin says that the inhabitants of Kamtschatka, about the beginning of July, collect the footstalks of the radical leaves, and after peeling off the rind (which is very acrid) dry them separately in the sun, and then tying them in bundles, lay them up carefully in the shade in bags; in this state they are covered with a yellow saccharine efflorescence, tasting like liquorice; this being shaken off is eaten as a great delicacy. The Russians distil an ardent spirit from the stalks thus prepared, by first fermenting them in water, with the greater bilberries (*Vaccínium uliginòsum*), which Gmelin says is more agreeable to the taste than spirits made from corn.

Var. β, *angustifòlium* (Smith, fl. brit. 307.) leaves deeply pinnatifid; the 2 lowest lobes elongated, and spreading in a radiating manner. ♂. H. Native of Yorkshire. Mr. Woodward has found this variety growing on the same root with the common kind.

Var. γ, *élegans* (Jacq. austr. t. 175.) leaflets decussate, narrow, toothed. ♂. H. Native of Austria, Piedmont, &c.

Var. δ, *laciniàtum* (Desf. hort. par. ex D. C. prod. 4. p. 192.) leaflets cuneated, ovate, coarsely and deeply serrated. ♂. H. Native country unknown.

Var. ε, *subcanéscens* (D. C. prod. 4. p. 192.) leaves canescent beneath. ♂. H. Native of France. This variety differs from *H. Pyrenàica* in the ovaries being glabrous.

Spondylium or Common Cow-parsnip. Fl. Jul. Brit. Pl. 4 ft.

10 H. CA'SPICUM (Hortul. ex D. C. prod. 4. p. 192.) leaves pinnate, scabrous; leaflets elongated, cut, and toothed, acuminated; leaves of involucrum linear, broadest at the base; leaves of involucels setaceous, ciliated on both sides with long villi; fruit obovate, glabrous in all stages. ♃. H. Native about the Caspian sea. This species is sufficiently distinct from any of the varieties of *H. Spondýlium*.

Caspian Cow-parsnip. Fl. Ju. Jul. Clt.? Pl. 4 feet.

11 H. CA'NDICANS (Wall. mss. ex D. C. prod. 4. p. 192.) leaves ternate, clothed with hoary tomentum beneath, as well as on the stems and petioles, but smoothish above; leaflets petiolulate, cuneated at the base, trifid or pinnatifid: lobes irregularly toothed; leaves of involucels linear, acuminated, about equal in length to the rays; fruit obovate-oblong; vittæ linear. ♃. H. Native of the north of India, at Deyradoon and Kamaon.

Whitened Cow-parsnip. Pl. 4 to 5 feet.

12 H. LANA'TUM (Michx. fl. bor. amer. 1. p. 166.) leaves ternate, petiolate, tomentose beneath: upper ones 3-lobed; leaflets petiolate, broad-ovate, roundish-cordate, lobed; leaves of involucels small, subulate; fruit broadly obcordate, oval. ♃. H. Native of Virginia, Pennsylvania, and Canada, as far as the Mackenzie river; moist banks of streams in north-west America, in humid pastures. Pursh, fl. amer. sept. 1. p. 181. Begel. fl. bot. p. 67. Torr. fl. bor. amer. 1. p. 313. H. Spondýlium, Cham. et Schlecht. in Linnæa. 1. p. 39. Petals said to be oblong. The plant is said to be very nearly allied to *H. Spondýlium*, but very distinct. The roots and stems of this plant are eaten by the Chenook Indians; and by the Cree Indians, under the name of Penpoon antic; *i. e.* flute stem; and the young stems are used by them as a pot-herb.

Woolly Cow-parsnip. Fl. Ju. Jul. Clt. 1810. Pl. 4 feet.

13 H. CORDA'TUM (Presl, del. prag. p. 135.) leaflets cordate-ovate, petiolulate, lobately pinnatifid, mucronately toothed, hispid beneath, as well as the petioles and stem, which is furrowed; leaves of involucels linear; involucra wanting; fruit glabrous, obovate, somewhat emarginate at the apex. ♃. H. Native of Sicily, in humid groves on the Nebrodes. Root black, sweet-scented, and is called *Angélica* by the Sicilians, and is used for the same purposes by them. H. Spondýlium and H. Pánaces Ucria, ex Guss. prod. fl. sic. 1. p. 364.

Cordate-leafletted Cow-parsnip. Pl. 4 to 6 feet?

14 H. PYRENA'ICUM (Lam. dict. 1. p. 403.) leaves very large, palmatifid, hoary from tomentum beneath; leaflets lanceolate, toothed or ternate; involucra of few leaves: young fruit covered with long hairs: adult ones glabrous, nearly orbicular.

♂. H. Native of the Eastern and Central Pyrenees, in rugged places; and of Italy, on the mountains; as well as of Croatia, Tyrol, and about Verona. D. C. fl. fr. 4. p. 315. H. amplifòlium, Lapeyr. abr. p. 153. Poll. ver. 1. p. 339. and H. setòsum, Lap. suppl. p. 44. ex Benth. cat. p. 89. H. platyphýllum, Ram. pyr. ined. H. alpìnum β, Pers. All the other synonymes added to this plant by Spreng. in Schultes, syst. 6. p. 577. are wrong or doubtful.

Pyrenean Cow-parsnip. Fl. June, July. Clt. 1798. Pl. 4 to 6 feet.

15 H. PA'NACES (Lin. spec. p. 358.) leaves pinnate, canescent beneath; leaflets on long petioles, cordate, usually 3-lobed, toothed; leaves of involucels linear-setaceous; young fruit bearing a few scattered hairs. ♂. H. Native of the southern Alps of Europe. Lob. icon. t. 701. f. 2. Mor. ox. sect. 9. t. 17. f. 3. H. setòsum, Lapeyr. abr. p. 153?

True Cow-parsnip. Fl. July, Aug. Clt. 1796. Pl. 6 feet.

16 H. A'SPERUM (Bieb. fl. taur. suppl. p. 224.) stem rough from strigæ; leaves deeply lobed, serrated, acute, scabrous above, pubescent beneath; umbels of 40 rays; leaves of involucra setaceous; fruit orbicularly elliptic, when young rather scabrous. ♂. H. Native of the north of Caucasus, on Mount Beschtau; and according to Koch also of the Alps of Bavaria and Tyrol. Spondýlium ásperum, Hoffm. umb. p. 134. Dorsal vittæ 2 longer than the lateral ones; all filiform; those in the commissure evidently clavate. In the cultivated plant the fruit is nearly glabrous even when young.

Rough Cow-parsnip. Fl. June, July. Clt. 1818. Pl. 6 to 8 ft.

17 H. VILLÒSUM (Fisch. in Schultes, syst. 6. p. 579.) leaves sinuately pinnatifid, sharply serrated, acuminated, clothed with hoary tomentum beneath; leaves of involucra and involucels setaceous, deflexed; umbels sparingly radiant; fruit elliptic, ciliated, woolly on the back. ♂. H. Native of Caucasus, in gravelly places on the margins of rivulets. Stev. obs. 1828. p. 72. H. Pyrenàicum, Bieb. fl. et suppl. no. 559. but not of Lam. H. decípiens and H. marginàtum, Hoffm. umb. p. 134. and 135. and probably H. gigánteum, Horn. hort. hafn. ex Prescott. Leaves as in *H. Pyrenàicum* hoary beneath, but differs in the young fruit being tomentose, and in the adult ones being roughly ciliated. Vittæ broad; the dorsal ones drawn out beyond the middle, and filling the furrows; the commissural ones short, rarely somewhat branched. There are varieties with larger and smaller fruit.

Var. β, subvillòsum (Hoffm. umb. gen.) fruit covered by scattered rather loose hairs; leaves less canescent beneath.

Villous Cow-parsnip. Fl. July. Clt. 1826. Pl. 4 to 6 feet.

18 H. PUBE'SCENS (Bieb. suppl. p. 225.) leaves pubescent beneath; cauline leaves ternate; leaflets somewhat palmately pinnatifid, toothed; segments and recesses acute; umbels of many rays; involucra of 1-2 leaves; involucels short, caducous, of few leaves; fruit elliptic, having the disk rather villous. ♂. H. Native of the south of Tauria, in shady places; and of Eastern Caucasus, in alpine places. Spondýlium pubéscens, Hoffm. umb. p. 134. H. speciòsum, Ledeb. hort. dorp. 77. H. Panàces, Steven. mem. mosc. 3. p. 259? To this species is probably referrible the H. gummíferum, Willd. enum. p. 312. hort. berol. 1. p. 53. t. 53. and t. 54. It differs, however, from H. Pyrenàicum and H. Panàces, in the young fruit being clothed with short down, not with long spreading down. Fruit glabrous in the adult state; having the dorsal vittæ slender, and drawn out beyond the middle, and being suddenly dilated into a club-shaped form at the apex. The young shoots are filled with a sweet aromatic juice, which is called Baldergan by the natives of Caucasus, and is eaten by them in a crude state.

Pubescent Cow-parsnip. Fl. July. Clt. 1823. Pl. 4 to 5 feet.

19 H. BARBA'TUM (Ledeb. fl. ross. alt. ill. t. 303.) leaves pinnate, with 2 pairs of leaflets; lower leaflets and terminal one sinuately pinnate-parted, petiolate: lobes acuminated, serrated: serratures ovate, acuminated; umbels radiant: fruit elliptic, beset with a few pili, somewhat emarginate at the apex; vittæ in the commissure parallel. ♂. H. Native of Altaia, in mountain meadows. Stem furrowed like the rest, beset with rigid pili, which rise from a callous or blackish point, and which are usually retrograde on the lower part of the stem; bearded with numerous pili at the knees. Petioles hispid, bearded at the insertion of the petioles. Leaves pubescent beneath, but green and furnished with a few stiff hairs beneath at the veins. Involucrum of one or few leaves, caducous; involucels of a few linear permanent leaves. To this plant may be referred the one in Gmel. fl. sib. 1. p. 213. no. 29. which Linnæus has cited for his H. Panàces. It is called *Sladkajatrawa*, i. e. a sweet herb, by the natives of Siberia, a name given by them to many other plants, as to Liquorice and Milk-vetch, &c.

Bearded Cow-parsnip. Pl. 4 feet.

20 H. DISSE'CTUM (Ledeb. fl. ross. alt. ill. t. 304. fl. alt. 1. p. 301.) leaves ternate; leaflets petiolulate: lateral leaflets pinnate-parted: terminal one palmate-parted: segments cut or pinnatifid, oblong, acuminated, serrated; umbels radiant; mericarps orbicularly elliptic, at length glabrous; commissural vittæ diverging. ♂. H. Native of Altaia, in meadows, near Tschetschulicha, and the metal mines at Riddersk; and elsewhere. H. laciniàtum, Fisch. in litt.? Stem deeply furrowed, sparingly pilose, hispid at the joints, villous towards the top. Leaves hispid above from a few thick hairs, but paler and pubescent beneath. Involucra wanting; involucels of a few linear leaves, which are variable in length. Flowers white.

Dissected-leaved Cow-parsnip. Fl. July. Pl. 3 feet.

21 H. DOUGLA'SII (D. C. prod. 4. p. 193.) leaves scabrous beneath, and on the petioles, glabrous above, ternate; leaflets petiolulate, cordate, 3-5-lobed, acuminated, toothed; leaves of involucra numerous, subulate at the apex; fruit obovate, glabrous: dorsal vittæ elongated, rather club-shaped; commissural vittæ 2, short, rather club-shaped, and 2 other small, nearly abortive ones. ♃. H. Native of the north-west coast of America. This may prove nothing but a variety of *H. lanàtum*.

Douglas's Cow-parsnip. Pl. 3 to 4 feet.

22 H. CUNEIFÓRME (D. C. prod. 4. p. 194.) leaves hispid beneath, as well as the petioles, glabrous above, pinnate; leaflets 3-5, petiolulate, cordate, lobed; lobes toothed, hardly acuminated; leaves of involucra many subulate; fruit obovate-cuneated, glabrous; dorsal vittæ filiform; commissural vittæ 2, rather clavate. ♃. H. Native country unknown, but probably of Siberia.

Cuneiform-fruited Cow-parsnip. Pl. 4 feet?

23 H. LIGUSTICIFÒLIUM (Bieb. fl. et suppl. no. 560.) leaves decompound, ternate or quinately pinnate, smoothish; leaflets cuneated, obtuse, deeply serrated; fruit villous; vittæ filiform, acute. ♂. H. Native of Tauria, on stony hills; and of Caucasus, in subalpine places above Nikita, ex Stev. obs. 1828. p. 71. H. montànum, Georgi in Willd. herb. ex Stev. Stem angular, pubescent, as well as the young leaves. Flowers white, radiant. Commissural vittæ equal in length to the dorsal ones.

Lovage-leaved Cow-parsnip. Fl. June, July. Clt. 1816. Pl. 2 feet.

24 H. CAUCA'SICUM (Stev. mem. soc. hist. nat. mosc. 3. p. 259.) leaves ternate; leaflets on long petioles, toothed, glabrous above, pubescently scabrous beneath: intermediate one 3-lobed. ♂. H. Native of Caucasus, on the mountains, at the river Jucharibasch. Flowers white, rather radiant. A plant like this from Iberia has the upper leaves ovate and 3-lobed, on long petioles, and the young fruit bristly.

Caucasian Cow-parsnip. Fl. June, July. Clt. 1818. Pl. 4 ft.

25 H. hu'mile (Sibth, et Smith, fl. græc. prod. 1. p. 193.) leaves rather bipinnate, cut, pubescent; stem nearly simple; umbels 4-7-rayed; fruit orbicular, smoothish. ♃. H. Native of Greece, on Mount Olympus. Umbels large. Stems hardly a hand high. Vittæ of fruit 4, red, oblong: the dorsal ones attaining the length of the middle.

Humble Cow-parsnip. Pl. ½ to ¾ foot.

Sect. IV. Carme'lia (from Mount Carmelo, the habitation of the species). D. C. prod. 4. p. 194. Fruit ornamented with thick adpressed stiff bristles. Vittæ not sufficiently known, but there are probably 4 dorsal ones, and 2 filiform hardly clavate commissural ones. Petals hispid; exterior ones radiant. Perhaps a proper genus, or perhaps only a species of *Zozímia* or *Pastinàca*.

26 H. Carme'li (Labill. syr. dec. 5. p. 3. t. 1.) leaves pinnate, scabrous from adpressed down beneath; leaflets ovate-oblong, deeply toothed: extreme one rather cordate, 3-lobed; rays of umbel 5, very unequal, contracted after flowering. ♂. H. Native of Syria, on Mount Carmel. Involucra and involucels composed of erect permanent setaceous leaves. Bristles on the stem and branches retrograde.

Carmelo Cow-parsnip. Pl. 2 to 3 feet?

Sect. V. We'ndtia (in honour of Frederick de Wendt, M. D. Professor of Medicine at Erlang). D. C. prod. 4. p. 194. Wéndia, Hoffm. umb. p. 136. Bieb. suppl. 227. Commissure without vittæ, or with 2 small obliterated vittæ. Umbels radiant. Petals white or rather rose-coloured.

27 H. alpi'num (Lin. spec. p. 359.) leaves cordate-roundish, smooth, palmately 5-cleft: lobes bluntish, crenately toothed, rarely cut; leaves of involucels setaceous; fruit obovate-orbicular. ♃. H. Native of the Alps of Jura, in pastures, and at the borders of woods; as well as of the Alps of Dauphiny, Provence, and the Pyrenees. D. C. fl. fr. 4. p. 316. H. testiculàtum, Lapeyr. suppl. p. 43.—C. Bauh. prod. 83. with a figure.—Barrel. icon. t. 55.

Alpine Cow-parsnip. Fl. June, July. Clt. 1739. Pl. 1 to 2 ft.

28 H. Austri'acum (Jacq. austr. t. 61.) leaves pinnate, with 2-3 pairs of leaflets, scabrous from scattered hairs on both surfaces; leaflets ovate-lanceolate, doubly serrated: terminal one somewhat 3-lobed. ♃. H. Native of Austria, Carniola, and Transylvania, in alpine meadows. Crantz, austr. 153. t. 1. Spondýlium Austrìacum, Scop. carn. ed. 2. vol. 1. p. 204. t. 1. To this Sprengel refers Tordýlium siifòlium, Scop. carn. no. 318. t. 8. but it differs in the petals being red, and in the fruit being hispid from villi.

Austrian Cow-parsnip. Fl. June, July. Clt. 1752. Pl. 2 ft.

29 H. Chroda'num (D. C. prod. 4. p. 194.) lower leaves ovate, somewhat lobed, serrated: superior ones cruciately pinnate; leaflets linear, all rather canescent beneath from down. ♂. H. Native of Caucasus, about Nartzana and Kobi, among grass on the mountains. Said not to be distinct from H. Austrìacum by Stev. obs. 1828. p. 70. Heraclèum longifòlium, Bieb. fl. taur. 1. p. 223. exclusive of the synonymes. Wéndia Chorodànum, Hoffm. umb. 139. t. 1. β, and in lit. f. 12, 13. Fruit obovate. Commissural vittæ wanting; but there are 4 dorsal ones which are clavate, and hardly attaining a third part of the length of the fruit. There is also a variety of this with rose-coloured flowers (H. ròseum, Stev. in mem. soc. mosc. 3. p. 260.) and more humble stem.

Chorodanum Cow-parsnip. Pl. 2 to 3 feet?

30 H. mi'nimum (Lam. dict. 1. p. 403.) plant dwarf, glabrous; leaves nearly all radical, bipinnate: leaflets lanceolate-linear, cut a little; involucra usually of one leaf; involucels wanting. ♃. H. Native of the Alps of Dauphiny, but rare. D. C. fl. fr. 4. p. 316. H. bipinnàtum, Cuss. H. pùmilum, Vill. dauph. 2. p. 640. t. 14. Peucédanum Vocontiòrum, Spreng. umb. spec. 51. Schultes, syst. 6. p. 571. It differs from *Peucédanum* in the petals being deeply emarginate; in the fruit being oval and flattened; in the vittæ extending nearly to the middle of the fruit, filiform, not saccate. It may hereafter prove also to be generically distinct from *Heràcleum*.

Small Cow-parsnip. Fl. May, July. Clt. 1810. Pl. 1 foot.

Sect. VI. Trichogònium (from θριξ τριχος, *thrix trichos*, a hair, and γωνια, *gonia*, an angle; in reference to the stems being bearded at the joints or knees). D. C. prod. 4. p. 195. Commissure without any vittæ. Umbels not radiant. Petals yellowish. Stems woolly or bearded at the joints.

31 H. Walli'chii (D. C. prod. 4. p. 195.) stem terete, hairy at the base, glabrous except at the knees or joints; leaves ternate, having a few scattered pili above, and bearing a few small ones at the nerves beneath; leaflets lanceolate, acuminated, serrated, undivided, or the lateral leaflets of the lower leaves are 2-lobed, and the terminal one 3-lobed. Involucra of 1-2 deciduous leaves.—Native of Nipaul. Fruit obovate, nearly orbicular, with 5 slender ribs. Vittæ 4, linear, drawn out a little beyond the middle of the mericarps.

Wallich's Cow-parsnip. Pl. 2 to 4 feet?

† *Species hardly known, but most of them may prove to be synonymous with those described above.*

32 H. tubero'sum (Molin. chil. ed. germ. p. 115. ex Willd. spec. 1. p. 1423.) leaves pinnate: with 7 leaflets; flowers radiant; root yellow, composed of tubers. ♃. F. Native of Chili. The rest unknown.

Tuberous-rooted Cow-parsnip. Pl. 2 to 3 feet?

33 H. Tau'ricum (Fisch. in litt. ex Loud. hort. brit. p. 109.) ♂. H. Native of Siberia. Perhaps the same as *H. villòsum*.

Taurian Cow-parsnip. Fl. Ju. July. Clt. 1820. Pl. 5 feet.

34 H. verruco'sum (Stev. in litt. ex Loud. hort. brit. p. 109.) ♂. H. Native of Tauria. Perhaps the same as *H. ásperum*.

Warted-stemmed Cow-parsnip. Fl. June, July. Clt. 1820. Pl. 7 to 8 feet.

Cult. All the species grow well in any soil, and are all easily increased by seed; and some of the perennial ones by dividing at the root.

CX. ZOZI'MIA (in honour of A. N. and Z. Zozima, distinguished editors of the Greek classics). Hoffm. umb. 1. p. 145. t. 1. β, f. 9. (under Zozìma,) Smith, in Rees' cycl. vol. 39. Bieb. suppl. 229. Koch, umb. 88. D. C. prod. 4. p. 195.—Heraclèum and Tordýlium species of authors.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-toothed. Petals obovate, emarginate, with an inflexed point. Fruit flatly compressed from the back, and rather convex in the middle, more or less hairy, girded by a smooth thickened dilated margin. Mericarps with very slender ribs, the 3 dorsal ones at equal distances, and the 2 lateral ones more remote, and contiguous to the dilated margin. Vittæ covering the whole seed, the dorsal ones solitary between the ribs, 4 on the back of each mericarp, and so large as to fill the furrows; but having 2 broad ones in the commissure. Carpophore bipartite. Seed flat.—Herbs, natives of the Levant, with decompound leaves, compound umbels, many leaved involucra and involucels, and white flowers, which are not radiant. This is an intermediate genus between *Heraclèum* and *Tordýlium*; but differs from the first of these in the margin of the fruit being thickened, not flat; and from the last in the margin of the fruit being smooth, not tubercular; and from both in the form and disposition of the vittæ.

1 Z. absinthifòlia (D. C. prod. 4. p. 195.) stem furrowed; leaves supra-decompound, hoary and pilose; leaflets lanceolate, rather remote, and somewhat trifid, cuneate at the base, short. ♂. H. Native of the Levant, between Bagdad and Kermancha; of Siberia, about Tiflis; of Caucasus, on Mount Beschtau, and on the mountains of Talusch, near Swant; and of Persia in stony places about Seidkhodzi. Heraclèum absinthifòlium, Vent. choix. t. 22. Schultes, syst. 6. p. 582. Sibth, fl. græc. t. 281. Heraclèum tomentòsum, Smith, prod. 1. p. 192. Tordýlium absinthifòlium, Pers. ench. 1. p. 314. Zozìma Orientàlis, Hoffm. umb. 1. p. 148. t. 4. Pastinàca incàna, Willd. herb. ex Stev. obs. ined. Pastinàca dissécta, Cels. hort. Leaves of involucra hoary; of the involucels about equal in length to the umbellules, which are dense. Fruit villous in the disk between the 3 dorsal ribs; but smooth on the margins.

Wormwood-leaved Zozimia. Fl. July, Aug. Clt. 1816. Pl. 2 feet.

2 Z. anethifo'lia (D. C. prod. 4. p. 196.) stem terete; leaves supra-decompound, glabrous, glaucous; leaflets linear, acute. ♂. H. Native of Persia, between Teheran and Ispahan. Habit of the first species. Involucra small, glabrous. Fruit more of an orbicular form than in *H. absinthifòlium*, and beset with scattered down over the whole disk, but when young rather pilose.

Fennel-leaved Zozimia. Pl. 2 feet.

Cult. The seeds of these plants should be sown in the open ground in spring. A light soil suits them best.

CXI. POLYTÆ'NIA (from πολυ, *poly*, many, and ταινια, *tainia*, vitta; the mericarps are furnished with many vittæ). D. C. coll. mem. v. p. 53. t. 13. prod. 4. p. 197.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-toothed. Petals oval, emarginate, with an inflexed point. Fruit oval, compressed from the back, which is lenticular, quite glabrous, with a smooth tumid margin, and a depressed dorsal area. Mericarps with very slender hardly distinct ribs. Vittæ twin between the ribs on the back, and 6 in the commissure. Carpophore indistinct. Seed complanate.—An American glabrous herb. Upper leaves tripartite, opposite. Lateral flowering branches opposite. Umbels terminal. Involucra none. Leaves of involucels setaceous. Flowers yellowish in the dried state. This genus is allied on the one hand to *Zozímia*, and on the other to *Tordýlium*.

1 P. Nutta'llii (D. C. l. c.) Native of North America, in the Arkansa territory. Tordýlium Americànum, Nutt. mss. Stem nearly terete. Leaflets trifid, cuneated at the base; lobes lanceolate, toothed at the apex.

Nuttall's Polytænia. Pl. 1 foot.

Cult. See *Zozímia* above for culture and propagation.

CXII. JOHRE'NIA (in honour of Mart. Dan. Johreni, who was the first to introduce the dichotomous method in botany). D. C. coll. mem. v. p. 54. t. 1. f. C. prod. 4. p. 196.

Lin. syst. *Pentándria, Digýnia.* Teeth of calyx obsolete, very blunt. Petals unknown. Stylopodium short, conical, a little furrowed; styles short, diverging, at length deciduous. Fruit oval, lenticularly compressed from the back, quite glabrous, rather spongy and suberose, with a tumid smooth margin, and a flat rather coloured dorsal area. Mericarps with 3 dorsal filiform ribs, which at length become brownish, and therefore probably contain vittæ; the 2 lateral ribs usually indistinct in the dilated margin: but sometimes rufous, and of the form of vittæ. Commissure spongy, without any vittæ, but furnished with 2 lines. Carpophore bipartite. Seed complanate.—A quite glabrous herb, native of the Levant. Stem terete, dichotomous. Lower leaves bipinnate; leaflets opposite, 2 pairs and an odd one, distant, divided into 2-5 linear acute lobes, which are confluent at the base; superior leaves parted into 3 linear elongated, quite entire lobes; upper ones reduced to a narrow elongated sheath. Umbels of 6-8 rays. Involucrum wanting or of one leaf; involucels of 4-5 linear-setaceous leaves.

1 J. dicho'toma (D. C. l. c.)—Native of the East, at Mount Lebanon. Hippomárathrum crithmi folio flore luteo, Vaill. herb.

Dichotomous Johrenia. Pl. 1 to 2 feet?

Cult. See *Zozímia* above for culture and propagation.

Tribe VIII.

TORDYLI'NEÆ (plants agreeing with *Tordýlium* in important characters), or Orthospérmæ paucijugàtæ annulàtæ, Koch, umb. p. 55. D. C. prod. 4. p. 196. Fruit lenticularly or flatly compressed from the back, girded by a thick dilated thickened knotted or plicate margin. Mericarps with 5 very slender or obsolete ribs: lateral ribs contiguous to the dilated margin, or forming the same. Seed flat. This tribe differs from tribe *Peucedàneæ*, in the margin of the fruit being ribbed or plicate, not smooth, and quite entire.

CXIII. HASSELQUI'STIA (so named by Linnæus in honour of his pupil Fred. Hasselquist, M.D. who travelled in the Holy Land, &c. and died at Smyrna in 1752: his travels are published). Lin. gen. 341. Spreng. umb. prod. p. 11. Koch, umb. 88. D. C. prod. 4. p. 197.—Tordýlium species, Lam. ill. t. 193. Lag. am. nat. 2. p. 93.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point; outer ones radiant, bifid. Fruit round the rays of the umbels flatly compressed, with a somewhat thickened accessory winged margin, which is hardly tubercularly wrinkled; those of the disk dissimilar, having one of the mericarps contracted into a hemispherical urceolus around the other, which is abortive. Mericarps with very slender ribs, the 3 dorsal ones at equal distances, and the 2 lateral ones contiguous to the thickened margin, or covered by it. Vittæ filiform, one in each furrow, and 2 in the commissure. Carpophore bipartite. Seed flattened. This genus hardly differs from *Tordýlium* unless in the unequal mericarps of the fruit, and in their margins being hardly wrinkled, and quite smooth in the disk on both sides, as in *Heráclеum*.

1 H. Ægypti'aca (Lin. amœn. 4. p. 270. exclusive of the synonymes,) stem hispid; leaves scabrous, pinnate; leaflets pinnatifid; segments bluntly lobed; involucra and involucels small, setaceous. ⊙. H. Native of Egypt and of Syria, on the sea shore. Jacq. hort. vind. t. 87. Tordýlium Ægyptìacum, Lam. ill. t. 193. f. 2. Poir. dict. 7. p. 711. Flowers white. In this species the flowers sometimes have 3-4 styles. Carpophore green. Styles white, erect.

Egyptian Hasselquistia. Fl. July. Clt. 1768. Pl. 1½ foot.

2 H. corda'ta (Lin. fil. suppl. p. 179.) plant pubescent; lower leaves ternate; leaflets ovate, rather cordate; superior leaves simple, cordate, toothed; leaves of involucra and involucels numerous, setaceous, reflexed. ⊙. H. Native of the Levant. Jacq. hort. vind. 2. t. 193. Tordýlium cordàtum, Poir. dict. 7. p. 712. Rays of umbels hispid. Leaves of involucels subulate, longer than the umbellules. Flowers white. Fruit as in most of the species of *Tordýlium* few, but unequal, as in *Hasselquístia*.

Cordate-leaved Hasselquistia. Fl. July. Clt. 1787. Pl. 2 ft.

Cult. The species being natives of warm climates, the plants are difficult to preserve through the winter. The surest way to procure good seed is to sow in autumn, and preserve the plants in a frame or green-house till spring, when they should be planted out in a warm sheltered situation.

CXIV. TORDY'LIUM (τορδυλιον of Dioscorides; said to

be from τορνος, *tornos*, a lathe, and ιλλω, *illo*, to turn; seeds). Tourn. inst. 320. t. 170. Lin. gen. no. 330. Spreng. prod. umb. p. 11. D. C. prod. 4. p. 197.

Lin. syst. *Pentándria Digýnia*. Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point; outer ones radiating and bifid. Fruit flatly compressed from the back, girded by a rugged tubercular thick accessory margin. Mericarps with very slender ribs; the 3 dorsal ribs at equal distances, and the 2 lateral ones contiguous to the thickened margin, or covered by it. Vittæ filiform, one or more in the furrows, and 2 or more in the commissure. Carpophore bipartite. Seed complanate.—Herbs, with pinnate leaves; leaflets ovate, deeply toothed. Involucra of many leaves. Flowers white. The two sections differ from each other in the number of vittæ.

Sect. I. Eutordy'lium (from *eu*, well, and *tordýlium;* this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 197.—Tordýlium, Hoffm. umb. 1. p. 198. t. 3. f. 3-4. A. Koch, umb. 87. f. 24, 25. Vittæ solitary in the furrows, and twin in the commissure.

1 T. Syri'acum (Lin. spec. p. 345.) plant pubescent; leaves pinnate; leaflets roundish, repandly toothed: terminal one ovate; involucra and involucels longer than the umbels. ⊙. H. Native of Syria, Caria, Asia Minor, and Greece. Jacq. hort. vind. 1. t. 54. Riv. pent. t. 3. Barrel. icon. t. 349.—Mor. ox. sect. 9. t. 16. f. 7. There is a variety of this with a simple erect stem; and another with diffuse procumbent stems.

Syrian Hart-wort. Fl. July. Clt. 1597. Pl. 1 foot high or procumbent.

2 T. ma'ximum (Lin. spec. 345.) stem scabrous or hispid from retrograde bristles; leaves pinnate; leaflets lanceolate, deeply serrated and notched: terminal one elongated; leaves of involucra and involucels linear, shorter than the umbels. ⊙. H. Native of middle and south Europe, Caucasus, and the Levant, in cornfields. In England on banks and waste ground, but rare; about London; under a hedge on the north side of the parks, Oxford; in a hedge about half a mile from Eton. Smith, engl. bot. 1173. Jacq. austr. t. 142.—Mor. ox. 3. p. 316. sect. 9. t. 16. f. 1.—Rivin. pent. irr. t. 1.—Lob. icon. 737. Heraclèum Tordýlium, Spreng. spec. umb. 49. T. mágnum, Brot. and T. Lusitánicum, Willd. does not differ from this species according to Link. Stem erect, branched, hollow. Leaves densely clothed with fine close bristly hairs, all directed towards the point; leaflets oblong-lanceolate, the lower ones ovate. Umbels dense, bristly. Flowers reddish, the outermost petal with equal lobes, the two next with extremely unequal ones.

Great Hart-wort. Fl. June, July. Britain. Pl. 3 to 4 feet.

Sect. II. Condyloca'rpus (from κονδυλος, *kondylos*, a finger joint, and καρπος, *karpos*, a fruit). Hoffm. umb. 1. p. 202. Koch, umb. p. 86. but not of Desf. D. C. prod. 4. p. 198. Vittæ numerous both in the furrows and commissure. In the commissure there are 4 in *T. Hasselquístiæ*, and therefore it is an intermediate plant between the two sections, as there are 8-10 in the commissure of the other species.

3 T. Hasselquí'stiæ (D. C. prod. 4. p. 198.) plant pubescent; leaves pinnate; leaflets roundish, repandly toothed: the terminal one in the lower leaves is reniformly cordate; leaves of involucra setaceous, shorter than the umbels: of the involucels similar, but longer than the umbellules. ⊙. H. Native of the Levant. Like *Hasselquístia cordàta*, but the character of the fruit is the same as that of *Tordýlium*. Habit of *T. officinàle*. Vittæ in the commissure 4, 2 curved and 2 straight.

Hasselquist's Hart-wort. Pl. 1 foot.

4 T. officina'le (Lin. spec. p. 345.) stem generally branched, furrowed, clothed with soft deflexed hairs; leaves pinnate, rough, hairy; leaflets ovate, cut, crenate, the odd one the largest, leaves of involucra and involucels lanceolate, acute; those of the latter about equal in length to the umbellules; radiant petals in pairs, with very unequal lobes. ⊙. H. Native of Portugal, south of France, Italy, Dalmatia, and Greece, in cultivated fields; possibly never seen at all in England, the *T. máximum* having been confounded with it; however, it is said to have been found by Mr. Doody about Isleworth, Ray, and about London. Petivier. Smith, engl. bot. 2440. fl. græc. 3. t. 267.—Colum. ecphr. t. 124. f. 1.—Mor, ox. 3. p. 316. sect. 9. t. 16. f. 6.—Dod. pempt. p. 313. f. 314. Lob. icon. 736.—Bauh. hist. 3. p. 84. f. 2. Small Hart-wort, Petiv. herb. brit. t. 24. f. 6. T. microspérmum, Ten. add. 1827. Condylocárpus officinàlis, Koch, l. c. Leaflets roundish or ovate, crenate, and variously cut. The radius of the umbellules formed of the very unequal outer petals of the flowers of the circumference, the large lobes of 2 flowers coming together, and resembling a single petal. These lobes are sometimes reddish. Fruit hairy on the disk, brown, with scarcely any ribs or veins; the border greatly elevated, tumid, neatly crenate transversely. *T. A'pulum* is readily distinguished from this species by having in each marginal flower only one radiant petal, with 2 equal lobes.

Officinal Hart-wort. Fl. June, July. Britain. Pl. 1 to 1½ ft.

5 T. A'pulum (Riv. pent. t. 2.) plant erect, villous below; leaves pinnate; leaflets of the lower leaves roundish, cuneated at the base, lobately crenated: of the upper ones pinnatifid, linear, acute; leaves of involucra and involucels setaceous; those of the latter shorter than the umbellules. ⊙. H. Native of Apulia and Greece, in cultivated fields. Lin. spec. 345. exclusive of the synonymes.—Jacq. hort. vind. t. 53. T. grandiflòrum, Mœnch, meth. p. 78. Condylocárpus A'pulus, Hoffm. umb. p. 203. T. insulàre, Clark in Spreng. neue entd. 3. p. 165. There is a variety of this which is almost glabrous below. Stem hairy at the joints.

Var. β, hùmile (D. C. prod. 4. p. 198.) plant of many stems; leaves for the most part radical: lower ones nearly bipinnatifid; involucels much shorter than the umbellules. ⊙. H. Native of Tunis, Sardinia, Istria, Malta, and Melos, in cultivated fields. T. hùmile, Desf. atl. 1. p. 235. t. 58. Condylocárpus hùmilis, Koch, umb. p. 87. T. A'pulum, Guss. prod. fl. sic. 1. p. 362. According to Smith in fl. græc. p. 61. there is no difference between *T. hùmile* and *T. A'pulum*.

Apulian Hart-wort. Fl. June, July. Clt. 1739. Pl. 1 to 1½ foot.

Cult. The seeds only require to be sown in the open border in spring. A light soil will suit the species best.

CXV. TORDYLO'PSIS (from *Tordy'lium* and οψις, *opsis*, appearance; plant resembling *Tordy'lium*). D. C. prod. 4. p. 199.—Tordylioìdes, Wall. mss.

Lin. syst. *Pentándria, Digýnia*. Margin of calyx 5-toothed: teeth acute: outer teeth the largest, dilated at the base, and cuspidate at the apex. Outer petals of umbels large and obcordately 2-lobed; the rest smaller, ovate, and cuspidate, entire, rarely a little 2-lobed. Stylopodium conical; styles 2, erect, elongated. Fruit hairy when young. The rest unknown.—Herb a foot high, more or less hairy. Stem terete, striated, erect, nearly simple. Petioles sheathing at the base. Leaves with 1-2 pairs of ovate cut toothed leaflets, and an odd one. Umbels terminal, 6-8-rayed. Involucra of 5-6 lanceolate linear acuminated leaves, which are almost longer than the rays. Umbellules crowded, 15-18-flowered. Leaves of involucels conforming to the leaves of the involucra, exceeding the flowers.—Habit almost of *Heráclеum*, but the involucra are of many leaves. It agrees also with *Tordýlium* in the hairiness, and in the corollas. The genus is very doubtful, the perfect fruit being unknown.

1 T. BRUNÒNIS (Wall. mss. ex D. C. prod. 4. p. 199.) ♃. F. Native of Nipaul, in Kamaon, towards Emodi.

Brown's Tordylopsis. Pl. 1 foot.

Cult. This plant should be grown in a pot, so that it may be placed under shelter in winter.

Tribe IX.

SILERI'NEÆ (this section contains plants agreeing with *Siler* in important characters,) or Orthospérmæ multijugàtæ lenticulàres, Koch, umb. 84. D. C. prod. 4. p. 199. Fruit lenticularly compressed from the back. Mericarps with 5 primary ribs, having the lateral ones of these marginating; and 4 secondary less prominent ones, these last are rarely wanting; all filiform and wingless. Seed flattish in front.

CXVI. KRUBE'RA (named after John Julius Kruber, M.D., a promoter of botany). Hoffm. umb. 1. p. 103. and 202. t. 1. β, f. 14. Koch, umb. 86. f. 32, 33. D. C. prod. 4. p. 199.—Capnophýllum spec. Lag. but not of Gærtn.—Ulospérmum, Link, hort. berol. 1. p. 267.—Tordýlium species, Lin.—Càchrys species, Spreng.—Cònium species, Desf.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point. Fruit lenticularly compressed from the back. Mericarps with thick plicately crenated ribs; the 3 intermediate ones elevated, blunt, and keeled: the 2 lateral ones marginating, roundish, keeled near the raphe. Vittæ none. Carpophore bifid. Seed flattish in front.—An herb, with multifid leaves, and short linear leaflets. Umbels not rayed, with very few male flowers. Involucra of 2-5 leaves; involucels of 4-5 leaves. Flowers white.

1 K. LEPTOPHY'LLA (Hoffm. umb. p. 104. t. 3.) ⊙. H. Native of the Canary Islands, Mauritania, Spain, Portugal, Sicily, Greece, and the Levant. Caúcalus Hispánica, Cam. hort. p. 37. t. 11. Tordýlium peregrìnum, Lin. mant. p. 55. Cònium dichótomum, Desf. atl. 1. p. 245. t. 66. Capnophýllum dichótomum, Lag. gen. et spec. 13. Càchrys dichótoma and C. peregrìna, Spreng. umb. spec. p. 21. Ulospérmum dichótomum, Link, enum. hort. berol. 1. p. 267. Tordýlium Lusitánicum cicutæ folio semine striato, Tourn. herb.

Fine-leaved Krubera. Fl. June, July. Clt. 1596. Pl. 1 to 1½ foot.

Cult. See *Tordýlium* above for culture and propagation.

CXVII. PACHYPLEU'RUM (from παχυς, *pachys*, thick, and πλευρον, *pleuron*, a rib; the ribs of the fruit are thick and corky). Led. fl. ross. alt. ill. and fl. alt. 1. p. 296.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx obsolete or minutely denticulated. Petals permanent; those of the disk flowers obovate-oblong, and emarginate with an acute inflexed point; those of the margins difformed: the 3 inner petals ovate, hardly emarginate, gradually attenuated into an acute inflexed point. Fruit lenticularly compressed from the back. Mericarps with 5 elevated thick corky ribs; the lateral ones marginating, and a little broader than the rest. Seed flattish in front. Vittæ wanting. Involucra and involucels of many leaves. This genus differs from *Krubèra*, to which it is very nearly allied, by the ribs of the fruit being equal, not plicately undulated; and in the very different habit.—A perennial herb, with a thick branched root. Stems solitary, rarely 2 or 3 from the same root, straight, about a foot high. Radical leaves on long petioles, bipinnate or tripinnate; leaflets oblong-linear, tapering at both ends, entire, glabrous, pale green. Cauline leaves for the most part only one, on a short petiole, very like the radical ones. Umbels of many rays. Leaves of involucra and involucels oblong or oblong-linear, with white margins.

1 P. ALPI'NUM (Led. fl. ross. alt. ill. with a figure, fl. alt. 1. p. 297.) ♃. H. Native in alpine or subalpine places, about the metal mines near Riddersk, and on Alp Aigulac.

Alpine Pachypleurum. Fl. May, July. Pl. 1 foot.

Cult. The plant will grow in any kind of soil; and can only be increased by seed.

CXVIII. AGASY'LLIS (the Greek name of the Ammoniac plant). Hoffm. umb. 176. Koch, in litt. D. C. prod. 4. p. 199.—Agasýllis species, Spreng.—Càchrys species, Bieb.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals lanceolate, incurved. Fruit oval, compressed from the back; mericarps with 5 primary obtuse ribs: the 2 lateral ones of these more humble than the rest, and placed in front of the short accessory margin: the secondary ones sometimes absent. Seed a free nucleus, which is flat on one side, and rather convex on the other, covered with many vittæ, 8-10 on the back, and 5-6 in the commissure.—A perennial herb, with the habit of *Càchrys*. Stem succulent. Leaves pubescent, ternately decompound; leaflets decurrent, lanceolate, serrated, a little lobed. Involucra wanting. Umbels of many rays. Leaves of involucels numerous, setaceous. Flowers white.

1 A. CAUCA'SICA (Spreng. umb. prod. p. 22. f. 4.) ♃. H. Native of Caucasus, in subalpine places near Nartzana. Càchrys latifòlia, Bieb. fl. taur. and suppl. no. 549. Sìler Caucásicum, Spreng. umb. spec. 90. Càchrys decursìva, Horn. hort. hafn. add. p. 960. Spondýlium Armènium foliis ammi perennis, Tourn. herb.

Caucasian Agasyllis. Fl. July, Aug. Clt. 1818. Pl. 2 to 3 ft.

Cult. See *Pachypleùrum* above for culture and propagation.

CXIX. STENOCŒ'LIUM (from στενος, *stenos*, narrow, and κοιλος, *koilos*, hollow; in reference to the narrow furrows of the fruit). Ledeb. fl. ross. alt. ill. t. 175. fl. alt. 1. p. 298.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals obovate-orbicular, somewhat emarginate, with an inflexed point. Fruit compressed from the back. Mericarps with 5 elevated roundish thick equal ribs; the lateral ribs marginating. Vittæ one in each furrow, and 2 in the commissure. Seed flat in front. Involucra and involucels of many lanceolate-linear leaves, with membranous margins.—A perennial herb, having a fuscescent root, nearly a foot long. Stem solitary, 2-3 inches high, leafy at top; but with numerous axillary elongated branches, which are furnished with leaves beneath the middle. Petals dilated into sheaths. Leaves pinnate; leaflets pinnatifid. Cauline leaves tripinnate; leaflets oblong, acute, entire or bifid. Umbels of many rays. Umbellules when bearing the fruit nearly globose. Flowers white. The whole plant is pubescent, and powdery towards the apex. Stems, petioles, peduncles, and rays of umbels violaceous.

1 S. ATHAMANTOI'DES (Led. l. c.) ♃. H. Native of Altaia, in stony alpine places at the river Tschuja, against the mouth of the river Tschegan. Càchrys athamantoìdes, Bieb. fl. taur. 3. p. 217. Schultes, syst. 6. p. 445.

Athamanta-like Stenocœlium. Fl. July. Clt. 1818. Pl. 1 ft.

Cult. See *Pachypleùrum* above for culture and propagation.

CXX. SI'LER (*siler*, withy, from *salio*, to spring; from the quick growth of the plant). Scop. carn. 1. p. 217. Gærtn. fruct. 1. p. 92. t. 21. Lag. am. nat. 2. p. 101. Koch, umb. 84. f. 34. and 35. but not of Mœnch. D. C. prod. 4. p. 200.—Sìler species, Spreng.—Laserpítium species, Lin.—Angélica species. Lam.—Bradlæ'ia species, Neck. elem. no. 280. but not of Lin.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed segment. Fruit

lenticularly compressed from the back; mericarps with elevated obtuse filiform ribs, having 5 primary ones: the lateral ones of these marginating; and 4 less prominent secondary ones. Vittæ one in each furrow, under the secondary ribs. Seed flattish in front.—Perennial glabrous herbs. Leaves triternate; petioles trifid, sheathing at the base; branches of petioles bearing 3 roundish, coarsely and bluntly crenated, or bluntly 3-lobed leaflets. Umbels large, of many rays. Involucra wanting or of few leaves, caducous. Flowers white.

1 S. tri'lobum (Scop. carn. 1. p. 217.) ♃. H. Native of Europe and Asia, from Spain to Kamtschatka; but the habitats given are doubtful, the plant being often confused with Laserpítium aquilegifòlium. Laserpítium trílobum, Lin. spec. p. 357. exclusive of some of the synonymes. Angélica aquilegifòlia, Lam. dict. 1. p. 173. D. C. fl. fr. p. 306. ed. 5. p. 508. Sìler aquilegifòlium, Gærtn. l. c.—Mor. ox. sect. 9. t. 13. no. 3. Libanòtis vi. C. Bauh. pin. 157.

Three-lobed-leaved Siler. Fl. May, July. Clt. 1796. Pl. 3 to 4 feet.

Cult. See *Laserpítium*, p. 351. for culture and propagation.

CXXI. GA'LBANUM (*galb* or *galban*, in Celtic, means fat, oily; in reference to the gum). D. Don, in Lin. trans. 16. p. 603.

Lin. syst. *Pentándria, Digýnia.* Fruit compressed from the back, elliptic, unguicular; raphe narrow, open, not closed. Mericarps with 5 elevated compressed bluntly keeled ribs, not winged: lateral ones distinct, marginal; furrows broadish, concave, without any vittæ. Commissure flat, dilated, furnished with 2 vittæ; vittæ broad, a little arched. The seeds from which the foregoing description has been drawn were picked from the gum. The rest of the plant remains unknown.

1 G. officina'le (D. Don, l. c.) ♃. H. The plant, according to Dioscorides, is a native of Syria; but it must be in some remote inaccessible part of it, as it has not been observed by any of the numerous travellers who have visited that country. As the gum-galbanum is partly imported from Smyrna and partly from India, it is very probable that the plant is also a native of Persia. The Bùbon Gálbanum of Linnæus possesses neither the smell nor the taste of Gálbanum, but in these particulars agrees best with Fennel, and the fruit has no resemblance whatever to that found in the gum. How a plant differing so essentially from Gálbanum should yet have been retained so long in the Pharmacopœia may well be subject of surprise, especially as the Bùbon Gálbanum, being so frequent in gardens, afforded abundant opportunities of settling the question.

Galbanum agrees in virtue with gum-ammoniac, but is generally accounted less proper in asthmas, and more so in hysterical complaints. It is exhibited in the form of pills or emulsions, to the extent of about a drachm. Applied externally, it is supposed to resolve and discuss tumours, and to promote suppuration. The best sort of galbanum consists of pale coloured pieces, about the size of a hazel nut, which, on being broken, appear to be composed of clear white tears, of a bitterish acrid taste, and a strong peculiar smell. But it most commonly occurs in agglutinated masses, composed of yellowish or reddish, and clear white tears, which may be easily torn asunder, of the consistence of firm wax, softening by heat, and becoming brittle by cold, mixed with seeds and leaves. Galbanum is generally obtained by cutting the plant across some inches above the root. The juice which flows from the wound soon hardens, and is the galbanum brought to us from Syria and the Levant.

Officinal Galbanum. Pl. 4 to 5 feet.

Cult. See *Thápsia*, p. 350. for culture and propagation.

Tribe X.

CUMI'NEÆ (this tribe contains plants agreeing with *Cumìnum* in important characters), or Orthospermæ multijugatæ contractæ, Koch, umb. 81. D. C. prod. 4. p. 200. Fruit contracted from the sides. Mericarps with 5 primary filiform ribs: the lateral ones of these marginating, and 4 secondary more prominent ones; all wingless. Seed straight, flattish in front.

CXXII. CUMI'NUM (*qamoun* is the Arabic name of *Cumin*). C. Bauh. pin. p. 146. Lin. gen. no. 351. Gærtn. fr. 1. t. 23. Lag. am. nat. 2. p. 95. Spreng. umb. prod. p. 25. Hoffm. umb. ed. 2. p. 194. D. C. prod. 4. p. 201.

Lin. syst. *Pentándria, Digýnia.* Teeth of calyx 5, lanceolate, setaceous, unequal, permanent. Petals oblong, emarginate, with an inflexed point, erectly spreading. Fruit contracted from the sides. Mericarps with 5 wingless ribs; the 5 primary ones filiform, and minutely muriculated, the lateral ones of these marginating: the 4 secondary ones more prominent and prickly. Vittæ one in each furrow, under the secondary ribs. Carpophore bipartite. Seed rather concave in front and convex on the back.—Herbs, with multifid leaves; linear setaceous leaflets. Involucra of 2-4 simple or divided leaves; involucels dimidiate, of 2-4 leaves, which are at length reflexed. Flowers white or reddish.

1 C. Hispa'nicum (Merat, herb. D. C. prod. 4. p. 201.) segments of leaves linear-setaceous, acute; umbels bifid; umbellules bearing 3-4 fruit; involucels about equal in length to the fruit, which are bearded by bristles. ☉. H. Native of Spain, in corn-fields in Valle de la Manca. Habit of *C. Cymìnum*, but differs in the fruit not being glabrous or puberulous, but bearded by long stiff spreading pili. Flowers reddish.

Spanish Cumin. Pl. 1 foot.

2 C. minu'tum (D'Urv. enum. 32. t. 272.) segments of leaves linear, obtuse; involucels about equal in length to the fruit, which is glabrous. ☉. H. Native of the island of Cos, in shady places frequent. Stem slender, branched, hardly 2-3 inches high. Every part of the plant is smaller than in the other species. In the specimens received from D'Urville, the segments of the leaves are acute, and the involucels are rather shorter than the fruit.

Minute Cumin. Pl. 2 to 3 inches.

3 C. Cymi'num (Lin. spec. p. 365.) segments of leaves linear-setaceous, acute; umbels 3-5-cleft; involucels exceeding the fruit, which is pubescent. ☉. H. Native of Upper Egypt. and Æthiopia. Cumìnum, Riv. pent. t. 40. Cam. epit. 518. Schkuhr, handb. no. 714. t. 80. Woodv. med. bot. t. 190. Nees, off. pflanz. 13. t. 7. Hayn. arz. gew. 7. t. 11. Plench. icon. 192. Cav. icon. 4. t. 360.—Mor. hist. p. 271. sect. 9. t. 2. There are varieties of *Cumin* with white, red, or purple flowers. Coat of fruit aromatic; albumen insipid. The plant is cultivated in the south of Europe and all Lesser Asia. In the islands of Malta and Sicily, where it is much cultivated for sale, it is called *Cumino aigro* or hot cumin, to distinguish it from *Cumino dolce*, sweet cumin. Cumin seeds have a bitterish warm taste, accompanied with an aromatic flavour, not of the most agreeable kind, residing in a volatile oil.

Var. α, scábridum (D. C. prod. 4. p. 201.) fruit clothed with short down; but roughish on the ribs. ☉. H. C. Ægyptìacum, Merat, in herb. This is the wild plant.

Var. β, glabràtum (D. C. l. c.) fruit glabrous. ☉. H. C. Cymìnum, Merat, in herb. This is the cultivated plant.

Cyminum or Officinal Cumin. Fl. June, July. Clt. 1594. Pl. ½ foot.

Cult. The seed should be sown in spring in a warm sheltered situation, where the plants will flower in summer, and produce seed in autumn.

CXXIII. TRÈPOCA'RPUS (from τρεπω, *trepo*, to turn, and

καρπος, *karpos*, a fruit; application not evident). Nutt. in litt. 1825. D. C. coll. diss. v. p. 50. t. 14. prod. 4. p. 201.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-toothed; teeth subulate, falling off but slowly after flowering. Petals obcordate, inflexedly emarginate. Fruit pyramidally angular or nearly terete, contracted from the sides. Mericarps convex on the back, with 5 primary, filiform, hardly prominent ribs, margined each by a brown vittæform line on both sides; and 4 secondary elevated ribs, bearing one vittæ at the lower part of each. Commissure thick, furrowed in the middle, and furnished with vittæ inside. Seed somewhat compressed on the back, straight. —Glabrous branched herbs, with the habit of *Æthùsa*. Leaves multifid, with linear segments. Umbels opposite the leaves, of 5 rays. Involucra linear, of 1-3 leaves. Umbellules 5-8-flowered; involucels linear, unequal, 4-5-leaved, dimidiate. Flowers white. This genus is more nearly allied to *Cumìnum* than *Æthùsa;* it differs from the first in the commissure being spongy, and in the mericarps having accessory margins.

1 T. Æthu'sæ (Nutt. l. c. ex D. C. l. c.) umbels of 5 rays; fruit 5 times longer than its breadth. ⊙. H. Native of North America, in the Arkansa territory, ex Nutt. The primordial leaves are nearly as in *Cynàpium*, with short acutish lobes; cauline leaves with long linear acute lobes. Involucra of 2-3 leaves; involucels of 4-5 leaves.

Æthusa-like Trepocarpus. Pl. 1 foot.

2 T. brachyca'rpus (D. C. prod. 4. p. 202.) umbellules of 2-3 rays; fruit 3 times longer than its breadth. ⊙. H. Native of Louisiana. Perhaps only a variety of the first. It differs from it in the involucra and involucels being of fewer leaves; in the lower umbels being on shorter peduncles; and in the fruit being thicker, and less angular.

Short-fruited Trepocarpus. Pl. 1 foot.

Cult. See *Cumìnum* above for culture and propagation.

Tribe XI.

THAPSIE'Æ (this section contains plants agreeing with *Thápsia* in important characters), or Orthospermæ multijugatæ alatæ, Koch, umb. p. 73. D. C. prod. 4. p. 202. Fruit compressed from the back, or the transverse section is nearly terete. Mericarps with 5 filiform bristly primary ribs: the lateral ones of these placed in the commissure, which is flat; and 4 secondary ones: interior ones of these filiform, and the exterior ones or all are winged; wings undivided; hence the fruit has 8 wings, or only 2 wings on each side. Seed somewhat complanate or teretely convex, but flat in front.

CXXIV. THA'PSIA (the first species was discovered in the island of Thapsus). Tourn. inst. 321. t. 171. Lin. gen. no. 361. Spreng. prod. 17. Lag. am. nat. 2. p. 90. Koch, umb. p. 74. f. 3-5. D. C. prod. 4. p. 202.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals elliptic, entire, with an inflexed or involute point. Fruit compressed from the back. Mericarps with 5 primary filiform ribs, 3 of which are dorsal, and the 2 lateral ones are placed in the commissure, which is flat; and 4 secondary ribs, the 2 dorsal ones are filiform, and the 2 lateral ones are membranous and winged; wings entire. Vittæ one in each furrow, under the secondary ribs. Carpophore bipartite. Seed complanate.—Perennial herbs. Leaves pinnate, bipinnate, and tripinnate, or decompound; petioles sheathing; the upper leaves usually reduced to the petioles. Umbels large, compound, of many rays. Involucra and involucels wanting, or of a few deciduous leaves. Flowers yellow. This genus differs from *Laserpítium*, in the wings of the mericarps being only 2, not 4; and from *Melanoselìnum* and *Artèdia*, in the wings being entire; and from *Lepidosciàdium*, in the backs of the mericarps not being scaly.

* *Involucra wanting or of* 1-2 *leaves.*

1 T. Garga'nica (Lin. mant. 57.) stem terete, glabrous; leaves bi-tripinnate, shining; segments linear, acute, elongated, quite entire along the margins, decurrent or confluent; involucra of few leaves; fruit cordate at the base, with a very open recess. ♃. H. Native of Calabria, Mauritania, Greece, Sicily, Sardinia, Spain, &c. in open places and on hills. Magn. bot. monsp. p. 286. with a bad figure.—Gouan. obs. p. 18. t. 10. Desf. alt. 1. p. 262. Sibth, et Smith, fl. græc. t. 287. There are varieties of this with glabrous or hairy petioles. To this the Férula Neapolitàna, Ten. fl. med. p. 316. append. 4th. p. 12. is referred by Sprengel, which is said by the author to be nearly allied to F. glaúca. The bruised root is said to be good for resolving tumours.

Var. β, *decussàta* (D. C. prod. 4. p. 202.) petioles and nerves of leaves hispid beneath; involucra wanting. ♃. H, Native of Spain and of Mauritania. T. decussàta, Lag. gen. et spec. p. 12.

Garganian Deadly-carrot. Fl. July, Aug. Clt. 1683. Pl. 2 to 4 feet.

2 T. Si'lphium (Viv. fl. lyb. p. 17.) stem terete, furrowed, glabrous; leaves pinnate; leaflets many-parted; segments simple or trifid, all linear, elongated, hairy on both surfaces, with revolute margins; fruit cordate at the base, having the recess constricted. ♃. H. Native of the north of Africa, on the mountains of Cyrenaica. This is supposed to be the plant which yielded the juice called *silphium*, a medicine held in such high estimation among the ancients, as to have imparted to the region where it grew (the vicinity of Cyrene, now included in the pashalic of Tripoli,) the appellation of "Silphifera!"

Silphium Deadly-carrot. Fl. July, Aug. Clt. 1824. Pl. 2 to 4 feet.

3 T. villòsa (Lin. spec. p. 375.) stem terete, glabrous; leaves tripinnate, and are, as well as the petioles, villous: leaflets oblong, sinuately pinnatifid: lower ones deflexed; involucra and involucels almost wanting. ♃. H. Native of Portugal, Spain, south of France, and Mauritania, on hills and in bushy places. Lam. ill. t. 206. D. C. fl. fr. 4. p. 342.—Moris. ox. sect. 9. t. 18. f. 3. Plench. icon. 219. Parkins. 878. 2. t. 877. f. 2. Ger. emac. 1030. Flowers yellow, as in the rest of the species. Aspect of plant hoary. Root carrot-shaped, black on the outside.

Villous Deadly-carrot. Fl. June, July. Clt. 1710. Pl. 3 to 4 feet.

4 T. Ascle'pium (Lin. spec. p. 375.) stem terete, glabrous; leaves tripinnate; leaflets digitately multifid, capillary, short; petioles glabrous; involucra and involucels wanting. ♃. H. Native of Apulia, Sicily, Rhodes, and about Constantinople. Sibth. fl. græc. t. 286. ex Smith, prod. 1. p. 201. Guss. prod. fl. sic. 1. p. 370. T. Apùlia, Mill. dict. no. 4.—Col. ecphr. 1. t. 86. Mor. hist. 3. p. 319. sect. 9. t. 18. f. 9. Fruit one-half smaller than those of *T. Gargánicum*, having the wings rather truncate at both ends. Habit of *Elæoselìnum meoìdes*. The root is about the thickness of a man's thumb; the bark is yellow and wrinkled; the inside white, abounding in a bitter milky juice.

Swallow-wort Deadly-carrot. Fl. July, Aug. Pl. 2 to 3 feet.

5 T. fœ'tida (Lin. spec. p. 375.) stem and petioles villous; leaves tripinnate; leaflets much spreading, pinnatifid, attenuated at the base: segments short, lanceolate, toothed; involucra wanting. ♃. H. Native of Spain, Zante, Cyprus, &c. Blackw. t. 459. Lob. icon. t. 780. ex Smith. Moris. hist. sect. 9. t. 18. f. 7. ex Lin. Lobel's figure is more probably referrible to Laserpítium gummíferum. T. tenuifòlia, Lag. gen. et spec. 12. is referrible to the figure of Morison, but differs in the stem being glabrous. It is probably only a variety of this species. The leaves are rough and hairy.

Fetid Deadly-carrot. Fl. July, Aug. Clt. 1596. Pl. 2 to 3 ft.

* * *Involucra of 5-7 leaves.*

6 T. POLY'GAMA (Desf. fl. atl. 1. p. 261. t. 75.) stem terete, glabrous, sparingly branched; leaves glabrous, bipinnate; leaflets multifid: lobes linear, acute, divaricately trifid; involucra of 5-7 leaves; central flowers male. ♃. H. Native of Mauritania, about Bone, Lacalle, and Tangiers. Spreng. in Schultes, syst. 6. p. 614. exclusive of the synonyme of Lam. and therefore the description. Flowers pale yellow. Stylopodium thick. Styles diverging, at length reflexed.—Barrel. icon. 356. appears to be intended for this plant, but the flowers are said to be white.

Polygamous Deadly-carrot. Pl. 1 to 2 feet.

† *Species not sufficiently known.*

7 T. PRÆA'LTA (D'Urv. enum. p. 32.) stem branched above; radical leaves quadrifariously decompound, shining; leaflets oblong, cut, almost pinnatifid; umbels numerous: central one much the shortest: lateral ones on peduncles, which are furnished each with a lanceolate twin bractea at the base. ♃. H. Native of the island of Cos, among broken rocks at the height of 900 feet. Stem 6-8 feet high. Fruit unknown.

Tall Deadly-carrot. Pl. 6 to 8 feet.

8 T. Transtaga'na (Brot. fl. lus. 1. p. 468.) leaves bipinnate; leaflets pinnatifid: segments linear-lanceolate, hairy. ♃. H. Native of Portugal, near Montemor and Serpa. Habit of *T. Gargánica*, but more hairy.

Transtagus Deadly-carrot. Pl. 2 to 4 feet.

9 T. MA'XIMA (Mill. dict. no. 2.) leaves pinnate; leaflets very broad, pinnatifid, villous beneath; petioles decurrent. ♃. H. Native of Spain, all over Old Castile quite to the Pyrenees. Perhaps not different from *T. villòsa*. Root said to be of a dark colour on the outside, and the leaves very thick.

Largest Deadly-carrot. Fl. June, July. Clt.? Pl. 4 to 5 ft.

10 T. ALTI'SSIMA (Mill. dict. no. 6.) leaves decompound; leaflets large, shining; umbels large. ♃. H. Native of Apulia. Perhaps the same as *T. prælta*.

Tallest Deadly-carrot. Pl. 8 feet.

Cult. The species of *Thápsia* will grow in any common garden soil. They are only to be increased by seeds, which should be sown in autumn as soon as ripe.

CXXV. CYMO'PTERUS (from κυμα, *kyma*, a wave, and πτερον, *pteron*, a wing; in allusion to the undulated wings of the mericarps). Rafin. journ. phys. 1819. aug. p. 100. but not of Schultes, syst. 6. p. 34.—Thápsia, Nutt. gen. amer. 1. p. 184.

Lin. syst. *Pentándria, Digýnia.* Calyx minutely 5-toothed. Petals roundish-oval, with an inflexed point. Fruit nearly elliptic, compressed, 7-8-winged: the perfect mericarps are therefore 4-winged, and the imperfect ones 3-winged: wings undulated; furrows of fruit flat, 1-nerved; commissure naked, but with 3 stripes. Carpophore not separable from the mericarps.—A smooth humble herb, with tuberous roots, rather decumbent, nearly naked stems; biternate leaves: with short obtuse decussate lobes, and long petioles. Umbels 4-6-rayed; involucra wanting; involucels 5-7-parted, dimidiate. Flowers polygamous; female ones nearly sessile and white; central ones male, pedicellate.—This genus is truly distinct from *Thápsia*, but perhaps may be joined with *Laserpitium*.

1 C. GLOMERA'TUS (D. C. prod. 4. p. 204.) ♃. H. Native of North America, in the open plains of the Missouri. Selìnum acaúle, Pursh, fl. bor. amer. 2. suppl. 732. Thápsia glomeràta, Nutt. gen. amer. 1. p. 184.

Glomerate-flowered Cymopterus. Pl. decumbent.

Cult. See *Thápsia* above for culture and propagation.

CXXVI. LASERPI'TIUM (from *laser*, its gum, and *pix*, pitch; the name of the ancient Silphium). Tourn. inst. 324. t. 172. Lin. gen. 344. Spreng. umb. prod. 17. Lag. am. nat. 2. p. 90. D. C. prod. 4. p. 204.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point. Fruit compressed from the back, or nearly terete, 8-winged; the 5 primary nerves of the mericarps being filiform: and the 4 secondary ones being winged. Vittæ 1 in each furrow, under the secondary ribs. Carpophore free, bipartite.—Herbs with bipinnate or tripinnate leaves; leaflets entire, toothed or cut. Umbels showy, of many rays. Involucra and involucels of many leaves. Flowers white, rarely yellow. This genus is easily distinguished from the others by the 8 wings to the fruit.

* *Fruit glabrous, or the primary ribs are clothed with adpressed, very short down.*

1 L. A'SPERUM (Crantz, austr. 3. p. 54.) leaves bipinnate, covered with rough hairs beneath and on the petioles; leaflets ovate, rather cordate, mucronately toothed: ultimate ones usually confluent; leaves of involucra linear-setaceous; wings of fruit curled. ♃. H. Native of Europe, on dry hills, and by the margins of woods. D. C. fl. fr. suppl. p. 509. L. latifòlium, Lam. dict. 3. p. 423. L. pubéscens, Lag. gen. et spec. 12. L. Cervària, Gmel. bad. 1. p. 657. L. Libanòtis, Spreng. in Schultes, syst. 6. p. 617. exclusive of many of the synonymes.—Lob. icon. 704. f. 2. Flowers white.

Rough Laserwort. Pl. 1 to 2 feet.

2 L. GLA'BRUM (Crantz, aust. 3. p. 54.) leaves bipinnate, quite glabrous in every part, and shining; leaflets obliquely cordate, mucronately toothed: but those of the superior leaves are quite entire; leaves of involucra setaceous; wings of fruit equal, rather curled. ♃. H. Native of Europe, on the mountains, in dry and stony places. D. C. fl. fr. suppl. p. 509. L. latifòlium, Lin. spec. 356. Jacq. fl. aust. t. 146. Schkuhr, handb. t. 67. Fl. dan. t. 1513. L. Libanòtis, Lam. dict. 3. p. 423.—Dod. pempt. 312. f. 2. Clus. hist. 2. p. 194. f. 2.—Riv. pent. t. 21.—Plench. icon. 179.—Mor. hist. sect. 9. t. 17.—Mor. hist. 3. p. 320. t. 19. f. 1-6. Stem and under side of leaves rather glaucous. Flowers white. In the Alps this plant is only a foot or 2 feet in height, while in cultivation it grows much larger. The plant is acrid and aromatic, with something of bitterness, and seems to merit a place amongst the aromatic stimulants, emmenagogues, and aperient sudorifics. It is used by the peasants for themselves, and by farriers for horses, in some countries. The root is the hottest part of the plant.

Var. β, *crìspum* (Turra, fl. ital. prod. p. 65. no. 14) wings of fruit very much curled. ♃. H. Native of Mount Baldo.

Glabrous Laserwort. Fl. June, Jul. Clt. 1640. Pl. 2 to 4 ft.

3 L. AQUILEGIFO'LIUM (Murr. syst. p. 228.) leaves biternate or triternate; leaflets ovate, rather cordate at the base, slightly lobed, glabrous, but puberulous on the nerves beneath; involucra and involucels deciduous, of few leaves; wings of fruit equal, flat. ♃. H. Native of France, Austria, Hungary, &c. on the mountains. D. C. fl. fr. 5. p. 510. Jacq. aust. 22. t. 147. L. trìlobum, Jacq. vind. 48. Crantz, austr. p. 187. but not of Lin. L. alpìnum, Waldst. et Kit. pl. hung. t. 253. Bess. prim. 2. p. 393. Stem glabrous, glaucous, green. This plant is usually confused with *Sìler trìlobum*, from the shape of the leaves; but it is easily distinguished from that plant in the 8-winged fruit.

Columbine-leaved Laserwort. Fl. May, July. Clt. 1640. Pl. 4 to 6 feet.

4 L. Gaudi'nii (Moretti, in Com. (1824.) fl. com. no. 344. and in bot. ital. (1825.) no. 3. p. 33.) leaves somewhat tripinnate: leaflets roundly 2-3-lobed, acutely and deeply serrated:

upper cauline ones tripartite; lobes linear-lanceolate; involucra and involucels of few leaves: wings of fruit flat, unequal: the dorsal ones a little smaller than the lateral ones. ♃. H. Native of Switzerland and Italy, in subalpine places. L. lutèolum, Gaudin, fl. helv. 2. (1828.) p. 348. L. trílobum, Sut. fl. helv. but not of Lin.—Hall. hist. no. 352. exclusive of the synonyme. Allied to *L. aquilegifòlium* and *L. glàbrum*, but differs from them in the flowers being yellow.

Gaudin's Laserwort. Pl. 3 to 4 feet.

5 L. MARGINA'TUM (Waldst. et Kit. pl. rar. hung. 2. p. 210. t. 192.) leaves biternate, shining, and are as well as the stems glabrous; petioles and nerves of leaves rather pilose beneath; leaflets ovate, sessile, somewhat 3-lobed, serrated; upper stem leaves reduced to the petioles; involucra and involucels of 2-5 linear-lanceolate leaves; wings of fruit unequal: the 2 lateral ones the broadest. ♃. H. Native of Croatia, in woods. Petals incurvedly obcordate at the apex, greenish yellow, margined with purple.

Margined-petalled Laserwort. Fl. Jul. Aug. Clt. 1823. Pl. 2 to 3 feet.

6 L. SI'CULUM (Spreng. syst. 1. p. 918.) stem terete, branched, few-leaved; leaves bipinnate; leaflets elliptic or obovate, glaucous, mucronate, veiny; involucra and involucels of many awned leaves; wings of fruit coloured, emarginate. ♃. H. Native of Sicily, among rocks, on the Nebrode mountains. Guss. prod. fl. sic. 1. p. 317. L. Nebrodénse, Jan. herb. 260. spec. 15. Allied to *L. Siler*, but the wings of the fruit are very different.

Sicilian Laserwort. Pl. 3 to 4 feet.

7 L. SI'LER (Lin. spec. 357.) leaves bipinnate, quite glabrous; leaflets lanceolate or oval, quite entire, mucronate, sometimes confluent and 3-lobed; leaves of involucra and involucels linear-lanceolate, awnedly acuminated; wings of fruit narrow. ♃. H. Native of middle and south Europe, on the mountains. Jacq. fl. aust. 2. t. 145. D. C. fl. fr. 4. p. 313. Hayne, arz. gew. 7. t. 7. Plench. icon. 178. Blackw. 426. Ligústicum Gargánicum, Till. pis. t. 30. Ten. in herb. Balb. and Mor. Sìler lancifòlium, Mœnch. L. montànum, Lam. fl. fr. L. trifoliàtum, Sieb. and Schultes, syst. 6. p. 619. Sìler montànum, Mor. oxon. sect. 9. t. 3. f. 1. Plant quite glabrous, growing from 1-2 feet high in subalpine places. Stem green or purplish. Flowers white. The root is extremely bitter, and might be useful in fevers, loss of appetite, &c. An infusion of it in wine has been given with success in disorders of the stomach. It yields an aromatic resinous oil on being wounded, and being made into a syrup, is recommended in disorders of the breast. Vill. dauph. 2. p. 627. Allion. pedem. no. 1316.

Withy or Mountain Laserwort. Fl. May, July. Clt. 1640. Pl. 1 to 6 feet.

8 L. GA'LLICUM (C. Bauh. pin. p. 156. Lin. spec. p. 357.) leaves supra-decompound, glabrous, shining; leaflets cuneated, 3-5-cleft, mucronate; leaves of involucra linear-lanceolate, acuminated; wings of fruit equal, flat. ♃. H. Native of the south of France; and of Upper Italy. D. C. fl. fr. 4. p. 312. Spreng. in Schultes, syst. 6. p. 624. Gaud. aix. t. 58. Park. theat. 938. f. 1. L. trifurcàtum, Lam. fl. fr. 3. p. 415. L. cuneàtum, Mœnch. meth. 79. There is a variety with broader segments (in Mor. hist. sect. 9. t. 19. f. 8.) and with the lobes very much divaricate and short (Pluk. alm. t. 199. f. 1. L. formòsum, Willd. spec. 1. p. 1518.); segments of leaves oblong-linear (Mor. hist. sect. 9. t. 19. f. 9. and therefore L. angustifòlium, Lin. spec. p. 357.); segments of leaves very narrow (J. Bauh. hist. 3. p. 137. and therefore L. angustifòlium, Willd. l. c.) segments of leaves cut into many lobes (L. Gállicum laciniàtum, Hortul, &c.). The most of the varieties have glabrous stems; very few have them hispid from scattered bristles. L. tenuifòlium, Riv. pent. irr. 22. is also a variety of this species. Flowers white.

French Laserwort. Fl. Ju. Jul. Clt. 1686. Pl. 1 to 2 ft.

9 L. PEUCEDANOI'DES (Lin. spec. p. 358.) leaves triternate, quite glabrous; leaflets quite entire, oblong, mucronate; leaves of involucra, and involucels setaceous; pistils elongated; wings of fruit unequal, flattish. ♃. H. Native of Carniola, Croatia, and Upper Italy, in mountain woods. There are varieties of this with oval-oblong leaflets (Hoppe, pl. exsic.); oblong leaflets (Jacq. icon. rar. 2. t. 250.); oblong-linear leaflets (Seg. ver. 3. p. 227. t. 7.); and linear leaflets (Pluk. alm. t. 198. f. 4.) but all these varieties differ from any of those of *L. Gállicum* in the segments of the leaves not being cuneated nor lobed. Flowers white.

Sulphur-wort-like Laserwort. Fl. June. Clt. 1816. Pl. 1 to 3 feet.

10 L. GUMMI'FERUM (Desf. fl. atl. 1. p. 254. t. 72.) leaves ternately decompound, glabrous; leaflets pinnatifid; lobes lanceolate, short, acute, stiffish; involucra and involucels of few leaves. ♃. H. Native of Portugal, Spain, and Mauritania, in sandy and barren fields. L. thapsiæfórme, Brot. phyt. lus. p. 77. t. 35. L. polýgamum, Lam. dict. 3. p. 425. Thápsia gummífera, Spreng. umb. spec. p. 31. Flowers white. Petals inflexedly emarginate. Fruit 8-winged (ex Brot.); and therefore this plant if referrible to *Laserpitium* and not to *Thápsia*. Lobes of leaves, when dry, usually channelled. Petioles sometimes pilose, usually glabrous as well as the lobes.

Gum-bearing Laserwort. Pl. 2 to 3 feet.

11 L. HIRSU'TUM (Lam. fl. fr. 3. p. 648.) leaves supra-decompound, hairy; leaflets narrow, pinnatifid: lobes short, linear, cuspidate; leaves of involucra and involucels membranous, rather trifid at the apex, ciliated; wings of fruit thin, flat. ♃. H. Native of France, Switzerland, Piedmont, on the Alps, in meadows; and of Kotzebue's Sound. D. C. fl. fr. 4. p. 313. L. Pànax, Gouan. ill. 13. L. Hallèri, All. pedem. no. 1315. —Hall. helv. no. 795. t. 19. exclusive of the synonyme of Gmel. and Seg.—Mor. hist. sect. 9. t. 15. f. 16. Flowers white.

Hairy Laserwort. Fl. June. Clt. 1759. Pl. 1 to 2 feet.

12 L. SCA'BRUM (Cav. icon. 2. p. 72. t. 190.) leaves bipinnate, scabrous; leaflets oblong, cut, acute, and are as well as the stems glaucous; leaves of involucra and involucels lanceolate, tapering into a bristle; fruit tomentose while young: adult ones 8-winged. ♂. H. Native of Spain, near Cati and Vallefames, on dry exposed hills. Referrible to *L. hirsùtum*, but truly distinct. Petals white, with a violaceous border, villous beneath. Stem scabrous.

Scabrous Laserwort. Fl. Ju. Jul. Clt. 1800. Pl. 2 to 3 ft.

13 L. NI'TIDUM (Zanted, comm. brix. 1813. ex Poll. fl. ver. p. 351.) leaves bipinnate, beset with setose bristles, as well as on the stem and petioles; sheaths of petioles glabrous; leaflets ovate, serrated: ultimate ones confluent; leaves of involucra and involucels lanceolate, with membranous margins, deeply serrated at the apex; wings of fruit nearly equal. ♂. or ♃. H. Native of Upper Italy, among rocks on the mountains. L. pilòsum, Com. fl. comp. p. 53. but not of Willd. Fruit glabrous. Flowers white.

Nitid-leaved Laserwort. Pl. 2 to 3 feet?

14 L. ARCHANGE'LICA (Jacq. icon. rar. 1. t. 58. Wulf. in Jacq. coll. 1. p. 214.) leaves ternately divided; stem and petioles hispid; leaflets ovate, cuneated at the base, serrated, extreme one 3-lobed: and the lateral ones 2-lobed; leaves of involucra and involucels linear-lanceolate, hairy, 2-3-cleft at the apex; wings of fruit flat, broader than the mericarps. ♃. H. Native of Carniola, Croatia, Silesia, Carpathian mountains, among rocks. L. Chirònium, Scop. carn. no. 324. Archangélica,

Clus. hist. 2. p. 195. Lob. icon. 701. Petioles large, saccate, very villous. Stem 5 feet high, furrowed. Flowers white, purplish when young. Fruit glabrous, or clothed with adpressed pubescence according to Koch.

Archangel Laserwort. Fl. Ju. Aug. Clt. 1800. Pl. 4 to 5 ft.

* * *Primary ribs of fruit hispid from spreading bristles.*

15 L. hi'spidum (Bieb. fl. taur. 1. p. 221. suppl. p. 222.) leaves ternately bipinnate; petioles, nerves on the under sides of the leaves, stem and umbels hispid; leaflets cuneiform-ovate, deeply serrated; stem terete, furrowed: leaves of involucra and involucels oblong, acuminated at the apex, or cut; wings of fruit unequal: 2 lateral ones the largest. ♃. H. Native of Tauria and Caucasus, in gravelly places. L. pilòsum, Willd. enum. p. 310. L. Archangélica, Hortul. but not of Jacq. Caúcalis híspida, Desf. hort. par. Petals white.

Hispid Laserwort. Fl. June, Jul. Clt. 1817. Pl. 2 to 3 ft.

16 L. Prute'nicum (Lin. spec. p. 357.) leaves decompound, rather hairy on the nerves and petioles; leaflets ovate-lanceolate, pinnatifid: lobes lanceolate, cuspidate: outer ones confluent; stem angular, beset with retrograde bristles; leaves of involucra and involucels linear, with entire hyaline margins; wings of fruit unequal: 2 lateral ones the largest. ♂. H. Native of Hungary, Carniola, Germany, Switzerland, east of France, on hills. Jacq. fl. aust. t. 153. L. selinoìdes, Crantz, aust. 182. L. Gállicum, Scop. carn. 321. Jacq. vind. 48.—Breyn. cent. t. 84.—Riv. pent. irr. 23. Flowers white.

Var. β, glabràtum (D. C. prod. 4. p. 206.) leaves and stems glabrous. ♂. H. Native of Piedmont, Pyrenees, &c. L. daucoìdes, Dufour, in litt. L. Pruténicum, Lapeyr. suppl. p. 48. Balb. fl. taur. 49. Fruit pilose on the primary ribs, as in var. *α*. The wings of the fruit are very unequal: the 2 lateral ones are large: and the 2 dorsal ones very small, or nearly wanting, hence this species falls in almost to *Thápsia*, but differs in the petals being emarginate.

Prussian Laserwort. Fl. Jul. Aug. Clt. 1759. Pl. 3 to 4 ft.

17 L. Athama'ntæ (Spreng. in Schultes, syst. 6. p. 624.) plant hispid; stem furrowed, much branched; leaves ternately decompound, rough on both surfaces, stiffish; leaflets oblong, pinnatifid; segments broadly lanceolate, mucronate; leaves of involucra and involucels oblong, reflexed. ♂. H. Native of Siberia. Perhaps the same as *L. híspidum* or a variety of *L. Pruténicum*.

Athamanta-like Laserpitium. Fl. June, July. Clt. 1817. Pl. 3 feet.

† *Species not sufficiently known.*

18 L. Cape'nse (Thunb. prod. p. 50. fl. cap. 2. p. 201.) stem terete, glabrous; leaves bipinnate; leaflets oval, mucronate, margined, quite entire; sheaths large, petiolar.—Native of the Cape of Good Hope. Fruit ovate, striated, and therefore the genus is doubtful.

Cape Laserwort. Pl. 1 to $1\frac{1}{2}$ foot.

19 L. au'reum (Willd. spec. 1416.) stem terete, nearly simple; leaves ternately decompound; leaflets ovate-lanceolate, pinnatifid: segments lanceolate, bluntish, mucronate; leaves of involucra and involucels filiform. ♃. H. Native of the Levant. Spreng. in Schultes, syst. 6. p. 626.—Buxb. cent. 1. t. 43. ex Spreng. but the description hardly agrees with it. L. élegans, Clark, in Spreng. neue. entd. 3. p. 160. is related to it according to Spreng. syst. 1. p. 918. Flowers golden yellow. Fruit unknown. Perhaps a species of *Thápsia*.

Golden-flowered Laserwort. Fl. June, July. Clt. 1820. Pl. 2 to 3 feet.

20 L. ferula'ceum (Lapeyr. abr. pyr. p. 152. but not of Lin.) stem naked, simple, furrowed; leaves decompound: leaflets capillary, simple in the lower part, and more decompound at the apex; mericarps of fruit 4-winged. ♃. H. Native of the Pyrenees, in a place called Pic du Gard. This is a very obscure species.

Fennel-like Laserwort. Pl. 2 to 3 feet?

Cult. All the species grow well in common soil, but it must be rather dry. They are only to be increased by seed, which should be sown in the autumn or spring.

CXXVII. LOPHOSCIA'DIUM (λοφος, *lophos*, a crest; and σκιαδιον, *sciadion*, an umbel; in reference to the crested wings of the mericarps). D. C. coll. mem. 5. p. 57. t. 3. f. 6. prod. 4. p. 207.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals elliptic, entire, acuminated, somewhat involute at the apex. Fruit compressed from the back. The primary ribs of the mericarps are unknown: but the 4 secondary ones are winged: the 2 lateral of which are expanded into a somewhat serrated wing each: and the 2 dorsal ones are expanded into interrupted wings, which at first sight appear like retrograde scales. Seed unknown.—Herb glabrous. Stem terete, erect. Lower leaves like those of *Achillèa millefòlia*, pinnate; leaflets short, innumerable, divided into linear-subulate lobes; upper leaves sessile, pinnate from the base, usually rising from the axils of the sheaths. Umbels compound, sometimes proliferous. Leaves of involucra 5-7, ovate-lanceolate, cuspidate; of the involucels 5-7, but narrower, and about equal in length to the umbellules. Flowers yellow. Allied to *Thápsia*, but differs in the ribs of the fruit being scaly; but the fruit examined being immature and incomplete, it is therefore doubtful in what part of the order the genus should be placed. Perhaps it should have been placed near *Càchrys*.

1 L. meifo'lium (D. C. l. c.) ♃. H. Native of the Levant. Férula meoìdes, Lin. spec. 356. Lam. dict. 2. p. 455. Laserpítium orientàle folio mei, Tourn. cor. p. 23. L. Pónticum meifolio flore luteo, Tourn. herb. without fruit. Laserpítium meifòlium, Vent. in herb. mus. par. Radical leaves long, pinnate; leaflets dense, opposite, pinnate-parted; partitions multifid: lobes short, setaceous.

Meum-leaved Lophosciadium. Fl. July, Aug. Clt. 1810. Pl. 3 feet.

Cult. See *Laserpítium* above for culture and propagation.

CXXVIII. MELANOSELI'NUM (from μελας μελανος, *melas melanos*, black, and σελινον, *selinon*, parsley; black parsley). Hoffm. umb. ed. 2. vol. 1. p. 156. Koch, umb. p. 75. f. 6-8. D. C. prod. 4. p. 208.—Selìnum species, Wendl. and Spreng.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point. Fruit flatly compressed from the back. Mericarps with 5 filiform, primary ribs: the 3 intermediate ones on the back: and the 2 lateral ones placed in the commissure, which is flat; and 4 secondary ones: the inner ones of these filiform and very slender, but the outer 2 are expanded into membranous serrated wings; under all the ribs there are oleiferous canals. Carpophore bipartite. Seed flat.—A shrub with a terete simple stem, which is naked below. Leaves tripinnate; leaflets ovate, acuminated, serrated: ultimate ones usually confluent; petioles sheathing. Umbels composed of many rays. Involucra of many cut leaves; and the involucels of many entire leaves. Flowers white.

1 M. deci'piens (Hoffm. umb. l. c.). ♄. G. Native of Madeira? Selìnum decipiens, Schrad. and Wendl. sert. hann. 3. p. 23. t. 13. Willd. spec. 1. p. 1400. enum. 1. p. 307. Horn. hort. hafn. 1. p. 274. Schultes, syst. 6. p. 562. This

plant is called by gardeners *Bùbon Gálbanum*, to which it is very similar in habit, hence it has the name of *decípiens*.

Deceiving Black-parsley. Fl. Ju. Jul. Clt. 1785. Shrub.

Cult. Any light soil will suit this plant; and it is only to be increased by seed.

Tribe XII.

DAUCI'NEÆ (this section contains plants agreeing with *Daúcus* in important characters) or Orthospe'rmæ multijuga'tæ arma'tæ. Koch, umb. p. 76. D. C. prod. 4. p. 208. Fruit lenticularly compressed from the back, or the transverse section is nearly terete. Mericarps with 5 primary, filiform, bristly ribs: the lateral ones placed in the commissure, which is flat, as in *Thapsièæ;* and with 4 secondary ones, which are more prominent and prickly than the primary ones: the prickles free, or joined into a wing. Seed complanate or somewhat semi-teretely convex, flattish in front.

CXXIX. ARTE'DIA (Peter Artedi, a student of medicine in Sweden. He arranged umbelliferous plants from the calyx; died in 1735.). Lin. gen. no. 332. Lam. ill. t. 173. Spreng. umb. prod. 18. Lam. am. nat. 2. p. 90. Koch, umb. 76. f. 9-10. D. C. prod. p. 208.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point; those in the outer ray of the umbels with unequal lobes: the outer lobe very large. Fruit compressed from the back. Mericarps with 5 primary, filiform ribs: the 3 intermediate dorsal, and the 2 lateral ones placed in the commissure; and 4 secondary ribs: the 2 inner ones of these filiform: and the 2 outer ones winged; the wings deeply and sinuately lobed. Carpophore bipartite. Vittæ none. Seed flat.—An annual, glabrous herb. Leaves, as well as those of the involucra and involucels divided into linear lobes. Umbels compound. Flowers white. Herb with the habit of *Nigélla Damascèna;* and the inflorescence like that of *Orlàya grandiflòra.*

1 A. squamma'ta (Lin. spec. p. 347.). ⊙. H. Native of the Levant, on Mount Lebanon (Lin.); between Bagdad and Kermancha (Olivier), on the banks of the Euphrates (C. Rostan); in Syria and Asia Minor (Schr.); in the Morea, and Lycia (Smith); Cyprus (Sibth.). Gingídium Rauwólfia, Cam. hort. 16. but not of Dioscorides, ex Sibth. and Smith, fl. græc. 268. Thápsia orientàlis, Tourn. cor. 22. 1. Mor. ox. sect. 9. t. 18. f. 11. Flowers white. There is a pencil-like brown brush in the centre of the umbels. Cotyledons long, linear. Compare D. C. mem. umb. t. 19. t. 7.

Scaly Artedia. Fl. Jul. Clt. 1740. Pl. 1 to 1½ foot.

Cult. The seeds should be sown as soon as they are ripe, in a warm border, as if sown in spring, the plant rarely produces seed.

CXXX. ORLA'YA (in honour of John Orlay, M.D. secretary to the Medico-Chirurgical Society of Moscow). Hoffm. umb. 1. p. 58. Koch, umb. p. 78. f. 12-13.—Caúcalis species, Lin. Spreng. Lag. Platyspérmum, Koch, in litt. 1828. but not of Hoffm. D. C. prod. 4. p. 209.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point: those in the outer rays of the umbel radiant and profoundly bifid. Fruit lenticularly compressed from the back. Mericarps with 5, filiform, primary, setiferous ribs: the 3 intermediate ones dorsal: and the 2 lateral ones placed in the commissure, which is flat: and with 4 secondary ones, bearing 2-3 series of prickles each: the outer ones more prominent, or a little winged; prickles hooked, or rayed at the apex. Vittæ 1 in each furrow, under the secondary ribs. Carpophore bifid or undivided. Seed flat, convex behind.—Annual herbs. Leaves multifid; lobes linear. Involucra variable; involucels of many leaves. Flowers white: those in the rays of the umbels hermaphrodite, with short styles: those in the disk male: the rest female, and fertile, with long styles.

1 O. grandiflo'ra (Hoffm. umb. 1. p. 58.) plant erect, dichotomous, glabrous; leaves bipinnate; leaflets pinnatifid: segments linear, short; leaves of involucra 5, with scarious margins; prickles of fruit hooked at the apex. ⊙. H. Native of south and middle Europe, and of Tauria, in fields. Echinóphora, Col. ecphr. 1. 91. t. 94. f. 1. Rivin. pent. t. 25. Caúcalis grandiflòra, Lin. spec. p. 346. Lam. ill. t. 192. f. 1. Jacq. aust. 1. t. 54. Daúcus grandiflòrus, Scop. carn. 1. p. 189.—Lob. icon. 728. f. 1.—Mor. hist. sect. 9. t. 14. f. 3. There is a variety of this with smaller flowers, a native of the south of France.

Great-flowered Orlaya. Fl. Jul. Aug. Clt. 1648. Pl. 1 to 2 ft.

2 O. platyca'rpos (Koch, umb. p. 79.) plant erect, divaricately branched, rough, or rather pilose; leaves bipinnate; segments lanceolate, remotish; peduncles stiff, opposite the leaves; leaves of involucrum 3, short; prickles of fruit coloured and hooked. ⊙. H. Native from the south of France to Tauria, in the region of Olives, in fields. Echinóphora platycárpos, Col. ecphr. 1. p. 94. Caúcalis platycárpos, Lin. spec. p. 347. C. latifòlia, Lam. fl. fr. 3. p. 426. exclusive of the synonymes.—J. Bauh. hist. 3. p. 2. p. 80. f. 1.

Broad-fruited Orlaya. Fl. Jul. Aug. Clt. 1800. Pl. 1 ft.

3 O. mari'tima (Koch, l. c.) plant diffusely procumbent, velvety from villi; leaves bipinnate: segments bluntish, mucronate; peduncles elongated; leaves of involucra 3, short, undivided; prickles of fruit radiately glochidate at the apex. ⊙. H. Native of Mauritania, Spain, and the south of France, Corsica, west of Italy, and Candia. Caúcalis marítimus, Gouan. hort. monsp. p. 135. D. C. fl. fr. 4. p. 335. C. pùmila, Gouan. flor. 285. Daúcus marítimus, Gærtn. fruct. t. 20 f. 4. but not of Lam. Daúcus marítimus β, Lin. mant. p. 352.—Moris. hist. sect. 9. t. 14. f. 7. There is a variety of this having a bifid umbel (Gerard. gallo-prov. p. 227. t. 10.) or 3-4-cleft, and the lower ones 5-cleft.

Sea-side Orlaya. Fl. May, Jul. Clt. 1810. Pl. proc.

Cult. Sow the seeds in spring, in the open ground.

CXXXI. DAU'CUS (Δαυκος, of Dioscorides, is said to be from δαιω, *daio,* to make hot; from its supposed effect in medicine). Tourn. inst. p. 307. t. 161. Lin. gen. no. 333 Gærtn. fruct. 1. t. 20. Duby, bot. gall. 1. p. 215. Koch in litt. 1828. D. C. prod. 4. p. 209.—Caúcalis species, Lag. Daúcus and Platyspérmum, Hoffm. umb. 1. p. 62. and 64. Koch, umb. p. 76 and 78.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point: outer ones usually radiating, and profoundly bifid. Fruit somewhat compressed from the back, ovate or oblong. Mericarps with 5 primary, filiform, bristly ribs: the 3 intermediate ones dorsal: and the 2 lateral ones placed in the commissure, which is flat; and with 4 more secondary, prominent, equal, winged ribs, which are divided into a simple series of prickles. Vittæ 1 in each furrow, under the secondary ribs. Seed flattish in front.—Herbs, usually biennial. Leaves bipinnate. Leaves of involucra many, trifid, or pinnatifid; involucels of many entire or trifid leaves. Flowers white or yellow: the central ones usually fleshy, dark purple, and sterile. The species of this genus are badly known, and are extremely difficult to extricate from confusion.

Sect. I. Platyspe'rmum (from πλατυς, *platys,* broad, and σπερμα, *sperma,* a seed; seeds broad). Hoffm. umb. 1. p. 64.

Koch, umb. 78. D. C. prod. 4. p. 210. Prickles of the secondary ribs evidently cohering and broader at the base. Involucra wanting, or very small: having the leaves divided a little.

1 D. muricàtus (Lin. mant. p. 392.) plant hispid; leaves tripinnate; leaflets multifidly cut; leaves of involucrum 5-7, many of which, or all, are trifid or pinnatifid; prickles of fruit longer than the breadth of the seed, peltately glochidate at the apex. ⊙. H. Native of Mauritania, Numidia, Calabria, and China, in fields.—Mor. hist. sect. 9. t. 14. f. 4. Herm. par. 111. Artèdia muricàta, Lin. spec. ed. 1. p. 242. D. muricàtus, Desf. atl. 1. p. 243. Spreng. in Schultes, syst. 6. p. 477. exclusive of the synonyme of Poir. Platyspérmum muricàtum, Hoffm. and Koch, l. c. and perhaps Caúcalis Mauritánica is referrible to this. The hairs on the lower part of the stem are bent back.—Col. ecphr. 1. p. 95. t. 94. Flowers pink.

Muricated-fruited Carrot. Fl. Ju. Jul. Clt. 1683. Pl. 1 ft.

2 D. littorà'lis (Sibth. and Smith, fl. græc. t. 272. prod. 1. p. 185.) stem decumbent, hispid from deflexed hairs; leaves bipinnate, hispid; leaflets short, multifid, cuneiform; leaves of involucrum 3-cleft, shorter than the umbel; fruit ovate, beset with glochidate prickles. ⊙. H. Native of the island of Cyprus, by the sea-side; and of Spain. Leaves of the involucrum usually 5; of the involucels membranous. Flowers white. Fruit angular, beset with strong prickles.

Sea-shore Carrot. Fl. Ju. Jul. Clt. 1820. Pl. dec.

3 D. pulche'rrimus (Koch, in litt. ex D. C. prod. 4. p. 210.) plant glabrous; leaves ternately supra-decompound; segments linear, very narrow, short; umbels of many rays; involucrum wanting; prickles of fruit longer than the breadth of the seed; when young covered with rough pubescence. ⊙. H. Native of Tauria, Caucasus, Iberia, Persia, on the sea-shore, in sand. Caúcalis orientàlis, Bieb. fl. taur. 1. p. 208. exclusive of the synonyme. Spreng. in Schultes, syst. 6. p. 469. exclusive of the synonyme. Caúcalis pulchérrima, Willd. enum. p. 301. Platyspérmum pulchérrimum, Koch, umb. p. 78.—Buxb. cent. 3. p. 16. t. 23. Flowers white.

Most-beautiful Carrot. Fl. Ju. Jul. Clt. 1816. Pl. 2 to 4 ft.

4 D. Bessara'bicus (D. C. prod. 4. p. 210.) glabrous; leaves ternately supra-decompound; segments linear-setaceous; umbels of many rays; involucrum wanting; prickles of fruit length of seeds, when young scabrous. ♂. H. Native on the shores of the Black Sea, about Odessa; and of the south of Bessarabia. Caúcalis littoràlis, Bieb. fl. taur. 1. p. 208. Càchrys littoràlis, Spreng. umb. prod. 20. no. 5. Platyspérmum littoràle, Koch, l. c. This is very different from *Daúcus littoràlis* of Sibth., but it nearly agrees with *D. pulchérrimus*, especially in the leaves of the involucels being ciliated, but differs from it in the segments of the leaves being fewer and longer; in the rays of the umbels and umbellules being fewer; and in the prickles of the fruit being shorter. Flowers white.

Bessarabian Carrot. Fl. May, June. Clt. 1819. Pl. 1 ft.

5 D. laserpitioi'des (D. C. prod. 4. p. 210.) plant glabrous; leaves pinnate and bipinnate: with linear, elongated segments; umbels of 6-8 rays; leaves of involucrum 5-6, linear, undivided; prickles of fruit joined at the base, neither scabrous nor glochidate. ♃. H. Native of Mauritania, in sand by the sea-side, near Bone. Laserpítium daucoìdes, Desf. fl. alt. 1. p. 253. t. 70. Caúcalis virgàta, Poir. voy. 2. p. 133. suppl. 2. p. 136.

Laserwort-like Carrot. Pl. 2 to 3 feet.

6 D. pube'scens (Koch, umb. p. 77.) stem rough, branched; leaves pinnate, rather hispid; leaflets pinnatifid, with linear or trifid segments; leaves of involucrum usually trifid or undivided; prickles glochidate at the apex, longer than the breadth of the fruit, which is oblong. ⊙. H. Native of Egypt, at Alexandria. Caúcalis glàbra, Forsk. descript. p. 206. Delile, fl. ægypt. 64. t. 23. f. 2 and 3.

Var. α; smaller, sea-side plant; stems humble, diffuse. Delile, l. c. f. 2.

Var. β; a larger plant, native of sandy places, with taller, erect stems, and more slender and more acutely divided leaves.

Pubescent Carrot. Fl. May, Ju. Clt. 1820. Pl. ½ to 1 ft.

7 D. setulo'sus (Guss. act. soc. borb. ex D. C. prod. 4. p. 211.) stem branched, bristly; leaves pinnate; leaflets multifid; segments linear; leaves of involucra multifid; prickles of fruit longer than broad, glochidately capitate at the apex. ⊙. H. Native of Calabria, and at Naples. D. scabròsus, Bert. ex Guss.

Bristly-stemmed Carrot. Pl. 1 to 2 feet.

Sect. II. Caro'ta (from *car*, celt. red; colour of root). D. C. prod. 4. p. 211. Prickles of secondary ribs slender, separate, even to the base. Rays of umbel nearly equal, or gradually shorter to the centre.

8 D. parviflòrus (Desf. fl. atl. 1. p. 241. t. 60.) stem tubercular, rather hairy; leaves bipinnate; leaflets of lower leaves ovate-oblong: of the superior ones linear-lanceolate, cut; leaves of involucra trifid, subulate, short; of the involucels simple; flowers equal, small; prickles shorter than the breadth of the fruit, which is ovate, peltately glochidate at the apex. ⊙. H. Native of Mauritania, about Arzeau (Desf.). Flowers yellowish, according to the dried specimens.

Small-flowered Carrot. Fl. June, Jul. Clt. 1824. Pl. 3 ft.

9 D. involucra'tus (Sibth. and Smith, fl. græc. t. 271. Smith, prod. 1. p. 184.) stem hispid from spreading hairs; leaves bipinnate; leaflets multifid; leaves of involucrum pinnatifid, longer than the umbel; umbellules few-flowered, uniform; leaves of involucels narrow. ⊙. H. Native of Cyprus, by the sea-side. Perhaps the same as *D. Créticus*, Mill. dict. no. 5.? Fruit small, scabrous from silvery prickles, which are hooked and glochidate at the apex.

Involucrated Carrot. Fl. June, July. Clt.? Pl. ½ to 1 ft.

10 D. Caro'ta (Lin. spec. 348.) stem hispid; leaves bipinnate, and tripinnate; leaflets pinnatifid, with linear-lanceolate acute segments; umbels with a solitary, coloured, abortive flower; when in seed concave; bristles of fruit slender; leaves of involucra pinnatifid, not so long as the umbels; umbellules few-flowered, equal; leaves of involucels undivided or trifid. ♂. H. Native of Europe, Tauria, Caucasus, and now introduced to South America, China, Cochin-china, &c. in pastures and the borders of fields, in a gravelly soil; common in Britain, in like situations. Smith, engl. bot. 1174. Mart. rust. t. 82. Fl. dan. 723. Plench. off. t. 176. Hayn. arz. gew. 7. t. 2. D. vulgàris, Neck. D. polýgamus, Jacq. vind. 3. p. 43. t. 78. Caúcalis Caròta, Crantz. Huds. ang. p. 114. Staphylìnus, Riv. pentap. irr. t. 28. Pastinàca sylvéstris, Math. valgr. vol. 2. p. 107. f. 1.—Ger. emac. 1028.—Fuchs. hist. p. 684. Root slender, aromatic, and sweetish, resembling the garden carrot, which is only a cultivated variety. Leaves rather hairy. Umbels white, except the one central neutral flower, which is blood red. Seeds small, protected by the incurvation of all the flower-stalks, by which the umbels are rendered hollow, like a bird's nest. There are several varieties of the wild carrot, besides the cultivated kinds.

Var. β, *satìva* (D. C. prod. 4. p. 211.) root spindle-shaped, thick, succulent. This is the cultivated carrot, of which there are varieties with white, red, but usually yellow or copper-coloured roots.

The root of the plant, in its wild state, is small, dry, sticky, of a white colour, and strong flavoured; but the root of the

cultivated variety is large, succulent, and of a red, yellow, or pale straw colour.

Use.—It is used in soups and stews, and as a vegetable dish. Parkinson informs us that, in his day, ladies wore carrot leaves instead of feathers. In winter, an elegant chimney ornament is sometimes formed by cutting off a section from the head or thick end of a carrot, containing the bud, and placing it in a shallow vessel with water. Young and delicate leaves unfold themselves, forming a radiated tuft, of a very handsome appearance, and heightened by contrast with the season of the year.

Varieties.—Those in common cultivation are:

1 *Large red* or *field carrot*, grows to a large size, and is chiefly cultivated in fields, and in farmers' gardens, for colouring butter.

2 *Orange carrot.* The root is long and large, of an orange colour, and is the best sort for the main crop.

3 *Early horn.* Root short, smaller. It is the best kind for a small, early crop; also for shallow soils.

4 *Late horn.* With the same characteristics as the preceding, but suited for a late crop.

William Christie enumerates the following sorts of horn carrots:—*Early red, common early, long horn.* Of long carrots:—*White, yellow, long yellow, long orange, long red*, and the *Altringham*, or *superb*, originally from Cheshire.

Soil.—The carrot requires a light mellow soil, mixed with sand, which should be dug or trenched one or two spades deep, breaking well all the lumpy parts, so as to form a porous bed, and an even surface. The orange and red sorts, on account of their longer roots, require a soil proportionally deeper than the horns.

Seed estimate and sowing.—The seeds have numerous forked hairs on their ribs, by which they adhere together, and therefore should, previously to sowing, be rubbed between the hands, and mixed with dry sand, in order to separate them as much as possible. They are also very light, and therefore a calm day must be chosen for sowing; and the seeds should be disseminated equally, and trod in before raking. Previously to sowing, if convenient, the seed should be proven, by sowing a few in a pot, and placing it in a hot-bed, or hot-house, as it is more frequently bad than most garden seeds. For a bed $4\frac{1}{2}$ feet by 30, one ounce will be requisite, and the same for 150 feet of drill rows.

Times of sowing.—To have early summer carrots, sow on a warm border in the beginning of February, or, to have them still more forward, sow in a moderate hot-bed, giving copious admission of air. In the open garden, begin with the early horn, in the last fortnight of February, or first week of March, as dry, fine, and open weather may occur. The first sown beds should be assigned a favourable situation, and covered for a time with haulm. Follow with the orange, in the first fortnight of March, and make successive sowings thence to the 20th of April for main crops. Add smaller sowings twice in May, for plants to draw young late in summer; also sow a few at the commencement of July, for a later succession of young carrots in summer and autumn. Lastly, in the beginning of August, two separate small sowings may be made for plants to stand the winter, and afford young roots early in spring, March and April.

Insects.—Carrots, when they come up, are apt to be attacked by insects, like the turnip; the most approved remedies for which are thick sowing, in order to afford both a supply for the insects and the crop; and late sowing, especially in light soils, thus permitting the grubs to attain their fly state before the seed comes up.

Culture.—When the plants are up 2 or 3 inches in growth, in May and June, they will require thinning and clearing from weeds, either by hand or small hoeing. Thin from 3 to 5 inches' distance, such as are designed for drawing in young and middling growth. But the main crop, intended for larger and full-sized roots, thin to 6 or 8 inches' distance. Keep the whole clean from weeds in their advancing young growth. Some of small and middling growth will be fit for drawing in June and July; large sizeable roots, in August and September; and those of full growth, by the end of October.

Preserving in winter.—Carrots are taken up at the approach of winter, cleaned, and stored among sand. They may be built very firm, by laying them heads and tails alternately, and packing with sand. In this way, if frost be excluded from the storehouse, they keep perfectly well till March or April of the following year. Some persons insist that the tops should be entirely cut off at the time of storing, so as effectually to prevent their growing; while others wish to preserve the capability of vegetation, though certainly not to encourage the tendency to grow.

To save seed.—Plant some of the largest best roots in October, November, or the last fortnight of February, 2 feet apart; insert them a few inches over the crowns. They will yield ripe seed in autumn, of which gather only from the principal umbel, which is likely not only to afford the ripest and largest seed, but the most vigorous plants. A considerable quantity of carrot-seed, for the supply of the London seedsmen, is raised near Weatherfield in Essex; and much is imported from Holland.

Field culture of the carrot.—It is observed, by a judicious writer, that the carrot has been too much neglected on lands, where it would have yielded a more valuable product in agriculture perhaps than any bulbous or tap-rooted plant whatever. Several contradictory experiments in its culture have been detailed in a number of publications, from which the practical husbandman will be at a loss to draw any definite conclusion. But in a communication to the board of agriculture from Robert Burrows, an intelligent Norfolk farmer, who has cultivated carrots on a large scale, and with great success, for several years, so accurate an account is presented of the culture, application, and extraordinary value of this root, that carrots will probably soon enter more largely into the rotation of crops on suitable soils.

Varieties.—The only sort adapted for field culture is the long red or field carrot. New seed is most essential, as it will not vegetate the second year.

The best soil for the carrot is a deep rich sandy loam; such a soil ought at least to be a foot deep, and all equally good from top to bottom; on any other the field culture of the carrot will not answer.

In preparing the soil for the carrot, it is essential to plough it before winter, that it may be pulverized by frost, and to work it well in the spring to at least the depth of a foot. This deep tillage may be perfectly accomplished by means of the trench plough, following the common one, or even by the common one alone with a good strength of team; but the former method is to be preferred, wherever the lands are inclined to be stiff or heavy. Three ploughings are mostly found sufficient where the land has been previously in a state of tillage, but more may in other cases be necessary. As soon as the last ploughing has been made in March, the land should be harrowed, and the surface made as fine as possible. In Suffolk the farmers sow carrots after turnips, barley, and peas, set upon a rye-grass ley; the crops upon the first have generally been most productive; next to that they prefer the latter. In the first place, they feed off the turnips by the beginning of February, and then lay the land up in small bulks or furrows, in which state it remains till the second week in March, when it is harrowed down, double furrowed to the depth of about a foot, and the seed sown.

The climate most suitable to the carrot is the same as for the turnip; but they will thrive better than the turnip in a dry and

warm climate, and are consequently of better growth in the south of England and France, in proportion to their size in moist climates, as Holland and Ireland, than the turnip.

Manure, according to some, should not be given to carrots the year they are sown, as it is alleged when the roots meet with it they become forked and wormy. This, however, is only applicable to cases in which recent unfermented manure has been given, or where other manure has not been properly broken in pieces, and spread over the soil, or in the drills. The Suffolk and Norfolk farmers, who are the best carrot growers, always use dung; a suitable proportion of well-rotted farm-yard dung being constantly turned into the soil at the last ploughing in March, as it has been fully shown by various trials detailed in the Annals of Agriculture, and other books on husbandry, that though good crops of carrots may be occasionally grown without the aid of manure, it is only by the liberal application of that substance that the greatest produce possibly can be obtained, as they are in general found to bear a relative proportion to the quantity that may have been employed. Mr. Burrows prepares the land with a good dressing of about 16 cart loads per acre of rotten farm-yard manure, or cottagers' ashes,—the load about as much as three horses can draw. He usually sows wheat stubbles after clover, ploughing the first time in autumn, and once more in the early part of the month of February, if the weather permits; setting on the manure at the time of sowing, which is about the last week in March, or sometimes as late as the second week in April. In Suffolk, when carrots are intended to be sown after peas, they usually plough the stubble as soon as the harvest is over, in order that the land may clear itself of weeds; in December, it is laid up in small bulks to receive the benefit of the frosts; in February, it is harrowed down, and manured at the rate of 15 loads per acre; the manure ploughed in to the depth of about 4 inches, and in the month of March the land is double-furrowed, and the seed sown. By pursuing this method, they say, the manure lies in the centre of the soil, and not only affords nourishment and support to the carrot in its perpendicular progress, but renders it easy to be turned up by a single ploughing, and greatly promotes the growth of the succeeding crop of barley. In Norfolk, it is the practice to sow carrots after a crop of turnips. The manure, after being put on the land in the beginning of March, is first ploughed in with a common plough, and afterwards trench ploughed about 14 or 15 inches deep; it is then harrowed very fine, and the seed sown about the beginning of March.

The season for sowing the carrot, preferred by Mr. Burrows, is the last week in March or first of April; but he prefers the first period, having generally found early crops the most productive.

The usual preparation of the seed for sowing, is by mixing it with earth or sand, to cause it to separate more freely; but Burrows adds water, turns over the mixture of seeds and moist earth several times, and thus brings it to a point of vegetation before he sows it. "Having then weighed the quantity of seed to be sown, and collected sand or fine mould in the proportion of 2 bushels to an acre, I mix the seed with the sand or mould 8 or 10 pounds to every 2 bushels, and this is done about a fortnight or 3 weeks before the time I intend sowing; taking care to have the heaps turned over every day, sprinkling the outside of them with water each time of turning over, that every part of the sand heaps may be equally moist, and that vegetation may take place alike throughout. I have great advantage in preparing the seed so long beforehand; it is by this means in a state of forward vegetation, therefore lies but a short time in the ground, and by quickly appearing above ground, is more able to contend with those numerous tribes of weeds in the soil, whose seeds are of quicker vegetation." Suppl. &c.

The quantity of seed, when carrots are sown in rows, is 2 pounds per acre, and for broad-cast sowing 5 pounds. Burrows sows 10 pounds per acre in the broad-cast manner.

The usual mode of sowing the carrot is broad-cast, but perhaps the better mode would be to sow them in rows at 12 or 14 inches asunder; drawing the drills, and hoeing the intervals by any suitable hoe. The most common practice, however, where carrots are best cultivated, is the hand or broad-cast method, the seed being dispersed as evenly as possible over the land, after the surface has been reduced to a very fine state of pulverization by harrowing, in order to provide a suitable bed for it to vegetate in, being then covered in by means of a light harrow. As the seed is not of a nature to be deposited with much regularity by the drill, and as the young plants can be easily set out to proper distances in the operation of hoeing, this is probably the most appropriate method of putting such sort of seed into the ground. And an additional proof of it is indeed found in its being that which is almost universally adopted in those districts where carrot-husbandry is practised to the greatest extent. The drill method, however, would save much hand labour. The seed may either be deposited by the drill-machine, or by furrows made with a hoe or other implements, burying the seed about an inch in depth, and harrowing once.

The after culture given to the carrot consists entirely of hoeing and weeding. In Suffolk they are hoed generally 3 times in the season. The first time, as soon as the plants can be distinguished from the weeds, which should be done with a 3-inch hoe. It is an operation that requires to be performed with great attention, as it is extremely difficult to distinguish the young carrots from the weeds. The second hoeing should be given in 3 or 4 weeks afterwards, according to the forwardness of the crop; it may be performed with common hoes, care being taken to set out the plants at proper distances. From 8 to 15 inches each way is the common distance, at which they are allowed to stand; and it has been proved by experience, that carrots which grow at such distances always prove a more abundant crop than when the plants are allowed to stand closer together. The third hoeing is commonly made about the middle or end of June, and in this, besides destroying the weeds, another material circumstance to be attended to, is to set the carrots at proper distances, and also wherever any have been left double at the former hoeings, to take the worst of the two plants away.

Carrots sown according to the plan of Burrows, are ready to hoe within about 5 or 6 weeks. He hoes 3, and sometimes 4 times, or until the crop is perfectly clean. The first hoeing is with hoes 4 inches long, and $2\frac{1}{4}$ inches wide. The second hoeing invariably takes place as soon as the first is completed, and is performed with 6-inch hoes, by $2\frac{1}{4}$ inches wide. By this time the plants are set; the first time of hoeing nothing was cut but the weeds. He leaves the plants 9 inches apart from each other, sometimes they will be a foot or even farther asunder.

Carrots are generally taken up in the last week of October. The operation is performed by 3-pronged forks. "I take up in autumn a sufficient quantity to have a store to last me out any considerable frost or snow that may happen in the winter months. The rest of the crop I leave in the ground, preferring them fresh out of the earth for both horses and bullocks. The carrots keep best in the ground, nor can the severest frosts do them any material injury; the first week in March it is necessary to have the remaining part of the crop taken up, and the land cleared for barley; the carrots can either be laid in a heap, with a small quantity of straw covered over them, or they may be laid into some empty outhouse or barn, in heaps of many hundred bushels, provided they are put together dry. This latter circumstance it is indispensable to attend to; for if laid together in large heaps when wet, they will certainly sustain

much injury. Such as I want to keep for the use of my horses until the months of May and June, in drawing over the heaps (which is necessary to be done the latter end of April, when the carrots begin to sprout at the crown very fast,) I throw aside healthy and most perfect roots, and have their crown cut completely off, and laid by themselves; by this means carrots may be kept the month of June out in a high state of perfection."—Burrows' Communications to the Board of Agriculture, vol. vii. p. 72.

The storing of the whole crop of carrots, may be a desirable practice when winter wheat is to follow them, in which case the same mode may be adopted as for turnips or potatoes, but with fewer precautions against the frost, as the carrot if perfectly dry is very little injured by that description of weather.

The produce of an acre of carrots in Suffolk, according to Arthur Young, is at an average 350 bushels; but Burrows' crop averaged upwards of 800 bushels per acre, which considerably exceeds the largest crop of potatoes.

The uses to which the carrot is applied in Suffolk are various. Large quantities are sent to the London markets, and also used as food to different kinds of live stock. Horses are remarkably fond of carrots, and it is even said when oats and carrots are given together, the horses leave the oats and eat the carrots. The ordinary allowance is about 40 or 50 pounds a day to each horse. Carrots, when mixed with chaff, that is, cut straw, and a little hay, keep horses in excellent condition for performing all kinds of ordinary labour. The farmers begin to feed their horses with carrots in December, and continue to give them chiefly that kind of provender till the beginning or middle of May; to which period, with proper care, carrots may be preserved. As many of the farmers in that country are of opinion, that carrots are not so good for horses in winter as in spring, they give only half the above allowance of carrots at first, and add a little corn for a few weeks after they begin to use carrots.

The application of the carrot to the feeding of working cattle and hogs, is thus detailed by Burrows: "I begin to take up the carrot crop in the last week of October, as at that time I generally finish soiling my horses with lucern, and now solely depend upon my carrots, with a proper allowance of hay, as winter food for my horses, until about the first week of June following, when the lucern is again ready for soiling. By reducing this practice to a system, I have been enabled to feed 10 cart horses throughout the winter months for these last 6 years, without giving them any corn whatever, and have at the same time effected a considerable saving in hay. I give them to my cart-horses in the proportion of 70 pounds weight of carrots a horse per day, upon an average, not allowing them quite so many in the very short days, and sometimes more than that quantity in the spring months, or to the amount I withheld in the short winter days. The men who tend the horses slice some of the carrots in the cut chaff of hay, and barn door refuse; the rest of the carrots they give whole to the horses at night, with a small quantity of hay in their racks, and with this food my horses generally enjoy uninterrupted health. I mention this, as I believe that some persons think that carrots only, given as food to horses, are injurious to their constitutions; but most of the prejudices of mankind have no better foundation, and are taken up at random, or inherited from their forefathers. So successful have I been with carrots, as a winter food for horses, that with the assistance of lucern for soiling in summer, I have been enabled to prove by experiments, conducted under my own personal inspection, that an able Norfolk team-horse, fully worked two journeys a day, winter and summer, may be kept the entire year round upon the produce of one statute acre of land. I have likewise applied carrots with great profit to the feeding of hogs in winter, and by that means have made my straw into a most excellent manure, without the aid of neat cattle. The hogs so fed are sold on Norfolk-hill to the London dealers as porkers." The profits of carrots so applied, he shows in a subsequent statement, together with an experiment of feeding four Galloway bullocks with carrots, against four others fed in the common way with turnips and hay.—Burrows' Communications, &c.

In comparing the carrot with the potatoe, an additional circumstance greatly in favour of the former is, that it does not require to be steamed or boiled, and it is not more difficult to wash than the potatoe. These, and other circumstances considered, it appears to be the most valuable of all roots for working horses.

The use of the carrot in domestic economy is well known. Their produce of nutritive matter, as ascertained by Sir H. Davy, is 98 parts in 1000, of which 3 are starch, and 95 sugar. They are used in the dairy in winter and spring to give colour and flavour to butter. In the distillery, owing to the great proportion of sugar in their composition, they yield more spirit than the potatoe; the usual quantity is 12 gallons per ton. They are excellent in soups, stews, and haricots, and boiled whole with salt beef.

Medical qualities.—The seeds, especially of the wild variety, have a moderately warm pungent taste, and an agreeable smell. They are carminative, and are said to be diuretic. The roots, especially of the cultivated variety, contain much mucilaginous and saccharine matter, and are therefore highly nutritious and emollient. When beaten to a pulp, they form an excellent application to carcinomatous and ill-conditioned ulcers, allaying the pain, checking the suppuration and fetid smell, and softening the callous edges.

Common *Carrot*. Fl. Ju. Jul. Britain. Pl. 2 to 3 feet.

11 D. MARI'TIMUS (Lam. dict. 1. p. 634. but not of With.) stem elongated, smooth, and glabrous at the base, but scabrous from tubercles above; leaves glabrous: lower ones bipinnate; leaflets jagged: segments linear, acuminated; leaves of involucra pinnatifid, linear, acute; of the involucels undivided; prickles about equal in length to the diameter of the fruit, which is ovate. ♂. H. Native of France, in sand, along the sea-shore; as well as along the shores of the Mediterranean Sea, where it is generally mixed with *D. Carôta*, but from which it is easily distinguished. D. C. fl. fr. 4. p. 329. bot. gall. 1. p. 215.

Sea-side Carrot. Fl. June, Jul. Clt.? Pl. 1 to 2 feet.

12 D. GLABE'RRIMUS (Desf. fl. atl. 1. p. 244. t. 64.) stem glabrous, or rather scabrous from small down; leaves pinnate; leaflets cuneated, bluntly 3-5-lobed, glabrous; leaves of involucra pinnatifid, acute, one half shorter than the umbels; involucels trifid or simple; prickles about equal in length to the breadth of the fruit, which is ovate. ☉. H. Native of the north of Africa, near Tozzer, in woods of palm trees. Flowers small, white.

Quite-glabrous Carrot. Pl. 1 to 2 feet.

13 D. GINGI'DIUM (Lin. spec. 348.) stem and petioles scabrous from scattered bristles; leaves bipinnate; leaflets deeply toothed, ovate: segments obtuse, mucronate; leaves of involucra striated, pinnatifid, about equal in length to the umbels; prickles bristle-formed, equal in length to the breadth of the fruit, capitately glochidate at the apex. ♂. H. Native of Corsica, on rocks by the sea-side, and probably of Sicily. D. Mauritánicus, Salzm. exsic.—Gingídium, Math. ed. Valgr. 373. f. 1. D. lùcidus, Lin. fil. suppl. 179. ex Smith, in Lin. trans. 9. p. 133.—Bocc. mus. t. 20. Habit of *D. Hispánicus*, but differs in the fruit. Γιγγιδιον, is a name employed by Dioscorides for an umbelliferous plant, but what plant is now unknown.

Chervil-like or Shining-leaved Carrot. Fl. June, July. Clt. 1722. Pl. 2 to 3 feet.

14 D. Hispa'nicus (D. C. prod. 4. p. 212.) stem hispid at the base, branched, smoothish above; leaves bipinnate; leaflets smoothish, ovate, deeply toothed, thick, obtuse, somewhat mucronate; leaves of involucra striated, pinnatifid, or trifid, shorter than the umbels; prickles stiffish, comb-formed, acute, and entire at the apex, shorter than the diameter of the fruit. ♂. H. Native of Sicily, Italy, France, on rocks by the sea-side. In the south of England, on the sea-coast, near Dover; and in Cornwall. D. gúmmifer, Lam. dict. 1. p. 634. D. C. fl. fr. 4. p. 328. 5. p. 512. Bert. amœn. ital. p. 136. D. marítimus, With. brit. 290. Sowerb. engl. bot. t. 2560. but not of Lam. D. Caròta γ, Smith, fl. brit. 300. D. Hispánicus, Gouan. ill. p. 9. Leaflets dilated, with rounded segments, whose edges and ribs are hairy. Bristles of fruit more flattened than in *D. Caròta*. Umbels convex when in seed, as in most of the species.

Spanish Carrot. Fl. Ju. Aug. England. Pl. 1 to 2 feet.

15 D. pectina'ceus (D. C. prod. 4. p. 212.) stem smoothish, striated, rather scabrous at the apex; leaves bipinnate, glabrous; leaflets ovate-lanceolate, pinnatifid: segments ovate-lanceolate, acute; leaves of involucra pinnatifid, about equal in length to the umbels, which are many-rayed; prickles simple, regularly pectinated, shorter than the breadth of the fruit, which is ovate. ♂. H. Native country unknown. This species differs from all the rest in the fruit.

Pectinated-fruited Carrot. Fl. Ju. Jul. Clt.? Pl. 2 to 3 ft.

16 D. Maurita'nicus (All. pedem. no. 1381. t. 61. f. 1.) stem scabrous from retrograde bristles; leaves bipinnate, glabrous; leaflets of the lower leaves lanceolate, deeply toothed: of the superior leaves linear, acute; leaves of involucra striated, pinnatifid, shorter than the umbels; prickles simple, acute, exceeding the breadth of the fruit, which is ovate. ♂. H. Native in fields about Nice, and in the south of France, and of Mauritania. D. C. fl. fr. 5. p. 512. and probably of Lin. spec. 348.

Var. β, pteroclæ'nus (D. C. prod. 4. p. 212.) leaves of the involucels variable, some of them undivided; and some, as the outer ones, pinnatifid. ♂. H. Native of Tauria, on the banks of rivers.

Mauritanian Carrot. Fl. June, July. Clt. 1768. Pl. 3 ft.

17 D. ma'ximus (Desf. fl. atl. 1. p. 241.) stem scabrous, striated; leaves bipinnate or tripinnate; leaflets of the lower leaves ovate, equally cut, with obtuse mucronate segments: of the upper leaves linear, acute; leaves of involucra pinnatifid, about equal in length to the umbels; prickles glochidate at the apex, equal in length to the breadth of the fruit, which is ovate. ⊙. H. Native of Mauritania, Sardinia, south of France, on the borders of fields. Umbels large, radiating: having the central flower abortive.

Largest Carrot. Pl. 2 to 4 feet.

18 D. gutta'tus (Sibth. et Smith, fl. græc. t. 269. Smith, prod. 1. p. 184.) stem hairy from spreading pili; leaves bipinnate; lower leaflets cuneated, pinnatifid, mucronate: superior ones lanceolate, finely serrulated; involucra shorter than the umbels; leaves of involucels membranous; central flowers of umbels abortive, and of a different colour from the rest. ⊙. H. Native of the Grecian islands, and of Asia Minor.

Spotted Carrot. Pl. 1 foot.

19 D. poly'gamus (Gouan. ill. p. 9.) stem terete, nearly scabrous; leaves bipinnate, smoothish, but pilose beneath on the nerves, as well as on the petioles; leaflets pinnatifid: segments lanceolate-linear, acute; leaves of involucra trifid or pinnatifid: outer flowers of umbel abortive; prickles acute, about equal in length to the fruit, which is ovate. ♂. H. Native of Spain, and probably of Sicily, if the figure in Bocc. sic. t. 40. f. 3. appertain to this species. D. Caròta β, Pers. ench. exclusive of the synonyme of Jacq. Fruit larger than those of *D. Caròta*, and the prickles are twice the length. Perhaps sufficiently distinct from *D. Caròta*.

Polygamous Carrot. Fl. Ju. Jul. Clt. 1817. Pl. 2 feet.

20 D. hi'spidus (Desf. atl. 1. p. 243. t. 63.) stem hispid from spreading or deflexed hairs; leaves bipinnate, rather villous; leaflets ovate, lobately toothed; leaves of involucra pinnatifid, shorter than the umbels; prickles about equal in length to the breadth of the fruit, incurved and glochidate at the apex. ♂. H. Native of the north of Africa, and the north of France, near Dieppe and Treport, by the sea-side on rocks. D. C. fl. fr. 4. p. 328. Bouch, fl. abb. p. 20. Spreng. in Schultes, syst. 6. p. 480. exclusive of the synonymes. The French plant is probably the same as the Mauritanian one. Flowers reddish.

Hispid Carrot. Fl. June, July. Clt. 1804. Pl. 1 to 2 feet.

21 D. grandiflo'rus (Desf. fl. atl. 1. p. 240. t. 59.) stem pilose; leaves tripinnate and quadripinnate; leaflets trifid, linear, cuspidate; leaves of involucra pinnatifid, with subulate segments, about equal in length to the radiating umbels; prickles peltately glochidate at the apex, exceeding the breadth of the fruit, which is ovate. ⊙. H. Native of Algiers, among corn. Flowers like those of *Orlàya grandiflòra*, and the leaves like those of *D. Mauritánicus*, but differs in the prickles of the fruit being glochidate at the apex.

Great-flowered Carrot. Pl. 2 to 3 feet.

22 D. pusi'llus (Michx. fl. bor. amer. 1. p. 164.) stem hispid from retrograde pili at the base, and rather scabrous at top; leaves bipinnate, rather scabrous; leaflets cut into linear segments; leaves of involucra pinnatifid, about equal in length to the umbels, which are small; prickles distinctly glochidate at the apex, about equal in length to the breadth of the fruit, which is ovate. ♂. H. Native of Carolina, at St. John's and Savannah, in dry places (Ell. sketch. 1. p. 349.); at the Red River (Nutt. in litt.); in Pennsylvania, at Reading (Herb. Koch.). Truly distinct from *D. Caròta*.

Small Carrot. Pl. 1 foot.

23 D. microphy'llus (Presl. in herb. Hænke, ex D. C. prod. 4. p. 213.) stem villous from soft retrograde hairs, especially at the bottom; leaves bipinnate, villous; leaflets cut into linear segments; leaves of involucra pinnatifid, about equal in length to the umbels, which are small and crowded; prickles distinctly glochidate at the apex, about equal in length to the breadth of the fruit, which is ovate. ⊙.? ♂.? H. Native of the north-west coast of America, at Nootka Sound; Straits of De Fuca; Rocky places of the Grand Rapids of the Columbia; and on the plains of the Multnomak River. Very nearly allied to *D. pusíllum*, but the hairs on the stem are more numerous, longer, soft, and not tubercular at the base; and the fruit is a little larger.

Small-leaved Carrot. Pl. 1 foot.

24 D. setifo'lius (Desf. fl. atl. 1. p. 244. t. 65.) stem smooth, erect; leaves decompound, pubescent; leaflets many-parted, opposite, somewhat verticillate: segments elongated, filiform, very narrow; leaves of involucra multifid; fruit cylindrical, pubescent, ciliately echinated at the angles; prickles short. ♃. H. Native of Mauritania, near Mascar, on uncultivated hills. Central flowers abortive. Perhaps the same as *D. verticillàtus*, Horn. hort. hafn. 1. p. 272.

Bristle-leaved Carrot. Pl. 3 feet.

25 D. au'reus (Desf. fl. atl. 1. p. 242. t. 61.) stem hispid from spreading pili; leaves glabrous, supra-decompound; leaflets multifid: segments linear-lanceolate, acute, with rather revolute edges; leaves of involucra and involucels decompound, reflexed; prickles stiff, peltately glochidate at the apex, longer than the diameter of the fruit, which is oblong. ⊙. H. Native of Mauritania, in corn-fields near Mascar; and of Sicily and Calabria, in argillaceous soil; and of Lycia. Flowers white,

but becoming yellowish on drying. Umbels of many rays. Fruit yellow.

Golden-flowered Carrot. Fl. July. Clt. 1823. Pl. 2 to 3 ft.

26 D. crini'tus (Desf. fl. atl. 1. p. 242. t. 62.) stem rather roughish from small, retrograde down; leaves glabrous, pinnate; leaflets multifid, somewhat verticillate: segments setaceous, stiffish; leaves of involucra many-parted at the apex; prickles bristle-formed, acute, and a little cleft at the apex, double the length of the diameter of the fruit. ♃. H. Native of Mauritania, near Tangiers, Mascar, Tlemsen, and on Mount Atlas. Bristles of fruit purplish in Desfontaine's specimens, but yellowish in those of Salzmann. Torìlis crinìta, Spreng. umb. spec. 141. D. meifòlius, Brot. phyt. t. 36. is not distinct from the present species.

Long-haired Carrot. Fl. June, Jul. Clt. 1804. Pl. 2 to 3 ft.

27 D. hirsu'tus (Sibth. and Smith, fl. græc. t. 269. prod. 1. p. 184.) stem hairy from spreading pili; leaves bipinnate; leaflets lanceolate, finely serrulated; leaves of involucra entire, trifid, or pinnatifid, shorter than the umbels; prickles of fruit elongated, glochidate, and coloured. ⊙. H. Native in the islands of the Archipelago and Asia Minor, frequent. Spreng. umb. 143. Leaves of involucels membranous. Flowers white: central ones abortive. Prickles of fruit golden yellow.

Hairy Carrot. Pl. 2 feet.

28 D. bi'color (Sibth. et Smith, fl. græc. t. 270. prod. 1. p. 184.) stem beset with spreading hairs; leaves puberulous, bipinnate; leaflets multifid, with linear lobes; leaves of involucra trifid, longer than the umbels; involucels membranous, on one side; central flower discoloured. ⊙. H. Native of Asia Minor.

Two-coloured-flowered Carrot. Pl. 1 to 1½ foot.

Sect. III. Anisa'ctis (from *ανισος, anisos*, unequal, and *ακτιν, aktin*, a ray; in allusion to the unequal rays of umbels). D. C. prod. 4. p. 214. Carpophore undivided, or hardly bifidly emarginate at the very top. Rays of umbels very unequal.

29 D. brachia'tus (Sieb. exsic. nov. holl. no. 115.) stem glabrous; leaves bipinnate, smoothish; leaflets divided into linear lobes; leaves of involucra multifid, much shorter than the rays of the umbel, which are unequal; leaves of involucels simple, much shorter than the pedicels; prickles glochidate at the apex, about equal in length to the breadth of the fruit, which is oblong. ⊙.? H. Native of New Holland. Stem 2 or 3 from the same root, about a foot high. Rays of umbels diverging much.

Brachiate-umbelled Carrot. Pl. 1 foot.

30 D. toriloi'des (D. C. prod. 4. p. 214.) stem hispid from deflexed hairs; leaves bipinnate, scabrous; leaflets divided into linear lobes; leaves of involucra multifid, much shorter than the rays of the umbels, which are unequal and scabrous from bristles; leaves of involucra simple, much shorter than the pedicels; prickles stellately hooked at the apex, about equal in length to the breadth of the fruit, which is oval-oblong.—Native of Peru, on the mountains; and of Mexico at Tolucco, and the Cordileras de Guchilaque; and probably of Chili and Caraccas. D. montànus, Willd. rel. in Schultes, syst. 6. p. 482.? Torìlis Peruviàna, Presl. in herb. Hænke. Habit of *Torìlis;* but differs from that genus in the albumen not being involute. Rays of umbels shorter and less diverging than in the preceding species.

Torilis-like Carrot. Pl. 1 foot.

31 D. Montevide'nsis (Hort. berol. ex Bernh. in herb. Balb. D. C. prod. 4. p. 214.) stem, petioles, and under side of leaves hispid from long, soft villi; leaves bipinnatifid; segments divided into linear-subulate lobes; terminal umbels 5-7-rayed: axillary ones 3-5-rayed; rays unequal; prickles of fruit glochidate at the apex. ⊙. H. Native of Monte Video. Leaves of involucrum multifid, about equal in length to the umbel. Petals obcordate.

Monte-Video Carrot. Fl. June, Aug. Clt. 1827. Pl. 1 ft.

32 D. austra'lis (Pœppig. pl. exsic. no. 97. diar. no. 330.) stem simple, hispid; hairs on the lower part of the stem deflexed; leaves bipinnate, hispid; leaflets multifid, with short acute lobes; leaves of involucra multifid, almost exceeding the umbels, which are crowded, and composed of few rays; prickles of fruit glochidate at the apex. ⊙. H. Native of Chili. Flowers small, golden yellow in the dried state. The whole herb yellowish.

Southern Carrot. Pl. 1 to 2 feet?

† *Species not sufficiently known.*

33 D.? cuminoi'des (Lam. ill. t. 192. f. 2. Poir. suppl. 2. p. 118.) stem glabrous, flexuous; leaves tripartite; segments linear, very long, glabrous; leaves of involucrum ternate, shorter than the umbel, which is composed of few rays; prickles shorter than the breadth of the fruit, which is oblong.—Native country unknown. Perhaps a species of *Anthriscus*.

Cumin-like Carrot. Pl. ½ foot.

34 D. Si'culus (Tineo, pug. sic. 1. p. 6.) stem erect, striated, hispid; leaves pinnate; leaflets ovate, deeply toothed; teeth obtuse, mucronate; petioles hairy; leaves of involucrum pinnatifid, larger than the umbel. ⊙. H. Native of Sicily. Schultes, syst. 6. p. 628. Schrank, in fl. 1819. p. 383. Outer flowers of umbels yellow: inner ones reddish. Fruit unknown.

Sicilian Carrot. Pl. 1 to 2 feet.

35 D. pro'lifer (Presl, del. prag. 130.) stem erect, rather dichotomous, furrowed, covered with retrograde hairs; leaves bipinnate; leaflets cordate, pinnatifid, toothed; leaves of involucrum entire, or deeply toothed; primary umbel proliferous; pedicels and fruit very hairy. ⊙. H. Native country unknown, according to Gussone, prod. fl. sic. 1. p. 324.; but according to Presl, it is a native of Sicily, between Syracuse and Catana, in sand by the sea-side. Perhaps the same as *D. Sículus*.

Proliferous-umbelled Carrot. Pl. 1 to 2 feet.

36 D.? ala'tus (Poir. suppl. 2. p. 118.) stem erect, furrowed, hairy; leaves glabrous, somewhat pinnate; leaflets broadly cut: segments bluntish; petioles pilose; leaves of involucra pinnatifid at the apex, with linear segments; rays of umbel crowded, hispid; ribs of fruit membranously winged, spiny-toothed. ♃. H. Native of Barbary, in uncultivated stony places by the sea-side.

Winged-fruited Carrot. Pl. 2 feet?

37 D. fœ'tidus (Rafin. fl. lud. 81.).—Native of Louisiana, in pastures. Plant stinking. Roots white, ex Rob. voy. p. 461.

Fetid Carrot. Pl.?

38 D. ri'gidus (Hort. par.) } These 2 species have not
39 D. macroca'rpus (Hort. erf.) } been described.

Cult. All the species grow well in any common garden soil. The seeds of them should be sown in spring.

Suborder II. Campylospe'rmæ (from *καμπυλος, kampylos*, curved, and *σπερμα, sperma*, a seed). D. C. prod. 4. p. 215. Albumen involute, or marked by a longitudinal furrow or channel on the inner side.

Tribe XIII.

ELÆOSELI'NEÆ (this tribe contains plants agreeing with the genus *Elæoselìnum* in important characters) or Campylospe'rmæ multijuga'tæ ala'tæ. Koch, in litt. D. C. prod. 4. p. 215. Fruit cylindrical, more compressed from the back than from the sides. Mericarps with 5 filiform, primary ribs; and 4 secondary ribs: the 2 dorsal ones of these last nerve-formed:

and the 2 lateral ones expanded into wings: having the margins nerve or wing-formed. Seed involute, semi-lunar.

CXXXII. ELÆOSELI'NUM (from ελαια, *elaia*, an olive tree, and σελινον, *selinon*, parsley). Koch, in litt. D. C. prod. 4. p. 215.—Laserpítium species, Desf. Thápsia species, Guss.

Lin. syst. *Pentándria, Digy'nia.* Margin of calyx hardly 5-toothed. Petals obovate, entire, with an inflexed point. Fruit somewhat compressed from the back, nearly terete, 4-winged. Mericarps with 5 filiform primary ribs: the 3 intermediate ones dorsal, and the 2 lateral ones placed within the wings and the nerve-formed margins: and 4 secondary ribs, the inner ones of these last obtuse, and the 2 outer ones expanded into membranous wings. Vittæ under all the ribs abounding in oil, those under the primary ribs slenderer and narrower than those under the secondary ones; and 4 in the commissure. Seed involute.—Perennial herbs. Stems terete, glabrous. Leaves decompound from the branched petioles. Umbels and umbellules of many rays. Involucra and involucels of many linear-cuspidate leaves. Flowers yellow. Carpophore undivided in *E. mecòides*, but bipartite in *E. thapsoìdes*.

1 E. meoi'des (Koch, in litt. D. C. prod. 4. p. 215.) leaves bipinnate, hispid on the petioles and nerves; leaflets divided into setaceous lobes. ♃. H. Native of Mauritania, about Algiers Tangiers; and on grassy hills and valleys in Sicily. Laserpitium meoìdes, Desf. fl. atl. 1. p. 250. t. 69. Thápsia meoìdes, Guss. prod. fl. sic. 1. p. 370. Peucédanum Siciliæ foliis hirsutis floribus luteis, J. Bauh. hist. 3. pt. 2. p. 37. ex Vaill. herb. There are simple leaves at the base of the flowering branches.

Meum-like Olive-parsley. Fl. July, Aug. Clt. 1818. Pl. 2 to 3 feet.

2 H. thapsoi'des (D. C. prod. 4. p. 215.) leaves pinnate, hardly velvety on the petioles and nerves; leaflets pinnate-parted, cuneated at the base: lobes oblong-oval, toothed: ultimate one trifid. ♃. H. Native of Mexico, about St. Angela. Herb 6-7 feet high, with the habit of *Thápsia Gargánica*. Teeth of calyx nearly obsolete. Fruit a little smaller than in *E. meoìdes*, but the rest of the plant is similar.

Thapsia-like Olive-parsley. Fl. July, Aug. Clt. 1683. Pl. 6 to 7 feet.

Cult. The plants will grow in any common garden soil; and are only to be increased by seed.

Tribe XIV.

CAUCALI'NEÆ (this tribe contains plants agreeing with *Caúcalis* in important characters), or Campylospérmæ multijugàtæ armàtæ, Koch, umb. p. 79. D. C. prod. 4. p. 216. Fruit contracted from the sides or nearly terete. Mericarps with 5 filiform primary bristly or prickly ribs: the lateral ones placed in the commissure, which is flat; and 4 secondary more prominent, prickly ribs, or they are obliterated from the copious prickles covering the whole furrows. Seed involute or inflexed on the margin. *Caucalíneæ* is allied on one hand to *Daucíneæ*, and on the other to *Scandicíneæ*.

CXXXIII. CAU'CALIS (a named used by Hippocrates and Theophrastes for an umbelliferous plant). Hoffm. umb. 54. t. 1. f. 14. Koch, umb. p. 79. f. 14. D. C. prod. 4. p. 216. Lin. Spreng. Lag.

Lin. syst. *Pentándria, Digy'nia.* Teeth of calyx 5, ovate-lanceolate. Petals obovate, emarginate, with an inflexed point: outer ones radiating, profoundly bifid. Fruit somewhat compressed from the sides. Mericarps with 5 filiform primary bristly or prickly ribs: the 3 intermediate ones on the back and the 2 lateral ones placed in the commissure, which is flat; and 4 secondary more prominent ones, which are deeply cleft into a simple series of prickles. Vittæ one in each furrow, under the secondary ribs, and 2 in the commissure, which is flat. Carpophore stiff, cleft at the apex. Seed involute or inflexed on the margin.—Herbs, with multifid leaves. Involucrum wanting, or of 1 or 2 leaves. Leaves of involucels 3-8, lanceolate, spreading. Flowers white; those in the disk of the umbels male and sterile.

1 C. daucoi'des (Lin. syst. nat. ed. 12. vol. 2. p. 204. mant. 351. but not of his species,) plant nearly smooth; stem hairy at the joints; leaves repeatedly subdivided, with narrow deep green segments; umbels of 3 rays; involucrum none; involucels 3-leaved; umbellules ripening about 3 fruits; prickles of fruit hooked at the apex. ⊙. H. Native of Middle and South Europe, even to Tauria, Caucasus, and Persia, in corn fields on a chalky soil. In England at Marham, Norfolk; Carlby, between Stamford and Bourn, Lincolnshire; Thorp Arch, Yorkshire. Frequent in the counties of Oxford and Cambridge. Jacq. fl. austr. t. 157. Smith, engl. bot. t. 197. Cònium Royèni, Lin. spec. 350. C. leptophýlla, Huds. ed. 1. p. 99. Lam. dict. 1. p. 657. Schkuhr. handb. t. 61. Daúcus leptophýllus, Scop. carn. 1. p. 190. Echinóphora, Riv. pent. irr. t. 24.—Caúcalis, no. v. Bauh. pin. 132. Stem deeply furrowed. Leaves on short membranous edged footstalks, 3-cleft at the base, then thrice compounded. Petals generally reddish, but slightly radiant.

Carrot-like Bur-parsley. Fl. June. Britain. Pl. 1½ foot.

2 C. leptophy'lla (Lin. spec. p. 347.) stem glabrous or rough from scattered retrograde hairs; leaves decompound, with linear-lanceolate acute segments; umbels 2-3-cleft; involucrum wanting; prickles of fruit scabrous, hooked at the apex. ⊙. H. Native of Middle and South Europe, and of Mauritania and the Levant, as well as of Caucasus. C. hùmilis, Jacq. hort. vind. 2. t. 195. C. parviflòra, Lam. dict 1. p. 657. Involucels of 5 leaves. Peduncles stiff. Flowers pinkish.

Slender-leaved Bur-parsley. Fl. Jul. Aug. Clt. 1739. Pl. 1 ft.

3 C. glochidia'ta (Poir. suppl. 2. p. 137) stem glabrous above, but rough from retrograde bristles at the base; leaves pilose, decompound, with short linear segments; involucra of 2 leaves; rays of umbel unequal, few; prickles of fruit glochidate at the apex. ⊙. H. Native of Van Diemen's Land. Scándix glochidiàta, Labill. nov. holl. 1. p. 75. t. 102. Caúcalis glochidiàta, Spreng. umb. prod. p. 24. Schultes, syst. 6. p. 471. Fruit ovate. The petals are said to be pilose on the outside.

Glochidate-prickled Bur-parsley. Pl. 1 foot.

4 C. tene'lla (Delil. fl. eg. p. 58. t. 21. f. 3.) stem hispid from adpressed retrograde hairs; leaves decompound, hispid, with linear-subulate setaceously-acute segments; umbels 5-7-rayed; involucra wanting or of one leaf; prickles shorter than the length of the fruit, which is oblong; furrows of fruit smooth. ⊙. H. Native about Alexandria, in stony places.

Slender Bur-parsley. Pl. 1 foot.

† *Species not sufficiently known.*

5 C. Maurita'nica (Lin. spec. p. 347.) stem stiff, rough, spreadingly branched; leaves bipinnatifid, with linear-lanceolate strigose segments; peduncles bifid; involucrum wanting; involucels usually of 3 leaves; umbellules 6-flowered. ⊙. H. Native of Mauritania. Spreng. umb. spec. 143. Fruit somewhat prismatic, having the 3 dorsal ribs prickly. The fruit under this name in Willd. herb. does not differ from that of *Daúcus muricàtus*, but the description given by Linnæus does not agree with that plant.

Mauritanian Bur-parsley. Fl. June, July. Clt. 1818. Pl. ½ ft.

6 C. strigòsa (Russ. beschr. alepp. ex Schultes, syst. 6. p. 473.) leaves pinnate, cut, pilose; umbel of many rays; leaves of involucra and involucels membranous; fruit glabrous, and the bristles are lanceolate-subulate. ⊙. H. Native about Aleppo.

Strigose Bur-parsley. Pl. 1 foot?

7 C. angustifòlia (Forsk. ægypt. descr. suppl. p. 206.)

leaves multifid, narrow; involucra and involucels hispid, as well as the fruit.—Native of Arabia, at Hadie.

Narrow-leaved Bur-parsley. Pl. ?

Cult. The seeds may be sown either in autumn or spring.

CXXXIV. TURGE'NIA (from *turgeo*, to swell; fruit). Hoffm. umb. p. 59. Koch, umb. 80. t. 16. D. C. prod. 4. p. 217.—Caúcalis species, Lam. Lag. Spreng.—Tordýlium species, Lin.—Torìlis species, Adans.

Lin. syst. *Pentándria, Digýnia.* Teeth of calyx 5, setaceous. Petals obovate, emarginate, with an inflexed point: outer ones radiating, bifid. Fruit contracted from the sides, rather didymous. Mericarps with 5 primary ribs, and 4 secondary ones: the lateral primary ones placed in the commissure, which is flat, furnished with a simple series of muricæ or prickles; not as in the rest of the ribs, which are furnished with 2 or 3 rows of prickles each; prickles all equal. Furrows under the secondary ribs 1-vittate from both sides of the raphe. Carpophore setaceous, bifid. Seed involute.—Erect scabrous herbs. Leaves pinnate; leaflets oblong, toothed. Umbels of few rays. Leaves of involucra and involucels 3-5, ovate, concave, equal, with membranous margins. Flowers white or rose coloured; those in the disk of the umbellules male and sterile.

1 T. latifòlia (Hoffm. l. c.) leaves pinnate; leaflets deeply pinnatifid or strongly serrated, the upper ones decurrent; umbels of 2-4, but usually of 3 long firm rays; umbellules having the flowers in the circumference alone fertile; ribs of fruit beset with double rows of straight purplish bristles; the ribs in the commissure bear acute tubercles, not bristles. ⊙. H. Native of Middle and South Europe, Mauritania, Greece, Caucasus, and Persia, in corn fields. In England in fields on a chalky soil, but rare; in Cambridgeshire not uncommon. Caúcalis latifòlia, Lin. syst. nat. ed. 12. vol. 2. p. 276. Smith, engl. bot. t. 198. Jacq. hort. vind. t. 128.—Mill. fig. t. 85. Garid. prov. t. 22. Tordýlium latifòlium, Lin. spec. 345. Reich. spec. 1. p. 666.—Colum. ecphr. 98. t. 97. f. 1. Broad Bur-parsley, Petiv. herb. brit. t. 27. f. 6. Broad-jagged Bur-parsley, Petiv. herb. brit. t. 27. f. 7. Herbage rough, rather glaucous. Stem beset with minute ascending prickles. Teeth of calyx broad, short, spreading. Petals bright pink; those in the circumference of the umbellules twice as large as the rest. The plant varies much in stature, in the leaves, and in the colour of the flowers, which are sometimes white. This is one of the most striking and handsome of our native umbelliferous plants.

Broad-leaved Turgenia. Fl. July. Britain. Pl. 2 to 3 feet.

2 T. multiflòra (D. C. prod. 4. p. 218.) leaves ternate above the sheath; leaflets pinnatifid; umbels of 4 or 5 rays; ribs of fruit in the commissure bearing true prickles. ⊙. H. Native of fields about Constantinople. Fruit more ovate than in the preceding species, 6-8, not 2-3 in each umbellule; and all parts of the plant are much more robust.

Many-flowered Turgenia. Fl. July. Pl. 3 feet.

3 T. heteroca'rpa (D. C. prod. 4. p. 218.) leaves pinnate; leaflets oblong, deeply toothed; umbels of 6-10 rays; mericarps of fruit dissimilar, having the secondary ribs in both toothless. ⊙. H. Native of Persia, in the district of Khoi, in corn fields; and of the Levant, between Bagdad and Kermancha. Habit and flowers very similar to those of *T. latifòlia*. Outer mericarp of fruit having the 3 dorsal primary ribs ornamented with 2-4 broad prickles each, and the lateral ribs filiform and toothless: the secondary ones hardly distinct, or a little toothed; the inner mericarp has the primary ribs all toothless, but the dorsal 3 are larger than the lateral ones: and the secondary ribs are hardly distinct. Albumen involu te

Variable-fruited Turgenia. Pl. 2 to 3 feet.

Cult. See *Caúcalis* above for culture and propagation.

CXXXV. TORI'LIS (a name employed by Adanson, and maintained by Gærtner. It probably, like many of Adanson's words, has no meaning). Spreng. umb. prod. p. 24. Hoffm. umb. 49. t. 1. f. 18. Lag. am, nat. p. 95. Koch, umb. p. 80. t. 15. D. C. prod. 4. p. 218.—Torìlis species, Adans, Gærtn. Mœnch. —Tordýlium, Caúcalis, and Scándix species of authors.

Lin. syst. *Pentándria, Digýnia.* Teeth of calyx 5, triangular-lanceolate, acute, permanent. Petals obovate, emarginate, with an inflexed point: outer ones of the umbellules larger than the central ones and bifid. Fruit contracted from the sides. Mericarps with 5 bristly primary ribs: the 3 intermediate ones on the back, and the 2 lateral ones placed in the commissure, which is flat; the secondary ribs beset with copious prickles, which occupy the whole furrows, having one vitta under each secondary rib below the prickles. Carpophore setaceous, bifid. Seed with an inflexed margin.—Herbs, with multifid leaves, beset with short adpressed hairs, which are retrograde on the stems, and erect on the rays of the umbels. Umbels opposite the leaves. Involucra of 1-5 leaves; involucels of 5-8 lanceolate ciliated leaves. Flowers white, those in the disk of the umbellules male and sterile. Prickles of fruit hair-formed, usually hooked at the apex.

Sect. I. Eutori'lis (from εν, *eu*, well, and *Torìlis*; this section is considered to contain the true species of the genus). D. C. prod. 4. p. 218. Fruit covered with stiff prickles, which are usually hooked at the apex.

1 T. microca'rpa (Bess. cont. enum. no. 1362.) stem branched; leaflets linear-cut, outer ones not elongated; umbels on long peduncles, 7-10-rayed; leaves of involucra and involucels setaceous; fruit ovate; prickles much shorter than the fruit, incurved. ⊙. H. Native of the Ukraine and the south of Podolia. Torìlis Ukránica, Spreng. in Schultes, syst. 6. p. 485. Involucels as in *T. Anthríscus*, equal in length to the umbellules.

Small-fruited Hedge-parsley. Pl. 2 to 3 feet.

2 T. Anthri'scus (Gmel. fl. bad. 1. p. 613.) umbels on long peduncles of from 5 to 10 close rays; leaves of involucra and involucels several, awl-shaped; fruit covered with incurved bristles. ⊙. H. Native of Europe and Caucasus, in hedges and on the borders of fields, very common; plentiful in Britain in like situations. Caúcalis Anthríscus, Scop. fl. carn. no. 311. Huds. angl. p. 114. Smith, engl. bot. t. 987. Fl. dan. t. 919. Curt. lond. fasc. 6. t. 22. Tordýlium Anthríscus, Lin. spec. 346. Jacq. fl. austr. t. 261. Torìlis rubélla, Mœnch, meth. p. 103. Caúcalis áspera α, Lam. dict. 1. p. 656.—Riv. pent. irr. t. 32. —Bauh. pin. 153. prod. 80. with a figure. Stem rough from deflexed hairs. Leaves bipinnate, pinnatifid, and sharply cut, rather soft than harsh to the touch; the lowermost one much more compound than the others. Flowers small, either white or flesh-coloured; the exterior ones only a little irregular or radiant.

Anthriscus or Upright Hedge-parsley. Fl. July, Aug. Britain. Pl. 2 to 3 feet.

3 T. negle'cta (Schultes, syst. 6. p. 484.) stem and branches erect; leaflets ovate-lanceolate, cut; the terminal one hardly longer than the rest; umbels on long peduncles of from 7 to 10 rays; involucrum wanting. ⊙. H. Native of Sardinia, Germany, &c. in fields and on the margins of woods. Scándix infésta, Jacq. fl. austr. 1. 46. Caúcalis infésta, Vest. ench. p. 495. ex Schultes. Peduncles longer and the fruit larger than in *T. infésta*. Flowers white.

Neglected Hedge-parsley. Fl. July, Aug. Clt. 1817. Pl. 1½ foot.

4 T. infe'sta (Hoffm. umb. p. 89. Spreng. prod. 24.) stem erect, much branched; leaves pinnatifid, deeply cut, and sometimes almost bipinnate: the terminal leaflets elongated; umbels

on long peduncles, of from 3 to 5 or 7 rather close rays; involucra wanting or of one leaf, which, like the leaves of the involucels, which are numerous, is lanceolate and acute; prickles exceeding the breadth of the fruit. ⊙. H. Native of Europe, in fields, and by way sides; plentiful in Britain in like situations. T. Helvética, Gmel. fl. bad. 1. p. 617. D. C. prod. 4. p. 219. Caúcalis Helvética, Jacq. hort. vind. 3. t. 16. Caúcalis arvénsis, Huds. aug. 113. Caúcalis infésta, Curt. fl. lond. fasc. 6. t. 23. Smith, engl. bot. 1314. Scándix infésta, Lin. syst. nat. ed. 12. vol. 2. p. 732. Caúcalis ségetum, Thuill. par. ed. 2. p. 136. Caúcalis áspera β, Lam. dict. 1. p. 656. Caúcalis hùmilis, Riv. pent. irr. t. 33.—Hall. hist. 1. p. 325. no. 742. Flowers cream-coloured or pure white. A very distinct species, well marked by the deficiency of the involucra, and by the spreading branches.

Var. α, *divaricàta* (D. C. prod. 4. p. 219.) stem branched, divaricate. ⊙. H.

Var. β, *anthriscoìdes* (D. C. prod. 4. p. 219.) stem sparingly branched, or almost simple, tall; branches erect. ⊙. H. This appears to be a variety intermediate between *T. infésta* and *T. anthríscus*, and is probably the T. Anthríscus, Spreng. exclusive of the synonymes.

Var. β, *purpùrea* (D. C. l. c.) leaflets hardly elongated. ⊙. H. Native of the south of Europe. Torìlis purpùrea, Ten. append. 4. p. 12. Guss. prod. fl. sic. 1. p. 325. In the specimens examined of this variety, the flowers are white, and the prickles of the fruit are more or less coloured. Perhaps a proper species.

Troublesome or Spreading Hedge-parsley. Fl. July. Britain. Pl. ½ to 1½ foot.

5 T. HETEROPHY'LLA (Guss. prod. fl. sic. 1. p. 326.) stem erect, sparingly branched: segments of leaves linear-lanceolate, cut; outer or terminal one not elongated: upper ones linear, entire; umbels on long peduncles of 2-3 rays; involucra almost wanting; prickles equal in length to the breadth of the fruit. ⊙. H. Native of Sicily, Corsica, and south of France. Caúcalis linearifòlia, Requien, in litt. 1815. The fruit in this species is very variable in form and size, as in *T. nodòsa*.

Variable-leaved Hedge-parsley. Fl. June, July. Pl. 1 foot.

6 T. AFRICA'NA (Spreng. in Schultes, syst. 6. p. 486.) umbels on long peduncles, bifid; involucrum wanting; prickles shorter than the breadth of the fruit. ⊙. H. Native of the Cape of Good Hope. Caúcalis Capénsis, Lam. dict. 1. p. 651. C. Africàna, Thunb. fl. cap. p. 256. Athamántha Capénsis, Burm. fl. cap. prod. 7. Habit of *C. Anthríscus*.

African Hedge-parsley. Pl. 1½ foot.

7 T. CHLOROCA'RPA (Spreng. syst. 1. p. 898.) stem branched, rather puberulous; leaves bipinnate; leaflets or segments lanceolate, pinnatifidly serrated; umbels on long peduncles, 7-8-rayed; involucra usually of only one leaf; bristles coloured, rather soft, scabrous, glochidate at the apex, rather longer than the diameter of the fruit. ⊙. H. Native of the Canary Islands.

Green-fruited Hedge-parsley. Pl. 1 to 2 feet.

8 T. NODÒSA (Gærtn. fruct. 1. p. 82. t. 20. f. 6.) umbels nearly sessile, glomerate, lateral, simple; stems prostrate; involucra of several linear hairy leaves; the outer mericarps of each external fruit thickly clothed with long, straight, pale, rough bristles, minutely hooked at the tops; the inner, as well as the interior fruits covered with dense, whitish, shining, tubercular granulations. ⊙. H. Native of Europe and the Levant, on banks, and about the borders of fields; most plentiful in a gravelly or chalky soil; plentiful in Britain. The plant is also to be met with in Chili and Peru, but has probably been transported thither. Caúcalis nodòsa, Huds. angl. 114. Smith, engl. bot. t. 199. but not of All. Tordýlium nodòsum, Lin. spec. 346. Jacq. aust. append. t. 24. Caúcalis nodiflòra, Lam. dict. 1. p. 656.—Riv. pent. irr. t. 36.—Mor. oxon. sect. 9. t. 14. f. 10. Stem rough from reflexed bristles. Leaves a deep glaucous green, hairy, bipinnate, and sharply cut, with very narrow tolerably uniform segments. Petals white or reddish, hardly at all radiating or unequal. This plant is very different from *Chærophýllum nodòsum*, of which it is said to be a synonyme by Sprengel in Schultes, syst. 6. p. 485. The Caúcalis Hispánica, Lam. 1. p. 658. appears to be referrible to this from the description; and Caúcalis lappulàcea, Pœppig. diar. no. 356. pl. exsic. p. 96. does not differ from this.

Knotted Hedge-parsley. Fl. May, June. Brit. Pl. prostrate.

9 T. JAPÓNICA (D. C. prod. 4. p. 219.) stem smoothish, terete, branched; leaves pubescent, bipinnate; leaflets oblong, pinnatifid; umbels pedunculate, axillary, and terminal, 5-7-rayed; involucra and involucels of a few short subulate leaves; mericarps oblong; bristles of fruit stiff, hooked at the apex. ⊙. H. Native of Japan. Caúcalis Japónica, Houtt. pfl. syst. 8. p. 42. t. 45. f. 1. Upper branches and rays of umbel angular, beset with upright hairs.

Japan Hedge-parsley. Pl. 1 to 2 feet.

10 T. SCA'BRA (D. C. prod. 4. p. 219.) stem smoothish, terete, branched; leaves pubescent, pinnate; leaflets oblong, pinnatifid, much acuminated; umbels terminal, and opposite the leaves, 5-7-rayed, sometimes without an involucrum; leaves of involucels subulate; mericarps oblong, covered with stiff bristles, which are hooked at the apex.—Native of Japan. Chærophýllum scàbrum, Thunb. fl. jap. 119.

Scabrous Hedge-parsley. Pl. 1 to 2 feet.

11 T. TUBERCULA'TA (Spreng. in Schultes, syst. 6. p. 486.) plant glabrous; branches twiggy; leaves pinnate; leaflets linear, quite entire; involucra and involucels wanting; hairs of fruit hardly hooked.—Native of Syria. Caúcalis tuberculàta, Poir. suppl. 2. p. 137. Styles tubercular at the base; hence the name. Fruit the size of that of *T. microcárpa*.

Tubercular-fruited Hedge-parsley. Fl. June, July. Clt. 1817. Pl. 1 foot.

12 T. ELA'TA; hispid, erect, branched; involucrum of many leaves; fruit ovate, very hispid from stiff bristles; leaves supradecompound; leaflets lanceolate, deeply pinnatifid: outer ones elongated. ⊙. H. Native of Nipaul, on the mountains. Caúcalis elàta, D. Don, prod. fl. nep. p. 183. Caúcalis coniifòlia, Wall. cat. mss. Umbels of 8-10 rays. Involucrum of 6-8 linear-subulate leaves.

Tall Hedge-parsley. Pl. 2 to 3 feet.

SECT. II. TRICHOCARPÆ'A (from θριξ τριχος, *thrix trichos*, a hair, and καρπος, *karpos*, a fruit; in allusion to the fruit being covered with long soft hairs). D. C. prod. 4. p. 220. Fruit covered with very long, soft, setaceous, crowded, spreading, coloured hairs, which are not hooked at the apex.

13 T. TRICHOSPE'RMA (Spreng. umb. spec. 142.) stem nearly erect; branches smoothish; leaves bipinnate, rough from adpressed hairs; leaflets pinnatifid, acute; umbels on long peduncles, 3-6-rayed; involucrum wanting; involucels of 2-3-subulate leaves. ⊙. H. Native of Egypt, ex Lin.; and of Syria, at Tripoli. Scándix trichospérma, Lin. mant. 57. Chærophýllum trichospérmum, Lam. dict. 1. p. 685. but not of Schultes. Anthríscus trichospérma, Pers. ench. 1. p. 685. but not of Schultes. Bristles of fruit painted with rufous or violet colour.

Hair-seeded Hedge-parsley. Fl. June, July. Clt. 1824. Pl. 1 foot.

Cult. Sow the seeds in the open ground.

Tribe XV.

SCANDICI'NEÆ (this tribe contains plants agreeing with

Scándix in many important characters), or Campylospermæ paucijugatæ, elongatæ, Koch, umb. p. 130. Sprengel in Schultes, syst. 6. p. 42. D. C. prod. 4. p. 220. Fruit evidently compressed or contracted from the sides, usually beaked. Mericarps with 5 filiform ribs, now and then winged: lateral ones marginating; all equal; and sometimes all are obliterated at the base, and only evident at the tops. Seed teretely convex, having a profound furrow in front, or with the margins somewhat involute.

CXXXVI. SCA'NDIX (Greek name of an eatable plant, but what plant is unknown). Gærtn. fruct. 2. p. 33. t. 85. D. C. fl. fr. 4. p. 291. Lag. am. nat. 2. p. 37. Koch, umb. p. 132. Spreng. syst. 1. p. 201. D. C. prod. 4. p. 220.—Scándix and Wýlia, Hoffm.—Scándix species, Lin.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete, or somewhat 5-toothed. Petals obovate, truncate or emarginate, usually furnished with an inflexed point. Fruit somewhat compressed from the sides, having a very long beak; mericarps with 5 blunt equal ribs: lateral ribs marginating; furrows without vittæ, or with obsolete ones. Carpophore undivided, or forked at the apex. Seed teretely convex, with a deep furrow in front. —Annual herbs, with terete, rather striated stems, and bi-pinnate leaves, having the leaflets divided into linear lobes. Umbels of few rays. Involucra wanting, or of one leaf. Umbellules of few rays; involucels of 5-7 leaves. Flowers white.

Sect. I. Pe'cten (from *pecten*, a comb; beaks of fruit like the teeth of a comb). Duby in D. C. bot. gall. 1. p. 240. D.C. prod. 4. p. 221.—Scándix, Hoffm. umb. 1. p. 23. Beak of fruit compressed from the back. Petals nearly equal. Carpophore setaceous, undivided.

1 S. pinnati'fida (Vent. hort. cels. t. 14.) leaves of involucels divided into linear lobes; umbels of few rays, fasciculate; fruit scabrous in the seminiferous part. ⊙. H. Native of the Levant, between Bagdad and Kermancha; and of Persia, in the province of Aderbeidjan, between Amadan and Teheran; also of Tauria and Iberia. Bieb. fl. taur. 1. p. 229. suppl. 235. Schultes, syst. 6. p. 505. S. stélla, Russ. alep. Stem and leaves glabrous, or hardly pilose. Leaves multifid, with slender segments. Perhaps S. parviflòra, Retz, pug. 12. Schultes, syst. p. 502. is referrible to this species.

Pinnatifid-leaved Shepherd's-needle. Fl. June, July. Clt. 1805. Pl. 1 foot.

2 S. Pe'cten-Ve'neris (Lin. spec. 368.) leaves of involucels jagged; fruit nearly smooth, with a bristly edged beak. ⊙. H. Native of Europe, Levant, north of Africa and Teneriffe, in cultivated fields, common; plentiful in Britain. Smith, engl. bot. t. 1397. Curt. lond. 5. t. 21. Mart. rust. t. 38. Fl. dan. 844. Jacq. austr. t. 263. S. Pécten, Hoffm. umb. 1. p. 24. t. 1. f. 22. Schultes, syst. 6. p. 501. Chærophýllum Pécten-Véneris, Crantz, austr. p. 189. Chærophýllum rostràtum α, Lam. dict. 1. p. 685. Mýrrhis Pécten-Véneris, All. pedem. no. 1376.—Riv. pent. irr. t. 38. Pécten-Véneris, Matth. valgr. 1. p. 481. with a figure. Cam. epit. 304. with a figure. Stem furrowed, smooth, or rather hairy, often purplish. Leaves pale green, triply pinnatifid: with linear acute smooth segments. Umbels simple, solitary or in pairs, over-topped by the broad jagged leaves of the involucels. Flowers in some degree radiant. Petals inflexed at the point. This is sometimes a troublesome weed, to which, though slightly aromatic and acrid, no particular use is attributed. Dioscorides, indeed, mentions it as eatable, but his Σκανδιξ may not be ours.

Common Shepherd's-needle, *Venus's-comb*, or Needle Chervil. Fl. June, Sept. Britain. Pl. 1 foot.

3 S. brachyca'rpa (Guss. ind. sem. 1825. prod. sic. 1. p. 350.) involucrum wanting; leaves of involucels entire; umbels of few rays; fruit glabrous in the seminiferous part; beak hardly twice the length of the seed. ⊙. H. Native of Sicily, on the Nebrodes; and of Syria. This is an intermediate plant between the two sections of the genus from habit; but the beak of the fruit is compressed from the back, not from the sides. Leaves ternately decompound, glabrous: lobes short. Stem hardly a hand high. Fruit 10 lines long.

Short-fruited Shepherd's-needle. Pl. ½ to ¾ foot.

Sect. II. Wy'lia (named in memory of Sir James Wylie, M.D. president of the Medico-Chirurgical Academy of Petersburgh, and first physician to the emperor of Russia). Duby in D. C. bot. gall. 1. p. 240. D. C. prod. l. c. Wýlia, Hoffm. umb. 1. p. 3. t. 2. Beak of fruit compressed from the sides. Carpophore bifid at the apex. Petals radiant.

4 S. austra'lis (Lin. spec. 569.) leaves of involucels ovate, acute, a little toothed, erect, somewhat convolute around the pedicels; radiant petals obovate, entire, exceeding the others a little; fruit scabrous in every part; stem glabrous below. ⊙. H. Native of the south of Europe, in corn fields and sterile places. D. C. fl. fr. 4. p. 202. Sibth and Smith, fl. græc. t. 285. Mýrrhis austràlis, All. pedem. no. 1377. Chærophýllum, austràle, Crantz. umb. 76. Chærophýllum rostràtum β, Lam. dict. 1. p. 685. Wy'lia austràlis, Hoffm. umb. 1. p. 5. t. 2. f. 1. Col. ecphr. 1. t. 90. Sheaths of leaves and petioles usually pilose.

Southern Shepherd's-needle. Fl. May, June. Clt. 1713. Pl. ½ foot.

5 S. falca'ta (Lond. journ. mosc. 1. p. 87. t. 5. ex Hoffm.) leaves of involucels obovate, bluntly bidentate, ciliated, with membranous margins; radiant petals obovate, somewhat emarginate; fruit rather falcate, scabrous from bristles; stem and petioles pilose; umbels glabrous. ⊙. H. Native of Tauria, frequent. S. austràlis β, Bieb. suppl. 424. Wy'lia ràdians, Schultes, syst. 6. p. 504.?

Falcate-fruited Shepherd's-needle. Fl. May, Ju. Clt. 1817. Pl. ½ foot.

6 S. apicula'ta (D. C. prod. 4. p. 221.) leaves of involucels oval, acutely mucronate or bidentate, with membranous ciliated margins; radiant petals oblong-obovate, entire or bifid, with an acute recess; fruit scabrous from bristles; stem and petioles pilose; umbels glabrous. ⊙. H. Native of the Levant. Very like *S. falcàta*, but differs in the involucels being mucronate and acute; in the styles being long, and at length diverging; in the lower leaves being on longer petioles, and in the plant being smaller.

Apiculated-fruited Shepherd's-needle. Pl. ½ foot.

7 S. grandiflòra (Lin. spec. 369.) leaves of involucels ovate, obtuse, somewhat denticulated, with membranous ciliated margins; radiant petals somewhat obcordate, with an obtuse recess; fruit bristly; stem and leaves hairy. ⊙. H. Native of Greece, Tauria, and Iberia, in fields; also of Dalmatia, if S. hirsùta of Biasoletto, collected at Lossin-Piccolo, be the same. Scándix orientalis flore maximo, Tourn. cor. p. 23. Chærophy'llum grandiflòrum, Lam. dict. 1. p. 686. Wy'lia grandiflòra, Hoffm. umb. 1. p. 15. t. 2. f. 3.

Var. β, glabràta (D. C. prod. 4. p. 222.) stem and leaves glabrous. ⊙. H. Native of the Levant, about Bagdad. Rays of umbel forming almost a straight angle: lateral ones bearing 12-15 fruit, and the terminal ones 5-6, the rest abortive. Involucels spreadingly deflexed, rather ciliated. Perhaps a proper species, or a variety of *S. falcàta*.

Great-flowered Shepherd's-needle. Fl. May, June. Clt. 1818. Pl. 1 foot.

8 S. Ibe'rica (Bieb. fl. taur. 1. p. 230.) leaves of involucels ovate, somewhat bidentate, with rather membranous ciliated margins; radiant petals obcordate, with an acute recess; fruit

scabrous from bristles; stem furnished with one row of hairs; umbels glabrous. ⊙. H. Native of Iberia, in corn fields, and in gravelly places; and of Persia, in the province of Aderbeidjan, at Seidkhodzi and Badalan. Wy'lia Ibérica, Hoffm. umb. 1. p. 19. t. 2. f. 4. Fruit nearly 2 inches long, scabrous in the seminiferous part, having the beak compressed and scabrous at the angles; the rest smooth.

Iberian Shepherd's-needle. Fl. June, Jul. Clt. 1823. Pl. 1 ft.

† *Species not sufficiently known.*

9 S. GILA'NICA (S. G. Gmel. itin. 3. p. 304. t. 31. f. 2.) stems branched, striated; fruit smooth.—Native of the north of Persia. Gmel. syst. veg. 486.

Gilan Shepherd's-needle. Pl. 1 foot.

Cult. Sow the seeds in the open ground.

CXXXVII. ANTHRI'SCUS (a name given by Pliny to a plant resembling *Scándix*). Hoffm. umb. 1. p. 38. Koch, umb. 131. f. 57-60. D. C. prod. 4. p. 222.—Chærophy'llum, Lag. am. nat. 2. p. 98. but not of Hoffm.—Cerefòlium, Hall.—Scándix and Chærophy'llum species, Lin.—Chærophy'llum, My'rrhis, and Anthríscus species, Spreng.

LIN. SYST. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals obovate, truncate or emarginate, with an inflexed point, which is usually very short. Fruit contracted from the sides, beaked; the beak shorter than the seed. Mericarps nearly terete, without any ribs, the beak alone 5-ribbed. Carpophore bifid at the apex. Seed teretely convex, having a deep furrow in front.—Perennial, biennial or annual herbs. Stems terete, striated or furrowed. Leaves decompound, with usually linear slender segments. Umbels opposite the leaves or terminal. Involucrum wanting. Involucels of many leaves. Flowers white. The fruit varying in many of the species, either naked or furnished with a whorl of hairs at the base, resembling a collar. (Koch, in litt.)

* *Perennial species.*

1 A. TORQUA'TA (Duby, in D. C. bot. gall. 1. p. 239.) glabrous; stem rather striated; leaves bipinnate; leaflets ovate-lanceolate, coarsely and deeply toothed; leaves of involucels deflexed, lanceolate, acuminated, ciliated; umbels terminal; rays glabrous; outer petals radiant; fruit shining, girded by a series of small bristles at the base. ♃. H. Native of the Alps of the south of Provence and Piedmont. Chærophy'llum torquàtum, D. C. fl. fr. suppl. 505. My'rrhis bulbòsa, All. pedem. no. 1373. exclusive of the synonymes. My'rrhis torquàta, Schultes, syst. 6. p. 514.

Collared-fruited Rough Chervil. Fl. May, June. Clt. 1819. Pl. 2 to 3 feet.

2 A. SÍCULA (D. C. prod. 4. p. 223.) stem glabrous, striated; leaves ternately decompound; sheaths and involucra ciliated; leaflets ovate, pinnatifid: lobes oblong, deeply toothed, bluntish; fruit oblong, glabrous, smooth, girded by a series of bristles or hairs at the base. ♃. H. Native of Sicily, in woods and shady groves. Chærophy'llum Sículum, Guss. prod. 1. p. 352.

Var. β, scàbra (D. C. l. c.) fruit scabrous from tubercles, particularly on one side. ♃. H. Native of Sicily.

Sicilian Rough Chervil. Pl. 2 to 3 feet.

3 A. CICUTA'RIA (Duby, in D. C. bot. gall. 1. p. 239.) plant smoothish; leaves ternate, then pinnate; leaflets pinnatifid, unequal at the base; segments lanceolate, bluntly toothed; umbels opposite the leaves and terminal; rays numerous, glabrous; petals hardly emarginate, outer ones radiant; fruit ovate-oblong, smooth, naked at the base. ♃. H. Native of the Alps of Dauphiny and Switzerland, &c. in humid places; also of Volhynia and Podolia, in woods. Chærophy'llum cicutària, Vill. dauph. 2. p. 644. D. C. fl. fr. suppl. p. 506. Anthríscus hùmilis, Bess. enum. p. 13. no. 358. Chærophy'llum daucifòlium, Desf. cat. hort. par. 1828. Leaves membranous, glabrous; leaflets broad. Involucels of 5 deflexed leaves, with ciliated margins. Flowers either white or red.

Cicuta-like Rough Chervil. Fl. May, Ju. Clt. 1810. Pl. 1½ ft.

4 A. SYLVE'STRIS (Hoffm. umb. 40-46. t. 1. f. 19. p. 210. t. 1. B, f. 17.) stem branched, striated, the lower part downy; leaves triply pinnate; leaflets ovate, pinnatifid, rough edged: extreme ones elongated; umbels smooth, terminal; involucels of 5 ovate fringed deflexed leaves; styles short, hardly diverging; fruit lanceolate, with a deep channel on each side, smooth. ♃. H. Native throughout the whole of Europe, even to Caucasus, in hedges and the borders of pastures and fields, in a rather fertile soil, very common; plentiful in Britain. Chærophy'llum sylvéstre, Lin. spec. 369. Smith, engl. bot. t. 752. Curt. lond. fasc. 4. p. 25. Mart. rust. t. 96. Jacq. austr. t. 149. Riv. pent. irr. t. 44. Hayn. arz. gew. 1. t. 33. Cerefòlium, no. 748. Hall. helv. 1. p. 328.—Moris. hist. 3. p. 303. sect. 9. t. 11. f. 5. Cicutària vulgàris, Raii. syn. p. 207. My'rrhis, Fuch's hist. 524. t. 525. Flowers white. Petals unequal in the marginal flowers, which alone are prolific. Perhaps A. prócerus, Bess. enum. pl. volh. 13. no. 359. is referrible to this species. The whole herb having the flavour of carrots, is eaten by domestic cattle, and is reported to be very grateful to rabbits. The snow white flowers, some of the earliest of their tribe, plentifully adorn the hedges and bushy margins of fields in spring, and announce the approach of summer. J. Bauhm mentions instances of two families being poisoned by eating small quantities of the root.

Var. β, tenuifòlia (D. C. prod. 4. p. 223.) plant glabrous; leaves finely cut. ♃. H. Native of the Alps of Dauphiny. Chærophy'llum alpìnum, Vill. dauph. 2. p. 462.

Var. γ, pilósula (D. C. mem. soc. gen. vol. 4.) petioles and nerves of leaves hispid from hairs beneath. ♃. H. Native country unknown, but grown in gardens under the name of Chærophy'llum angústum.

Var. δ, scábrida (Spreng. umb. prod. 4. p. 223.) fruit rather scabrous. ♃. H. Native of Germany and Italy. Chærophy'llum Magellénse var. *α*, Tenore, prod. fl. neap. append. 4. p. 15. exclusive of variety *β*, which is a synonyme of *A. nemoròsa*, according to Koch.

Wild Chervil or Smooth Cow-parsley. Fl. April, May. Britain. Pl. 3 feet.

5 A. NEMORÒSA (Spreng. umb. prod. 27.) stem striated, branched, glabrous; leaves triply pinnate: leaflets pinnatifid: segments broad-lanceolate, acute; petioles pilose; umbels terminal, and opposite the leaves; leaves of involucel ciliated; fruit ovate, short, muricated, and girded by a circle of hairs at the base. ♃. H. Native of Caucasus and Kamtschatka. Chærophy'llum nemoròsum, Hoffm. umb. 45 and 210. t. 1. *β*, f. 19. Cham. et Schlecht. in Linnæa. 2. p. 390. The whole herb is very like *A. sylvéstris*, but the fruit is more ovate and shorter, and always more or less echinated.

Var. β, lùcida (D. C. prod. 4. p. 223.) fruit somewhat muricated on one side; lobes of lower leaves blunter. ♃. H. Chærophy'llum lùcidum, Desf. cat. hort. par. 1828.

Grove Chervil. Fl. May, June. Clt. 1810. Pl. 2 to 3 feet.

** *Annual species.*

6 A. CEREFÒLIUM (Hoffm. umb. 41. 47. t. 1. f. 21. p. 210. t. 1. *β*, f. 26.) herb pale green, shining, delicate, and tender; stem a little hairy at the joints, only striated; leaves twice pinnate, cut, with channelled footstalks; umbels either axillary or opposite the leaves, sessile, of 3-5 pubescent rays; fruit somewhat furrowed, not ribbed, oblong-linear, smooth. ⊙. H. Native of the south of Europe. In Britain, near Worcester; in great

plenty on a bank near Halesworth, Suffolk; frequent near Glasgow; but probably an outcast of gardens. Scándix cerefòlium, Lin. spec. p. 368. Smith, engl. bot. t. 1268. Jacq. austr. 390. Hayn. arz. gew. 7. t. 14. Berg. act. nov. soc. dronth. 1788. vol. 2. p. 496. Cerefòlium satìvum, Bess. gall. 1. p. 218. Chærophy'llum cerefòlium, Crantz. austr. 191. Chærophy'llum satìvum, Bauh. pin. 152. Gærtn. fr. 1. p. 107. Lam. dict. 1. p. 684. Schultes, syst. 6. p. 520. Smith, engl. fl. 1. p. 48. Chærofòlium satìvum, Trag. hist. 471. with a figure. Cerefòlium, Riv. pent. irr. t. 43. Cam. epit. p. 302. with a figure. Gingídium, Fuschs, hist. 217. t. 216. Flowers slightly radiant. This herb is much used in France for salads, and is mentioned as a pot-herb by Gerarde, though now little regarded. The leaves are frequently used in soups, especially by the Dutch. Geoffroi relates, that he has found it from experience of remarkable service in dropsy. Haller, who is copious on the properties of chervil, has no opinion of it in dropsy; but thinks it may be of service in obstructions of the bowels, in external hæmorrhoides, &c. Chervil is not admitted in our practice, and has almost disappeared from our kitchens and tables.

Var. β, trichospérma (Koch, in litt. ex D. C. prod. 4. p. 224.) stem weak, glabrous; leaves ternately decompound or triply pinnate; leaflets coarsely 5-7-toothed: segments bluntish; umbels opposite the leaves, pedunculate; rays few, glabrous; fruit oblong-linear, muricated from short down; styles short, erect. ⊙. H. Native of Pannonia. Chærophy'llum trichospérmum, Schultes, œstr. fl. 2. 1. p. 504. but not of Lam. Anthríscus trichospérma, Schultes, syst. 6. p. 525. but not of Pers. Chærophy'llum trichospérmum, Bess. in litt. Allied to *A. cerefòlium*, but very different from *Torìlis trichospérma*. Perhaps a variety of *Scándix cerefòlium*, with scabrous fruit, ex Jacq. and Bieb, and therefore Chærophy'llum nemoròsum, Jacq. appertains to this plant.

Garden *Chervil*. Fl. June. Britain. Pl. 1½ foot.

7 A. fumarioìdes (Spreng. umb. prod. 27.) plant quite glabrous; stem striated, branched; leaves ternately supra-decompound; leaflets pinnatifid: segments linear, remote, cut, ciliated; umbels terminal; leaves of involucels reflexed, not ciliated; fruit oblong-linear, scabrous. ♂. H. Native of Croatia, on calcareous mountains. Schultes, syst. 6. p. 525. Scándix fumarioìdes, Waldst. et Kit. pl. rar. hung. 3. p. 249. t. 224. Petals white, oblong, cuneated. Fruit oblong, echinated with stiff short hairs. Styles short, parallel, erect. Perhaps the same as Chærophy'llum divaricàtum, Poir. suppl. 4. p. 343. and Chærophy'llum tuberculòsum, Poir. suppl. 4. p. 342. or Anthríscus tuberculàta, Schultes, syst. 6. p. 527.?

Fumitory-like Chervil. Fl. May, June. Clt. 1810. Pl. 1 to 2 ft.

8 A. vulga'ris (Pers. ench. 1. p. 320.) stems smooth and polished; leaves triply pinnate; leaflets pinnatifid; segments short, obtuse, their edges, ribs, and stalks a little hairy; sheaths ciliated; umbels on rather short stalks, opposite the leaves, smooth; fruit ovate, covered with numerous short ascending incurved bristles, and tipped with a smooth pyramidal angular beak, scarcely half its own length. ⊙. H. Native throughout Europe, even to Tauria, in cultivated grounds. In Britain, on banks and waste grounds, chiefly near large towns. Scándix Anthríscus, Lin. spec. 368. Smith, engl. bot. t. 818. Curt. lond. fasc. 1. t. 19. Mart. rust. t. 75. Jacq. austr. t. 154. Caúcalis Scándix, Scop. carn. no. 312. Caúcalis scandicìna, Roth, fl. germ. 1. p. 121. D. C. fl. fr. 4. p. 334. Fl. dan. 863. Chærophy'llum Anthríscus, Lam. dict. 1. p. 685. Anthríscus Caúcalis, Bieb. fl. taur. no. 574. Anthríscus vulgàris, Hoffm. umb. 43. 47. t. 1. f. 24. p. 211. t. 1. β. f. 27. Koch, umb. 132. f. 59, 60.—Riv. pent. irr. t. 35.—Column. ecphr. 110. t. 112. Involucra wanting; involucels of 5-6 ovate-lanceolate leaves, with fringed margins. Flowers small, white, all uniform. Leaves of a most beautiful light green when young. The whole herb has a sweetish aromatic flavour, approaching to the garden chervil, to which it is in habit very nearly allied. Stem swelled under each joint.

Common Beaked-parsley. Fl. May. Britain. Pl. 2 to 3 feet.

Cult. All the species are of the most easy culture, and will grow in any soil and situation.

CXXXVIII. CHÆROPHY'LLUM (from χαιρω, *chairo*, to rejoice, and φυλλον, *phyllon*, a leaf; in reference to the smell of the leaves). Hoffm. umb. 1. p. 33. Koch, umb. 130. f. 61-63. D. C. prod. 4. p. 224.—Chærophy'llum species, Lin.—Chærophy'llum and My'rrhis species, Spreng.—My'rrhis species, Lag.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point. Fruit without a beak, compressed or contracted from the sides. Mericarps with 5 obtuse equal ribs: lateral ribs marginating. Commissure with a deep furrow. Vittæ one in each furrow of the mericarps between the ribs. Carpophore bifid. Seed teretely convex, the transverse section semilunar.—Perennial, biennial, or annual herbs. Leaves decompound; leaflets toothed or multifid. Involucra none, or of few leaves. Involucels of many leaves. Flowers white, sometimes rose colour.

Sect. I. Physocau'lis (from φυσα, *physa*, a bladder, and καυλις, *kaulis*, a stem; in allusion to the stems being tumid at the joints). D. C. coll. diss. 5. p. 59. prod. 4. p. 225. Fruit subcylindrical, somewhat attenuated at the apex, covered by stiff, compressed, angular bristles: having the ribs obtuse and much depressed. Styles short, straight.—Annual.

1 C. nodòsum (Lam. dict. 1. p. 685.) stem fistular, tumid at the joints, scabrous; leaves triternate; leaflets cut; fruit hispid. ⊙. H. Native from France to Tauria, in hedges. Scándix nodòsa, Lin. spec. p. 369. Jacq. hort. vind. 3. t. 25. Anthríscus nodòsa, Spreng. umb. prod. 27. Schultes, syst. 6. p. 526. Torìlis macrocárpa, Gærtn. fruct. 1. p. 83. t. 25. Torìlis tùmida, Mœnch, meth.—Moris. oxon. sect. 9. t. 10. f. 4. Flowers white.

Knotted-stemmed Cicely. Fl. May, June. Clt. 1656. Pl. 1 to 1½ foot.

Sect. II. Brachy'stylis (from βραχυς, *brachys*, short, and στυλος, *stylos*, a style; in reference to the short styles). D. C. coll. diss. 5. p. 59. prod. 4. p. 225. Fruit glabrous, and evidently ribbed. Styles very short, straight. Annual. Umbels of few rays.

2 C. procu'mbens (Lam. dict. 1. p. 685.) stems smoothish, decumbent; sheaths of petioles and leaves of involucels ciliated; leaves bipinnate; leaflets lanceolate, pinnatifid, with bluntish lobes; umbels bifid, few-flowered, without involucra. ⊙. H. Native of Virginia, Pennsylvania, and Maryland, in humid shady places. Scándix procúmbens, Lin. spec. 369. Mýrrhis procúmbens and M. bífida, Spreng. prod. 2. p. 25. Schultes, syst. 6. p. 516. Chærophýllum bífidum, Willd. herb.—Morr. oxon. sect. 9. t. 11. ultimate figure. Flowers small, white. Fruit 3 lines long. Herb slender, smoothish.

Var. β, Bóscii (D. C. prod. 4. p. 225.) stem rather hairy, erectish; leaves tripinnate; leaflets pinnatifid; segments short, bluntish; umbels of 2-3 rays. ⊙. H. Native of Carolina. Stem a foot or a foot and a half high, contracted at the nodi in the dried state. Involucra of 1 or 2 multifid leaves; involucels of 5 ovate entire leaves. Fruit 3 lines long, without any beak. Mericarps with 5 ribs, and one vitta in each furrow. Styles 2, very short. Chærophýllum articulàtum, Bosc, in herb. Vent.

Procumbent Cicely. Pl. procumbent.

3 C. villòsum (Wall. cat. no. 558.) stem erect, the base beset

with retrograde hairs, and the top with spreading ones; leaves rather pilose, pinnate; leaflets bipinnatifid: lobules short, acutish; umbels of 3-4 rays, without any involucra. ⊙. H. Native of Nipaul, on the mountain called Chandaghiry. Herb 2 feet high, branched, very hispid at the base. Involucels of 3-4 linear acute leaves. Fruit a little shorter than the pedicels. Styles short, straight.

Villous Cicely. Pl. 2 feet.

Sect. III. Euchærophy'llum (from *ευ, eu*, well, and *chærophyllum;* this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 225. Fruit glabrous, evidently ribbed. Styles more or less diverging.—Perennial or biennial plants.

* *Biennial plants.*

4 C. colora'tum (Lin. mant. p. 57.) root simple, fusiform; stem terete, and is as well as the petioles pilose; leaves ternately decompound: leaflets pinnatifid, divaricate; involucels glabrous, yellow. ♂. H. Native of Dalmatia. Jacq. hort. vind. 1. t. 51. Mýrrhis coloràta, Spreng, in Schultes, syst. 6. p. 515.—Pluk. alm. t. 100. f. 5.—Moris, oxon. sect. 9. t. 10. f. 6. Root yellowish. Flowers yellow. Styles short, diverging. Hairs on the stem usually deflexed.

Coloured Cicely. Fl. July, Aug. Clt. 1806. Pl. 1½ foot.

5 C. Prescóttii (D. C. prod. 4. p. 225.) root unknown; stem beset with retrograde hairs below, but glabrous above; leaves supra-decompound, the lower ones pilose at the petioles: superior ones glabrous: leaflets multifid: lobes linear; leaves of involucels cuspidate and glabrous; styles hardly diverging; fruit cylindrical.—Native of Altaia. Very like *C. bulbòsum*, but the styles are hardly diverging, and erectish on the fruit, which is much slenderer and longer.

Prescott's Cicely. Pl. 1½ foot.

6 C. bulbòsum (Lin. spec. p. 370.) root turbinate; stem beset with retrograde hairs at the bottom, and glabrous at the top; leaves supra-decompound; lower ones pilose at the petioles: superior ones glabrous; segments multifid, linear; leaves of involucels glabrous, cuspidate; styles short, divaricate. ♂. H. Native of Alsatia, Germany, Siberia, Dahuria, even to Persia, in humid parts of woods. Jacq. fl. austr. t. 63. Hayn. arz. gew. 1. t. 32. Scándix bulbòsa, Roth, germ. 1. p. 123. Mýrrhis bulbòsa, Spreng. in Schultes, syst. 6. p. 513. Horn. fl. dan. t. 1768.—J. Bauh. hist. 3. p. 183. with a figure.—Plench. icon. t. 207. Perhaps the same as C. verticillàtum, hort. paris, ex Pers. Root not bulbous, but tuberous and turnip-formed. Stem usually tumid at the nodi, spotted at the base. Leaves triply pinnate, finely cleft. Flowers white. The roots taken up early in the spring are eaten boiled, with oil and vinegar. Gmelin affirms both these and the seeds to occasion vertigoes; but certainly this is not true, at least of the fresh root, many persons having eaten of that with impunity.

Bulbous-rooted Cicely. Fl. Ju. July. Clt. 1726. Pl. 3 to 6 ft.

7 C. temule'ntum (Lin. spec. 370.) root spindle shaped, subdivided; stem solid, striated, rough with short deflexed hairs, and spotted with dark purple, swelled under each leaf like most of the other species; leaves dark green, hairy, twice pinnate; leaflets pinnatifid or lobed; umbels of many unequal hairy seeds; involucra wanting, of one leaf, rarely of several; involucels of several ovate pointed leaves, which are finely fringed at the margins and keel, occasionally confluent at the base; seeds furrowed, nearly smooth. ♂. H. Native of Europe, in bushy places, and under hedges, common; plentiful in Britain. Jacq. austr. t. 65. Fl. dan. 918. Smith, engl. bot. 1521. Curt. lond. fasc. 6. t. 24. Hayn. arz. gew. t. 34.—Scándix témula, Roth, fl. germ. 1. p. 22. C. témulum, D. C. prod. 4. p. 126. Scándix nùtans, Mœnch, meth. p. 101. Mýrrhis témula, Gærtn. fruct. 1. p. 23. t. 10. Schultes, syst. 6. p. 514. Mýrrhis temuléntum, Smith, engl. fl. 1. p. 51. C. aúreum, Lin. mant. p. 356. but not of his spec. according to Smith in Lin. trans. 10. p. 339.—Mýrrhis, Riv. pent. irr. t. 49.—Moris. hist. 9. p. 308. sect. 9. t. 10. f. 7. Cerefòlium sylvéstre, Raii. syn. 207. Anthríscus Plìnii, Dalesch. hist. 791. with a figure. Wild Chervil, Petiv. herb. brit. t. 25. f. 3. Flowers white, numerous, very slightly irregular, partly barren; those of the circumference principally fertile. Fruit linear, crowned with the short recurved styles. The whole plant is sweetish and aromatic, acceptable to domestic cattle, nor is any intoxicating quality recorded, notwithstanding the specific name. The herbage is often mildewed. Linnæus asserts that all the flowers are perfect, which does not accord with Haller's account, nor with our English specimens.

Intoxicating or Rough Cicely, or Rough Cow-parsley. Fl. June, July. Britain. Pl. 3 feet.

* * *Perennial species.*

8 C. monógynum (Kit. ex Link, enum. 1. p. 281.) stem quite glabrous; leaves decompound; leaflets lanceolate, deeply serrated, having the middle nerve and margins hairy; leaves of involucra and involucels ciliated. ♃. H. Native of Hungary. C. angulàtum, Kit. According to Link and Koch, this is a very distinct plant from *Anthríscus sylvéstris*, although it has been joined to it by Sprengel. Perhaps C. ciliàtum, Kit. in Schultes, syst. is the same, and probably C. nítidum, Wahl. fl. carp. p. 85. It is perhaps only a variety of *C. aúreum*.

Monogynous Cicely. Fl. May, June. Clt. 1810. Pl. 3 feet.

9 C. au'reum (Lin. spec. p. 370. but not of his mant.) stem solid, branched, angular, striated, downy, with copious short deflexed hairs, intermixed with more or less numerous coarser bristles; leaves decompound: the stem ones remarkable for their tapering leaflets, with numerous fine sharp parallel segments, their surfaces hairy or smooth; fruit in the early state club-shaped, when ripe linear, crowned with the lengthened spreading styles; seeds linear, of a tawny yellow, each with 3 prominent obtuse permanent ribs, which are often roughish upwards, as well as the furrows; involucra wanting, or of very few leaves; leaves of involucels ovate-lanceolate, pointed, reflexed, coloured. ♃. H. Native of Middle Europe, among the mountains. In Scotland between Arbroath and Montrose; and at Corstorphine near Edinburgh, on the borders of fields. Smith, engl. bot. 2103. Jacq. austr. t. 64. Mýrrhis aúrea, Spreng. prod. 29. and in Schultes, syst. 6. p. 511. Smith, engl. fl. 1. p. 52. exclusive of the synonymes of Willd. Scándix aúrea, Roth, germ. 1. p. 123.—Lob. icon. t. 734. Ger. emac. 1039.—Moris. hist. 3. p. 301. sect. 9. t. 10. f. 2.—Rupp. gen. ed. Hall. 282. t. 5. Joints of stem more densely hairy than the other parts, and a little swelled, crowned by the narrow annular base of each petiole. Flowers cream coloured, slightly irregular, the barren ones numerous, with only globose rudiments of styles. Stylopodia somewhat depressed, and considerably wrinkled.

Golden-seeded Cicely. Fl. June, July. Scotland. Pl. 3 ft.

10 C. macula'tum (Willd. enum. suppl. 15.) stems smoothish, angular, spotted; leaves supra-decompound, pilose; leaflets lanceolate, deeply serrated, attenuated at the apex; fruit mutic, coloured, 6 times longer than broad. ♃. H. Native of the south of Europe, but the particular places are not known. It differs from *C. aúreum*, to which it has been joined by Sprengel, in the stem being spotted and smooth, and in the fruit being twice the length.

Spotted-stemmed Cicely. Fl. May, Ju. Clt. 1810. Pl. 3 ft.

11 C. millefòlium (D. C. prod. 4. p. 226.) stem and petioles hispid from pili; leaves many-parted; leaflets linear-filiform, glabrous, distant; involucrum of one leaf; leaves of invo-

lucels deflexed, subulate at the apex, and ciliated with wool at the base, longer than the umbellules. ♃. H. Native of Caucasus, at the base of the mountains. C. tenuifòlium, Stev. in Hoffm. umb. p. 180. and 212. t. 1. f. 33. but not of Poir. Mýrrhis millefòlia, Spreng. in Schultes, syst. 6. p. 519. Scándix millefòlia, Willd. herb. C. ròseum var. β, Bieb. suppl. 239. Mýrrhis orientalis mei folio semine brevi, Tourn. cor. 22. Chærophýllum brachycárpum, Bieb. in Hoffm. umb. 212. ? Fruit ovate, short. Styles short, diverging. Flowers white. Leaves as fine as Caraway leaves.

Millefoil-leaved Cicely. Fl. May, June. Clt. 1818. Pl. 1 to 1½ foot.

12 C. ròseum (Stev. mem. mosc. 3. p. 260. Bieb. fl. taur. no. 582.) stem and petioles hispid, and rather pilose; leaves many-parted: leaflets pinnatifid, glabrous; segments linear, approximate; involucra generally of one leaf; leaves of involucels numerous, deflexed, subulate at the apex, ciliated at the base, woolly, longer than the umbellules. ♃. H. Native of Caucasus and Iberia, in mountain meadows. Leaves as finely cut as those of the carrot. Petals of a fine rose colour, not ciliated as in *C. hirsùtum*. Mýrrhis ròsea, Spreng. in Schultes, syst. 6. p. 519. Fruit not seen.

Rose-coloured-flowered Cicely. Fl. May, June. Clt. 1817. Pl. 1 to 1½ foot.

13 C. humile (Bieb. suppl. 240.) stems aggregate, declinate, equal, pubescent; leaves decompound; leaflets pinnatifid; segments oblong, very short; involucra of 1 or 2 leaves; involucels usually of 5 leaves, which are ciliated and margined with white. ♃. H. Native of Iberia, at the river Ksani. Mýrrhis hùmilis, Schultes, syst. 6. p. 519. Flowers white.

Humble Cicely. Fl. May, June. Clt. 1823. Pl. 1 foot.

14 C. hybridum (Ten. fl. neap. prod. 66.) stem glabrous, striated, rather scabrous; leaves tripinnate; leaflets lanceolate-oblong, deeply serrulated; segments acuminated, smoothish above, rather hispid beneath; leaves of involucra and involucels ovate, acuminated, ciliated with long hairs; petals glabrous; styles divaricate. ♃. H. Native of the kingdom of Naples, in the woods of Magella. Flowers white.

Hybrid Cicely. Fl. May, June. Clt. 1822. Pl. 3 feet.

15 C. hirsutum (Lin. spec. 371.) stem fistular, beset with deflexed hairs; leaves ternately decompound, nearly naked; leaflets ovate-cordate, acute, pinnatifid: segments deeply serrated; petals usually ciliated; styles stiff, diverging, straight, permanent. ♃. H. Native of the temperate parts of Europe, as in Switzerland, Germany, Austria, Carniola, in mountain groves. Jacq. fl. austr. t. 148. Scándix hirsùta, Scop. carn. no. 350. Mýrrhis hirsùta, Spreng. in Schultes, syst. 6. p. 510. —Riv. pent. irr. t. 51.—J. Bauh. hist. 3. pt. 2. p. 182. f. 2.—Moris. hist. p. 304. sect. 9. t. 10. f. 6. Petals white, with the ciliæ sometimes deciduous or almost wanting. Involucels of 5 lanceolate acuminated leaves. Leaves sometimes hairy on the veins beneath.

Var. β, glabràtum (Lam. dict. 1. p. 683.) stem and leaves smooth. ♃. H. Native of more humid places than the species. C. cicutària, Murr. bot. 60. but not of Vill. C. palléscens, Presl. in helv. Balb. Petals ciliated.

Var. γ, élegans (Schleich. cat. 1821.) stem hairy; leaves pubescent; leaflets and segments elongated. ♃. H. Native of the Alps of Switzerland. Ch. élegans, Gaudin, fl. helv. 2. fr. 364. Ch. hirsùtum subverticillàtum, Schleich. cat. and exsic. no. 40.

Var. δ, rubriflòrum (D. C. prod. 4. p. 227.) flowers of a rosy purplish colour. ♃. H. Native of Switzerland, Savoy, Germany, Carniola, &c. in meadows on the higher mountains.

Hairy Cicely. Fl. June, July. Clt. 1759. Pl. 1½ foot.

16 C. Magelle'nse (Tenor. prod. fl. neap. append. 4. p. 15. var. β, exclusive of variety α,) stem beset with retrograde hairs, especially at the base; leaves pubescent, many-parted; leaflets oblong, pinnatifid; lobes acute, deeply toothed, lanceolate; petals a little ciliated; fruit cylindrical; styles stiff, permanent, diverging. ♃. H. Native of the kingdom of Naples, on Mount Magella. The specimen received from Tenore under this name is nothing but *Anthriscus sylvéstris* var. γ; but another specimen has been sent by him to Moricand in flower and fruit, which differs from *C. hirsùtum* in the fruit being longer and thicker.

Magella Cicely. Fl. May, June. Pl. 3 feet.

17 C. Cala'bricum (Guss. in act. reg. soc. borb. ex litt. 1828.) stem finely pubescent; leaves doubly dissected; leaflets broad, ovate, somewhat cordate, acute, deeply toothed, puberulous along the nerves, the rest glabrous; sheaths of leaves and leaves of involucels glabrous, hardly ciliated; petals subciliated; styles erect. ♃. H. Native of Calabria, on the mountains about springs and rivulets. In habit the plant is intermediate between *C. hirsùtum* and *C. aromáticum*.

Calabrian Cicely. Pl. 1 to 2 feet.

18 C. aroma'ticum (Lin. spec. 371. Jacq. fl. austr. t. 150.) stem striated, round, and hairy in the lower part, but smooth upwards, slightly tumid and angular below each joint; leaves biternate, large, on narrow-winged footstalks; leaflets stalked, broad, ovate or elliptic-oblong, acute, sharply and finely serrated, both sides nearly smooth, the serratures minutely fringed; umbels smooth; involucra occasionally of a few lanceolate pointed leaves; involucels of several; fruit linear, smooth, crowned by the long, slender, spreading styles. ♃. H. Native of Greece, Turkey, Hungary, Poland, Silesia, Austria, &c. In Scotland, near Guthrie, by the road leading from Forfar to Arbroath. Scándix tinctòria, Scop. carn. no. 351. Mýrrhis aromática, Spreng. prod. 28. Smith, engl. fl. 1. p. 52. Schultes, syst. 6. p. 509.—Riv. pent. irr. t. 53.—Bocc. mus. 29. t. 19. Herb when bruised somewhat aromatic; but the seeds, according to Jacquin, have scarcely any flavour. Scopoli says, they stain the fingers when rubbed with a brownish red. Flowers numerous, white, the external ones fertile.

Aromatic Cicely. Fl. June. Scotland. Pl. 3 feet.

19 C. angelicæfòlium (Bieb. suppl. 1. p. 240.) stem and petioles pubescent; leaves ternately divided, somewhat bipinnate; leaflets ovate-cordate, coarsely serrated. ♃. H. Native of the Levant and Iberia. Mýrrhis aromática, Schultes, syst. 6. p. 509. Mýrrhis orientàlis, &c. Tour. cor. 22. Ch. aromáticum, Lin. spec. 371. ? C. aromáticum, β, Pers. ench. no. 12. Ch. orientàle, Willd. herb. ex Stev. obs. mss. Very like *C. aromáticum*, but differs in the lower leaflets being cordate-ovate, in the upper ones being lanceolate, and in the uppermost ones being linear-subulate. The root is said to be tuberous by Tournefort.

Angelica-leaved Cicely. Fl. May, June. Clt. 1820. Pl. 2 ft.

† *Species not sufficiently known.*

20 C. arbore'scens (Lin. spec. 1. p. 371.) stem frutescent; leaves supra-decompound, smooth; involucels present only; flowers all fertile. ♄. H. Native of Virginia. This species is very doubtful.

Arborescent Cicely. Shrub.

21 C. Cape'nse (Thunb. prod. p. 51. fl. cap. 2. p. 204.) stem terete, glabrous; leaves triternate, rather hairy; leaflets rather remote, linear-lanceolate, somewhat trifid, cuspidate; involucels glabrous: fruit obversely pyramidal, a little beaked, acutely 5-ribbed; styles permanent, reflexed.—Native of the Cape of Good Hope. Mýrrhis Capénsis, Spreng. umb. spec. p. 132. Schultes, syst. 6. p. 513.

Cape Cicely. Fl. May, June. Clt. 1810. Pl. 1½ foot.

22 C. ? arista'tum (Thunb. fl. jap. 119.) stem terete, gla-

brous; leaves ternately decompound, rather hispid on both surfaces; leaflets ovate, acuminated, pinnatifidly cut; fruit rather strigose; styles permanent, divaricate.—Native of Japan. Mýrrhis aristàta, Spreng. umb. spec. 133. Schultes, syst. 6. p. 512. Said to be allied to *Urósporum dúlce*, and probably a species of that genus.

Awned Cicely. Pl. 2 to 3 feet.

23 C. mi'nimum (Vand. in Rœm. script. p. 56.) stems numerous, hairy; radical leaves flat on the ground, biternate, hairy; leaflets somewhat 3-lobed, cut; involucra wanting; involucels usually of about 7 leaves.—On the mountains about Milan. Vittm. suppl. p. 369. Schultes, syst. 6. p. 524. Moretti suspects this to be nothing but a variety of *C. hirsùtum*.

Least Cicely. Pl. $\frac{1}{2}$ foot.

24 C. tenuifòlium (Poir. suppl. 4. p. 342. but not of Stev.) plant glabrous; leaves decompound; leaflets finely cut, acute; fruit nearly glabrous, profoundly ribbed.—Native of the kingdom of Morocco. Mýrrhis tenuifòlia, Schultes, syst. 6. p. 520.

Fine-leaved Cicely. Pl. 1 to 2 feet?

Cult. All the species are of the most easy culture, and will grow in any soil.

CXXXIX. CALDA'SIA (in honour of J. Caldas, a naturalist of Santa Fe de Bogota). Lag. am. nat. 1821. no. 2. p. 98. obs. apar. p. 26. and diss. in litt. D. C. coll. diss. 5. p. 60. t. 2. f. 1. but not of Willd. nor Mutis.—Mýrrhis, Kunth, nov. gen. amer. 5. p. 13. t. 419. but not of Koch.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals oval, with an entire subinvolute point, pilose on the outside. Fruit somewhat compressed from the sides, ovate-oblong, crowned by the short diverging styles. Mericarps with 5 obtuse prominent ribs, 3 dorsal, and 2 marginating; vittæ one in each furrow, which are broad, flat, and striated. Commissure furrowed in the middle. Carpophore bipartite. Seed teretely convex, somewhat convolute at the commissure.—Puberulous or hairy tufted herbs, not above 2 or 4 inches high. Leaves tripinnately multifid; segments lanceolate-linear, acute. Scapes erect, pubescent. Umbels simple, containing about 20 flowers, surrounded by involucra composed of about 20 leaves each, which are oblong-lanceolate. Flowers white, some male, and others female.—This genus, from the seed and fruit, is allied to *Scándix;* but differs from *Chærophýllum* in the umbels being simple, in the ribs of the mericarps being distant, and in the furrows being broad.

1 C. Andícola (Lag. in litt. D. C. coll. mem. 5. t. 2. f. j. 1-3.) the plant is either wholly glabrous or puberulous; pedicels smoothish, a little longer than the involucrum. ♃. F. Native of South America, in grassy plains at Antisana, at the height of 6000 to 7000 feet. Mýrrhis Andícola, H. B. et Kunth, nov. gen. amer. 5. p. 13. t. 419. Plant dwarf, tufted, deep green, but becoming blackish on drying. Umbels 10-12-flowered. Scapes hardly twice the length of the leaves. Kunth's specimen is less than that of Dombey's, and more glabrous; but the hairs of the scapes in both are deflexed. Pedicels glabrous.

Andes Caldasia. Pl. 2 to 3 inches.

2 C. eriópoda (D. C. l. c. f. j. 4-5.) the whole plant is clothed with hoary pubescence; pedicels tomentose or hairy, much longer than the involucrum. ♃. F. Native of New Holland, where it was collected by D'Urville. Scape 4 times longer than the leaves. Leaves of involucrum oval-oblong. Fruit quite glabrous, seated on very hairy pedicels.

Woolly-pedicelled Caldasia. Pl. 2 to 3 inches.

† *Species not sufficiently known.*

3 C. chærophyllæ'a (Lag. am. nat. 2. p. 98. and in litt. ined.) stems covered with retrograde hairs; segments of involucrum entire, or cut, about equal in length to the flowering umbel. ♃. F. Native of Peru.

Var. a, glabriúscula (D. C. prod. 4. p. 229.) leaves puberulous, especially above, as well as the outside of the involucra; petals almost glabrous; peduncles dichotomous, twin. ♃. F. Native of Peru, at the town of Chinchin, in the province of Chancay, where it was collected by Ruiz et Pav.

Var. β, hirsùta (D. C. l. c.) leaves pubescently hairy on both surfaces, as well as the outside of the involucels and petals; forks of umbels 3-4-rayed.

Charvil-like Caldasia. Pl. 2 to 3 inches.

4 C. lasiope'tala (Lag. in litt. ex D. C. prod. 4. p. 229.) stem and leaves rather tomentose, greyish; segments of involucels cut and pinnatifid, longer than the umbels; petals pubescent on the outside. ♃. F. Native on the Andes, in the tract called Cordillera del Peru.

Hairy-petalled Caldasia. Pl. 2 to 3 inches.

Cult. See *Fragòsa*, p. 259. for culture and propagation.

CXL. SPHALLEROCA'RPUS (*σφαλλω, sphallo,* to deceive, and *καρπος, karpos,* fruit; from the fruit being liable to be mistaken for cumin seed). Bess. in litt. 1828. D. C. coll. mem. 5. p. 64. t. 2. f. N. prod. 4. p. 230.

Lin. syst. *Pentándria, Digýnia.* Teeth of calyx 5, subulate. Petals obovate-cuneated, emarginate, with an inflexed point; outer ones of the umbel radiant. Styles short, at length reflexed. Stylopodium rather urceolate, toothed. Fruit elliptic-oblong, contracted from the sides, without a beak. Mericarps with 5 subalate ribs: lateral ribs marginating. Vittæ 2-3 in each furrow, which are convex; and 4-6 in the commissure. Carpophore bipartite. Seed having a furrow inside.—Herbs. Stems terete, and are as well as the petioles hairy. Leaves bipinnate; leaflets pinnatifid: lobes linear, acute. Involucrum wanting. Umbels 6-7-rayed. Involucels of 5 lanceolate leaves. Flowers white, nearly all hermaphrodite in the terminal umbels, and male in the lateral ones.

1 S. Cymi'num (Bess. l. c.) ♂. Native of Dahuria, about Nerschinski Sawod. ex Fisch.; and of Volhynia, ex Bess. Chærophýllum Cymìnum, Fisch. in litt. 1819. Cat. hort. Vratisl. 1821. Chær. gràcile, Bess. hort. crem. 1822. Trev. nov. act. nat. bonn. 1826. vol. 13. p. 172. Mýrrhis gràcilis, Spreng. syst. 4. pt. 2. p. 120. Fruit thickish, elliptic-oblong, with acute angles, very aromatic according to the testimony of Fisch. Leaves almost like those of *Chær. aromáticum*, triplicately pinnatifid, with linear segments. Stem smooth.

Cumin-like Sphallerocarpus. Fl. June, July. Clt. 1822. Pl. 2 to 3 feet.

Cult. The seeds of this plant only require to be sown in the open border.

CXLI. MOLOPOSPE'RMUM (from *μωλωψ, molops,* a stripe, and *σπερμα, sperma,* a seed; the fruit is yellowish, and the vittæ chestnut coloured, giving the fruit the appearance of being striped). Koch, umb. p. 108. diss. ined. in litt. 1828. D. C. prod. 4. p. 230.—Ligústicum species, Lin. and Spreng.

Lin. syst. *Pentándria, Digy'nia.* Calyx 5-toothed, foliaceous. Petals lanceolate, entire, ending in a long ascending acumen each. Fruit contracted from the sides; mericarps with 5 membranous winged ribs, the 2 lateral ones marginating, and one-half shorter than the rest, and the 3 dorsal ones are very sharp. Seed bluntly tetragonal or angular; angle of commissure opposite, engraven by a profound furrow; the canals empty between the seed and commissure of the pericarp. Vittæ broad, brown, solitary in the furrows; but none in the commissure, which is very narrow. Carpophore bipartite.—A perennial glabrous herb. Leaves ternately decompound; leaflets lanceo-

late, elongated, shining, or decurrently pinnate-parted; segments sharply pinnatifid. Leaves of involucrum numerous, elongated, rather membranous, sometimes multifid. Involucels of many leaves. Flowers white, on short pedicels. Terminal umbels, large, fertile: lateral ones smaller, male. Fruit often deformed, having the lateral ribs almost wanting, and the vittæ of the lateral furrows. Perhaps this genus comes nearer to *Pleurospérmum* and *Hymenolæ`na* than to *Velæ`a*.

1 M. Cicuta`rium (D. C. prod. 4. p. 230.) ♃. H. Native of the Pyrenees, Cevennes, Alps of Provence, Dauphiny, Piedmont, and Carniola. Séseli Peloponénse, Matth. ed. Valg. 502. f. 4. but not of Dioscorides. Ligústicum Peloponesìacum, Lin. spec. 360. Jacq. fl. austr. append. t. 13. Lig. Peloponénse, Lam. dict. 3. p. 576. Lig. Cicutàrium, Lam. fl. fr. 3. p. 453. Molopospérmum Peloponesìacum, Koch. l. c. Séseli Peloponénse, Diosc. lib. 3. cap. 62. is *Angélica sylvéstris*, which grows frequently in the Morea, ex Smith, prod. fl. græc. 1. p. 193.

Cicuta-like Molopospermum. Fl. May, July. Clt. 1596. Pl. 3 to 5 feet.

Cult. This plant will grow in any soil, and is easily increased either by dividing at the root or by seed.

CXLII. VELÆ`A (named after Seb. Eug. Vela, who illustrated umbelliferous plants under the auspices of Lagasca). D. C. coll. mem. v. p. 61. t. 2. f. H. prod. 4. p. 230.—Ligústicum species of H. B. et Kunth.

Lin. syst. *Pentándria, Digy'nia.* Margin of calyx obliterated. Petals unknown. Stylopodium conically depressed, short. Styles erect, filiform. Fruit ovate, without a beak; mericarps somewhat compressed from the sides, having the transverse section nearly terete; ribs 5, the 2 lateral ones marginating, and nearly filiform, the 3 dorsal ones winged; vittæ usually 3 in the furrows, but sometimes only 2, probably from 2 of them being joined in one; and 4 in the commissure. Albumen involute. Carpophore bipartite from the base.—A branched glabrous herb. Stem sulcately striated. Leaves ternately decompound; leaflets nearly sessile, trifid, or pinnatifid, serrated, cuneated at the base. Umbels terminal, of about 20 rays. Involucra and involucels none. Fruit almost like that of *Cnídium*, but differs in the albumen being involute; of *Molopospérmum*, but the calyx is toothless, the commissure less contracted, and the furrows marked with many stripes; of *My'rrhis*, but the vittæ are more numerous, and the carpophore is bipartite to the base.

1 V. Tolucce'nsis (D. C. prod. 4. p. 231.) ♃. H. Native of Mexico, in the mountains near Tolucca. Ligústicum Toluccénse, H. B. et Kunth, nov. gen. amer. 5. p. 19. t. 422. Cnídium Toluccénse, Spreng. syst. 1. p. 388.

Tolucca Velæa, Pl. 2 feet.

Cult. This plant will require some shelter in severe winters. It will be easily increased by seed or by dividing at the root.

CXLIII. MY'RRHIS (from *μυρον, myron*, perfume, or *μυῤῥα, myrrha*, myrrh; scent of plant). Scop. carn. 2. p. 341. Hoffm. umb. 1. p. 27. t. 1. f. 23. Koch, umb. 123. D. C. prod. 4. p. 231.—Chærophýllum species, Lam.—Scándix species, Lin.—Mýrrhis species, Spreng.

Lin. syst. *Pentándria, Digy'nia.* Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point. Fruit compressed from the sides. Seed involute, covered by a double membrane; the outer membrane acutely keeled by 5 equal sharp ribs, which are hollow inside: the inner membrane closely adnate to the seed. Vittæ wanting. Carpophore cleft at the apex.—Perennial villous herbs, having a strong scent of anise. Roots fusiform. Leaves ternately decompound; leaflets pinnatifid. Involucrum wanting. Involucels of many lanceolate ciliated leaves. Central flowers of umbel male. Petals white.

1 M. odora`ta (Scop. l. c.) leaves rather villous beneath; leaves of involucels lanceolate, finely fringed. ♃. H. Native of Middle and South Europe, from Spain to Asia Minor; Germany, Switzerland, Austria, the south of France, and the north of Italy. In Britain, in Yorkshire, Cumberland, and Lancashire, and in the lowlands of Scotland, in mountain pastures. It is also to be found in Chili, but it has probably been introduced thither. Mýrrhis, Dod. pempt. 701. with a figure. Odoràta, Riv. pent. irr. with a figure. Scándix odoràta, Lin. spec. 368. Smith, engl. bot. t. 697. Jacq. austr. 5. append. t. 37. Blackw. t. 243. Plench. icon. 206. Chærophýllum odoràtum, Lam. dict. 1. p. 683. Scándix odoràta of Burm. fl. cap. p. 8. is our plant. This was one of the old medicinal plants, but it is now disused. Formerly the young leaves and seeds were put into salads, and the roots were boiled or eaten, cold or in tarts, and in a variety of sauces. "Sweet Chervil gathered while it is young," says Parkinson, "and put among other herbs in a sallet, addeth a marvellous good relish to all the rest." In Germany, it is said to be still used in soups. It no longer appears at the table with us. In the north of England the seeds were formerly employed in polishing and perfuming oak floors and furniture.

Sweet Cicely or Great Chervil. Fl. May, June. Britain. Pl. 2 to 3 feet.

2 M. sulca`ta (Lag. gen. et spec. p. 13.) leaves hoary from tomentum beneath; leaves of involucels oblong, concave, setaceously mucronate. ♃. H. Native of Spain. Fruit deeply furrowed.

Furrowed-fruited Cicely or Great Chervil. Pl. 2 feet.

Cult. These plants will grow in any common garden soil, and are easily increased by seed or dividing at the root.

CXLIV. OSMORHI'ZA (from *οσμη, osme*, scent, and *ῥιζα, rhiza*, a root; roots sweet scented). Rafin. journ. phys. 1821, D. C. prod. 4. p. 232.—Uraspérmum, Nutt. gen. amer. 1. p. 192. but not of Juss.—Spermatùra. Reichenb. consp. 1827. 1. p. 141.—Mýrrhis species, Michx. Torr. Spreng.

Lin. syst. *Pentándria, Digy'nia.* Margin of calyx obsolete. Petals obovate, hardly emarginate, but with a short inflexed point each. Fruit elongated, tapering into a tail at the base, solid, acutely angled: having the transverse section nearly terete; mericarps with the angles rather furrowed and hispid: having 5 acute ribs each; commissure furrowed; vittæ none. Seed terete, involute, much shorter than the tube of the calyx. Carpophore semibifid.—American perennial herbs. Roots fusiform, sweet-scented. Stems branched, 2 feet high. Leaves biternate; leaflets broadly ovate-lanceolate, deeply-toothed. Involucra of 2-3 leaves; involucels usually of 5 leaves; leaves of both the involucra and involucels lanceolate, ciliated. Flowers white, the central ones of the umbellules male, the outer ones alone fertile.

§ 1. *Involucra and involucels of 3 or 5 leaves.*

1 O. longístylis (D. C. prod. 4. p. 232.) styles filiform, somewhat diverging, equal in length to the breadth of the fruit, or rather longer. ♃. H. Native of North America, about Albany and New York, &c. ex Torrey; in moist parts of woods about Boston, ex Bigel, &c. Throughout Canada, from Lake Huron to the Saskatchawan, and on the banks of the Columbia in shady places, ex Hook. fl. bor. amer. 1. p. 271. t. 96. Mýrrhis longístylis, Torr. fl. un. st. 1. p. 310. Uraspérmum Claytònii, Nutt. gen. amer. 1. p. 193. Bigel. fl. bost. ed. 2. p. 112. Scándix dúlcis, Muhl. ex spec. Nutt. Schrad. in litt. My'rrhis Claytònii, Spreng. spec. umb. 129. t. 3. f. 6. Chærophy'llum Claytònii, Pers. There are varieties of this having the stem and leaves more or less villous or smooth. Umbels usually of 5 rays. Leaves of involucra and involucels oval-lanceolate. Root smelling of anise according to Bigelow. Fruit clavate. Involucra permanent.

Long-styled Osmorhiza. Fl. July, Aug. Clt. 1806. Pl. 1 foot.

2 O. brevi'stylis (D. C. prod. 4. p. 232.) styles short, conical, tapering at the base and apex, one-half shorter than the breadth of the fruit. ♃. H. Native of North America, in the United States and Canada, and in woody places on the west side of the Rocky Mountains; and from the mouth of the Columbia to Observatory Inlet, in lat. 55° on the north-west coast. Hook. fl. amer. bor. 1. p. 272. t. 97. My'rrhis Claytònii, Torr. fl. un. st. 1. p. 310. exclusive of many synonymes. Uraspérmum hirsùtum, Big. fl. bost. ed. 2. p. 112. Umbels usually of 3-4 rays. Leaves of involucra linear-lanceolate, deciduous. The root, according to Bigelow, has an ungrateful scent, similar to that of *Aràlia nudicaúlis;* but according to Torrey it has a sweet anise scent.

Short-styled Osmorhiza. Pl. 2 feet.

§ 2. *Involucra and involucels wanting.*

3 O. Berte'rii (D. C. prod. 4. p. 232.) plant hairy; leaves decompound; leaflets pinnatifid; styles very short, diverging; fruit villous, especially at the base. ♃. H. Native of Chili, near Tagua-tagua, and about Conception, in shady woods. Herb nearly like that of *O. brevistylis.* O. Chilénsis, Hook. et Arn. in Beech. bot. p. 26. Scándix Chilénsis, Molina, chil. p. 125. ed. gall. p. 331. Leaves bipinnate; leaflets cuneate-ovate, pinnatifid; segments subdivided, acute. Flowers some of them male.

Bertero's Osmorhiza. Pl. 2 feet.

Cult. See *My'rrhis*, p. 369. for culture and propagation.

CXLV. GRAMMOSCIA'DIUM (from γραμμη, *gramme*, a line, and σκιαδιον, *sciadion*, an umbel; fruit lined). D. C. coll. mem. v. p. 62. t. 3. f. K. prod. 4. p. 232.

Lin. syst. *Pentándria, Digýnia.* Teeth of calyx 5, stiff, permanent. Petals obcordate, with an inflexed point. Styles short, conical, diverging, permanent, stiff. Fruit cylindrical, without a beak; mericarps with 5 primary flattish white ribs; furrows flat, having one vitta in each; and the commissure having 2. Seed unknown.—Quite glabrous herbs, natives of the Levant. Stems branched. Leaves pinnate; leaflets multifid: lobes linear-setaceous. Umbels compound, of from 5 to 16 rays. Leaves of involucra 5-7, multifid; of the involucels linear-subulate, rarely cut. Pedicels stiff, thickening after flowering. This is a very distinct genus, but from the structure of the seed being unknown, the place which it should occupy in the order is doubtful.

1 G. daucoìdes (D. C. l. c. t. 3. f. K.) leaves of involucra multifid; most of the flowers in each umbellule are fertile; fruit terete, crowned by the calycine teeth, which are conical and elongated.—Native of Armenia, ex herb. Tourn. about Amadan in Persia, ex herb. Oliv. et Brug. My'rrhis Armena foliis Mei seu fœniculi semine brevi. Tourn. herb. Herb quite glabrous, erect. Root terete, nearly simple. Stem furrowed, a foot high. Leaves nearly like those of *Daúcus setifòlius*, having the petioles dilated at the base. Central umbel of 15-16 rays, lateral ones of 10-12.

Carrot-like Grammosciadium. Pl. 1 foot.

2 G. meoìdes (D. C. l. c.) leaves of involucra hardly cut; the central flower in each umbellule alone fertile; fruit rather club-shaped; calycine teeth small.—Native of Armenia. My'rrhis orientalis Mei folio semine longissimo, Tourn. cor. 22. My'rrhis orientalis semine unciam longo, Tourn. herb. Scándix macrospérma, Willd. herb. ex Schultes, syst. 6. p. 507. Scándix clavàta, Spreng. syst. 1. p. 903. Stem branched, terete. Leaves none in the specimen. Involucrum wanting, or of one usually undivided leaf. Umbels of 5-7 rays. Umbellules each containing 7-8 sterile flowers, and one fertile one. Fruit in Tournefort's specimen shorter than in the preceding.

Meum-like Grammosciadium. Pl. 1 foot.

Cult. The species will grow in any common soil, and will be easily increased by seed.

Tribe XVI.

SMY'RNEÆ (this tribe contains plants agreeing with the genus *Smy'rnium* in character), or Campylospermæ paucijugatæ turgidæ, Koch, umb. 133. D. C. prod. 4. p. 233. Fruit turgid, usually compressed or contracted from the sides; mericarps with 5 ribs: the lateral ribs marginating, or situated in the front of the margin; the ribs sometimes nearly obliterated. Seed involute, or with a furrow inside, semilunar or complicate. —Habit of plants and inflorescence variable; the genus *Exoacántha* and *Echinóphora* agree in habit with *Ery'ngium*, in consequence of having spinose leaves; *Lagœ'cia* agrees with *Actinòtus* in the one-seeded fruit; *Pleurospérmum* with *Astrántia* in the utricular fruit.

CXLVI. LAGŒ'CIA (from λαγως, *lagos*, a hare, and οικος, *oikos*, a house; the place where a hare lies; the seeds enveloped in the hairy involucrum have been likened to young leverets in a hare's form). Lin. gen. no. 285. Gærtn. fruct. 1. p. 103. t. 23. f. 3. Lag. am. nat. 2. p. 106. D. C. prod. 4. p. 233.—Cuminoìdes, Tourn. inst. t. 155.

Lin. syst. *Pentándria, Digýnia.* Lobes of calyx large, pectinated. Petals obcordately bifid, shorter than the calyx; lobes awned. Ovarium bilocular, one of the cells abortive; the fruit is therefore ovate, and crowned by the calyx, hence there is a furrow on one side indicating the place of the abortive cell. Seed marked with a furrow on one side, and therefore appearing involute.—An annual erect herb. Leaves pinnate; leaflets ovate, uniform, alternate, coarsely toothed: teeth awned. Peduncles opposite the leaves. Umbels compound, of many rays. Umbellules 1-flowered. Leaves of involucra 8-10, pectinated, of the involucels 4, also pectinated. Flowers pedicellate, within the involucel, white. Fruit downy.

1 L. cuminoìdes (Lin. spec. 294.) ⊙. H. Native of Galatia, Persia, Greece, Candia, Lybia, Spain, &c. in corn fields and vineyards. Smith, fl. græc. t. 243. prod. 1. p. 162. Schkuhr, handb. 1. t. 48. Lam. ill. t. 142. Sabb. hort. 4. t. 55. Plench. icon. t. 153.—Mor. hist. 3. sect. 9. t. 13. umb. t. 1. f. 13. Umbels nodding before flowering, but at length becoming nearly globose. The seeds are mostly all abortive in the plants cultivated in gardens.

Cumin-like Lagœcia or Wild Cumin. Fl. June, July. Clt. 1640. Pl. ½ foot.

Cult. The seeds should be sown in autumn, soon after they are ripe; otherwise if this is deferred till spring, they commonly remain a year, and sometimes two or three years before they grow.

CXLVII. OLIVE'RIA (in honour of M. G. A. Olivier, author of a history of insects, and formerly one of the editors of the Encyclopédie Methodique, and who was sent with M. Bruguiere by the French government into the Levant, for the purpose of collecting objects of natural history). Vent. hort. cels. t. 21. Lag. am. nat. 2. p. 105. D. C. prod. 4. p. 234.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals profoundly obcordate, nearly bipartite: lobes involute on the margin at the base, and excavated on the side, undulated and reflexed above. Fruit obovate-ovate, hairy; mericarps nearly terete, bluntly 5-ribbed. Carpophore bifid at the apex. Seed marked with a furrow on the inside, therefore the albumen is probably involute.—A branched herb, native of the Levant. Stems erect, white. Leaves pinnate, having the scent of thyme when bruised; leaflets many-parted: segments trifid, acute. Umbels of 3-4-rays. Umbellules dense, many-flowered. Leaves of involucrum 3-4, trifid: lobes usually tridentate. Leaves of

involucels numerous, cuneiform, trifid. Flowers equal, hermaphrodite, white.

1 O. orienta'lis (D. C. prod. 4. p. 234.) ⊙. H. Native about Bagdad, on the banks of the Euphrates, where it was detected by Olivier and Bruguiere. Olivèria decúmbens, Vent. hort. cels. t. 21. Stems white, decumbent in Ventenat's figure, but stiff and erect in the spontaneous specimens. Lower and floral leaves clothed with soft velvety villi.

Eastern Oliveria. Fl. May, July. Clt. 1816. Pl. 1 foot.

Cult. The seeds of this plant only require to be sown in the open border in spring or autumn, in a warm sheltered situation.

CXLVIII. ANISOSCIA'DIUM (from *ανισος, anisos,* unequal, and *σκιαδιον, sciadion,* an umbel; in reference to the lobes of the calyx and petals being unequal in the outer and inner flowers of the umbel). D. C. coll. mem. v. p. 63. t. 15. prod. 4. p. 234.

Lin. syst. *Pentándria, Digýnia.* Lobes of calyx in the outer flowers of the umbels, large, ovate, and foliaceous; in the outer central flowers stiff, hooked, and mucrone-formed; in the inner ones all wanting or tooth-formed. Petals very unequal, outer ones large, obcordately bifid; inner ones small. Fruit rather pubescent, oblong-cylindrical, crowned by the calyx, and 2 stiff conical erect styles. Mericarps semi-terete, one of which is usually abortive; ribs 5, very blunt; vittæ one in each furrow, brown, but none in the commissure. Albumen involute.—An herb, native of the Levant. Root simple. Stems diffuse, stiff, dichotomously branched, puberulous when examined by a lens. Leaves petiolate, pinnate; leaflets deeply pinnatifid: lobules short, hardly acute. Branches opposite the leaves. Involucra of 4-5 leaves, which are unequal, oblong, acute, and at length rather spinescent. Rays of umbel 4-5, stiff, a little longer than the involucrum. Leaves of involucels 4-5, oval, spreading, permanent, unequal. Flowers white, 7-10, sessile, stiff.

1 A. orienta'le (D. C. l. c. t. 15.) ⊙. H. Native of the Levant, between Bagdad and Aleppo, where it was collected by Olivier and Bruguiere.

Eastern Anisosciadium. Pl. spreading.

Cult. See *Olivèria* above for culture and propagation.

CXLIX. ECHINO'PHORA (from *εχινος, echinos,* a hedgehog, and *φερω, phero,* to bear; in allusion to the strong stiff spines of the involucrum). Tourn. inst. 656. t. 423. Lin. gen. no. 329. Lam. ill. t. 190. Lag. am. nat. 2. p. 106. Koch, umb. 135. D. C. coll. mem. v. p. 64. t. 16. prod. 4. p. 234.

Lin. syst. *Pentándria, Digy'nia.* Margin of calyx 5-toothed. Petals obovate, emarginate, with an inflexed point; or the outer ones are larger and bifid. Styles in the female flowers elongated (f. 65. *h.*), filiform, 2, rarely 3. Fruit ovate, nearly terete (f. 65. *f.*), inclosed in a hollow receptacle, furnished with a short emersed beak. Mericarps with 5 depressed equal undulated ribs. Vittæ one in each furrow, covered by a cobwebbed membrane. Albumen deeply involute (f. 65. *j.*).—Perennial herbs. Leaves bipinnatifid; segments cut. Umbels terminal; the flowers of the ray male, and joined together at the base before flowering, having the receptacle girding them; the female flowers solitary and central. Involucra and involucels constantly of many leaves.

Sect. I. Leucóphora (from *λευκος, leucos,* white, and *φερω, phero,* to bear; in reference to the white flowers of the species). D. C. prod. 4. p. 235. Flowers white. Petals obcordate, glabrous, nearly equal. Lobes of leaves pungent, terete or conical.

1 E. spinòsa (Lin. spec. 344.) plant glaucous, finely downy; leaves pinnate; leaflets subulate, trifid, stiff; leaves of involucrum and involucels spinose. ♃. H. Native along the Mediterranean, in the sand by the sea side. Said to have been found by Ray on the sea coast of Lancashire, and by Mr. Blackstone between Feversham and Sea Salter; between Whitstable and the Isle of Thanet, by Sandwich, and near West Chester by Gerarde; but it has been since searched for without success; it was therefore nothing but the common samphire that was found in the above mentioned habitats. Cav. icon. 2. t. 127. Smith, fl. græc. t. 265. eng. bot. 2413. D. C. coll. mem. v. t. 16.—Mor. ox. sect. 9. t. 1. f. 1. Root fusiform, edible. Flowers white. (f. 65.)

FIG. 65.

Var. β, *pubéscens* (Guss. prod. fl. sic. 1. p. 309.) stem pubescent, deeply furrowed; leaves scabrous; rays of umbels pilosely pubescent. ♃. H. Native of the Levant.

Prickly Sea-parsnip. Fl. Jul. Pl. 2 to 3 feet.

2 E. platy'loba (D. C. prod. 4. p. 235.) plant smoothish or pubescent in the upper part; leaves petiolate, pinnate: leaflets 3-4-cleft: lobes lanceolate, flattish, divaricate, spinescent; leaves of involucra lanceolate, spiny. ♃. F. Native of Persia, about Teheran. Stems angular, flexuous. Umbels small, when young, pubescent. Flowers white.

Broad-lobed Sea-parsnip. Pl. ½ to 1 foot.

3 S. trichophy'lla (Smith, in Rees' cycl. vol. 12. no. 3.) leaves bitriternate; segments filiform, channelled, acute, unarmed. ♃. F. Native of the Levant, in stony places at the foot of Mount Ararat; and of Persia, in the province of Aderbeidjan, where it was gathered by Szowits. Umbels turgidly muricated, about the size of those of *E. spinòsa,* of a deep purple while young; petals white. Perhaps this plant is the same as E. orientàlis peucedanifòlio, Vaill. herb. The plant has a strong smell of *galbanum* according to Szowits.

Hair-leaved Sea-parsnip. Fl. July. Clt. 1820. Pl. 1 foot.

Sect. II. Chrysóphora (from *χρυσος, chrysos,* gold, and *φερω, phero,* to bear; in reference to the yellow flowers). D. C. prod. 4. p. 235. Flowers yellow. Petals ovate, barbately ciliated; the outer ones of the umbel rather radiant. Lobes of leaves flat, foliaceous, toothed at the apex. According to Fischer it is probably a distinct genus.

4 E. tenuifòlia (Lin. spec. 344.) plant pubescent; leaves bipinnate; leaflets pinnatifid or cut, cuneated, unarmed at the apex. ♃. F. Native of Apulia, Sicily, Greece, Tauria, and about Smyrna and Constantinople, in fields; and of Persia, in the province of Erivan, in dry saltish places. Sibth. and Smith, fl. græc. 266. prod. 1. p. 179. Stev. mem. soc. mosc. 3. p. 249 and 258. D'Urv. enum. 29.—Moris. oxon. sect. 9. t. 1. f. 2. Pluk. alm. t. 11. f. 1. The fruit is similar to the rest of the species. A much branched glaucous plant.

Fine-leaved Sea-parsnip. Fl. July, Aug. Clt. 1731. Pl. 1½ ft.

Cult. These plants not producing seeds in this country are increased by cuttings of the roots or stems. Place them in a warm situation and a dry soil, or else cover them in winter, to prevent the frost from destroying them.

CL. EXOACA'NTHA (from *εξω, exo,* without, and *ακανθα, akantha,* a spine; in allusion to the leaves of the involucels being spinose, and situated on the outside of the umbellules). Labill. pl. syr. dec. 1. p. 10. t. 2. Lag. am. nat. 2. p. 106. D.C. prod. 4. p. 235.

Lin. syst. *Pentándria*, *Digýnia*. Flowers polygamous, central ones fertile, the rest sterile. Calyx in the sterile flowers, with obsolete margins. Petals obcordate, inflexed, equal. Young fruit of the sterile flowers obovate, and striated; those of the central flowers much larger, ovate, and somewhat papillose, crowned by 15 elongated stiff bristles. Seed unknown.—An herb, native of the Levant. Leaves pinnate: leaflets of the radical leaves ovate, toothed, rather cut; of the cauline leaves lanceolate-linear, acute. Umbels terminal, compound; umbellules on short peduncles. Leaves of involucra 10-12, large, channelled, spinose, longer than the rays, spreading; leaves of involucels 7-11, spinose, situated on the outer side of the umbellules, and longer than them, very unequal, 1 of which is very long, 2-4 are middle-sized, and 2-4 are bristle-formed. Flowers white.—This very singular genus is allied to *Echinóphora* and *Arctòpus* from the inflorescence, but the fruit is scarcely known. Perhaps the fruit is said to be crowned by 15 bristles, because the calyx is 5-parted, and each of these parts again trifid.

1 E. heterophy'lla (Labill. l. c.) ♂. F. Native of the Levant, at Nazareth.

Variable-leaved Exoacantha. Pl. 2 feet.

Cult. The seed of this plant ought to be sown in a pot, and the plants when of sufficient size to be potted separately; and in the second year, about the month of May, they may be planted out into the open border, where they will flower and seed freely.

CLI. ARCTO'PUS (from *αρκτος*, *arktos*, a bear, and *πους*, *pous*, a foot; this singular plant is beset with spines, which have been compared to the claws of a bear). Lin. hort. cliff. 495. gen. no. 1165. Lam. ill. t. 865. Gærtn. fil. carp. 3. p. 14. t. 182. f. 4. D. C. prod. 4. p. 236.—Apràdus, Adans, fam. 2. p. 182.

Lin. syst. *Pentándria*, *Digýnia*. Flowers polygamo-dioecious. Margin of calyx 5-toothed. Petals lanceolate, with an incurved acute entire acumen. Stamens in the male flowers twice the length of the corolla, antheriferous. Stylopodium flat. Styles 2, very short, deciduous. Ovarium abortive. Stamens in the female flowers none. Styles 2, thickened at the base, and divaricate at the apex. Fruit ovate, beaked, crowned by the calyx, and conferruminated with it from the base to the middle, having one side depressed and naked, with a furrow, not separable into two parts, but bilocular, with one of the cells abortive; the fruit is therefore 1-seeded from abortion, roundish, convex on one side, and concave with a furrow on the other.—A perennial herb, native of the Cape of Good Hope. Radical leaves pressed close to the ground in a stellate manner, with flat petioles, and roundish trifid limbs: the lobes toothed and spiny-ciliated. Male umbels compound, pedunculate, sterile, but mixed with a few female flowers; umbellules nearly globose; involucrum usually of 5 leaves, which are joined together after flowering. Female umbels sessile, fertile, surrounded by the 4 concrete leaves of the involucrum, which are coriaceous, reticulated, and spiny toothed, girding the fruit. Petals white.

1 A. echina'tus (Lin. spec. ed. 2. vol. 2. p. 1512.) ♃. G. Native of the Cape of Good Hope, on hills about Cape Town, &c. Thunb. fl. cap. 255. Ker, bot. reg. t. 705.—Burm. afr. 1. t. 1.—Pluk. mant. t. 271. f. 5. The roots are used with success at the Cape in cases of siphilis; but upon trial here some years since they were found to be less efficient than sarsaparilla.

Rough Arctopus. Fl. May, June. Clt. 1774. Pl. 1 foot.

Cult. This plant should be grown in a mixture of peat, sand, and loam; and it may either be increased by dividing the plant or by seed.

CLII. CA'CHRYS (one of the names given by the Romans to the Rosemary. According to Morison, the name was derived from *καιω*, *kaio*, to burn, on account of the carminative qualities of the plants). Tourn. inst. t. 172. Lin. gen. no. 342. D. C. coll. mem. v. p. 65. prod. 4. p. 236.—Càchrys and Hippomárathrum, Link. hort. berol. 1. p. 271. Koch, umb. 136. f. 36, 37.—Càchrys species, Spreng.

Lin. syst. *Pentándria*, *Digýnia*. Margin of calyx 5-toothed, or rarely obsolete. Petals ovate, entire, involute or inflexed at the apex. Stylopodium depressed, short, hardly distinct in the mature fruit. Fruit turgid, the transverse section nearly terete, or somewhat didymous; mericarps with 5 thick ribs, variable in the different sections. Commissure nearly equal to the breadth of the mericarps. Seed constituting a free nucleus, covered with copious vittæ, deeply involute. Cotyledons of embryo diverging.—Perennial herbs. Leaves decompound. Umbels numerous. Involucra and involucels of many leaves. Flowers yellow.

Sect. I. Euca'chrys (from *eu*, well, and *cachrys*; this section contains what are supposed to be the true species of the genus). D. C. prod. 4. p. 236. Càchrys, Koch, umb. l. c. Margin of calyx obsolete. Ribs of fruit broad, thick, obtuse, sometimes so very broad at the base as hardly to be distinct. Prickles, bristles, or tubercles none.

1 C. læviga'ta (Lam. dict. 1. (1783) 256.) plant glabrous; leaves decompound; leaflets multifid, linear-setaceous, divaricate; leaves of involucra and involucels few, entire; fruit globose, with very blunt, hardly distinct, smooth ribs. ♃. H. Native of the south of France, in dry open places.—Moris. umb. t. 3. superior figure.—C. Libanòtis, Gouan. ill. p. 12. but not of Lin. C. Morisònii, All. pedem. auct. (1789) p. 23. Schultes, syst. 6. p. 441. exclusive of the synonyme of Desf. The oldest name is here admitted. Flowers yellow.

Smooth-fruited Cachrys. Fl. July, Aug. Clt. 1710. Pl. ½ to 1 foot.

2 C. macroca'rpa (Ledeb. fl. ross. alt. ill. t. 313. fl. alt. 1. p. 365.) radical leaves ternate: leaflets bipinnate or tripinnate: pinnula ternate or palmate: segments entire or 3-parted: lobes linear or oblong; involucra and involucels of many leaves; fruit oval; mericarps glabrous, 11-angled. ♃. H. Native of Siberia, on hills in the Kirghisean steppe, at Ustkamenogorsk, and between Bucktorminsk and Lake Noor-Saisan. Root rather woody, stupose. Stems many from the same root, striately furrowed, pubescent, branched at top. Leaves a foot long and more than a foot broad. Umbels of 5-10-rays, but usually of 8. Leaves of involucra ovate or lanceolate, short, membranous; of the involucels of unequal size. Flowers yellow, all hermaphrodite in the primordial umbels; but in the lateral ones they are polygamous, the outer ones fertile, and the inner ones for the most part sterile. Calyx very minute. Petals yellow, oblong, concave, reflexed, hardly keeled on the inside. Stylopodium pulvinate. Fruit large, compressed from the sides; mericarps with 5 thick keeled ribs. Carpophore bipartite, free.

Large-fruited Cachrys. Pl. 1 to 2 feet.

3 C. odonta'lgica (Pall. itin. 3. p. 720. t. g. f. 1, 2, 3. ed. germ. 3. append. no. 75. t. 9. ed. gall. in 8vo. append. no. 309. t. 78. f. 1.) leaves decompound, clothed with hoary pubescence; leaflets linear, short, rather trifid; stem naked; leaves of involucra and involucels few, undivided; fruit oblong, having the mericarps somewhat compressed from the back, and hardly furrowed. ♃. H. Native of Siberia, Tauria, and Caucasus, in very arid muddy places. Bieb. fl. taur. 1. p. 217. suppl. 216. Hoffm. umb. 1. p. 176. t. 3. f. 2. and f. 4. d. e. f. Càchrys callospérma, Pall. itin. 3. p. 663. Involucrum none, ex Hoffm. 1-leaved, ex Vest.; few-leaved, ex Pall. Fruit oblong, smooth, and ribless on the outside, as in *C. lævigàta*, but cylindrical, not

nearly globose. The Cossacks of the Jaïk chew the seeds for pain in the teeth, and obtain relief by the copious salivation which follows their use.

Tooth-ache Cachrys. Pl. 1 foot.

4 C. peucedanoi'des (Desf. fl. alt. 1. p. 250.) leaves decompound; leaflets filiform, stiffish, rather pubescent; leaves of involucra pinnatifid; of the involucels undivided; fruit oval, with smooth obsolete ribs. ♃. H. Native of Algiers, in corn fields. This species differs from *C. lævigàta* in the leaves of the involucra being multifid, and in the leaves being pubescent.

Peucedanum-like Cachrys. Pl. 1 foot.

5 C. vagina'ta (Led. fl. ross. alt. ill. t. 9. fl. alt. 1. p. 366.) radical leaves bipinnate: leaflets pinnate-parted: segments oblong-linear, acute; lower leaflets and segments approximating the rachis; sheaths of cauline leaves, ventricose; involucrum almost wanting; involucels of many leaves; fruit didymous; mericarps nearly globose. ♃. H. Native of Siberia, on the mountains of Dolenkara, in the Kirghisean steppe. Stems rather flexuous, sulcately striated. Umbels of 10-20, unequal, spreading rays. Leaves of involucels linear-lanceolate, with membranous margins. Margin of calyx obsoletely denticulated. Petals whitish, nearly orbicular, emarginate, with an inflexed acumen, keeled inside.

Sheathed-petioled Cachrys. Pl. 1½ foot.

6 C. alpi'na (Bieb. fl. taur. 1. p. 217. suppl. 216.) plant glabrous; leaves decompound; leaflets linear, elongated; leaves of involucra and involucels very short, undivided; fruit oval, having the mericarps a little furrowed and striated, the striæ crenulated. ♃. H. Native of Tauria, on the tops of mountains. Hoffm. umb. 1. p. 176. C. Libanòtis, Pall. ind. taur. Allied to *C. Libanòtis* and *C. lævigàta*, but differs in the fruit not being perfectly smooth in *C. lævigàta*, nor deeply furrowed as in *C. Libanòtis*. Perhaps this and the two preceding plants belong to the following section.

Alpine Cachrys. Fl. July. Clt. 1826. Pl. 1 foot.

Sect. II. Ægoma'rathrum (from *αιξ αιγος, aix aigos*, a goat, and *μαραθρον, marathron*, fennel; goats' fennel). D. C. prod. 4. p. 237.—Hippomárathrum, Link, l. c. and Koch, diss. but not of Riv.—Ægomárathrum, Koch, in litt. Margin of calyx 5-toothed. Ribs of fruit very thick, obtuse, almost filling the furrows, more or less tubercular, papillose, wrinkled, or tomentose, rarely smooth.

7 C. Libanòtis (Lin. spec. p. 355.) plant glabrous; leaves decompound; leaflets trifid, linear, rather pungent: superior ones opposite: upper ones trifid; leaves of involucra and involucels numerous, undivided; fruit ovate; mericarps very bluntly 5-ribbed. ♃. H. Native of Mauritania, Sicily, but not in France. Schkuhr, handb. t. 65. good. Hippomárathrum Libanòtis, Koch, in litt. Hippom. Sículum, Bocc. sic. t. 18.—Mor. ox. sect. 9. t. 1. f. 6. umb. t. 3. lower figure. C. vèrior, Lob. icon. t. 783. f. 2. C. Sícula γ, Guss. prod. 1. p. 359. and perhaps C. sphærospérma, Ten. prod. xix. syn. 120. is also referrible to this plant.

Libanotis or Smooth-seeded Goat's-fennel. Fl. July, Aug. Clt. 1570. Pl. 2 to 3 feet.

8 C. pterochlæ'na (D. C. prod. 4. p. 237.) plant glabrous; leaves decompound: leaflets trifid, keeled, stiff, divaricate, with the margins and keel scabrous; central umbels furnished with divided leaves of involucra, and the lateral ones with undivided leaves of involucra; leaves of involucels all undivided; fruit nearly globose; mericarps with 5 thick blunt ribs, which are granularly muricated on every side, having the furrows between the ribs deep and very narrow. ♃. H. Native of Barbary, Italy, and Greece, ex Vahl. Salzm; of Sicily, Spain, and the island of Cyrus, ex Sibthorp. C. Sícula, Lin. spec. p. 355. exclusive of Bocc. syn. Desf. fl. atl. 1. p. 240. Sibth. et Smith, fl. græc. t. 278. Hippomárathrum Sículum, Link. enum. 1. p. 271. Koch, l. c. Flowers yellow, as in the rest of the species.

Wing-covered Goat's-fennel. Fl. July, Aug. Clt. 1604. Pl. 2 to 3 feet.

9 C. cri'spa (Pers. ench. 1. p. 311.) plant glabrous, or nearly so; leaves multifid, trichotomous: ultimate segments short, nearly conical; leaves of involucra and involucels linear, very short; fruit nearly globose, granular from papillæ; ribs of fruit thick, almost closing the furrows. ♃. H. Native of Palestine and of Eastern Caucasus. C. críspa, Spreng. in Schultes, syst. 6. p. 443. Hippomárathrum críspum, Koch, umb. 136. C. microcárpa, Stev. in litt. 1819. but not of Bieb. C. nudicaúlis, Godet, in litt. 1829. Perhaps the Caucasian plant and the Palestine one are distinct. Flowers yellow.

Curled-fruited Goat's-fennel. Fl. July. Clt. 1810. Pl. 1½ ft.

10 C. amplifòlia; leaves scabrous; petioles 6 times divided, furrowed; leaflets tripartite: segments stiff, subulate, trigonal, or somewhat pentagonal, channelled above; involucra and involucels of 5 short lanceolate leaves; mericarps granular, with rather prominent ribs, and distinct furrows. ♃. H. Native of Caucasus, by the sea side, in the province of Baku, near Kaljari. Hippomárathrum amplifòlium, Ledeb. in litt. Meyer, verz. pfl. p. 131. Echinóphora? Caspia, D. C. prod. 4. p. 235. Segments of leaves short, hardly 2 lines long, thick, and stiff, by which it is easily distinguished from *C. críspa*.

Ample-leaved Goat's-fennel. Pl. 2 to 3 feet?

11 C. longíloba (D. C. prod. 4. p. 237.) plant smoothish; leaves multifid, trichotomous; leaflets linear, stiffish, elongated; leaves of involucra and involucels linear, short; fruit nearly globose, granular from papillæ: with thick ribs: which almost close the furrows. ♃. H. Native of Persia, among rocks on the mountains about Seidkhodzi, where it was collected by Szowits. Flowers and fruit like the Caucasian variety of *C. crispa*, but the ultimate lobes of the leaves are very slender, about 2 inches long, not 2 lines as in that plant.

Long-lobe-leaved Goat's-fennel. Pl. 1½ foot.

12 C. involucra'ta (Pall. in Willd. herb. ex Schultes, syst. 6. p. 447.) plant glabrous; leaves ternately tripinnate: leaflets cuneiform, jagged, acute; leaves of involucra and involucels lanceolate, membranous; fruit spongy, tubercular from papillæ all over. ♃. H. Native of Persia. This species is hardly known, but from the character given it is nearly allied to the preceding species. Stem branched at the base. Leaves three times tripinnate.

Involucrated Goat's-fennel. Pl. 2 feet.

13 C. eria'ntha (D. C. prod. 4. p. 238.) leaves multifid, and are, as well as the stems, quite glabrous; lobes or leaflets trichotomous: segments linear-subulate, stiffish; rays of umbel puberulous; umbellules crowded with flowers; calyx and fruit tomentose. ♃. H. Native of Persia, in gravelly places at Badalan. This is a very distinct species, from the fruit being nearly an inch long, and tomentose, with thick obtuse ribs, and very narrow furrows.

Hairy-flowered Goat's-fennel. Pl. 1½ foot.

14 C.? acau'lis (D. C. prod. 4. p. 238.) radical leaves bipinnate; petioles and scapes clothed with short white hairs; leaflets multifid, smoothish: lobes linear, soft, short; rays of umbel 4-5, puberulous, sometimes proliferous; leaves of involucra and involucels linear, with membranous margins; umbellules crowded with flowers; calyxes glabrous. ♃. H. Native of Persia, on arid hills at the Lake Ormiah, in the province of Aderbeidjan, where it was collected by Szowits. Herb small, with a fibrous neck. This is a very distinct species, allied to the preceding, but the fruit is unknown.

Stemless Goat's-fennel. Pl. ½ foot.

15 C. hu'milis (Schousb. maroc. p. 118.) plant glabrous; leaves supra-decompound, fleshy; leaflets linear, trifid, mucronate; leaves of involucra and involucels numerous, lanceolate, undivided; fruit furrowed, smoothish. ♃. H. Native of Barbary, near Cape Spartel, mixed with *Críthum marítimum*. Perhaps belonging to a different section.

Humble Goat's-fennel. Pl. ½ foot.

Sect. III. Lophoca'chrys (from λοφος, *lophos*, a crest, and *cachrys*; in reference to the species contained in this section having crested or winged fruit). Gen. propr. Koch, umb. in litt. D. C. prod. 4. p. 238. Margin of calyx 5-toothed. Ribs of fruit sharply winged: wings cleft into mucrone-formed teeth: the furrows broad and open.

16 C. crista'ta (D. C. prod. 4. p. 238.) plant glabrous; leaves decompound; leaflets trifid: lobes linear, blunt, short, divaricate; leaves of involucra and involucels linear; fruit ovate; mericarps with 5, rather winged crested ribs, and broad concave furrows. ♃. H. Native of the Grecian Archipelago, as in the islands of Melos, Samos, and Astypalæa. C. Sícula, D'Urvil. enum. pl. 31. but not of Lin. C. semine fungosa sulcato aspero minore foliis peucedani, Mor. ox. 3. p. 267. sect. 9. t. 1. f. 3. Stem much branched. Teeth of calyx 5, elongated, permanent.

Crested-fruited Goat's-fennel. Pl. 2 feet.

17 C. pu'ngens (Jan. pl. exsic. Guss. prod. 1. append. p. 7.) plant glabrous; leaves decompound; segments or leaflets filiform, linear, acute, somewhat pungent, elongated; leaves of involucra and involucels linear; fruit ovate, with distant somewhat winged crested ribs, and broad concave furrows. ♃. H. Native of Calabria and Sicily, in the sand on the sea shore. C. Sícula β longifòlia, Guss. prod. fl. sic. 1. p. 360. Segments of the leaves elongated, 1-3 inches long.

Var. β, *echinóphora* (D. C. prod. 4. p. 238.) leaves decompound; leaflets trifid, lanceolate-linear, acute, rather scabrous from short scattered down, especially on the margins; leaves of involucra and involucels lanceolate-linear, acuminated, entire, of the involucra deflexed, of the involucels equal in length to the umbellules; fruit obscurely ribbed; ribs tubercular, somewhat echinately crested. ♃. H. Native of Sicily, and in fields about Naples, and probably of Greece and Spain. C. Sícula, Ten. fl. neap. prod. 19. C. Sícula var. α, Guss. prod. fl. sic. 1. p. 359. There is sometimes a one branched leaf at the base of the rays of the umbel, which may be taken for an involucrum. It is perfectly distinct from *C. peterochlæ'na*; the upper leaves are opposite as in it, but the segments are broader, and striated beneath by elevated nerves. Leaves of involucra broadest at the base.

Pungent Goat's-fennel. Pl. 1 to 3 feet.

Cult. The species of *Càchrys* are only to be increased by seeds, which should be sown in autumn. A deep light soil suits them best.

CLIII. PRA'NGOS (the native name of *P. pabulària*). Lindl. in journ. sc. lond. 1825. no. 37. p. 7. Lag. obs. apar. 1826. p. 15. D. C. coll. mem. 5. p. 67.—Pteromárathrum, Koch. in litt.—Càchrys spec. of authors.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals ovate, entire, involute at the apex. Stylopodium depressed, hardly prominent in the fruit. Transverse section of fruit nearly terete; commissure broad. Mericarps compressed from the back, with 5 smooth ribs, which are thick at the base, and ending each in a vertical membranous wing on the back. Seed girded by copious vittæ. Albumen involute.—Perennial herbs, with terete stems. Leaves decompound; leaflets or segments linear. Umbels numerous. Flowers yellow.

1 P. pabula'ria (Lindl. l. c. Wall. pl. rar. asiat. 3. t. 212.) plant glabrous; leaves supra-decompound; segments linear; leaves of involucra and involucels simple; fruit corky; mericarps with 5 ribs, which are expanded into crenated wings. ♃. H. Native of the temperate parts of the East Indies, about Imfal and Droz. This plant is called *prangos* at Imfal and Droz. It is employed in the form of hay as winter fodder for sheep and goats, and frequently for neat cattle, but its seed, when eaten by horses, is said to produce inflammation in the eyes, and temporary blindness. The properties of *prangos*, as a food, appear to be heating, producing fatness in a space of time singularly short, and also destructive to the *Fásciola hepática*, or liver flake, which in Britain, after a wet autumn, destroys some thousands of sheep by the rot, a disease which has hitherto proved incurable. The last-mentioned properties of the plant, if they be retained in Britain, would render it especially valuable to our country. But this, taken along with its highly nutritious qualities, its vast yield, its easy culture, its great duration, its capability of flourishing on lands of the most inferior quality and wholly unadapted to tillage, impart to it a general character of probable utility unrivalled in the history of agricultural productions. When once in possession of the ground, for which the preparation is easy, it requires no subsequent culture, save that of cutting and converting the foliage into hay. Of the duration of the plant there are several facts. Seeds having been transported westward along with those of yellow lucern above 40 years ago, and sown on the eastern frontier of Kashmeer, where they vegetated, and of which the plants of the first growth still remain in a flourishing condition. In another instance, the seeds were transported eastward, and sown upon rocks near Molbee, where the plants flourished for about 40 years, but in consequence of a long period of drought the *prangos* perished along with the crops of that district in general. From various facts it is conceived not unreasonable to presume, that by the cultivation of this plant moors and wastes, hitherto uncultivated, and a source of disgrace to British agriculture, may be made to produce large quantities of winter fodder, and that the yield of the highlands, and of downs enjoying a considerable depth of soil, may be trebled. As the *prangos* has hitherto been of spontaneous growth alone, practices better adapted to the nature of the plant or of the country may be adopted at a future time; but from a view of its habitudes, Mr. Moorcroft ventures to suggest that the seeds should be dibbled into holes singly, at an inch deep and a foot apart. Yellow lucern, which is also a spontaneous production of the country of the *prangos*, is of a constitution more hardy than that of the lucern of Europe, and requires no other culture than that necessary for sowing it, and lasts in vigour for a long series of years. It is submitted that, as it naturally grows along with the *prangos*, it would be well to imitate this habitude. The joint yield is vastly greater than that of the richest meadow land, and is produced on a surface of the most sterile nature, in regard to other herbage.

Fodder Prangos. Pl. 2 to 3 feet.

2 P. ferula'cea (Lindl. journ. sc. lond. 1825. no. 37. p. 7.) leaves supra-decompound, hairy; leaflets or segments linear-subulate, divaricate; leaves of involucra and involucels short, undivided; fruit ovate: ribs expanded into subundulate, entire, membranous wings; mericarps 3 times longer than their diameter. ♃. H. Native of Persia, on hills, Asia Minor, Iberia, Eastern Caucasus, Italy, and Sicily. Càchrys orientàlis ferulæ folio, Tourn. voy. 2. p. 186. with a figure. Laserpítium ferulàceum, Lin. spec. 358. Càchrys alàta, Hoffm. 1. p. 186. Bieb. fl. taur. 1. p. 217. suppl. 215. Càchrys Libanòtis, Guss. prod. 1. p. 358. but not of Lin. Thápsia laserpítii, Spreng. umb. spec. 32. exclusive of the synonymes? Calyx obsolete. There is a variety with glabrous leaves. The Italian specimen has larger

fruit than the Asiatic ones, but they are probably hardly varieties. Flowers yellow, as in the rest of the species.

Giant-fennel-like Prangos. Clt. 1752. Pl. 1 to 2 feet.

3 P. cylindra'cea (D. C. prod. 4. p. 239.) leaves supra-decompound, rather hairy; segments or leaflets linear, divaricate; leaves of involucra and involucels undivided, linear; fruit cylindrical, expanded into membranous, entire, subundulated wings; mericarps 5 times longer than their diameter. ♃. H. Native of Calabria. Càchrys cylíndrica, Guss. in litt. 1829. Fruit an inch long; the section of the mericarps are not semicircular, as in *P. ferulàcea*, but somewhat depressed on the back.

Cylindrical-fruited Prangos. Pl. 1 to 2 feet.

4 P. ulóptera (D. C. prod. 4. p. 239.) leaves decompound, glabrous, with the petioles trichotomous; segments or leaflets linear; leaves of involucra and involucels linear, spreading; fruit ovate, with very curled membranous wings. ♃. H. Native of Persia, on rocks at Seidhodzi, in the province of Aderbeidjan, where it was collected by Szowits. Allied to *P. ferulàcea*, but evidently distinct from it in the fruit being one-half smaller; in the wings being much more curled and white, and in the umbellules being more dense.

Curled-winged-fruited Prangos. Pl. 1 to 2 feet.

5 P. thapsioìdes (D. C. prod. 4. p. 340.) leaves supra-decompound, glabrous: leaflets or segments subulate, stiffish, shining; leaves of involucra and involucels 5-7, undivided, deflexed; fruit ovate: having the ribs expanded into thick wings. ♃. H. Native of Mount Atlas. Laserpítium thapsioìdes, Desf. fl. alt. 1. p. 252. t. 68. Laserpítium Atlánticum, Poir. suppl. 3. p. 304. Thápsia Laserpítii, Spreng. in Schultes, syst. 6. p. 613. It differs from *Laserpítium* in the petals being yellow, not white, oblong, not emarginate. Ribs of fruit few.

Thapsia-formed Prangos. Pl. 2 to 3 feet.

6 P. anisope'tala (D. C. prod. 4. p. 240.) plant glabrous; leaves decompound: lobes or segments linear, short; stem nearly naked; leaves of involucra and involucels ovate-lanceolate, acute, entire; mericarps of fruit compressed from the back, oblong: with the ribs expanded into wings, the 3 dorsal ribs attenuated at the base, and somewhat concrete, the 2 lateral ones marginating and broader than the rest. ♃. H. Native of Syria, near Nazareth. It is allied to *Càchrys odontálgica*, but differs in being glabrous, and in the fruit being winged. Calyx with 5 short teeth.

Unequal-petalled Prangos. Pl. 2 to 3 feet.

7 P. fœnicula'cea (Meyer, verz. pflanz. p. 131.) plant quite glabrous; leaves supra-decompound; segments setaceous; leaves of involucra and involucels lanceolate; wings of mericarps flat: furrows naked. ♃. H. Native of Caucasus, among rocks or in stony places, on the higher mountains of Talusch, at the elevation of 2000 or 3000 feet.

Fennel-like Prangos. Pl. 2 to 3 feet.

Cult. The species of *Prángos* are of easy culture, but grow best in a dry soil. They are only to be increased by seeds, which should be sown in the autumn.

CLIV. COLLADO'NIA (dedicated in honour of F. Colladon, M. D. author of a monagraph of Cássia). D. C. prod. 4. p. 240. but not of Spreng.—Perlèbia, D. C. coll. mem. v. p. 67. but not of Mart.—Laserpítium species, Vent.—Càchrys species, Spreng.

Lin. syst. *Pentándria*, *Digýnia*. Margin of calyx entire. Petals oval, entire, involute at the apex. Stylopodium depressed, hardly prominent in the fruit. Transverse section of fruit oval; mericarps compressed from the sides; commissure narrow, furnished with 2 vittæ. Mericarps expanded into 5 vertical membranous wings on the back, with the furrows between the wings broadish, and furnished with one vitta each. Albumen involute.—Perennial glabrous herbs. Stems acutely triquetrous, at length somewhat spirally twisted. Leaves pinnatifid; lobes broadly oblong, toothed. Umbels and umbellules of many rays. Leaves of involucra and involucels many, undivided. Flowers golden yellow. This genus, according to Lagasca, in obs. apar. p. 26. is easily distinguished by its character and habit. *Perlèbia* is a name given to a genus by Martius, and is therefore already preoccupied. *Colladònia* of Sprengel is a species of *Palicoúrea*.

1 C. tríquetra (D. C. prod. 4. p. 240.) ♃. H. Native in the neighbourhood of Constantinople, near the canal. Laserpítium tríquetrum, Vent. cels. t. 97. Càchrys tríquetra, Spreng. in Schultes, syst. 6. p. 443.

Triquetrous-stemmed Colladonia. Fl. June, July. Clt. 1816. Pl. 3 to 4 feet.

Cult. See *Prángos* above for culture and propagation.

CLV. LECO'KIA (named after Henry Lecoq, author of an elementary work on the natural history of Auvergne). D. C. coll. mem. v. p. 67. t. 2. f. L. prod. 4. p. 240.—Càchrys species, Tourn. Lam.—Scándix species, Sibth. et Smith.

Lin. syst. *Pentándria*, *Digýnia*. Margin of calyx with 5 very short teeth. Petals ovate, with an inflexed acumen. Stylopodium 2, distinct, conical, permanent, exserted; styles subulate, diverging. Fruit ovate, didymous; commissure narrow. Mericarps semi-terete, with 5 obtuse fungous ribs, which are muricated with prickles. Seed girded by copious vittæ. Albumen involute, with the central area empty and orbicular.—A perennial herb, with the appearance of a species of *Angélica*. Root a fascicle of tubers. Leaves glabrous, triternate; leaflets ovate, coarsely toothed. Umbels of many rays, without involucra; rays unequal, angular. Umbellules of 10-15 flowers; involucels of 5-8 subulate leaves. Flowers white, some of them in each umbellule sterile.

1 L. Cre'tica (D. C. l. c.) ♃. H. Native of Candia and Cyprus. Càchrys Crética Angelicæ folio et asphodeli radice, Tourn. inst. 23. Càchrys Crética, Lam. dict. 1. p. 259. Desf. ann. mus. 11. p. 274. t. 29. pl. cor. t. 42. Sieb. pl. exsic. cret. Scándix latifòlia, Sibth. et Smith, fl. græc. t. 284. Smith in Rees' cycl. no. 31. Plant dark green, glabrous. Stem furrowed.

Cretan Lecokia. Fl. July, Aug. Clt. 1823. Pl. 3 to 4 feet.

Cult. See *Prangos* above for culture and propagation.

CLVI. MAGYDA'RIS (the Latin name of the herb Laserwort). Koch, in litt. 1828. D. C. coll. diss. v. t. 68. prod. 4. p. 241.—Eriocàchrys, D. C. in litt.—Càchrys species of authors.—Athamánta species, Spreng.

Lin. syst. *Pentándria*, *Digy'nia*. Margin of calyx obsolete. Petals obcordate, with an inflexed point. Fruit ovate, villously tomentose; mericarps with 5 thick, very blunt ribs, and narrow furrows. Seed covered all over with numerous very fine vittæ, convex on the outside, and with a deep involute furrow on the inside.—Perennial herbs, hoary from villous tomentum in every part; referrible to *Hérmas* or *Heraclèum* in habit. Leaves pinnate; leaflets lobed: lobes ovate, toothed, decurrent. Umbels and umbellules many-flowered, involucrate. Flowers white. This genus is easily distinguished at once from *Càchrys*, in the petals being white and obcordate.

1 M. tomentòsa (Koch, in litt. 1828. D. C. prod. 4. p. 241.) leaves pinnate, with 3-5 large, broadly ovate, toothed, cut leaflets: ultimate leaflets confluent; all tomentose beneath, and nearly glabrous above; leaves of involucra and involucels numerous, elongated, linear, undivided; fruit ovate; mericarps bluntly 5-ribbed, tomentose all over. ♃. H. Native of Barbary and Sicily. Càchrys tomentòsa, Desf. atl. 1. p. 249.

Càchrys Pastinàca, Lam. dict. 1. p. 260. C. Pànax Sículum Ucria. C. panacifòlia, Vahl, symb. 1. p. 25. ? Guss. prod. fl. sic. 1. p. 327. Athamánta panacifòlia var. Spreng. umb. spec. 140.—Bocc. sic. t. 1. Moris. ox. sect. 9. t. 1. f. 4. Leaves like those of *Heraclèum spondylium*.

Tomentose Magydaris. Fl. June, July. Clt. 1823. Pl. 3 ft.

2 M. AMBÍGUA (D. C. prod. 4. p. 241.) leaves pinnate, with 5 oval-oblong crenulated leaflets, which are glabrous above, and scabrous on the nerves beneath, as well as on the petioles: ultimate ones distinct; leaves of involucra and involucels numerous, lanceolate-linear, undivided; fruit ovate, woolly. ♃. H. Native of Mauritania, near Tangiers. Càchrys ambígua, Salzm. pl. exsic. 1825. This species is intermediate between the preceding and following; to the first in the fruit, and to the last in the analogy of the leaves.

Ambiguous Magydaris. Pl. 3 feet.

3 M. PANA'CINA (D. C. prod. 4. p. 241.) leaves on long petioles, some of them undivided, oval-oblong, and toothed: others are pinnate, with the ultimate segments confluent, all scabrous beneath on the nerves, and on the petioles; leaves of involucra and involucels numerous, deflexed, undivided; fruit oblong, beset with spreading villi, hardly furrowed. ♃. H. Native of Spain. Càchrys panacifòlia, Vahl, symb. 1. p. 25. Brot. fl. lus. 1. p. 434. Athamánta panacifòlia, Spreng. umb. spec. 1. p. 140.—Tuero, Clus. hist. 2. p. 192.

Panax-leaved Magydaris. Fl. June, July. Clt. 1823. Pl. 3 feet.

Cult. See *Perángos*, p. 375. for culture and propagation.

CLVII. HE'RMAS (a name the meaning of which is wholly unknown). Lin. gen. no. 1332. Thunb. nov. act. petrop. 14. p. 531. Gærtn. fruct. 2. p. 30. t. 85. Lam. ill. t. 851. Lag. am. nat. 2. p. 102. D. C. prod. 4. p. 241.

LIN. SYST. *Pentándria, Digýnia*. Margin of calyx 5-parted, foliaceous, permanent. Petals oval-oblong, acute, keeled, entire, equal. Fruit ovate; mericarps rather inflated, compressed from the back, 5-ribbed, the dorsal rib exserted, the two middle ones larger, and the 2 marginating ones small, and placed under the commissure; vittæ many in the furrows, which are broad. Seed elliptic, somewhat concave on the inside, and probably revolute, not adnate to the tegument.—Cape herbs, having the leaves clothed with soft white tomentum. Leaves undivided, hardly toothed. Umbels compound, nearly globose, of many rays. Involucrum of many leaves; involucels of 3 leaves. Rays of umbellules many; outer ones bearing sterile male flowers: the inner one or three bearing hermaphrodite flowers; the pedicels of the sterile or abortive flowers setaceous and permanent after the inflorescence, forming as it were an involucel to the fertile flowers. Lateral umbels sterile, male. Flowers white or purple.

1 H. GIGANTE'A (Lin. fil. suppl. 435.) radical leaves on long petioles, oval or oblong, somewhat serrated, clothed with dense soft tomentum on both surfaces. ♃. G. Native of the Cape of Good Hope. Thunb. nov. act. petrop. 14. p. 529. t. 11. fl. cap. 249. Bupleùrum gigantèum, Thunb. prod. 50. Leaves from the dense tomentum usually entire. The upper part of the plant and umbels glabrous. Petals purple, ex Thunb. The wool scraped from the leaves is used for tinder at the Cape of Good Hope, as that from *Artemìsia* is in China and Japan.

Gigantic Hermas. Fl. June, July. Clt. 1794. Pl. 4 feet.

2 H. VILLÒSA (Thunb. nov. act. petrop. 14. p. 531. fl. cap. 249.) leaves ovate-oblong, acute, somewhat cordate at the base, stem-clasping, toothed, glabrous above, and clothed with white tomentum beneath. ♃. G. Native of the Cape of Good Hope, on the Table Mountain. Burm. afr. t. 71. f. 2. Bupleùrum villòsum, Lin. spec. 343. Burm. fl. cap. p. 7. H. depauperàta, Lam. dict. 3. p. 121. ill. t. 351. f. 1. Stem tomentose between the leaves, and glabrous above. There is also tomentum under the bracteas and involucra. Stems purple.

Var. β, *depauperàta* (D. C. prod. 4. p. 242.) leaves on short petioles, velvety beneath from short rufous tomentum; involucra and bracteas glabrous at the base. ♃. G. Native of the Cape of Good Hope. Hérmas depauperàta, Lin. mant. 299. Perhaps a proper species.

Villous Hermas. Fl. June, July. Clt. 1795. Pl. 1 to 3 ft.

3 H. CAPITA'TA (Lin. fil. suppl. 435.) radical leaves petiolate, ovate-cordate, obtuse, crenately toothed, glabrous above, but clothed with white tomentum beneath; stem glabrous at the apex. ♃. G. Native of the Cape of Good Hope, on the Table Mountain. Thunb. nov. act. petrop. 14. p. 532. t. 12. fl. cap. 248. Lam. dict. 3. p. 122. ill. 851. f. 2. Leaves of involucra 3-nerved. Perhaps sufficiently distinct from the following. Umbels capitate. Scape biumbellate.

Capitate-flowered Hermas. Pl. 1½ foot.

4 H. QUINQUEDENTA'TA (Lin. fil. suppl. p. 436.) leaves almost radical, petiolate, ovate, cuneated at the base, few-toothed, naked above, but clothed with white tomentum beneath; stem subtomentose even to the apex. ♃. G. Native of the Cape of Good Hope, on the Table Mountain. Bupleùrum quinquedentàtum, Thunb. prod. p. 50. H. quinquedentàta, Thunb. nov. act. petrop. 14. p. 533. t. 12. fl. cap. 249. Leaves of involucra striated with 3 longitudinal nerves. Corolla white. Stem filiform. Umbels nearly globose.

Five-toothed-leaved Hermas. Pl. 1 foot.

5 H. CILIA'TA (Lin. fil. suppl. 4. p. 436.) leaves radical, petiolate, ovate or obovate, obtuse, ciliated, naked above, and clothed with white tomentum beneath; umbels few, densely capitate; male flowers on long peduncles, exserted. ♃. G. Native of the Cape of Good Hope, on the Mountains. Burm. afr. t. 72. f. 1. Bupleùrum ciliàtum, Thunb. prod. 50. H. ciliàta, Thunb. nov. act. petrop. 14. p. 531. fl. cap. 248. Stem glabrous, leafless. Petioles length of the limbs. Corolla white.

Ciliated-leaved Hermas. Fl. June, July. Clt. 1816. Pl. 1½ foot.

Cult. A mixture of peat, sand, and loam is the best soil for the species of *Hérmas*, and they may be either increased by seed or cuttings.

CLVIII. CO'NIUM (said by Linnæus to be from κονις, or κονια, *konis*, or *konia*, dust or powder; but the application of the term is not evident). Lin. gen. no. 469. Hoffm. umb. p. 99. t. 1. f. 3. Lag. am. nat. 2. p. 103. Koch, umb. p. 135. f. 40.—Cicùta, Tourn. inst. t. 160. Gærtn. fruct. 1. t. 22. Lam. dict. 2. p. 3.

LIN. SYST. *Pentándria, Digy'nia*. Margin of calyx obsolete. Petals obcordate, somewhat emarginate, with a short inflexed point. Fruit ovate, compressed from the sides; mericarps with 5 prominent equal undulately-crenulated ribs: lateral ones marginating; furrows with many striæ, but without vittæ. Carpophore bifid at the apex. Seed with a deep narrow furrow, and as if it were complicate.—Biennial poisonous herbs, natives of Europe. Root fusiform. Stem terete, branched. Leaves decompound. Involucra of 3-5 leaves; involucels dimidiate. Flowers white, all fertile.

1 C. MACULA'TUM (Lin. spec. 349.) leaves of involucels lanceolate, shorter than the umbellules. ♂. H. Native throughout the whole of Europe, in cultivated ground, among rubbish, and on dung hills; also of the eastern parts of Asia, North America, and Chili, where it has been introduced; plentiful in some parts of Britain. Schkuhr, handb. t. 62. Bull. herb. t. 63.

Hayn. arz. gew. 1. t. 31. Sowerb. engl. bot. t. 1191. Jacq. austr. 2. t. 156. Woodv. med. bot. t. 22. Plench, icon. t. 183. Cicùta maculàta, Lam. fl. fr. 3. p. 104. Cicùta màjor, Lam. dict. 2. p. 3. Coriándrum Cicùta, Crantz, austr. 24. Coriándrum maculàtum, Roth, fl. germ. 1. p. 130. Cicùta, Hall. helv. no. 766. Riv. pent. irr. 75. Blackw. t. 451. Lob. icon. 732. f. 1. Cicùta doméstica, Mor. umb. 18. c. b. sect. 9. t. 6. f. 1. Cònium tenuifòlium, Mill. dict. no. 2. Stem hollow, green, but often of a livid colour, marked with dark spots. Hemlock is obviously distinguished from all other umbelliferous plants by its spotted stem, by the dark and shining green colour of the bottom leaves, and particularly by their disagreeable smell when bruised. According to Linnæus, sheep eat the leaves, and horses, cows, and goats refuse it. Ray informs us, that the thrush will feed upon the seeds even when corn is to be had. Hemlock has been stigmatised as one of the most noxious of vegetable poisons, has for many years been considered as a highly useful and powerful article of the Materia Medica, and it has been proved that though highly deleterious when imprudently used, yet in small doses it has been productive of considerable benefit in cases which have resisted the usual methods. The first physician who endeavoured to bring hemlock into repute as a medicine was Baron Stoerck, of Vienna, who announced its extraordinary effects in the most inveterate chronic disorders in 1760. The whole plant is a virulent poison, but varying very much in strength, according to circumstances. When taken in an over-dose, it produces vertigo, dimness of sight, difficulty of speech, nausea, fetid eructations, anxiety, tremors, and paralysis of the limbs. But Dr. Stoerck found that in small doses it may be taken in great safety, and that, without at all disordering the constitution, or even producing any sensible operation, it sometimes proves a powerful remedy in many obstinate disorders. In scirrhus, the internal and external use of hemlock has been found useful, but mercury has been generally used at the same time. In open cancer it often abates the pain, and is free from the constipating effects of opium. It is likewise used in scrofulous tumours, and in other ill-conditioned ulcers. It is also recommended by some in chin-cough, and various other diseases. Its most common and best form is that of the powdered leaves, in the dose at first of 2 or 3 grains a day, which in some cases has been gradually increased to upwards of 2 ounces a day. An extract from the seeds is said to produce giddiness sooner than that from the leaves.

Hemlock should not be gathered unless its peculiar smell be strong. The leaves should be collected in the month of June, when the plant is in flower. The leaflets should be picked off, and the footstalks thrown away. The leaflets are then to be dried quickly in a hot sun, or rather on tin plates before a fire, and preserved in bags of strong brown paper, or powdered and kept in close vessels, excluded from the light; for the light soon dissipates their green colour, and with it the virtues of the medicine. The narcotic seeds are most active and uniform when perfectly ripe. When the fresh root is wounded, it yields a bitter and acrid juice, which Stoerck found to excite in the tongue swelling, stiffness, violent pain, and transient paralysis. Pfaff is of opinion, that the virtues of the hemlock reside in a volatile principle, which, however, he was not able to obtain separate. Dr. Paris says, that the medicinal activity of the plant resides in a resinous element, which may be obtained in an insulated form by evaporating an etherial tincture made with the leaves on the surface of water. It has a rich dark green colour, and tastes of hemlock in perfection. A dose of half a grain will produce vertigo and headache.

Var. β, *striàtum* (Tratt. arch. 1. t. 24.) stem diffuse, much branched, very straight; umbels and umbellules proliferous. ♂. H. Native of Hungary, at the river Leitha, Schultes, syst. 6. p. 655.

Spotted-stemmed or Common Hemlock. Fl. June, July. Brit. Pl. 4 to 6 feet.

2 C. Croa'ticum (Waldst. et Kit. in Willd. enum. p. 305.) leaves of involucels linear, equal in length to the umbellules or exceeding them. ♂. H. Native of Croatia. According to Kittabail and Willd. this is a distinct species; but it is only a variety of the preceding according to Schultes, Koch, and Host. The cultivated plant is hardly to be distinguished from the common species, unless in its more glaucous hue.

Croatian Hemlock. Fl. June, July. Clt. 1818. Pl. 5 to 6 feet.

Cult. The seeds only require to be sown in the open ground in autumn.

CLIX. VICA'TIA (named after M. Vicat, who has wrote upon poisonous plants). D. C. prod. 4. p. 243.—Sìson species, Wall.

Lin. syst. *Pentándria*, *Digýnia*. Margin of calyx entire. Petals unknown. Styles short, at length diverging. Fruit ovate-oblong. Mericarps almost semi-terete, with 5 filiform ribs: and broad flat furrows containing many small vittæ each; commissure narrow. Carpophore thick, rather bifid at the apex. Albumen furnished with a furrow in the commissure, convex on the outside.—A glabrous erect herb, native of Nipaul. Leaves petiolate, bipinnate; leaflets bipinnatifid: lobes linear, acute, slender. Stems sparingly leafy at the base; the rest naked. Umbels terminal, without any involucrum, of many rays; rays unequal, umbellules of the shorter ones sterile. Involucels wanting, or very small, and of few leaves. Habit of *Cònium*, but the character is near that of *Arracácha*. Fruit almost like that of the genus *Pimpinélla*, but differs in the seed being curved.

1 V. coniifòlia (D. C. prod. 4. p. 243.) ♃. ? H. Native of Nipaul, at Kamaon. Sìson? coniifòlium, Wall. mss. Herb 1½ foot high. Leaves a foot long, of a thin membranous consistence.

Hemlock-leaved Vicatia. Pl. 1½ foot.

Cult. This plant will grow in any soil or situation, and will be easily propagated by seed.

CLX. ARRACA'CHA (the name of the plant by the Spaniards of South America). Bancr. in gart. dir. p. 382. ex Linnæa. litt. 1829. p. 13. D. C. in bibl. univ. 1829. jan. p. 74. prod. 4. p. 243.—Cònium species of authors.

Lin. syst. *Pentándria*, *Digýnia*. Margin of calyx obsolete. Petals lanceolate or ovate, entire, with an inflexed point, curved above the middle nerve. Stylopodium conical, thick; styles diverging, at length reflexed. Fruit ovate-oblong, somewhat compressed from the sides; mericarps with 5 equal, not crenulated ribs: lateral ribs marginating; vittæ many in the furrows. Albumen nearly semi-terete, furnished with a furrow in the commissure.—Perennial South American herbs, of a salubrious quality. Roots tuberous, thick, edible. Leaves pinnate or bipinnate: leaflets deeply toothed, lower ones tripartite. Umbels opposite the leaves or terminal. Involucrum wanting or of one leaf; involucels of 3 leaves. Flowers polygamous; those of the rays hermaphrodite, and those of the disk male or imperfect. Petals white. This genus is nearly allied to *Cònium*, but differs in the form of the petals, and in the ribs of the fruit being entire, not undulately crenulated.

1 A. escule'nta (D. C. prod. 4. p. 244.) leaves pinnate; leaflets 5, broadly ovate, acuminated, deeply pinnatifid, profoundly serrated: the 2 lower leaflets petiolate, subternate; involucrum wanting; ribs of fruit obtuse. ♃. F. Native of

South America, at Santa Fe de Bogota, and of the Caraccas, where it is cultivated for culinary purposes under the name of *Arracacha*. Cònium Arracácha, Hook. exot. fl. bot. t. 152. Arracácha xanthorhìza, Bancroft, l. c. who first published the history and uses of the plant in Alced. dict. geogr. amer. ex Vargas, in Kœn. ann. 1. p. 400. Bancr. in rev. brit. 1826. Root forming large oblong tubers in cultivation. Stem 1½ foot high. Petioles tubular.

The first account which reached our country of this interesting and valuable plant was published in the first volume of the Annals of Botany, about the year 1805, from a communication made to the editors of that excellent work by Mr. Vargas, a native of Santa Fe de Bogota, who at that period was residing in London. The arracacha is one of the most useful vegetables in that part of South America; in some parts of the country it is called *apio*, from its resemblance to celery. The roots immediately divide into 4 or 5 branches, and each of these, if the soil be light, and the season favourable, will grow to the size of a cow's horn. This root yields a food, which is prepared in the same manner as potatoes, is grateful to the palate, and so easy of digestion, that it constitutes the chief aliment of the sick; starch and pastry are made from its fecula; and the roots, reduced to a pulp enter into the composition of certain fermented liquors, supposed to be efficacious as tonics. In the city of Santa Fe, and indeed wherever it can be procured, the arracacha is as universally used as the potatoe is with us. The cultivation of this plant requires a deep black soil, that will easily yield to the descent of the large vertical roots. It is propagated by planting pieces of the root, in each of which is an eye or shoot; these acquire in 3 or 4 months a size sufficient for culinary purposes, though if permitted to continue 6 months in the ground, they attain to immense dimensions, without any injury to their flavour. The colour of the root is white, yellow, or purple, but all the varieties have the same quality. Like the potatoe, the arracacha does not thrive in the hotter regions of America, for in such parts the roots acquire no size, and are indifferent in flavour, and sometimes run altogether to stems. In the countries which are there called temperate, being less hot than those at the foot of the Cordilleras, this vegetable sometimes succeeds; but never so well as in the elevated region of those mountains, where the medium heat is between 58° and 60° of Fahrenheit. Here it is that these roots grow the most luxuriant, and acquire the most delicious taste. Before Vargas this plant was not mentioned by any other American writer, except by Alcedo, who notices it in a few words, at the end of his "Diccionario Geographico-historico de las Indias Occidentales O America." According to the late Baron de Schack, the arracacha is an essential article of food, not only to the poor, but to the rich, throughout Santa Fe and New Granada, and is every where cultivated as carrots are with us. It is also cultivated abundantly in the Caraccas and the adjacent mountainous country.

Plants of the arracacha have been introduced to this country, but have not succeeded, although every situation, temperature, and soil have been tried; they have only produced at best a few leaves, and at the end of the year or less have perished altogether. Mr. Shepherd of Liverpool alone has been so fortunate as to have a few plants flowering in his garden.

Esculent Arracacha. Fl. Ju. Jul. Clt. 1823. Pl. 1 to 2 ft.

2 A. moscha'ta (D. C. prod. 4. p. 244.) leaves bipinnate, or tripinnate; leaflets pinnatifid: lobes ovate, acutish, serrated; involucrum of 1-3 jagged leaves; ribs of fruit acute. ♃. F. Native of South America, in the province of de los Pastos, near Teindela, where it is called by the inhabitants *Sacharachaca*. Herb smelling of musk. Cònium moschàtum, H. B. et Kunth, nov. gen. amer. 5. p. 14. t. 420.

Musk Arracacha. Fl. June, July. Clt. 1824. Pl. 2 feet.

Cult. These plants are of easy culture if kept from the frost; they may be either increased by seed or dividing at the root.

CLXI. PLEUROSPE'RMUM (from πλευρον, *pleuron*, a rib, and σπερμα, *sperma*, a seed; in allusion to the mericarps being furnished with a double membrane, both having ribs). Hoffm. umb. in præf. p. 9. lit. f. 16. 22. Koch, umb. 6. p. 457. Spreng. in Schultes, syst. 6. p. 39. D. C. prod. 4. p. 244.—Ligústicum species, Lin.—Physospérmum, Vela et Lag. am. nat. 2. p. 75. and 97. but not of Cuss.—Enymonospérmum, Spreng.

Lin. syst. *Pentándria*, *Digýnia*. Margin of calyx 5-toothed. Petals obovate, entire, flat, or somewhat attenuately inflexed at the apex. Fruit ovate, somewhat compressed from the sides; mericarps furnished with a double membrane, outer membrane inflated into 5 hollow winged ribs; interior one closely adnate to the seed, elevated into 5 smaller ribs, situated under the exterior ones; furrows of the inner membrane furnished with 1-2 vitta each. Commissure furnished with 2 vittæ. Carpophore filiform, bipartite. Seed semi-lunar.—Perennial glabrous herbs. Leaves bipinnate; leaflets pinnatifid, cut: lobes acute. Stem fistular. Involucra and involucels of many foliaceous leaves. Flowers white.

1 P. Austri'acum (Hoffm. l. c.) vittæ one in each furrow of the fruit; ribs bluntish. ♃. H. Native of the Alps of Dauphiny, Provence, Switzerland, Silesia, Austria, and of the Carpathian Mountains. Schultes, syst. 6. p. 457. Ligústicum Austrìacum, Lin. spec. 36. Jacq. austr. 151. All. pedem. t. 43. Ligústicum Gmelìni, Vill. dauph. 2. p. 610. t. 13. exclusive of the synonyme of Gmel. Ligústicum Archangélica, Geners. el scept. no. 252. ex Schultes. Ligust. Sprengèlii, Sieb. in Spreng. umb. spec. 124. Physospérmum Cussòni, Lag. am. nat. 2. p. 97. Ligust. Hacquètii, Guss. pl. rar. p. 132. Athamánta Golàka, Hacq. pl. carn. t. 5. Athamánta Galátta, Gmel. Plant glabrous. Leaves ternately pinnate; leaflets pinnatifid, decurrent at the base; segments cuneiform, oblong, deeply toothed. Leaves of involucra oval-lanceolate, entire, permanent. Umbels all fertile. Fruit oval, glabrous. Stems furrowed.

Austrian Pleurospermum. Fl. June, July. Clt. 1597. Pl. 2 to 3 feet.

2 P. Urale'nsis (Hoffm. l. c.) vittæ one in each furrow of the fruit; ribs very acute. ♃. H. Native of Siberia, on the Ural Mountains. Ligústicum, Gmel. sib. 1. t. 45. This plant differs from *Pleurospérmum Austrìacum* in the rays of the umbel being evidently velvety when examined by a lens; the colour of the leaves is more glaucous; the petals more obtuse at the apex, and flat.

Ural Pleurospermum. Pl. 2 to 3 feet.

3 P. Kamtscha'ticum (Hoffm. l. c.) vittæ 2 in the furrows of the fruit; ribs somewhat denticulated; membranes almost cohering between themselves. ♃. H. Native of Kamtschatka. Petals obovate, with somewhat undulated margins, a little inflexed at the apex. A plant agreeing with this was found about Irkutsk in Siberia, but differs in the leaves of the involucra being sometimes multifid, as is sometimes the case in *P. Austrìacum*.

Kamtschatka Pleurospermum. Pl. 2 to 3 feet.

4 P. Archange'lica (Led. fl. alt. 1. p. 369.) ♃. H. Native of Siberia. This plant is not well known. It has the habit exactly of *Archangélica officinàlis*, and grows in the same places with it. The fruit is grey or dirty yellow.

Archangelica-like Pleurospermum. Pl. 4 to 6 feet.

Cult. Any common soil will suit these plants; and they may either be increased by dividing at the root or by seed.

CLXII. HYMENOLÆ'NA (from ὑμην, *hymen*, a membrane, and χλαινα, *chlaina*, a cloak; in reference to the ribs of the fruit

being winged and membranous). D. C. prod. 4. p. 244.—Ligústicum spec. Wall. mss.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals obovate, entire, flat or attenuately inflexed at the apex. Fruit ovate or oblong; mericarps with 5 exserted nearly equal winged ribs; vittæ 2 in the commissure, which is flat, and one in each furrow. Seed with a furrow in front, convex on the outside. Carpophore bipartite.—Perennial glabrous herbs, natives of the mountains of Nipaul. Leaves decompound. Umbels terminal, of many rays. Involucra and involucels of many leaves, which are membranous, and are usually toothed or cut. This genus is allied to *Molopospérmum* on the one hand, and *Pleurospérmum* on the other; it differs from the first in the commissure being flat, in the ribs being equally winged, and in there being no empty canal before the commissure, &c.; and from the last in the fruit having the membranes joined together, and from both in the obsolete margin of the calyx. Perhaps this genus should be divided into two, from the oblong or ovate fruit of the species, and from the seeds being angular or convex on the outer side; but in most of the species the fruit is not sufficiently known.

1 H. angelicoi'des (D. C. prod. 4. p. 245.) leaves ternate; leaflets tripartite: lobes oval-lanceolate, acuminated, toothed: teeth ovate, mucronate; leaves of involucra and involucels lanceolate-linear, acuminated, entire, with membranous margins. ♃. H. Native of Nipaul, on the highest mountains at Kamaon and Gosaingsthan. Ligústicum angelicoìdes, Wall. mss. Habit, when dried, almost of *Ligústicum Scóticum*. Fruit oblong, 5 lines long, somewhat compressed from the sides. Seed with very prominent angles, as in *Molopospérmum*, but the commissure is flat and bivittate. Leaves of involucels 6-8 lines long, membranous.

Angelica-like Hymenolæna. Pl. 1 to 2 feet.

2 H. rotunda'ta (D. C. prod. 4. p. 245.) leaves ternate, rarely triternate; leaflets ovate-roundish, obtuse, toothed: teeth roundish, hardly mucronate; leaves of involucra 1-2, of the involucels 4-7, linear-lanceolate, acute, membranous, entire. ♃. H. Native of Nipaul, on Gosaingsthan and Himalaya. Ligústicum rotundàtum, Wall. mss. Petioles broadly dilated at the base, many-nerved, those of the radical leaves very long, and those of the cauline ones gradually shorter, till at length the uppermost ones are very short. Leaves sometimes tripartite.

Roundish-leaved Hymenolæna. Pl. 2 to 3 feet.

3 H. pu'mila (D. C. prod. 4. p. 245.) leaves pinnate; leaflets 5, ovate, deeply pinnatifid: lobes equally toothed: teeth roundish, mucronate; stems scape-formed, nearly naked; leaves of involucra 2-3, of the involucels 4-5, lanceolate, acute, membranous, entire. ♃. H. Native of Nipaul, at Gosaingsthan. Ligústicum pùmilum, Wall. mss. Herb a foot high when in flower. Leaves radical, or 1-2 rising from the base of the stem. Umbels of 7-8 rays. Leaves of involucra sometimes drawn out into a small cut leaf.

Dwarf Hymenolæna. Pl. 1 foot.

4 H. denta'ta (D. C. l. c.) radical leaves ternate, with trifid petioles; leaflets bipinnatifid; cauline leaves bipinnate: leaflets ovate, acute, serrated; leaves of involucra 1-3, of the involucels 7-8, lanceolate, acuminated, membranous, undulately-serrulated. ♃. H. Native of Nipaul, at Kamaon and Gosaingsthan. Ligústicum dentàtum, Wall. mss. Leaves membranous. Rays of umbel 5-8, angular, somewhat puberulous. Leaves of involucels exceeding the flowers.

Var. β, *eròsa* (D. C. l. c.) cauline leaves pinnate: leaflets tripartite: lobes ovate-oblong, irregularly and deeply toothed; umbels of 15-18 rays: rays scabrous; leaves of involucra 5-6, lanceolate, serrated, of the involucels 7-8, obovate, erosely-serrated, tipped by a mucrone. ♃. H. Native of Nipaul.

Toothed-leaved Hymenolæna. Pl. 1 to 2 feet.

5 H. Candóllii (D. C. l. c.) leaves pinnate: leaflets petiolate, ovate, deeply pinnatifid: lobes deeply serrated at the apex; peduncles in fascicles; umbels and umbellules crowded; leaves of involucra and involucels many, obovate, obtuse, membranous, large, entire. ♃. H. Native of Nipaul, on the Himalaya, at the temple of Buddrinath. Ligústicum Candóllii, Wall. mss. Herb hardly a foot high, agreeing with *Pleurospérmum* in habit. Upper leaves membranous, emulating the leaves of the involucra. Leaves of involucrum nearly an inch long.

De Candolle's Hymenolæna. Pl. 1 foot.

6 H. Brunònis (D. C. l. c.) leaves capillaceously multifid; segments linear, acute; leaves of involucra 5-6, membranaceously dilated, multifid at the apex: of the involucels 6-8, membranous, some of which are undivided, with the middle nerve simple: and others are trifid, with the middle nerve trifurcate. ♃. H. Native of the mountains of Nipaul, on the Himalaya, Kamaon, and Gosaingsthan. Ligústicum Brunònis, Wall. mss. There are varieties of this having the leaves of the involucels smaller, length of the flowers, and larger exceeding the flowers.

Brown's Hymenolæna. Pl. 1 to 2 feet.

7 H. Govania'na (D. C. prod. 4. p. 246.) leaves pinnate: leaflets deeply pinnatifid: lobes oblong-linear, acute; leaves of involucra 5-7, multifid, much shorter than the rays of the umbels; leaves of involucels membranous at the base and margin, multifid at the apex, and exceeding the flowers. ♃. H. Native of the Snowy Mountains of Sirmore. Ligústicum Govaniànum, Wall. mss. Leaves like those of *A'pium*. Rays of umbel 7-8, unequal. Stem striated.

Govan's Hymenolæna. Pl. 1 foot.

8 H. Bentha'mi (D. C. l. c.) leaves pinnate: leaflets 5-7, ovate, cuneated at the base, coarsely toothed, trifid or tripartite: teeth mucronate; leaves of involucra foliaceous, oblong, deeply toothed, much shorter than the rays of the umbels; involucels about the length of the flowers. ♃. H. Native of Nipaul, at Gosaingsthan. Ligústicum Benthàmi, Wall. mss. Fruit ovate; mericarps somewhat compressed from the back, with broad furrows and narrow winged ribs. Seed convex on the back.

Bentham's Hymenolæna. Pl. 1 foot.

9 H. obtusiu'scula (D. C. l. c.) leaves pinnate: leaflets 5-7, ovate, deeply pinnatifid, bluntly toothed: leaves of involucra foliaceous, dilated at the base, and multifid at the apex, a little shorter than the rays of the umbel; leaves of involucels oblong, foliaceous, deeply toothed. ♃. H. Native of Nipaul, at Gosaingsthan. Ligústicum obtusiúsculum, Wall. mss. Fruit ovate; mericarps semi-ovate, with broad furrows, and undulately-toothed narrow-winged ribs. Carpophore thick, bipartite. Seed semi-ovate, obtuse on the back.

Bluntish-seeded Hymenolæna. Pl. 1 foot.

Cult. See *Pleurospérmum*, p. 378. for culture and propagation.

CLXIII. PHYSOSPE'RMUM (from *φυσα, physa*, a bladder, and *σπερμα, sperma*, a seed; in reference to the tegument not adhering to the seed in the young state). Cusson, mem. soc. med. par. 1782. p. 279. Spreng. mem. soc. mosc. 5. p. 1. t. 1. f. 1-3. Koch, umb. 134. D. C. prod. 4. p. 246.—Danàa, All. pedem. no. 1392. D. C. fl. fr. 4. p. 311. Lag. am. nat. 2. p. 97. but not of Smith.—Hænselèra, Lag. gen. et spec. p. 13.—Vèla, in Lag. am. nat. 2. p. 75.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed. Petals obovate, somewhat emarginate, with an inflexed point. Fruit contracted from the sides, didymous; mericarps reniformly globose, with 5 filiform, slender, equal ribs: the lateral ribs placed in front of the margins; vittæ broad, one in each furrow. Seed involutely semi-lunar.—Perennial herbs. Lower leaves triternately cut; upper ones often reduced to the scale-formed

sheaths. Leaves of involucra and involucels many. Flowers white. The tegument does not adhere to the fruit in the young state, but when ripe it does, whence the name is incongruous when the fruit is mature.

1 P. aquilegifòlium (Koch, l. c.) lower leaves triternate, glabrous; leaflets cuneated, deeply toothed; upper leaves many, reduced to the quite entire stipula-formed sheaths. ♃. H. Native of Tauria, Italy, Spain, and Portugal, in woods and shady places. Danàa aquilegifòlia, All. pedem. no. 1392. t. 63. Hænselèra damæcórnis, Lag. l. c. Ligústicum aquilegifòlium, Willd. spec. 1. p. 1425. Balb. mem. acad. taur. 1804. p. 333. Sìson sylváticum, Brot. fl. lus. 37. Danàa sylvática, Lag. am. nat. 2. p. 97. Oreoselìnum Lusitánicum, Tourn. herb. Smýrnium medicaúle, Bieb. fl. taur. 1. p. 238. Spreng. umb. spec. t. 4. f. 7. Pimpinélla Danàa, Bieb. casp. p. 163.

Columbine-leaved Physospermum. Fl. May, June. Clt. 1817. Pl. 3 feet.

2 P. Cornubie'nse (D. C. prod. 4. p. 246,) lower leaves triternate, glabrous; leaflets cuneate-lanceolate, deeply toothed: uppermost ones reduced to the sheaths, each sheath bearing 3 linear, nearly entire leaflets. ♃. H. Native only of Cornwall, in thickets, among bushes, and in hedges; in great plenty in the neighbourhood of Bodmin. Ligústicum Cornubiénse, Lin. spec. p. 359. Smith, engl. bot. t. 683. Smith, icon. pict. t. 11. Physospérmum commutàtum, Spreng. umb. spec. t. 4. f. 8. exclusive of many synonymes. Danàa aquilegifòlia, Lag. am. nat. 2. p. 97.? ex synonyme of Spreng. Cornwall Saxifrage, Petiv. herb. brit. t. 26. f. 9. Cattle are so fond of the plant that they eat it down to the ground. The root contains a yellow resinous juice.

Cornish Physospermum. Fl. Jul. Aug. Engl. Pl. 2 to 3 ft.

3 P. cicuta'rium (Spreng. umb. spec. 23.) lower leaves supradecompound: cauline ones decompound: upper ones ternate; leaflets 3-lobed, toothed, acute; stem leafy, furrowed. ♃. H. Native of Eastern Caucasus. Smýrnium cicutàrium, Bieb. fl. taur. 1. p. 239. suppl. 249. Ligústicum Caucásicum, Willd. herb. ex Schultes, syst. 6. p. 457. Umbels lateral and terminal.

Cicuta-like Physospermum. Fl. June, July. Clt. 1827. Pl. 2 to 3 feet.

4 P. angelicæfòlium (Guss. ind. sem. 1825. prod. fl. sic. 1. p. 356.) stem furrowed, nearly naked; radical leaves biternate, with the ramifications not divaricate: leaflets of the lower leaves ovate, of the superior ones oval-oblong, 2-3-parted, dentately serrated, glabrous above, and pubescent beneath. ♃. H. Native of Sicily, on shady gravelly parts of mountains. Leaves like those of *Angélica sylvéstris*.

Angelica-leaved Physospermum. Pl. 2 to 3 feet.

Cult. See *Pleurospérmum*, p. 378. for culture and propagation.

CLXIV. SMY'RNIUM (from σμυρνα, *smyrna*, a synonyme of μυρρα; the odour of myrrh is common to many umbelliferous plants, among others the *My'rrhis odoràta*, for which reason it is so named). Lag. am. nat. 2. p. 101. Koch, umb. p. 133. f. 38, 39. D. C. prod. 4. p. 247.—Smýrnium species, Lin. and Spreng.

Lin. syst. *Pentándria*, *Digýnia*. Margin of calyx obsolete. Petals lanceolate or elliptic, entire, acuminated, with an inflexed point. Fruit contracted from the sides, didymous from the mericarps being reniformly globose; mericarps with 3 dorsal, rather prominent sharp ribs, and 2 lateral, nearly obliterated marginal ones; vittæ many in the furrows. Carpophore bipartite. Seed involute.—Erect, biennial, glabrous herbs. Roots fleshy. Leaves variable. Umbels terminal. Involucra variable. Flowers yellow or greenish-yellow, usually polygamous.

1 S. olusa'trum (Lin. spec. 376.) stem terete; cauline leaves ternate; leaflets ovate, serrated; involucels very short. ♂. H. Native of Middle and South Europe, in humid places; as in France, Spain, Italy, Belgium, and Britain. It is rather a maritime plant, and is found near our coast in various places, as about Scarborough Castle, and about Dover; it is common in Anglesea and in all the western counties, and in the flat parts of Gloucestershire, as also in many places of Dorsetshire. It occurs also about many inland towns, as Nottingham, York, Bury, Newmarket, and about Mackerell's Tower, Norwich. In several places of Cambridgeshire, Worcestershire, Kent, and Middlesex. In Scotland upon the coast of Dunglass, on the edge of Berwickshire. Lam. ill. 204. Smith, engl. bot. t. 230. S. Mathìoli, Tourn. inst. 316.—Lob. icon. 708. f. 2. Moris. sect. 9. t. 4. The whole herb is of a pale bright green, in flavour something like celery. Lower leaves biternate: upper ones ternate. Petioles inflated. Umbels globular. Flowers greenish white. The plant was formerly eaten in various parts of Europe, either as a salad or potherb, whence, and from its blackness, the name *olusatrum*, from *olus* and *ater*. Ray says it was called Alexanders, because in Italy and Germany it had long been denominated *herba alexandrina;* having been supposed to have been brought from Alexandria. It flowers in May, and by the middle of July the stalks are dried up, but remain laden with large black seeds.

Olusatrum or Common Alexanders. Fl. May. Britain. Pl. 2 to 4 feet.

2 S. apiifòlium (Willd. spec. 1. p. 1468.) stem terete; cauline leaves cuneiform, obtuse, trifid, toothed: involucra and involucels wanting. ♂. H. Native of Candia. Schultes, syst. 6. p. 440. S. Créticum paludapifòlio, Tourn. cor. 23. S. Créticum, Mill. dict. no. 4. Perhaps only a variety of the preceding. Stem angular, glabrous. The lower leaves of this plant are much smaller than those of the preceding, and more like those of smallage; the umbels are also smaller, and the seeds are less.

Smallage-leaved Alexanders. Fl. May. Clt. 1731. Pl. 2 to 3 feet.

3 S. rotundifòlium (Mill. dict. no. 2.) stem terete; cauline leaves stem-clasping, orbicular, quite entire, or hardly toothed. ♂. H. Native of the islands in the Mediterranean, as in Corsica, Sicily, Cos, &c. on the mountains. Moretti, pl. ital. dec. 2. p. 9. S. Dodonæ'i, Spreng. umb. spec. 24. exclusive of many of the synonymes. S. Créticum, Math. ed. Valgr. 1570. p. 515. f. 2. S. Mathìoli, Presl. del. prag. p. 127. but not of Tourn. S. ramòsum, D'Urv. enum. no. 278. S. perfoliàtum *a*, Lam. dict. 3. p. 266. S. Ægyptìacum, Lin. amœn. 4. p. 270. probably belongs to this species, which has often 2 single cordate, quite entire leaves on the floral branches, as in it. Root tuberously fusiform, black on the outside, with a sweet taste. Leaves pale green: lower ones ternately decompound; leaflets ovate, deeply serrated, for the most part attenuated at the base. Lower cauline leaf 3-lobed.

Round-leaved Alexanders. Fl. May, June. Clt. 1700. Pl. 3 ft.

4 S. perfolia'tum (Mill. dict. no. 3.) stem angularly winged above; cauline leaves stem-clasping, ovate-cordate, denticulated. ♂. H. Native of Spain, Provence, Italy, Dalmatia, Balearic Islands, Greece, &c. Lin. spec. 376. Moretti, pl. ital. dec. 2. p. 10. S. Dioscóridis, Spreng. umb. spec. p. 25. Smith, fl. græc. 289. exclusive of the synonymes of Math. and Dalech,—Dodon. pempt. p. 698. f. 2. Lob. icon. 709. Lower leaves ternately decompound, and the leaflets 3-lobed, ovate, and toothed. Flowers yellow.

Var. β, Kittabèlii (D. C. prod. 4. p. 247.) superior leaves coarsely toothed. ♂. H. Native of Hungary. S. perfoliàtum, Waldst. et Kit. hung. 1. p. 22. t. 23.

Perfoliate-leaved Alexanders. Fl. May, June. Clt. 1½ foot.

5 S. Ægopodioi'des (H. B. et Kunth, nov. gen. amer. 5. p. 16.) leaves somewhat biternate; leaflets oblong, sharply serrated; umbels of 10-12 rays; involucra and involucels of one leaf. ♂. H. Native of Mexico, near Moran, at the height of about 4000 feet; and on the Cordilleras de Quahilapa. Sìson ægopodioìdes, Spreng. syst. 1. p. 886. Flowers yellow. Fruit didymous, hardly compressed; vittæ small; ribs filiform; furrows broad, reticulated; albumen involute.

Gout-weed-like Alexanders. Pl. 1 foot.

† *A doubtful species.*

6 S.? latera'le (Thunb. fl. cap. 2. p. 206.) leaves pinnate and ternate; leaflets obovate, deeply lobed, mucronately toothed; umbels lateral, nearly sessile; involucels few-leaved. ♂. G. Native of the Cape of Good Hope. Petals white, inflexed. Fruit globose, pubescent. This plant evidently does not belong to the present genus, but to what genus it belongs is unknown.

Lateral-umbelled Alexanders. Pl. 1 foot.

Cult. The species will grow in any kind of soil in which the seeds may be sown.

CLXV. EU'LOPHUS (from *ευ, eu*, well, and λοφος, *lophos*, a crest; in reference to the stripes as well as the ribs of the fruit being rather prominent). Nutt. in litt. 1825. D. C. coll. mem. v. p. 69. t. 2. f. M. prod. 4. p. 248.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx 5-toothed, at last falling off after flowering. Petals unknown. Fruit somewhat contracted from the sides, rather didymous; mericarps ovate, with 5 hardly prominent ribs: the furrows between the ribs furnished with 3 convex stripes each, which are more prominent than the ribs, they are hollow inside, and replete with oil, from sustaining oleiferous canals; commissure bearing 4 similar stripes or vittæ. Seed semilunar, filling the mericarp; carpophore bipartite.—Glabrous herbs. Leaves multifid; lobes linear, elongated. Terminal umbels large, of 10 rays, fertile; the lateral ones opposite, and sterile. Involucra and involucels of many linear acute leaves. Flowers many, abortive. This genus is very nearly allied to *Physospérmum*, but differs in the fruit being covered with many vittæ, as in *Smy'rnium.*

1 E. America'nus (Nutt. in litt.)—Native of North America, in the Arkansa territory. Root composed of fascicles of oblong tubers. Stem terete, fistular.

American Eulophus. Pl.

Cult. See *Smyrnium* above for culture and propagation.

CLXVI. SCALIGE'RIA (in honour of J. C. Scaliger, commentator on Theophrastus). D. C. coll. mem. v. p. 70. t. 1. f. B. prod. 4. p. 248.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx entire. Petals obcordate, with a short, inflexed, obtuse point. Stylopodium thick, conically cylindrical, parallel; styles filiform, bent outwards. Fruit somewhat didymous; mericarps ovate, contracted at the raphe, scarcely compressed from the sides, with 5 filiform ribs, and flattish-convex furrows, each furrow containing 2-3 vittæ. Commissure flattish, containing 4-6 vittæ. Albumen furnished with a furrow inside.—Herb glabrous. Radical leaves on long petioles, which are hardly dilated at the base, ternate; leaflets pinnate: segments pinnatifid: lobes diverging, lanceolate, acute. Stem branched, rather dichotomous, terete. Upper leaves reduced to quite entire, or unidentate, elongated ligula. Umbels terminal, without involucra, of 9-10 rays; umbellules 12-15-flowered; involucels of a few small, linear leaves. Flowers white.—This genus is allied to *Eúlophus* and *Physospérmum* from habit and character, but differs from both in the calyx being toothless, in the form of the stylopodium, and in the want of involucra. From habit and the somewhat didymous fruit it comes also very near *A'stoma.*

1 S. microca'rpa (D. C. l. c.). Native of the Levant, near Seyde, at the foot of Mount Lebanon. Fruit small, blackish.

Small-fruited Scaligeria. Pl. 1 foot?

Cult. Sow the seeds in autumn, in the open ground; they will grow in any common soil.

Suborder III. COELOSPE'RMÆ (from κοιλος, *koilos*, hollow, and σπερμα, *sperma*, a seed; from the seeds being involutely curved from the base to the apex, and therefore forming a hollow on the inner side). D. C. prod. 4. p. 249. Albumen involutely curved from the base to the apex, excavated in front.

Tribe XVII.

CORIA'NDREÆ (this tribe contains plants agreeing with *Coriándrum* in important characters). Koch, umb. p. 82. D. C. prod. 4. p. 249. Fruit globose or didymous, with 2 subglobose mericarps. Mericarps with 5 primary, depressed, or flexuous ribs; the lateral ribs placed before the accessory margin; the 4 secondary ribs are more prominent than the primary ones; all wingless. Seeds involute, or curved from the base to the apex, hence they are excavated in front.

CLXVII. BI'FORA (*bis*, twice, and *foris*, a door; in reference to the commissure being furnished with 2 holes). Hoffm. umb. 191. f. 2. in tit. Koch, umb. 83. D. C. prod. 4. p. 249. —Bíforis, Spreng. in Schultes, syst. 6. p. 38. and p. 448.—Còrion, Hoffm. et Link, fl. port. 2. p. 457.—Coriándrum species, C. Bauh. Tourn. Lin.—Anídrum, Neck. elem. no. 319.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point; outer petals nearly equal, or radiating and bifid. Fruit didymous: mericarps somewhat globosely ventricose, granularly wrinkled, marked with 5 impressed obsolete stripes: the 2 lateral stripes semicircular, and placed before the accessory margin. Vittæ none. Commissure furnished with 2 holes. Seed involute from the base to the apex. Carpophore bipartite, adnate on both sides.—Fetid herbs, with sulcately angular stems; and decompound leaves; having five segments. Umbels of 2-3 rays. Involucra and involucels wanting, or of one leaf. Flowers white.

1 B. testicula'ta (Spreng. l. c.) umbels of 2-3 rays; involucra and involucels of one leaf; flowers nearly equal; styles very short. ⊙. H. Native of Europe, especially in the south of France, Italy, Greece, Spain, and of Barbary. Coriándrum testiculàtum, Lin. spec. p. 367. fl. fr. 4. p. 293. Bífora dicócca. Hoffm. umb. 192. Bífora flosculòsa, Bieb. suppl. 232. —Lob. icon. t. 706. f. 1.—Pluk. alm. t. 196. f. 2.—Riv. pent. 72. Bauh. hist. 91-92. f. 1. Herb fetid when bruised. Petals white; anthers red.

Twin-fruited Bifora. Fl. June, Jul. Clt. 1640. Pl. 1 to 2 ft.

2 B. ra'dians (Bieb. suppl. 233.) umbels of 5 rays; involucra and involucels of 1-2 leaves; outer flowers radiant; styles elongated after flowering. ⊙. H. Native of Tauria, frequent among corn. Coriándrum testiculàtum, Bieb. fl. taur. 1. p. 228. exclusive of the synonymes. Coriándrum orientàle, chamæmeli folio, Tourn. cor. 22.? Herb fetid. Petals white; anthers red.

Radiant Bifora. Fl. Ju. Jul. Clt. 1817. Pl. 1½ foot.

Cult. The seeds only require to be sown in the open border.

CLXVIII. A'STOMA (from *a* priv. and στομα, *stoma*, a mouth; this genus differs from *Bífora* in the want of the 2 holes in the commissure; hence the name). D. C. coll. mem. v. p. 71. t. 17. prod. 4. p. 249. but not of Gray.

Lin. syst. *Pentándria, Digýnia.* All as in *Bífora*, but the

fruit is more evidently didymous; the commissure narrow, neither perforated nor dilated at the apex; and the styles rather divergent.—A glabrous herb, at first sight appearing like a species of *Séseli*. Stem terete, striated, erect, branched. Superior leaves bipinnatifid: with a few linear, nearly subulate, elongated, quite entire segments. Umbels by threes, pedunculate at the tops of the branches: the 2 lateral ones axillary and opposite, 6-8-rayed: but the central umbel is 10-12-rayed. Leaves of involucrum 5-6, lanceolate, entire, acuminated. Umbellules of 10-12 flowers; involucels of 4-5 leaves. Flowers white, all hermaphrodite. This is an intermediate genus between *Bifora* and *Atrèma;* from the first it differs in the commissure being imperforated, in the fruit being smaller, and in the involucra and involucels being of many leaves; and from the last in the margin of the calyx being obsolete, in the fruit being without ribs, and exactly didymous.

1 A. seselifòlium (D. C. l. c.). ⊙. H. Native of Egypt, or rather of Syria, where it was gathered by Donati. Coriándrum seselifòlium, D. C. The fruit of this plant is 5 times smaller than in all the other genera of *Coriándreæ*, and exactly didymous. Mericarps nearly globose.

Seseli-leaved Astoma. Fl. June, Jul. Pl. 1 foot.

Cult. See *Bifora*, p. 381. for culture and propagation.

CLXIX. ATRE'MA (from *a* priv. and *τρημα*, *trema*, a hole; there are no holes in the commissure, as in the genus *Bifora*). D. C. coll. mem. v. p. 71. t. 18. prod. 4. p. 250.

Lin. syst. *Pentándria, Digýnia.* Teeth of calyx 5, acute, small, permanent. Petals obovate, emarginate, nearly equal, with an inflexed segment. Fruit nearly didymous; mericarps nearly globose, ventricose: marked with 5 rather prominent small ribs. Vittæ none. Commissure narrow, closed. Seed involute from the base to the apex.—An herb with a furrowed stem, having the angles acute and dentately muricated under the umbels. Leaves multifid, with linear segments. Umbels and umbellules of 5-8 rays. Involucra and involucels of many linear-setaceous, undivided leaves. This genus is intermediate between *Coriándrum* and *Bifora*. The flowers are equal and the fruit is didymous as in *Bifora*, and the fruit is sapid, 5-ribbed, and the calyx 5-toothed, as in *Coriándrum satìvum*.

1 A. America'num (D. C. l. c.). ⊙. H. Native of North America, in the southern provinces at the Red River. Coriándrum Americànum, Nutt. in litt.

American Atrema. Pl. 1 to 2 feet.

Cult. See *Bifora*, p. 381. for culture and propagation.

CLXX. CORIA'NDRUM (a name used by Pliny, derived from *κορις*, *coris*, a bug; in reference to the fetid smell of the leaves). Hoffm. umb. p. 186. f. 14-15. in tit. D. C. prod. 4. p. 250. Spreng. in Schultes, syst. 6. p. 448. Koch, umb. p. 82. f. 72-73.—Coriándrum species, C. Bauh. Tourn. and Lin.

Lin. syst. *Pentándria, Digýnia.* Teeth of calyx 5, acute, unequal, permanent. Petals obovate, emarginate, with an inflexed point; outer petals radiant and bifid. Fruit globose, 10-ribbed, hardly separable; mericarps with 5 primary depressed flexuous ribs: and 4 secondary more prominent keeled ones. Vittæ none in the furrows, but 2 in the commissure. Carpophore free in the middle, semi-bifid, adnate at the base and apex. Seed excavated in front, covered by a loose membrane.—Herb glabrous. Stems terete. Leaves decompound: the superior ones most so. Umbels of 3-4 rays, without any involucra; involucels of 3 dimidiate leaves. Flower-buds sometimes rose-coloured. Flowers white. Stylopodium conical.

1 C. satìvum (Lin. spec. p. 367.). ⊙. H. but in gardens sometimes ♂. Native of corn-fields in the Levant, Tartary, Greece, Italy, and the south of France. The plant, although found wild in Essex, where it has been long cultivated, is not a native of this country. Smith, engl. bot. t. 67. fl. græc. t. 283. Blackw. herb. t. 176. Hayne, arz. gew. 7. t. 13. Brunf. hist. 1. p. 203. Mart. rust. t. 141. Rivin. pent. irr. t. 71. Woodv. med. bot. 492. t. 181. Plench. icon. t. 204. Moris. hist. 3. p. 269. sect. 9. t. 11. f. 1. The culture and management of the coriander consists in sowing the seeds on a light rich soil in September. Twenty pounds of seed will sow an acre. When the plants come up, thin them to 6 or 8 inches distance every way, and next spring stir the soil with a pronged hoe. In August the seed will be ripe, and if great care be not used, the largest and best part of the seed will be lost. To prevent this, women and children are employed to cut plant by plant, and to put it immediately into cloths, in which it is carried to some convenient part of the field, and there threshed upon a sail cloth. A few strokes of the flail get the seeds clean out, and the threshers are ready for another bundle in a few minutes. In Essex it is sometimes cultivated with *caraway* and *teazle*. See *Càrum cárvi*. The produce of coriander is from 10 to 14 cwt. on an acre. It is used by the distillers for flavouring spirits; by the confectioner for incrusting with sugar; and by the druggists for various purposes, for all of which it is said to have a ready sale. Coriander seeds are strong and disagreeable when fresh; but by drying become sufficiently grateful. They are recommended as carminative and stomachic; they are also used to cover the taste of senna, and in spices as currie powder, and seasoning for black puddings: formerly they were steeped in wine, and then dried to render them milder.

Var. β? microcárpum (D. C. prod. 4. p. 250.) fruit one half smaller than that of the species; segments of the leaves very slender and short. ⊙. H. Native of Mexico, at Tampico. Perhaps a proper species.

Cultivated Coriander. Fl. Ju. Jul. England. Pl. 1½ foot.

Cult. Sow the seeds in the autumn or spring in the open ground.

CLXXI. CYMBOCA'RPUM (from *κυμβος*, *kymbos*, a hollow, and *καρπος*, *carpos*, a fruit; in reference to the shape of the mericarps, which are hollow in front). D. C. ex Meyer, verz. pflanz. p. 132.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx obsolete. Petals equal, obcordate; with an inflexed point. Stylopodium depressed; styles reflexed. Fruit nearly globose; mericarps solid, hemispherical: with 5 primary, filiform ribs, which are often obliterated: the lateral ones of these marginating; secondary ribs none. Vittæ wanting. Carpophore bipartite, free in the middle, but adnate at the base and apex. Seed excavated in front.—A small, annual fetid plant. Leaves decompound, with short, linear segments. Umbels opposite the leaves. Leaves of involucra and involucels linear. Flowers white.

1 C. anethioi'des (D. C. ex Meyer, verz. pflanz. p. 132.) ⊙. H. Native of Caucasus, in stony places on the mountains of Talusch, near Swant, about 2000 feet above the level of the sea.

Fennel-like Cymbocarpum. Pl. 1 foot.

Cult. For culture and propagation see *Bifora*, p. 381.

N.B. The two species of *Coriándrum* cultivated in China and Cochin-china, are mentioned by Loreiro in his fl. coch. p. 225. under the names of *C. satìvum* and *C. testiculàtum;* but the first differs from the true *C. satìvum* in the involucels being of one leaf; and the second differs from the true *C. testiculàtum* or *Bifora*, from the involucra and involucels being multifid, and in the fruit being sweet scented.

Order CXXIV. ARALIA'CEÆ (this order contains only plants agreeing with the genus *Aràlia* in important characters). Juss. dict. 2. p. 348. D. C. prop. med. ed. 2. p. 163. D. Don, prod. fl. nep. 186. D. C. prod. 4. p. 251.—Aràliæ, Juss. gen. p. 247.

Tube of calyx adnate to the ovarium: with the limb entire or toothed. Petals 5-10, alternating with the calycine teeth, valvate in æstivation, rarely wanting altogether. Stamens equal in number to the petals, rarely double that number, inserted beneath the margin of a large epigynous disk; anthers bilocular, peltate. Ovarium adnate to the calyx: with 2 or more cells, containing each only one ovulum. Styles many, simple, sometimes distinct and diverging, sometimes joined in one, rarely wanting; stigmas simple. Berry 2-15-celled, crowned by the entire or toothed limb of the calyx; having as many 1-seeded cells as there are styles. Seeds angular, erect, with a crustaceous testa, and a membranous endopleura. Embryo small, inverted, surrounded by copious fleshy albumen: having a superior radicle, which is twice the length of the cotyledons.—Trees or shrubs, rarely herbs. Stems frutescent, often scandent, adhering by root-formed fibres to other substances, as in ivy. Leaves alternate, exstipulate, petiolate, simple or compound. Petioles long, always dilated and thickened at the base. Flowers axillary or terminal, umbellate or capitate; the umbels or heads often disposed in a racemose or paniculate manner: having involucels usually present.

The order *Araliàceæ* approximates *Umbellíferæ*, but differs from it in the inflorescence being often imperfectly umbellate; in the styles being usually many; in the fruit being baccate, and usually plurilocular, always without vittæ; and in the parts of the fruit not being separable; in the albumen being fleshy, and in the embryo being nearly the length of the albumen. It also comes near *Ampelídeæ*, but differs in the stamens in *Araliàceæ* alternating with the petals, not as in *Ampelídeæ* opposite them, in the leaves being exstipulate, and in the inflorescence never being opposite the leaves, as well as in the calyx adhering to the ovarium, not free from it. The genus *Hédera* has often been confused with *Caprifoliàceæ*, but agrees best with the present order, in the free petals and structure of the fruit.

The flowers have no beauty, but the foliage of many is extremely fine. The medicinal properties are much the same as those of *Umbellíferæ*, except the fruit, which differs in virtues, as it does in botanical structure. The bark of many of the species exudes an aromatic gum-resin, as in *Aràlia umbellífera* and others. The roots are tonic, with, in some cases, the flavour of parsnip. The famous Ginseng, which is produced by a species of *Pànax*, is reputed to have powerful tonic, restorative, and even aphrodisiacal qualities; but it is probable that these have been greatly exaggerated. The plant has perhaps some really invigorating power when fresh, which after the statements made by Father Jartoux cannot reasonably be doubted.

Synopsis of the genera.

1 Adóxa. Calyx 2-3-cleft. Corolla rotate, 4 (f. 66. *a.*) -5-cleft. Stamens 8-10. Styles 4-5 (f. 66. *b.*). Berry 4-celled 4-seeded. Seed girded by a membranous border.

2 Pa'nax. Flowers polygamous. Margin of calyx obsoletely 5-toothed. Petals 5. Stamens 5. Styles 2-3, short. Fruit fleshy, compressed, orbicular, or didymous, 2-celled.

3 Cussònia. Margin of calyx entire, or with 5-7 acute teeth. Petals 5-7. Stamens equal in number to the petals. Ovarium crowned by a broad disk. Styles 2-3, short. Fruit 2-3-celled, roundish, nearly dry.

4 Mara'lia. Margin of calyx small. Petals and stamens 5. Styles 3. Berry cylindrical, 3-celled, 3-seeded.

5 Gilibe'rtia. Margin of calyx entire, drawn out beyond the ovarium. Petals 5-10. Stamens 5-10. Ovarium 5-10-celled, crowned by a broad disk. Style short, composed of 5-10 concrete ones, which at length diverge a little at the apex. Fruit fleshy, 5-10-celled.

6 Gastònia. Margin of calyx entire, drawn out beyond the ovarium. Petals 5-16. Stamens double the number of the petals, 2 in front of each petal. Styles 8-12, short, rather concrete at the base. Fruit 8-12-celled, 8-12-ribbed, nearly dry.

7 Poly'scias. Margin of calyx short, denticulated. Petals 5-7, but usually 8. Stamens 5-7, but usually 8. Style none. Stigmas 3-5, short, spreading. Berry globose, 4-celled, 4-seeded.

8 Torice'llia. Margin of calyx acutely 5-toothed. Petals 5, uncinately incurved at the apex. Stamens 5, very short. Styles 4, short. Berry nearly dry, 4-celled.

9 Ara'lia. Margin of calyx very short, entire or toothed Petals 5, free at the apex. Stamens 5. Styles 5. Berry 5-celled, usually torose. Seed chartaceous.

10 Sciodaphy'llum. All as in *Aràlia*, but the petals are joined together into the form of a calyptra at the apex.

11 He'dera. Margin of calyx elevated or toothed. Petals 5-10, not cohering at the apex. Stamens 5-10. Styles 5-10, conniving, or joined in one. Berry 5-10-celled.

12 Paratro'pia. All as in *Aràlia* or *Hédera*, but differs in the stigmas being sessile, at first approximate, and immersed in the epigynous disk.

13 Arthrophy'llum. Margin of calyx short, obsoletely 5-toothed. Petals 5. Stamens 5. Style short, or almost wanting; stigma obtuse. Fruit baccate, crowned, containing a one-seeded nucleus.

I. ADO'XA (from *a* priv. and *δοξα*, *doxa*, glory; without any appearance. This plant covers the places where it grows, but the flowers are hardly to be seen, being of the same colour as the leaves). Lin. gen. no. 501. Gærtn. fruct. 2. p. 141. t. 112. f. 9. Lam. ill. t. 320. D. C. prod. 4. p. 251.—Moschatellìna, Tourn. inst. t. 68.

Lin. syst. *Octándria, Tetragýnia.* Tube of calyx adnate to the ovarium, with 2-3 deep segments. Corolla of one petal, wheel-shaped, in 4-5 (f. 66. *a.*) deep ovate, acute, spreading segments, longer than the calyx. Stamens 8 or 10; anthers roundish. Ovarium half superior. Styles 4-5 (f. 66. *b.*), short, united at their base, which is permanent. Berry globose, its lower half invested with the permanent calyx, whose segments surround the middle part, of one cell, pulpy inside. Seeds 4, ranged round the

central pulp, compressed, surrounded by a vertical membranous border. The terminal flower is only 4-cleft, with 8 stamens: the rest 5-cleft; hence according to the rule assumed by Linnæus, this genus is placed in Octandria.—A smooth herb of humble growth, with twice ternate leaves, and terminal capitate green flowers. (f. 66. *a*.)

FIG. 66.

1 A. moschatelli'na (Lin. spec. p. 527.) ♃. H. Native of Europe and Siberia, even to Dahuria, in groves, thickets, and under hedges; plentiful in Britain in like situations; in North America in the woods between lat. 54° and 64°, and the Rocky Mountains between lat. 42° and 46°. Smith, engl. bot. t. 453. Curt. fl. lond. t. 26. Fl. dan. 94. Moschatellìna tetragòna, Mœnch. meth. 478.—Lob. icon. 674. f. 2.—Cord. hist. 1722. f. Gerard. emac. 1091. Root of several white imbricated concave scales, producing fibres and runners from their interstices. Stem angular. Radical leaves twice ternate, on long stalks; cauline ones ternate, on long stalks. Flowers with a musk scent, when moist, forming a round head. (f. 66. *a*.)

Tuberous *Moschatell.* Fl. April, May. Britain. Pl. $\frac{1}{3}$ foot.

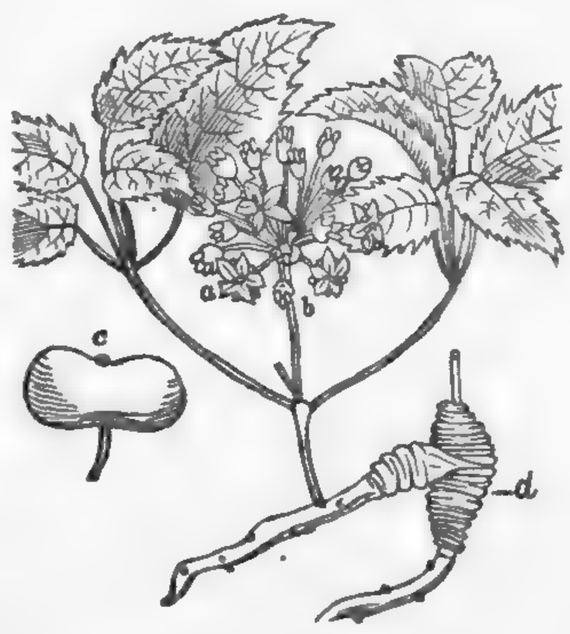
Cult. The plant will grow freely under the shade of trees; and will be easily increased by the offsets.

II. PA'NAX (from *παν, pan*, all, and *ακος, akos*, a remedy; that is to say, a remedy for all diseases; in allusion to the miraculous virtues which is attributed to *P. quinquefòlium*, the ginseng of the shops). Lin. gen. no. 1166. Lam. ill. t. 860. D. C. prod. 4. p. 252.

Lin. syst. *Polygàmia, Diœ'cia.* Flowers polygamous. Margin of calyx very short, obsoletely 5-toothed. Petals 5 (f. 67. *a*.). Stamens 5, inserted along with the petals under the margin of the disk, alternating with them. Styles 2-3, short. Fruit fleshy, compressed, orbicular, or didymous (f. 67. *c*.), 2-celled: cells coriaceously chartaceous, 1-seeded.—Herbs, shrubs, and trees, having the leaves and inflorescence variable. The habit of the species is heterogeneous, but the characters of those that are perfectly known agree.

§ 1. *Herbaceous plants, with tuberous roots; and verticillate, petiolate, palmately-compound leaves.—Aureliàna, Cat. car. append. t.* 16.—*Araliástrum, Vaill. serm. p.* 43.

FIG. 67.



1 P. quinquefòlium (Lin. spec. 1512.) root fusiform, a little branched; leaves with 5 leaflets, which are stalked from the top of the common petiole; peduncle of umbel shorter than the petioles; styles and seeds 2. ♃. H. Native of North America, in shady mountain woods, from Canada to Carolina; and of the north of Asia, as in Tauria; and the north of China. Sims, bot. mag. 1333. Bigel. med. bot. 2. t. 29. Woodv. med. bot. t. 99. Blackw. 513. —Lafit. gins. 51. t. 1. Catesb. car. 16.—Trew, ehret. t. 6. f. 1. Jartoux, in phil. trans. 20. p. 237. Herb larger than the following species. Flowers yellowish. Berry globose, depressed, red. This plant is a native of Chinese Tartary, and also of North America. In the former country it has been gathered as an invaluable drug from time immemorial. In 1709 the Emperor of China gave orders to 10,000 Tartars to go in quest of the root, and to bring as much as they could find; every one was to give two pounds of the best to the emperor, and to sell the rest for the same weight of fine silver. The roots, which are said to bear some resemblance to the human form, are gathered and dried, and enter into almost every medicine used by the Tartars and Chinese. Osbeck says that he never looked into the apothecaries' shops but they were always selling ginseng, that both poor people and those of the highest rank made use of it, and that they boil half an ounce in their tea or soup every morning, as a remedy for consumption and other diseases. Jartoux relates that the most eminent physicians of China have written volumes on the medicinal powers of this plant, asserting that it gives immediate relief in extreme fatigue, either of body or mind, that it dissolves petuitous humours, and renders respiration easy, strengthens the stomach, promotes appetite, stops vomiting, removes hysterical, hypochondriacal, and all nervous affections, giving a vigorous tone of body, even in extreme old age. The French in Canada use the root for curing the asthma, and as a stomachic. After all, our physicians say that we have no proof of the efficacy of ginseng in Europe, and that from its sensible qualities it seems to possess very little power as a medicine. The Chinese name of *yansam* or *yanson*, and the American one *garangtonges* or *garangtoging* are both derived from the fancied resemblance in the root.

Five-leaved Panax. or Ginseng. Fl. Ju. Clt. 1740 Pl. 1½ ft.

2 P. trifòlium (Lin. spec. 1512.) root globose; leaves of 3, rarely of 5 leaflets, which are sessile on the top of the common petiole; peduncle of umbel longer than the petioles; styles and seeds 3. ♃. H. Native of North America, in low shady woods, from Canada to Georgia. Michx. fl. bor. amer. 2. p. 256. Bigel. fl. bost. ed. 2. p. 376. P. pusílla, Sims, bot. mag. 1334. Aràlia triphýlla, Poir. suppl. 1. p. 418.—Pluk. mant. t. 435. f. 7.—Trew. ehret. t. 6. f. 2. A small herb, with the habit of *Anemòne nemoròsa*. Flowers greenish. Berry greenish, bluntly trigonal.

Three-leaved Ginseng. Fl. May, June. Clt. 1759. Pl. ½ ft.

3 P. pseu'do-gínseng (Wall. in act. soc. med. et phys. calc. 4. p. 117. pl. rar. asiat. 2. p. 30. t. 137.) tubers of roots in fascicles; leaves in threes or fours, quinate or ternate; leaflets lanceolate, ending in a long taper point, petiolate, much attenuated at both ends, doubly and cuspidately serrated, sometimes deeply serrated, beset with hoary bristles along the nerves and midrib; peduncles terminal, usually trifid, about equal in length to the petioles; flowers hermaphrodite; berries 2-3-seeded. ♃. H. Native of Nipaul, on the top of Mount Sheopore. Flowers whitish. Styles 2-3. Berry 2-3-celled, red. This species comes very near to *P. quinquefòlium* or Ginseng, but is not known to possess any medicinal qualities.

False Ginseng. Fl. June. Pl. 1 to 2 feet.

4 P. tripinna'tum (Wall. cat. no. 4934.) herbaceous, unarmed; leaves triternate; leaflets ovate, acuminated, mucronately serrated, pale beneath, rather downy; panicle long, pubescent; umbellules many-flowered. ♃. H. Native of Nipaul, at Gosaingsthan. P. decompósitum, Wall. but not of D. C.

Tripinnate-leaved Panax. Pl. 2 to 3 feet.

§ 2. *Prickly shrubs. Leaves ternate, or palmately lobed.*

5 P. aculea'tum (Ait. hort. kew. 3. p. 448.) stem shrubby;

branches and petioles prickly; leaves of 3 ovate, or nearly lanceolate, glabrous leaflets; umbels terminal, usually simple, rarely compound, on short peduncles; petals 5. ♄. G. Native of China. Jacq. coll. 4. p. 175. icon. rar. t. 634. Zanthóxylum trifoliàtum, Lin. spec. 1455. Lam. dict. 2. p. 40. Umbels exinvolucrate. Pedicels purplish. Flowers white, polygamous. Calyx exactly 5-toothed. Styles 2-3, short. Prickles hooked.

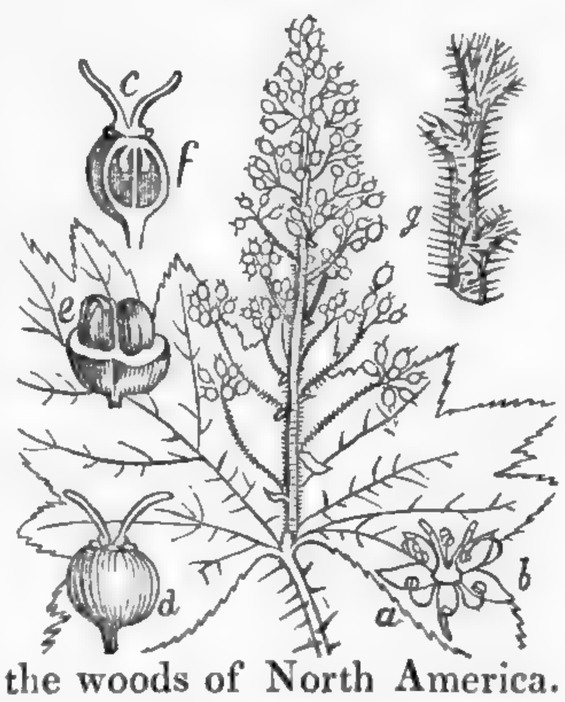
Prickly Panax. Fl. Nov. Clt. 1773. Shrub 3 to 5 feet.

6 P. Loureiria'num (D. C. prod. 4. p. 252.) stem shrubby; branches prickly: leaves of 3 broad, lanceolate leaflets; umbels terminal, dense; petals 4. ♄. G. Native of China, in the province of Canton. Plectrònia Chinénsis, Lour. coch. p. 162. This is a true species of *Pànax*, and probably nothing but *P. aculeàtum*. Flowers white. Stamens 5. Berry 2-seeded.

Loureiro's Panax. Shrub 5 feet.

7 P. ho'rridum (Smith, in Rees' cycl. 26. no. 10.) shrub bushy and very prickly; leaves simple, palmately lobed, deeply serrated, cordate: with prickly veins; umbels capitate, racemose; styles and seeds 2. ♄. H. Native of the west coast of North America, at Nootka Sound. Abundant on the west side of the Rocky Mountains, from the head-springs of the Columbia to the coast; and of North California, ex Smith; and of the islands of Kadiak and Sitka, according to Steven. Styles 2, short. Fruit orbicular, pulpy. Racemes hispid. Flowers polygamous. Aràlia occidentàlis, Willd. herb. ex Stev. The entangled stems of this remarkable plant are described as a great impediment to travellers in the woods of North America. Hook. fl. bor. amer. 1. p. 273. t. 98. (f. 68.)

FIG. 68.



Horrid Panax. Shrub straggling.

8 P.? Haínla (D. C. prod. 4. p. 253.) stem arboreous, prickly; leaves cordate, 5-lobed, toothed, coriaceous, glabrous; umbels globose, tomentose, disposed in racemose panicles. ♄. F. Native of Nipaul, at Narain-hetty. Hédera Haínla, Hamilt. in D. Don, prod. nep. 187.

Hainla Panax. Tree.

§ 3. *Shrubby, unarmed. Leaves simple, undivided.*

9 P. cochlea'tum (D. C. prod. 4. p. 253.) stem thick, frutescent, unarmed; leaves petiolate, cordate, ovate-roundish, concave, cochleate, spiny-ciliated, and somewhat toothed; umbels densely capitate, disposed in a panicle. ♄. S. Native of the Moluccas and Java. Aràlia cochleàta, Lam. dict. 1. p. 224. Schultes, syst. 6. p. 697. P. scutellarioìdes, Reinw. in Blum. bijdr. ned. ind. 880. P. conchifòlia, Roxb.—Scutellària, Rumph. amb. 4. p. 75. t. 31.

Shell-leaved Panax. Clt. 1820. Shrub 10 to 12 feet.

10 P. Heynea'num (Wall. cat. no. 4927.) shrubby, unarmed; leaves broad, roundish-cordate, petiolate, quite entire, coriaceous, glabrous; branches of panicle in clusters; umbellules few-flowered. ♄. S. Native of the East Indies.

Heyne's Panax. Tree.

11 P. si'mplex (Forst. prod. no. 399.) stem fruticose; leaves lanceolate, serrated; umbels compound. ♄. G. Native of New Zealand. Perhaps the same as *P. simplicifòlium*, Dietr. gærtn. lex. 6. p. 633.

Simple-leaved Panax. Shrub.

§ 4. *Unarmed shrubs, with digitate leaves.*

12 P. attenua'tum (Swartz, prod. p. 54. fl. ind. occ. 1. p. 562.) stem shrubby, unarmed; leaves petiolate, digitate; stipulas intrapetiolar, membranous: leaflets 5, rarely 3, petiolate, ovate, narrowly acuminated, crenated, glabrous; umbels terminal; branches racemiferous. ♄. S. Native of Guadaloupe and St. Christopher. Racemes shorter than the leaves. Fruit compressed, indehiscent, obtuse, hardish, 2-seeded, rarely 3-seeded. Flowers hermaphrodite, all fertile. Style bifid, rarely trifid.

Attenuated-leafletted Panax. Clt. 1823. Shrub 10 to 12 ft.

13 P. arbòreum (Forst. prod. 398.) stem arboreous, unarmed; leaves digitate, petiolate; leaflets 5, obovate, serrate-toothed; umbels compound; rays of umbel elongated. ♄. G. Native of New Zealand. Lin. fil. suppl. 441.

Arboreous Panax. Tree.

14 P.? Gaudichau'dii (D. C. prod. 4. p. 253. Hook. and Arn. in Beech. voy. pt. bot. 1. p. 84.) stem arboreous, glabrous, unarmed; leaves digitate, petiolate: superior ones opposite; leaflets 5, on long petioles, oval-elliptic, obtuse, remotely and sharply serrated, coriaceous; peduncles terminal, bearing umbels which are disposed in panicles; pedicels very short; styles 3; fruit globosely-trigonal, 3-seeded. ♄. G. Native of the Sandwich Islands, in temperate places. Aràlia trígyna, Gaud. voy. p. 474. t. 98. This species is very nearly allied to *P. Lessònii*, and will perhaps, along with it, form a separate genus.

Gaudichaud's Panax. Tree.

15 P.? Lessònii (D. C. prod. 4. p. 253.) shrub glabrous, unarmed; leaves digitate, petiolate; leaflets 3-5, obovate-lanceolate, cuneated at the base, acute, and quite entire at the apex, or bluntly somewhat toothed; umbels panicled, rising from the upper axils of the leaves, length of leaves. ♄. G. Native of New Zealand, where it was gathered by Lesson. Petioles not dilated at the base. Peduncles having the branches umbellately disposed at the apex, the rest scattered. Leaves scattered along the branches. Styles 3, very short, almost concrete.

Lesson's Panax. Shrub.

16 P.? ova'tum (Hook. et Arn. in Beech. voy. pt. bot. 1. p. 84.) stem arboreous, glabrous, unarmed; leaves petiolate: superior ones opposite; leaflets 3, on long petiolules, ovate, quite entire, coriaceous. ♄. F. Native of the Sandwich Islands. Flowers and fruit unknown.

Ovate-leaved Panax. Tree.

17 P.? platyphy'llum (Hook. et Arn. in Beech. voy. pt. bot. 1. p. 84.) stem arboreous, glabrous, unarmed; leaves petiolate: upper ones opposite; leaflets 3, on long petiolules, transversely oblong, twice as broad as long, apiculated at the apex, coriaceous, quite entire; peduncles terminal, bearing umbels of flowers, which are disposed in panicles. ♄. S. Native of Oahu, one of the Sandwich Islands.

Broad-leaved Panax. Tree.

18 P. glabra'tum (H. B. et Kunth, nov. gen. amer. 5. p. 10.) stem arboreous, unarmed; leaves petiolate, digitate; leaflets 5, petiolulate, elliptic-oblong, acute at the base, quite entire, glabrous; panicle terminal; umbellules few-flowered. ♄. S. Native of South America, near La Vente Grande de Caraccas.

Smooth Panax. Tree 20 feet.

19 P. longi-petiola'tum (Pohl, in litt. ex D. C. prod. 4. p. 253.) stem arboreous, unarmed; leaves on long petioles, digitate, glabrous; leaflets 5-9, oblong, acuminated, acute at the base, entire, or acutely toothed, membranous, on long petioles: adult ones glabrous, but when young clothed with rusty tomentum beneath. ♄. S. Native of Brazil.

Long-petioled Panax. Tree.

20 P. sple'ndens (H. B. et Kunth, l. c. p. 11.) stem arboreous, unarmed; leaves digitate, on long petioles; leaflets 9, petiolulate, somewhat oblong, cuspidately acuminated, rounded at the base, or somewhat cordate, sharply and doubly toothed, rather hispid above and silky beneath. ♄. S. Native of South America, in the temperate parts of Popayan. Aràlia mìcans, Willd. mss. in Schultes, syst. 6. p. 701. Flowers and fruit unknown.

Splendent-leaved Panax. Tree 20 feet?

21 P. serra'tum (Wall. in herb. Moricand. ex D. C. prod. 4, p. 253.) stem shrubby, unarmed; leaves on long petioles, digitate; leaflets 7, petiolulate, oblong-lanceolate, acuminated, rather bluntish at the base, somewhat serrated, pale beneath, glabrous on both surfaces in the adult state. ♄. G. Native of Nipaul. Umbels many, disposed in a racemose manner.

Serrated-leaved Panax. Shrub.

22 P. tomentòsum (Wall. in herb. Moricand, ex D. C. prod. 4. p. 254.) stem shrubby, unarmed; leaves on long petioles, digitate; leaflets 5? petiolulate, oblong-lanceolate, quite entire, acuminated, somewhat attenuated at the base, glabrous above, and tomentose beneath. ♄. G. Native of Nipaul. Flowers like those of *P. serràtum*, and perhaps, with that species, ought to be excluded from *Pànax*.

Tomentose Panax. Shrub.

23 P. speciòsum (Willd. spec. 4. p. 1126.) stem arboreous, unarmed; leaves petiolate, digitate; leaflets 7-10, petiolulate, ovate-oblong, rounded at the base, acute and quite entire at the apex, flat, clothed with silky tomentum beneath; panicles terminal, crowded; umbels of 12-15 flowers. ♄. S. Native of Caraccas and Porto-Rico, on sterile hills. P. spinòsa, Poir. suppl. 2. p. 778. P. undulàtum, H. B. et Kunth, nov. gen. amer. 5. p. 11. t. 417. f. 2. Panicle very showy, rather silky. Petioles 3 feet long; leaflets nearly a foot long.

Showy Panax. Tree large.

24 P. Morototòni (Aubl. guian. 2. p. 949. t. 360.) stem arboreous, unarmed; leaves petiolate, digitate; leaflets 7-9, oblong-lanceolate, attenuated at both ends, quite entire, undulated, clothed with golden tomentum beneath; panicle terminal, diffuse; umbellules of 8-13 rays. ♄. S. Native of Cayenne, and the Island of Trinidad. P. chrysophýllum, Vahl. eclog. 1. p. 33. P. undulàta, Pers. ench. 1. p. 298. but not of Kunth. Fruit compressed, pubescent. Leaflets like the leaves of *Chrysophýllum Cainìto*. *Morototòni* is the Guiana name of the tree.

Morototoni Panax. Clt. 1822. Tree 100 feet.

25 P. seri'ceum (Pohl, in litt. ex D. C. prod. 4. p. 254.) stem arboreous, unarmed; leaves digitate; leaflets 6-7, nearly sessile, oblong, obtuse, cuneated, with a revolute entire margin, coriaceous, silky from very fine rusty down beneath; racemes umbelliferous, panicled, clothed with silky rusty down. ♄. S. Native of Brazil. P. vinòsus, Schlecht. ex Pohl.

Silky Panax. Tree.

§ 5. *Shrubby or herbaceous plants. Leaves pinnate, bipinnate, and pinnately decompound.*

26 P.? Anìsum (D. C. prod. 4. p. 254.) stem shrubby, unarmed; branches very hispid; leaves impari-pinnate: with 5-7 oval, quite entire leaflets, which are acute at both ends; umbels terminal, compound. ♄. S. Native of the Moluccas, and other Indian islands. Anìsum Moluccànum, Rumph. amb. 2. p. 132. t. 42. Fruit rather didymous, with the scent of anise-seed.

Anise-scented-seeded Panax. Shrub 10 feet.

27 P. Leschenau'ltii (D. C. prod. 4. p. 254.) stem shrubby, unarmed; leaves pinnate: with 5 petiolulate, broadly ovate, narrowly acuminated, acutely serrated, glabrous leaflets; umbels compound, bracteate. ♄. F. Native of the East Indies, on the Nellighery mountains, where it was gathered under the name of *Solé maliquet*. Calyx bluntly 5-toothed.

Leschenault's Panax. Tree.

28 P. bi'jugum (Wall. cat. 4937.) unarmed; leaves pinnate; leaflets 5, broad-ovate, acuminated, smooth, spinulosely serrated, rather oblique at the base; panicle umbellate, compound, spreading; umbellules of many flowers. ♄. G. Native of Nipaul.

Two-paired-leafletted Panax. Tree.

29 P. pinna'tum (Lam. dict. 2. p. 715.) stem shrubby, unarmed; leaves impari-pinnate; leaflets oval-lanceolate, acuminated, nearly entire, glabrous; panicle terminal; umbels few-flowered. ♄. S. Native of the Moluccas. Scutellària secúnda, Rumph. amb. 4. p. 76. t. 32. Pànax secúnda, Schultes, syst. 6. p. 215. Berry somewhat compressed.

Pinnate-leaved Panax. Shrub 10 to 12 feet.

30 P. arma'tum (Wall. cat. no. 4933.) stem shrubby, prickly; rachis of leaves jointed, furnished with hooked prickles, particularly at the joints; leaflets ovate, acuminated, serrated, beset with bristly hairs on both surfaces, but particularly on the nerves; panicle long, downy; umbellules many-flowered. ♄. S. Native of the East Indies.

Armed Panax. Shrub.

31 P. Finlaysonia'num (Wall. cat. no. 4936.) shrub furnished with hooked prickles on the stems, and rachis of leaves; leaves pinnate and bipinnate; leaflets ovate, acuminated, membranous, coarsely serrated, beset with bristly hairs on both surfaces; panicle large; umbellules many-flowered. ♄. S. Native of the East Indies.

Finlayson's Panax. Shrub.

32 P. fra'grans (Roxb. hort. beng. p. 21.) stem shrubby, unarmed; leaves decompound, having the petiole many times oppositely branched: the ultimate branches of the petiole trifoliate; leaflets ovate, acuminated, entire, petiolulate, the middle one the longest; panicles loose: ultimate branches short, bearing few-flowered umbellules. ♄. G. Native of Nipaul. Hédera fràgrans, D. Don, prod. fl. nep. 187.? but the leaves are not truly ternate, nor the margins setaceously serrated, nor any ways glaucous beneath.

Fragrant Panax. Clt. 1816. Shrub.

33 P. fruticòsum (Lin. spec. 1513.) stem shrubby, unarmed; leaves pinnately decompound; leaflets petiolate, oval-oblong, acuminated, coarsely and dentately serrated: ultimate ones deeply trifid; panicle corymbose: with the branches umbelliferous at the apex. ♄. S. Native of the islands of Ternatea, Java, and Amboyna. Andr. bot. rep. t. 595. Blum. bijdr. p. 880. Scutellària tértia, Rumph. amb. 4. p. 78. t. 33. Styles 3. Berry 2-3-seeded. Leaves bipinnate or tripinnate.

Shrubby Panax. Fl. Aug. Sept. Clt. 1800. Shrub 6 feet.

34 P. obtu'sum (Blum. bijdr. p. 880.) stem shrubby, unarmed; leaves supra-decompound; leaflets obovate-roundish, entire, or deeply parted, repandly and cuspidately serrated; umbels compound, terminal. ♄. S. Native of Java, where it is called *Kodong-dong*.

Obtuse-leafletted Panax. Shrub.

35 P. sambucifòlium (Sieb. pl. exsic. nov. holl. 2. no. 256.) stem shrubby, unarmed; leaves pinnate, and somewhat bipinnate; leaflets petiolulate, distant, oblong, acuminated, remotely serrated; panicle terminal; umbels 10-12-flowered. ♄. G. Native of New Holland. Styles 2, acute.

Elder-leaved Panax. Shrub.

36 P. decompósitum (Wall. in herb. Moricand. ex D. C. prod. 4. p. 255.) stem herbaceous? unarmed; leaves impari-pinnate, of 2-4 pairs of petiolulate, ovate, acuminated, sharply serrated, glabrous, or rather scabrous leaflets; umbels decompound.—Native of Nipaul. Umbellules many-flowered; pedicels 4-5 lines long.

Decompound-umbelled Panax. Pl. 2 to 3 feet.

Cult. The hardy species of this genus grow best in peat, and are increased by dividing at the root. The other species grow well in a mixture of loam and sand: and are increased by cuttings which should be planted in sand, with a hand-glass placed over them.

III. CUSSO'NIA (in honour of Peter Cusson, once Professor of Botany in the University of Montpelier: his writings are principally on umbelliferous plants). Thunb. nov. act. ups. 3. p. 212. nov. gen. 1. p. 11. Lin. fil. suppl. 182. Juss. gen. p. 217. Lam. ill. t. 187. Schultes, syst. 6. p. 22. D. C. prod, 4. p. 255.

Lin. syst. *Pent-Heptándria, Di-Trigýnia.* Margin of calyx short, entire or with 5-7 acute teeth. Petals 5-7. Stamens 5-7, alternating with the petals. Ovarium turbinate, crowned by a broad disk. Styles 2-3, short, erect, distinct, approximate. Fruit 2-3-celled, roundish, nearly dry.—Cape shrubs; with rather succulent, thick trunks. Leaves glabrous, petiolate, palmate; leaflets 5-7, 1-nerved, entire, or lobed. Flowers greenish.

1 C. spica'ta (Thunb. nov. act. ups. 3. p. 212. t. 13.) leaves palmate; leaflets petiolate, variously and acutely cut, often trifid at the apex; flowers spicate, exactly sessile along the rachis. ♄. G. Native of the Cape of Good Hope. Thunb. fl. cap. 247. Ait. hort. kew. 2. p. 115. Shrub glabrous, 8-10 feet high. Leaflets usually 7, rarely 5, lower ones 3, variously pinnate-parted, ternate at the apex; lobes angularly toothed, very acute. Calyx entire. Flower bud globose. Styles 2-3. Flowers spirally disposed along the rachis of the spike in 5-6 series.

Spiked-flowered Cussonia. Clt. 1789. Shrub 6 to 10 feet.

2 C. thyrsiflòra (Thunb. act. nov. ups. 3. t. 12.) leaves palmate; leaflets sessile, cuneiform, obtuse, truncate, tridentate; flowers racemose, pedicellate along the rachis. ♄. G. Native of the Cape of Good Hope. Jacq. fil. eclog. 1. p. 89. t. 61. C. thyrsoídea, Thunb. nov. gen. 1. p. 11. Pers. ench. 1. p. 298. Leaflets some of them entire, and a little toothed: others are ternate, varying in number from 3 to 5. Calyx acutely 5-toothed. Styles 3. There is a variety of this with jointed leaflets, the lowest joints dilated at end into smaller lobes.

Thyrse-flowered Cussonia. Clt. 1795. Tree 6 to 12 feet.

3 C. tri'ptera (Colla, hort. ripul. 43. t. 26.) leaves palmate, leaflets sessile, variously and deeply pinnatifid, trifid at the apex. ♄. G. Native of the Cape of Good Hope. The leaflets are the number and form of those of *C. spicàta*, but they are sessile, as in *C. thyrsiflòra*. Flowers unknown.

Three-winged Cussonia. Shrub.

Cult. A mixture of peat, loam, and sand is a good soil for the species; and cuttings root readily if planted under a hand-glass.

IV. MARA'LIA (altered from *Aràlia*). Pet. Th. nov. gen. mad. p. 13. no. 43. D. C. prod. 4. p. 255. Aràlia species of Schultes.

Lin. syst. *Pentándria, Trigýnia.* Margin of calyx small. Petals and stamens 5. Styles 3. Ovarium cylindrical. Berry cylindrical, 3-celled, 3-seeded.—A small shrub, native of Madagascar. Leaves pinnate. Racemes hanging. Umbellules on long peduncles. Berries blackish.—This genus differs from all others in the present order, particularly in the ovarium and fruit being cylindrical, not turbinate nor obovate.

1 M. Madagascarie'nsis (D. C. prod. 4. p. 255.). ♄. S. Native of Madagascar. Aràlia Maràlia, Schultes, syst. 6. p. 704.

Madagascar Maralia. Shrub.

Cult. See *Cussònia* above for culture and propagation.

V. GILIBE'RTIA (named after J. E. Gilibert, a French botanist, author of Chloris de Lyon). Ruiz et Pav. fl. per. prod. p. 50. t. 8. D. C. prod. 4. p. 255.—Gastònia species, Lam.

Lin. syst. *Pent-Decándria, Monogýnia.* Margin of calyx entire, drawn out beyond the ovarium. Petals 5-10. Stamens the same number as there are petals, and alternating with them. Ovarium 5-10-celled, crowned by a broad disk above. Style short, thick, conical or pyramidal, composed of 5-10 joined ones, which are erectly conniving at the apex at first, but at length diverging a little. Fruit fleshy.—Shrubs or small trees. Leaves variable. Flowers umbellate, disposed in racemose panicles. This genus differs from *Gastònia* in the stamens being equal in number to the petals, not double that number as in that genus; and in the style being thick and pyramidal, hardly divided at the apex, not parted to the base, and stellate.

1 G. umbella'ta (Ruiz et Pav. fl. per. 3. p. 75. t. 312.) leaves simple; petioles unarmed; limb oval-oblong, obsoletely denticulated, glabrous; umbels terminal, compound. ♄. G. Native of Peru, in the groves of Munna. Calyx 7-toothed. Petals 7. Style thick, conical; stigmas 7, at length spreading a little. Fruit 7-celled. Wangenheìmia umbellàta and Ginánnia umbellàta, Dietr. ex Steud.

Umbellate-flowered Gilibertia. Tree.

2 G. palma'ta (D. C. prod. 4. p. 256.) leaves simple, glabrous above, and clothed with rusty pubescence beneath, cordate, palmately lobed: lobes lanceolate, acute, serrated; petioles long, prickly; flowers umbellate. ♄. G. Native of the East Indies, at Chittagong. Gastònia palmàta, Roxb. hort. beng. 33. Lindl. bot. reg. 894. Calyx plicate. Petals white, nearly ovate, 5-9. Perhaps G. palmàta, Mess. sc. 1825. in Feruss. bull. 1825. oct. 220. From the description the leaves are said to be nearly peltate; the leaflets petiolate, and the petals wanting. Flowers whitish.

Palmate-leaved Gilibertia. Fl. Feb. March. Clt. 1818. Shrub 4 to 6 feet.

3 G. repa'nda (D. C. l. c.) leaves or leaflets broadly ovate, feather-nerved, coriaceous, glabrous on both surfaces, bluntly somewhat attenuated at the base, on short petioles, with repand-toothed margins; flowers umbellate. ♄. S. Native of the Mauritius. Margin of calyx short, entire. Ovarium sulcate, conical in the superior part. Style hardly any; stigmas 5-7, very short, nearly stellate. The leaves or leaflets being detached from the specimen examined, it is doubtful whether the leaves are simple or compound; but from analogy we would rather consider them as compound.

Repand-toothed-leaved Gilibertia. Shrub.

4 G. Nalu'gu (D. C. l. c.) leaves impari-pinnate: with 5 ovate, acuminated, feather-nerved, coarsely and irregularly-toothed, coriaceous, glabrous leaflets; flowers corymbose. ♄. S. Native of Malabar. Nalùgu, Rheed. mal. 2. p. 43. t. 26. Gastònia Nalùgu, Lam. dict. 2. p. 611. Smith, in Rees' cycl. vol. 15. Petals 5. Stamens unknown. Fruit nearly globose, depressed, blueish black, 8-9-seeded. Flowers whitish or green. *Nalugu* is the Brahmin name of the tree.

Nalugu Gilibertia. Shrub 8 to 10 feet.

5 G. paniculà'ta (D. C. l. c.) leaves or leaflets broadly obovate, obtuse, feather-nerved, quite entire, coriaceous, glabrous; flowers panicled, disposed in racemes along the branches of the panicle. ♄. S. Native of the Mauritius and Bourbon. The leaves or the leaflets, whichever they may be, are about a foot long, and 6 inches broad. Panicle 6-8 inches long. Flowers on short pedicels. Margin of calyx entire; flower-bud conical, obtuse, 10-angled. Petals 10, valvate. Stamens 10, alternating with the petals. Style thick, conical, hardly 8-10-lobed at the apex. Ovarium 8, rarely 9-10-celled.

Panicled Gilibertia. Tree.

† *A species not described.*

6 G. saururoìdes (D. C. l. c.) ♄. S. Native of the Moluccas. Gastònica saururoìdes, Roxb. hort. beng. p. 90.

Saururus-like Gilibertia. Tree.

Cult. Shrubs and trees, having handsome foliage. The soil best adapted to grow these is a mixture of sand, loam, and peat; and cuttings are readily rooted, if planted in sand under a hand-glass in heat.

VI. GASTO'NIA (Commerson instituted this genus in honour of Gaston de Bourbon, son of Henry IV. of France; a promoter of botany). Comm. in Juss. gen. 217. Lam. dict. 2. p. 610. D. C. prod. 4. p. 256.

Lin. syst. *Pentándria, Digýnia.* Margin of calyx entire, drawn out beyond the ovarium. Petals 5-16. Stamens double the number of the petals, 2 of which are opposite each petal. Ovarium 8-12-celled. Styles 8-12, short, concrete at the very base. Fruit 8-12-celled, 8-12-ribbed, nearly dry, ex Juss. capsular.—A tree, native of the Mauritius. Leaves impari-pinnate. Flowers umbellate; umbels exinvolucrate, disposed in panicles.

1 G. cutispóngia (Lam. dict. 2. p. 610.) ♄. S. Native of Bourbon, where it is called by the inhabitants *bois d' éponge* or *sponge-wood.* G. spongiòsa, Pers. ench. 2. p. 20. Aralìaceæ, Sieb. fl. maur. exsic. 2. p. 197. A tall smooth tree, covered with spongy bark. Leaves at the tops of the branches impari-pinnate: with 5 coriaceous, ovate, obtuse, quite entire leaflets. Racemes rising under the leaves, bearing umbels, containing about 20 flowers each.

Spongy-barked Gastonia. Tree tall.

Cult. See *Gastònia* above for culture and propagation.

VII. POLY'SCIAS (from πολυ, *poly*, many, and σκια, *skia*, a shadow; in reference to the numerous umbels). Forst. gen. p. 63. t. 32. Lam. dict. 5. p. 559. ill. t. 320. with a figure. D. C. prod. 4. p. 257.

Lin. syst. *Pent-Octándria, Tri-Pentagýnia.* Margin of calyx short, denticulated. Petals 5-7, but usually 8, lanceolate, spreading. Stamens equal in number to the petals, and alternating with them. Style wanting; stigmas 3-5, short, erectly spreading. Berry globose, crowned by the margin of the calyx and stigmas, 4-celled, 4-seeded. Leaves pinnate. Umbels compound or verticillately proliferous; umbellules of many rays, flat. The rest unknown. A very doubtful genus, but probably only a species of *Aràlia.*

1 P. pinna'ta (Forst. l. c.) ♄. G. Native of the islands in the Southern ocean. P. umbellàta, Spreng. ex Steud. nom. 546. A plant has been sent by La Billardière from New Zealand, under the name of *Polýscias*, which rather disagrees with the description given by Forster of his plant, in the branches of the panicle being verticillate, and in the umbellules being 5-7-flowered. Margin of calyx nearly entire. Disk fleshy, covering the ovarium. Styles 2-3, erect, approximate, acute. Leaflets oblong, obtuse at the base, and acuminated at the apex, with somewhat denticulated margins.

Pinnate-leaved *Polyscias.* Tree or shrub.

Cult. See *Cussònia*, p. 387. for culture and propagation.

VIII. TORICE'LLIA (in honour of Dr. Toricelli, who prepared a barometer for the measurement of mountains, and therefore has done something towards the geography of botany). D. C. prod. 4. p. 257.

Lin. syst. *Pentándria, Tetragýnia.* Margin of calyx acutely 5-toothed. Petals 5, oblong, attenuated at the base, and uncinately incurved at the apex. Stamens 5; filaments very short; anthers ovate. Styles 4, straight, short. Berry nearly dry, ovate, crowned by the calyx, 4-celled. Seed unknown.—A small mountain shrub: with terete white glabrous branches, ringed with cicatrices. Leaves alternate, exstipulate, simple, cordate, roundish, membranous, palmately 5-nerved, coarsely and acutely toothed, somewhat 5-lobed, pubescent along the nerves and nervules; petioles rather dilated at the base. Panicle terminal, many flowered. Flowers abortive or polygamous, or the number of parts are rather variable. This genus is nearly allied to *Polýscias.*

1 T. tiliæfòlia (D. C. prod. 4. p. 257.) ♄. H. Native of Nipaul, on the highest mountains. Sambùcus? tiliæfòlia, Wall. mss. Leaves 5-6 inches in diameter, on petioles 3 inches long.

Lime-tree-leaved Toricellia. Shrub 1 to 2 feet.

Cult. This shrub will grow very well in the open ground, and it may be increased by cuttings or seeds.

IX. ARA'LIA (a name of unknown meaning, under which one species was sent to Fagon from Quebec, in 1764, by one Sarrazin, a French physician). D. Don, prod. fl. nep. 185. in a note. Kunth, nov. gen. amer. 5. p. 8. in a note. D. C. prod. 4. p. 257.—Aràlia species of Lin. and other authors.—Aràlia veræ, Blum. bijdr. 869.

Lin. syst. *Pentándria, Pentagýnia.* Margin of calyx very short, entire or toothed. Petals 5, free, and expanded at the apex. Stamens 5. Styles 5, expanded, spreading divaricately. Berry 5-celled, usually torose. Pyrenæ chartaceous.—Herbs and shrubs, indigenous to North America, with compound leaves; and umbellate white flowers, which are usually disposed in panicles.

§ 1. *Unarmed species.*

1 A. nudicau'lis (Lin. spec. 393.) plant stemless; radical leaf one, with a trifid petiole: impari-pinnate divisions, bearing each 5 ovate acute serrated leaflets; scape trifid at the apex, shorter than the leaf: each division bearing a many-flowered umbel, without any involucrum. ♃. H. Native of North America, from Canada to Carolina, and from Lake Huron throughout the woody country to lat 64°, and the Rocky Mountains; and of Newfoundland. Lam. dict. 1. p. 224. Torr. fl. un. st. 1. p. 327. Big. fl. bost. ed. 2. p. 122. Rafin. med. bot. 1. t. 8.—Pluk. alm. t. 238. f. 5. Petals white, reflexed. Stamens exserted. Styles 3-5, short, erect, distinct. The Crees use the root of this plant as a remedy against the venereal disease, under the name of *wawpoos-ootchepeh*, i. e. rabbit-root; and also they apply the bruised bark of its root to recent wounds.—Richardson. The roots were formerly brought over and sold for *sarsaparilla*, and some of the inhabitants of Canada make use of it as such, but it is very different from the true sort. A. nudicaúlis, Blum. bijdr. p. 870. introduced into Java from Japan, is distinct from our plant.

Naked-stemmed Aralia. Fl. June, July. Clt. 1731. Pl. ½ to 1 foot.

2 A. racemòsa (Lin. spec. 393.) stem herbaceous, smooth, divaricately branched; petioles tripartite, the partitions bearing each 3-5, ovate or cordate, acuminated, serrated, smoothish leaflets; peduncles axillary, and disposed in a terminal raceme, umbelliferous; involucrum small, of few leaves. ♃. H. Native of North America, from Canada to Virginia, in rocky shady situations; throughout Canada, &c. from Lake Huron to the Saskatchawan. Schkuhr, handb. 1. t. 86. Hayn. term. bot. t. 38. f. 5.—Corn. can. t. 75.—Moris. hist, sect. 1. t. 2. f. 9. Petals greenish-white, spreading. Styles 5, short, erect, hardly recurved at the apex. Fruit 5-ribbed. Stamens equal in length to the petals. The plant is called *spikenard* in North America, and is highly esteemed as a medicine. Axillary branches leafy.

Racemose-flowered Aralia. Fl. June, Sept. Clt. 1658. Pl. 3 to 4 feet.

3 A. HU'MILIS (Cav. icon. 4. p. 7. t. 313.) stem herbaceous, glabrous, a little branched; leaves impari-pinnate, pubescent: leaflets cordate, acute, serrated; umbels disposed in terminal racemes; involucra very short, of many leaves. 4. G. Native of New Spain. The fruit, according to Cav. icon. is nearly globose. Styles 5, erect, rather distant. Stem variegated with brown tubercles. Petals green.

Humble Aralia. Pl. 1½ foot.

4 A. PUBE'SCENS (D. C. cat. hort. monsp. 1813. p. 80.) stem woody, unarmed, glabrous, branched; leaves impari-pinnate, pubescent; leaflets ovate-lanceolate, serrated, attenuated at the base, and acuminated at the apex; umbels numerous, disposed in a terminal raceme; involucra very short, of few leaves. ħ. G. Native of New Spain. A. scàbra, Presl, in herb. Hænke. Petioles not dilated into auricles at the base. Styles 5, divaricately recurved. Fruit globose, dark purple.

Pubescent Aralia. Clt. 1818. Shrub.

5 A. HI'SPIDA (Michx. fl. bor. amer. 1. p. 185.) stem suffruticose, very hispid at the base from bristles; leaves bipinnate; leaflets ovate, acute, deeply serrated, glabrous; petioles hispid; umbels on long peduncles; involucra of many short setaceous leaves. ħ. H. Native of North America; in stony woods in New England, &c.; on high mountains in Pennsylvania and Virginia; Canada, from Lake Huron to the Saskatchawan; Hudson's Bay, and of Newfoundland. Vent. hort. cels. t. 41. Sims, bot. mag. t. 1085. Lodd. bot. cab. 1306. A. Muhlenbergiàna, Schultes, syst. 6. p. 704. does not differ from this species. The shrub is called *Wild-elder*. Stem paniculately branched at top.

Hispid Aralia. Fl. June, July. Clt. 1799. Shrub 1 foot.

† *Unarmed species, which are not sufficiently known.*

6 A. CORDA'TA (Thunb. jap. p. 127.) stem almost herbaceous, angular, unarmed, a little branched; leaves cordate-ovate, serrate-toothed, scabrous on both surfaces; pedicels of umbels tomentose. 4. H. Native of Japan. Dos Jen, Kœmpf. amœn. 5. p. 826. Styles 5, divaricate, ex Thunb.

Cordate-leaved Aralia. Pl. ?

7 A. JAPÓNICA (Thunb. fl. jap. 128.) stem shrubby, unarmed; leaves petiolate, 7-nerved, 7-lobed: lobes ovate, serrated at the apex; panicles terminal; peduncles umbelliferous. ħ. H. Native of Japan, near Nagasaki. Banks, icon. Kæmpf. t. 10. Styles 5, diverging. Berry striated. Petals ovate, acute, reflexed (Thunb.). Leaves coriaceous, glabrous in the adult state, but when young woolly on both surfaces. (Blum. bijdr. p. 371.) Petals white.

Japan Aralia. Shrub 5 to 6 feet.

8 A. SCHEFFLE'RA (Spreng. pug. 1. p. 28.) stem shrubby, smooth; leaves on long petioles, digitate; leaflets 5, petiolulate, lanceolate, attenuated at the base, serrulated, glabrous on both surfaces. ħ. G. Native of New Zealand. Schefflèra digitàta, Forst. gen. t. 23. Lam. ill. t. 221. Petals 5, nearly spatulate, erect, not as in the genus *Sciadophy'llum*, cohering into a calyptra at the apex. Styles 8-10, diverging, not erect, as in *Hédera*. Berry 8-10 angled.

Scheffler's Aralia. Shrub.

9 A.? OCTOPHY'LLA (Lour. coch. p. 187.) stem almost arboreous, unarmed; leaves petiolate, digitate: leaflets 8, oblong, obtuse, quite entire, glabrous; panicle umbellate. ħ. G. Native of Cochin-china. Flowers yellow, of 5 petals. Stigmas 5, sessile. Berry ovate, 5-seeded. Perhaps a species of *Poly'scias*. Panicle large, ending in umbels, which are without involucra.

Eight-leafletted Aralia. Shrub 10 feet.

10 A.? PALMA'TA (Lam. dict. 1. p. 224. but not of Lour.) stem shrubby, unarmed; leaves petiolate, pinnately 9-nerved, 9-cleft: lobes lanceolate, serrated; berry sulcately angular, 6-8-celled. ħ. S. Native of the Moluccas.—Rumph. amb. 4. t. 43. Perhaps a species of *Poly'scias* or *Hédera*. Umbels crowded, terminal.

Palmate-leaved Aralia. Shrub.

11 A.? MI'CANS (Willd. herb. ex Spreng. syst. 1. p. 953.) leaves digitate; leaflets or lobes 10, subcordate, oblong, acuminated, mucronately toothed, hispid above, and silky beneath; heads disposed in racemes. ħ. S. Native country unknown. Perhaps a species of *Hédera*.

Glittering Aralia. Tree or shrub.

§ 2. *Prickly species.*

12 A. SPINÒSA (Lin. spec. p. 392.) stem arboreous, and are, as well as the petioles, prickly; leaves doubly and triply pinnate; leaflets ovate, acuminated, deeply serrated; panicle much branched, beset with velvety stellate down; umbels numerous; involucra small, of few leaves. ħ. H. Native of North America, in fertile low woods; of Carolina and Virginia; likewise in the Illinois country. Wats. dend. brit. t. 116. Comm. hort. amst. 1. t. 47. Pluk. alm. t. 20. Schmidt, arb. 102 and 103. A tree about 8-12 feet high, with a simple stem. Petals white, reflexed. Styles 5, divaricate, arched. Fruit 5-ribbed. Known under the name of *angelica-tree*. The berries used in an infusion of wine or spirits are a remarkable medicine for relieving rheumatic pains.

Var. β, *inérmis* (Pursh, fl. amer. sept. 1. p. 209.) stem spinose, glaucous; petioles unarmed. ħ. H. Native of South Carolina, near Charlestown.

Spiny Aralia or Angelica-tree. Fl. Aug. Sept. Clt. 1688. Tree 8 to 12 feet.

13 A. MONTA'NA (Blum. bijdr. p. 870.) stem arborescent, and are, as well as the petioles and base of the leaves, prickly; leaves decompound; leaflets ovate, acuminated, obliquely subcordate at the base, doubly serrated, hairy on both surfaces; panicle branched; flowers umbellate. ħ. S. Native of Java, on the mountains of Seribu, where it is called *Kibohoya*.

Mountain Aralia. Shrub 8 to 10 feet?

14 A. CHINE'NSIS (Lin. spec. 393.? Blum. bijdr. p. 870.) stem arborescent, and is, as well as the petioles, prickly; leaves bipinnate, decompound: leaflets ovate-oblong, acuminated, unequally rounded at the base, sharply serrated, villous; panicle branched; flowers glomerate. ħ. S. Native of Java, on the mountains (Blum.), China (Lin.), Lour. coch. 187. Styles diverging, revolute. Petioles villous, bearing a few straight prickles. The figure in Rumph. amb. 4. t. 44. cited by Linnæus for this plant, is a species of *Leèa*. Loureiro describes the plant as very troublesome to travellers, with its numerous crooked prickles, as it climbs in the hedges. According to him the corolla is white. Styles scarcely any.

China Aralia. Tree 10 to 12 feet.

15 A. ERINA'CEA (Hook. in Brewst. edinb. journ. sc. 1827. p. 64.) stem very spiny; leaves nearly palmate, very acute: lobes cut; petioles and nerves of leaves spiny; umbellules globose, disposed in racemes. ħ. H. Native of the west coast of North America, in Queen Charlotte's islands.

Erinaceous Aralia. Shrub.

16 A.? PENTAPHY'LLA (Thunb. fl. jap. 128.) stem arboreus, prickly; leaves digitate: leaflets 5, ovate, acute, somewhat petiolate, serrated at the top; umbels simple, pedunculate. ħ. H. Native of Japan. Pànax spinòsa, Lin. fil. suppl. 441. ex Lam. dict. 2. p. 715.

Five-leaved Aralia. Tree.

Cult. The hardy herbaceous species of *Aràlia* grow best in peat or vegetable mould, and are increased by dividing at the

root, or by seed. The hardy shrubby kinds also grow best in peat-earth, and are very ornamental and curious; they are increased by seeds brought from the places of their natural growth, which do not vegetate until the second year; or by slips of the roots. The other species being either green-house or stove plants, require to be grown in pots, in a mixture of loam, peat, and sand; and cuttings of them root readily under a hand-glass.

X. SCIODAPHY'LLUM (*σκιοεις, skioeis*, shady; from *σκια, skia*, shadow, and *φυλλον, phyllon*, a leaf; the leaves are large, and usually digitate, and afford much shade). P. Browne, jam. p. 190. Poir. dict. 6. p. 745. Spreng. syst. 1. no. 1139. Blum. bijdr. p. 874. D. C. prod. 4. p. 259.—Actinophýllum, R. et Pav. fl. per. prod.—Aràlia species, Blume, in litt, &c.

Lin. syst. *Pentándria, Pentagy'nia.* All as in *Aràlia*, but the petals cohere in the form of a calyptra at the apex, notwithstanding it ought perhaps still to be joined with *Aràlia*.

§ 1. *Leaves simple, undivided.*

1 S. hu'mile (Blum. bijdr. p. 875.) shrub parasitical, diffuse; leaves simple, ovate-oblong, acuminated, distantly serrated, coriaceous, glabrous; racemes terminal; flowers umbellate, tetrandrous. ♄. S. Native of Java, in woods on Mount Salak.

Humble Sciodaphyllum. Shrub diffuse.

§ 2. *Leaves simple, palmate-lobed.*

2 S. palma'tum (Blum. l. c. p. 875.) stem arboreous, prickly; leaves membranous, glabrous, palmately 5-9-parted: segments lanceolate, serrated from the middle to the apex; racemes axillary; flowers umbellate, with 8-12 stamens. ♄. S. Native of Java, in humid parts of woods on the mountains, where it is called *tjankuran* by the natives. Fruit hemispherical, 6 lines in diameter.

Palmate-leaved Sciodaphyllum. Tree.

§ 3. *Leaves trifoliate.*

3 S. sca'ndens (Blum. bijdr. p. 878.) stem shrubby, scandent; leaves trifoliate; leaflets lanceolate, much acuminated, quite entire, coriaceous, glabrous: the middle one on a long petiole; racemes crowded, terminal, divaricate; flowers umbellate, pentandrous. ♄. ◡. S. Native of Java, in woods on Mount Tjerimai.

Scandent Sciodaphyllum. Shrub cl.

4 S. parasíticum (Blum. bijdr. p. 877.) stem shrubby, parasitical; leaves ternate: leaflets oblong, acuminated, obtuse at the base, remotely serrated, coriaceous, glabrous, nearly veinless; racemes axillary and terminal, solitary or twin; flowers umbellate, hexandrous. ♄. S. Native of Java, at the foot of Mount Salak, where it is called *Ramo giling huntje.*

Parasitic Sciodaphyllum. Shrub parasitical.

§ 4. *Leaves digitate.*

* *East Indian species.*

5 S. subave'ne (Blum. bijdr. p. 876.) stem frutescent; leaves digitate: leaflets 3-5, oblong, acuminated at both ends, coriaceous, nearly veinless; racemes crowded, terminal, diverging; flowers umbellate, pentandrous. ♄. S. Native of Java, on Mount Salak, in woods, where it is called *Ramo-huntje* by the natives.

Nearly-veinless-leaved Sciodaphyllum. Shrub.

6 S. tomentòsum (Blum. bijdr. p. 877.) stem pubescent; leaves digitate; leaflets 5-7, oblong, acuminated, rounded at the base, shining above, but clothed with stellate tomentum beneath; racemes panicled, axillary, and terminal; flowers umbellate, pentandrous. ♄. S. Native of Java, in woods on Mount Burangrang.

Var. β, farinòsum (Blum. bijdr. p. 875.) leaflets 7, ending in a long taper-point each. ♄. S. Native of the west of Java, in mountain woods, where it is called *Pangany tapok.* Actinophýllum farinòsum, Blum. cat. hort. buit. p. 43.

Tomentose Sciodaphyllum. Shrub.

7 S. ellípticum (Blum. bijdr. p. 878.) stem shrubby, scandent; leaves digitate; leaflets 5-7, rarely 3, elliptic, acutish at both ends, coriaceous, glabrous; panicle terminal, divaricate; flowers umbellate, pentandrous. ♄. ◡. S. Native of Java, at the foot of Mount Salak, where it is called *Ramo-gunti* by the natives. Petals purplish.

Elliptical-leafletted Sciodaphyllum. Shrub cl.

8 S. divarica'tum (Blum. bijdr. p. 876.) stem arborescent, sometimes scandent; leaves digitate: leaflets 5-9, petiolulate, oblong, bluntish at both ends, glabrous; racemes panicled, terminal; flowers umbellate, pentandrous. ♄. S. Native of Java, on the mountains in humid woods, in the province of Buitinzorg, where it is called *Ramo-giling* or *Sanga-boanah.* Actinophyllum divaricàtum, Blum. cat. hort. buit. p. 42. and in flora 1825. p. 147.

Divaricate Sciodaphyllum. Shrub cl.?

9 S. lu'cidum (Blum. bijdr. p. 877.) stem arborescent; leaves digitate: leaflets 11-12, oblong, acuminated, rounded at the base, coriaceous, glabrous; racemes crowded, terminal, divaricate, glabrous; flowers umbellate, pentandrous. ♄. S. Native of Java, on the top of Mount Salak.

Shining Sciodaphyllum. Tree.

* * *American species.*

10 S. Brównii (Spreng. syst. 1. p. 953.) stem arboreous; leaves digitate; leaflets 7-11, nearly umbellate, petiolulate, oblong-lanceolate, glabrous, unequal; racemes compound, very long, nutant; flowers nearly capitate, pentandrous; corollas hemispherical. ♄. S. Native of Jamaica, on the mountains in woods. Sciodaphy'llum, Browne, jam. 195. t. 19. f. 1. Aràlia Sciodaphy'llum, Swartz, prod. 55. Hédera Sciodaphy'llum, Swartz, fl. ind. occ. 1. p. 519. Schultes, syst. 5. p. 510. Vìtis heptaphy'lla, Lin. mant. p. 212. ex Smith, exclusive of the country. The central leaflets of the leaves are smallest. Anthers purple.

Browne's Sciodaphyllum. Clt. 1793. Tree 10 to 15 feet.

11 S. cónicum (Poir. dict. 6. p. 746.) stem shrubby; leaves digitate: leaflets 7-13, petiolulate, oblong, abruptly acuminated, coriaceous, glabrous, reticulately veined; racemes 2-3, rather velvety; flowers capitate, with 7-8-9-10-11 stamens; corollas conical. ♄. S. Native of Peru, in groves. Actinophy'llum cónicum, Ruiz et Pav. fl. per. 3. p. 74. t. 309. Heads of flowers about the size of a pea. Corollas of a whitish-red colour. Branches violaceous.

Conical-flowered Sciodaphyllum. Shrub 10 to 12 feet.

12 S. penta'ndrum (Poir. dict. 6. p. 747.) stem shrubby, somewhat arboreous; leaves digitate: leaflets 7-11, petiolulate, oblong, acuminated at the apex, coriaceous, glabrous above, but beset with stellate pili beneath; racemes 1-3, woolly; flowers capitate, pentandrous; corollas conical, obtuse. ♄. S. Native of Peru. Actinophy'llum pentándrum, Ruiz et Pav. fl. per. 3. p. 75. t. 311. Corollas of a whitish purple colour; anthers yellow. Berry whitish, about the size of a cherry. Leaflets dark-brown beneath. Racemes pale-reddish.

Pentandrous Sciodaphyllum. Clt. 1820. Tree 18 to 20 ft.

13 S. angula'tum (Poir. dict. 6. p. 745. exclusive of Browne's synonyme,) stem arboreous; leaves digitate: leaflets 7-11, petiolulate, oblong, acuminated, concave at the base, shining above,

but clothed with powdery velvety rusty down beneath; racemes elongated, granular; flowers capitate, with 7-9 stamens; corollas obovate, angular, and truncate. ♄. G. Native of Peru and New Granada, on shady hills. Actinophy'llum angulàtum, Ruiz et Pav. fl. 5. p. 73. t. 307. H. B. et Kunth, nov. gen. amer. 5. p. 9. Heads of flowers about the size of a walnut, yellowish. Berry dark purple, cuneiform, angular. Styles 4-6.

Angular Sciodaphyllum. Tree 20 to 30 feet.

14 S. pedicella'tum (Poir. dict. 6. p. 746.) stem scandent; leaves digitate: leaflets 9-13, petiolulate, oblong, acuminated, somewhat sinuately undulated, and concave at the base, glabrous; racemes many; flowers pedicellate, umbellate on the branches; corollas hemispherical. ♄. ◡. G. Native of Peru, in groves at Munna. Actinophy'llum pedicellàtum, Ruiz et Pav. fl. per. 3. p. 73. t. 308. Stem rooting, filled with medullæ; branches purplish. Racemes purplish, a foot long. Stamens 6-7. Berries angularly globose, greenish purple.

Pedicellate-flowered Sciodaphyllum. Shrub cl.

15 S. acumina'tum (Poir. dict. 6. p. 746.) stems scandent; leaves digitate: leaflets 7-11, petiolulate, oblong, obliquely acuminated, coriaceous, glabrous, reticulately veined; racemes 2-5, tomentose; flowers pentandrous and octandrous, capitate; corollas hemispherical, apiculated. ♄. G. Native of Peru, in groves. Actinophy'llum acuminàtum, Ruiz et Pav. fl. per. 3. p. 74. t. 310. Corollas yellow, disposed in heads, which are a little larger than a pea. Styles 5.

Acuminated-leaved Sciodaphyllum. Shrub cl.

16 S. anómalum (G. Don, in Loud. hort. brit. p. 112.) arboreus; leaves digitate: leaflets 5-7, oblong-lanceolate, acuminated at the apex, green and smooth on both surfaces: outer ones the smallest; umbels capitate, panicled; branches green and smooth. ♄. S. Native of Trinidad, in woods. Carolínea insígnis, Hortul. Flowers whitish yellow. Largest leaflets 1 foot long.

Anomalous Sciodaphyllum. Clt. 1817. Tree 20 feet.

17 S. Quindue'nse (D. C. prod. 4. p. 261.) stem shrubby, scandent; leaves digitate: leaflets 7, oblong, acuminated, quite entire, glabrous; umbels 4-flowered, racemose; flowers with 8-10 stamens. ♄. ◡. G. Native of the Andes, about Quindiu, at the height of 3300 feet above the level of the sea. Aràlia Quinduénsis, H. B. et Kunth, nov. gen. amer. 5. p. 8. t. 417. f. 1. Styles 3-10, spreading. Petals cohering at the apex. Fruit 8-10-ribbed. Perhaps a species of *Aràlia*.

Quindiu Sciodaphyllum. Shrub cl.

Cult. All the species are worth cultivating in gardens for the sake of their fine handsome large foliage. A mixture of loam, peat, and sand is a good soil for them; and they are easily increased by cuttings under a hand-glass in sand, placed in a moderate heat.

XI. HE'DERA

(a name for which many etymologies have been offered. The best explanation is, that it has been derived from *hedra*, cord in Celtic, *lierre* in French. The English name of ivy is derived from the Celtic word *iw*, green, from its being always green. The word *iw* is given to *Táxus* by the French, hence also the English name of the genus *Yew*). Swartz, fl. ind. occ. p. 518. D. Don, prod. nep. p. 186. Gærtn. fruct. 1. t. 26. D. C. prod. 4. p. 261.—Aràlia sect. Gymnapteína, Blum. bijdr. p. 871.—Hédera and Aràlia species Lin. and all other authors.

Lin. syst. *Pent-Decándria, Pent-Decagy'nia.* Margin of calyx elevated or toothed. Petals 5-10, not cohering at the apex in the form of a calyptra. Stamens 5-10. Styles 5-10, conniving, or joined in one. Berry 5-10-celled.—Climbing or erect shrubs. Leaves simple or compound. Flowers umbellate or capitate.

§ 1. *Leaves simple, undivided, or lobed.*

1 H. He'lix (Lin. spec. 292.) stems climbing, throwing out roots from the side by which it is placed to any substance; leaves coriaceous, glabrous, shining, with 5 angular lobes; those on the old upright branches, which form the tops of the plants, ovate, acute, quite entire; umbels simple, pubescent. ♄. ◡. H. Native of Europe. Common ivy is a valuable ornamental evergreen climbing shrub. It is useful for covering walls and sides of houses, or training into fanciful shapes, as of human figures, &c. on skeletons of wire-work, or trained up to a stake, so as to form a standard; but when ivy has reached to the top of any support, the branches shorten, and become woody, forming themselves into large bushy heads, and the leaves become entire and more of an oval shape, and not divided into lobes like the lower ones, and in this state they produce flowers at the end of every shoot. The berries are black at maturity. The flowers are yellowish, and appear late in the season, and in consequence is much resorted to by bees and flies, when little other food is to be had. The berries increase during the winter, are full formed in February, and ripen in April; furnishing food for wild pigeons, blackbirds, thrushes, &c. in the spring. Blackbirds, and several other birds, build their nests in the stumps of ivy tufts. Sheep are fond of the leaves, especially during severe weather. The ancients held ivy in great esteem, and Bacchus is represented crowned with it to prevent intoxication; and Homer describes his heroes as drinking out of a cup made of the wood. Haller says, that the leaves are given in Germany as a specific in atropus in children. Common people apply them to issues and corns. The berries are aperient and emetic. The wood is soft and porous, so as to transmit liquids if turned of a sufficient degree of thinness. The roots are used by leather-cutters to whet their knives upon. The whole plant is rather aromatic; and a very fragrant resin exudes from the old stems when bruised. The specific name *Hèlix* is derived from *ειλεω, eileo*, to encompass or turn round; in reference to the twining stems.

Var. α, vulgàris (D. C. prod. 4. p. 261.) pedicels clothed with stellate down; floral leaves ovate; fruit black; leaves of the rooting branches 5-lobed, with white veins. ♄. ◡. H. Native of Europe, in woods, hedges, and on old buildings. Hédera Hèlix, Lin. spec. 292. Smith, engl. bot. t. 1267. Curt. lond. fasc. 1. t. 16. Fl. dan. t. 1027. Bull. fr. t. 133. Drev. and Hayne, pl. europ. t. 66. There is a variegated-leaved variety of this in the gardens.

Var. β, Canariénsis (D. C. prod. 4. p. 261.) pedicels beset with lepidotted pubescence; floral leaves subcordate: those of the creeping branches 5-lobed, larger than those of the common ivy; fruit red. ♄. ◡. H. Native of the Canary Islands. Hédera Canariénsis, Willd. in berl. mag. 2. p. 170. t. 5. f. 1. Schultes, syst. 5. p. 508. In the gardens this is called Irish Ivy.

Var. γ, chrysocárpa (D. C. prod. 4. p. 261.) pedicels lepidotted; floral leaves elliptic, usually cuneated at the base; fruit yellow. ♄. ◡. H. Native of the north of India. H. Hèlix, Wall. in Roxb. fl. ind. 2. p. 515. D. Don, prod. fl. nep. 187. It differs from var. *α, vulgàris* in the stature being more gigantic, in the leaves being much more cuneated at the base, in the pedicels being lepidotted, in the berries being yellow and usually 5-seeded. H. Poética, C. Bauh. pin. p. 305. H. chrysocárpos, Dalech. lugd. H. Dionýsias, J. Bauh. hist. with a figure.

Helix or Common Ivy. Fl. Oct. Britain. Shrub cl.

2 H. corymbòsa (Choisy, mss. in herb. D. C. ex prod. 4. p. 262.) stem arboreous, bushy; leaves cordate, acute, bluntly 5-angled, when young velvety on the nerves beneath, but in the adult state glabrous on both surfaces; flowers corym-

bose. ♄ . ◡. H. Native of the Canary Islands, where it has been probably introduced, and is called *Pepìta de St. Augustin*. This is probably nothing but the Irish ivy of the gardens.

Corymbose-flowered Ivy. Shrub cl.

3 H. polyaca'ntha (Wall. cat. no. 4907.) stem beset with short, conical prickles; leaves glabrous, 5-lobed, cordate at the base: lobes serrated; panicle large, pubescent; umbellules many-flowered, furnished with woolly scales at the base of the pedicels; flower buds white from pubescence. ♄ . H. Native of Nipaul.

Many-spined Ivy. Tree.

4 H. arbòrea (Swartz, fl. ind. occ. p. 518.) stem arboreous, unarmed; leaves oval, acuminated; racemes terminal; umbels pedunculate; pedicels longer than the flowers. ♄ . S. Native of Jamaica and Porto Rico. Aràlia arbòrea, Lin. amœn. acad. 5. p. 369. Jacq. hort. schœnbr. t. 51. Leaves feather-nerved at the base, not 3-nerved, as in *H. capitàta*. Flowers almost umbellate; umbellules girded by short scarious involucels. Berry hexagonal.

Tree Ivy. Tree 10 to 12 feet.

5 H. pe'ndula (Swartz, fl. ind. occ. 1. p. 512. icon. t. 9.) stem arboreous, unarmed; leaves ovate, lanceolate, entire; umbels almost capitate; peduncles very long, drooping. ♄ . S. Native of Jamaica, on the higher mountains. Willd. spec. 1179. Schultes, syst. 5. p. 509. Petals oblong, spreading. Style short. Berry 5-seeded.

Pendulous-umbelled Ivy. Clt. 1824. Tree 12 to 15 feet.

6 H. umbelli'fera (D. C. prod. 4. p. 262.) stem frutescent, unarmed; leaves on long petioles, lanceolate, acuminated, rarely serrated; peduncles umbellate, trifid; umbellules capitate, nearly globose, ♄ . S. Native of Amboyna, on the mountains. Pseùdo-sántalum Amboinénse, Rumph. amb. 2. p. 54. t. 12. Aràlia umbellífera, Lam. dict. 1. p. 225. Schultes, syst. 6. p. 697. There is a yellow gum issues from this tree, which becomes blackish on drying, and is sweet scented, which is called *Saruru* in Amboyna. Flowers whitish.

Umbelliferous Ivy. Tree.

7 H. cunea'ta (D. C. prod. 4. p. 262.) stem arboreous, unarmed; leaves petiolate, broadly oblong, acute, quite entire, cuneated at the base, membranous, glabrous, with pinnate nerves: the 2 lower nerves parallel with the margins, rising from an acute angle; umbels terminal, of many rays; heads half globose. ♄ . S. Native of Brazil, where it was collected by Schott. Aràlia umbellàta, Pohl. in litt. but not of Lam.

Cuneate-leaved Ivy. Tree small.

8 H. nu'tans (Swartz, fl. ind. occ. 1. p. 514.) stem arboreous, unarmed; leaves elliptic, acutish, coriaceous, entire; umbels nodding, hemispherical; peduncles erectish. ♄ . S. Native of the south of Jamaica, on the tops of the Blue Mountains. Very like *H. péndula*, but the peduncles are shorter, the petioles terete, and the petals reflexed. Style short, 5-angled.

Drooping-umbelled Ivy. Tree 10 to 15 feet.

9 H. ramiflòra (D. C. prod, 4. p. 262.) stem arboreous, unarmed; leaves petiolate, acute, quite entire, membranous, glabrous, hardly cuneated at the base, with pinnate nerves: the 2 lower nerves parallel to the margin, and rising from an acute angle; racemes few, rising from the old branches; umbels semiglobose. ♄ . S. Native of Brazil, where it was collected by Schott. Aràlia ramiflòra, Pohl. in litt. Flowers 15-16 in each umbel, pedicellate.

Branch-flowered Ivy. Tree 10 to 15 feet.

10 H. capita'ta (Smith, icon. pict. rar. 1. t. 4.) stem arboreous, unarmed; leaves elliptic, acuminated, entire, with pinnate nerves: the 2 lower nerves rising from an acute angle; raceme terminal, compound; umbels capitate, on long peduncles; flowers sessile. ♄ . S. Native of Jamaica, Guadaloupe, and the province of Caraccas, in subalpine places. Swarts, fl. ind. occ. p. 546. H. B. et Kunth, nov. gen. amer. 5. p. 2. Schultes, syst. 5. p. 510. Aràlia capitàta, Jacq. amer. 89. t. 61. Petioles long, terete. Leaves cuneated at the base, 3-nerved. (Horn. add. 125.) Flowers as if they were in a calyculate receptacle. Petals oblong, acute, white. Berry globose, 5-celled. Styles 3-5, contiguous, joined at the base, at length reflexed.

Capitate-flowered Ivy. Fl. Oct. Nov. Clt. 1823. Tree 50 to 60 feet.

11 H. multiflòra (D. C. prod. 4. p. 262.) stem arboreous, unarmed; leaves on long petioles, oblong-elliptic, acuminated, somewhat cuneated at the base, quite entire, membranous, glabrous, with pinnate nerves: the 2 lower nerves remote from the rest, parallel with the margin, and rising from an acute angle; racemes panicled, diverging: heads globose. ♄ . S. Native of Brazil, where it was collected by Schott. Aràlia multiflòra, Pohl, in litt.

Many-flowered Ivy. Tree 10 to 12 feet.

12 H. Mutisia'na (D. C. prod. 4. p. 262.) stem arboreous? unarmed; leaves oblong, somewhat serrulated at the apex, acute, rounded at the base, coriaceous, glabrous, shining; racemes solitary; flowers capitate. ♄ . S. Native of New Granada, at the altitude of from 3000 to 4000 feet. Aràlia Mutisiàna, H. B. et Kunth, nov. gen. amer. 5. p. 1. Aràlia heterophylla, Mut. but not of Willd. Styles 5, short, conniving.

Mutis's Ivy. Tree or shrub.

13 H. ova'ta (Wall. cat. no. 4911.) stem unarmed; leaves ovate, elliptic, quite entire, coriaceous, ending in a short blunt point, rusty beneath; peduncles axillary, solitary, and terminal, umbellate; umbellules many-flowered. ♄ . S. Native of Madras.

Ovate-leaved Ivy. Shrub.

14 H. acutifòlia (D. C. prod. 4. p. 263.) stem arboreous; leaves roundish-ovate, acuminated; umbels corymbose. ♄ . S. Native of South America. Humb. and Bonpl. Aràlia acutifòlia, Willd. in Schultes, syst. 6. p. 697.

Acute-leaved Ivy. Tree or shrub.

15 H. avicenniæfòlia (D. C. prod. 4. p. 263.) arboreous, unarmed; leaves oblong-lanceolate, acute at the apex, and acutish at the base, quite entire, coriaceous, glabrous above, but clothed with white tomentum beneath; corymbs branched; flowers capitate. ♄ . S. Native of South America, in the province of Quito, between Tambo de Burgay and Delay, at the altitude of 4000 to 5000 feet. Aràlia avicenniæfòlia, H. B. et Kunth, nov. gen. amer. 5. p. 2. t. 2. Aràlia tarchonanthifòlia, Willd. in Schultes, syst. 6. p. 698. Styles 4-5, short, connivent.

Avicennia-leaved Ivy. Tree.

16 H. Cumane'nsis (D. C. l. c.) stem arboreous, unarmed; leaves ovate, acuminated, cuneated at the base, quite entire, somewhat 3-nerved, membranous, glabrous, shining. ♄ . S. Native of Cumana, in shady places at Mount Cocollar, at the elevation of 1200 feet. Aràlia Cumanénsis, H. B. et Kunth, nov. gen. amer. 5. p. 3. Flowers and fruit unknown.

Cumana Ivy. Tree.

17 H. catalpæfòlia (D. C. l. c.) stem arboreous; leaves ovate, subcordate, acuminated, quite entire, glabrous; racemes short, bracteate at the base; heads of flowers globose. ♄ . S. Native of South America. Humb. et Bonpl. Aràlia catalpæfòlia, Willd. in Schultes, syst. 6. p. 697.

Catalpa-leaved Ivy. Tree or shrub.

18 H. septemne'rvia (D. C. l. c.) stem arboreous? unarmed; leaves ovate, acuminated, rounded at the base, 7-nerved, rather coriaceous, glabrous; racemes panicled; heads globose. ♄ . S. Native of New Granada, at the altitude of 4000 feet. Aràlia septemnérvia, H. B. et Kunth, nov. gen. amer. 5. p. 3. Said to be hardly distinct from *H. capitàta*. Style 1.

Seven-nerved-leaved Ivy. Tree or shrub.

19 H. TURBACE'NSIS (D. C. l. c.) stem arboreous; leaves on long petioles, acute at the base, membranous, glabrous, of one colour; some of them are undivided, and others are trifid at the apex: with the lobes or segments entire and acuminated: having the recesses between the lobes rounded. ♄. S. Native of New Granada, in hot places near Turbaco, where it is called *Arbol de Guaco*. Aràlia Turbacénsis, H. B. et Kunth, nov. gen. amer. 5. p. 3. Flower and fruit unknown.

Turbaco Ivy. Tree 40 to 50 feet.

20 H. DI'SCOLOR (D. C. l. c.) stem arboreous? leaves petiolate, rather coriaceous, glabrous, rounded at the base, shining above, and of a rusty-purplish colour beneath: some of them undivided and 1-nerved, and others are 3-nerved and trifid at the apex: having the lobes somewhat acuminated, the intermediate one the longest; racemes panicled; heads globose. ♄. S. Native of New Granada? Aràlia díscolor, H. B. et Kunth, nov. gen. amer. 5. p. 4. Flowers and fruit not sufficiently known.

Discoloured-leaved Ivy. Tree or shrub.

21 H. ARGENTA'TA (D. C. l. c.) stem arboreous, unarmed; leaves petiolate, coriaceous, glabrous and shining above: but marked by silvery dots beneath; some of which are undivided and 1-nerved, and others are 3-nerved and trifid at the apex: having the lobes or segments somewhat acuminated: the intermediate lobe remotely serrated; racemes panicled; heads of flowers globose. ♄. S. Native of New Granada, in cold parts. Aràlia heterophýlla, Willd. in Schultes, syst. 6. p. 698. Aràlia argentàta, H. B. et Kunth, nov. gen. amer. 5. p. 4. t. 414. Styles 3, conniving. Petals white.

Silvery-dotted Ivy. Tree 15 to 20 feet.

22 H. CRASSINE'RVIA (D. C. l. c.) stem arboreous? leaves petiolate, acute at the base, coriaceous, glabrous above and shining, densely beset with rusty dots beneath: some entire, ovate-oblong, and others 3-lobed and somewhat acuminated; racemes panicled; heads globose. ♄. G. Native of South America, along with *H. argentàta*. Aràlia crassinérvia, H. B. et Kunth, nov. gen. amer. 5. p. 5. Styles 5-6, conniving.

Thick-nerved-leaved Ivy. Tree.

23 H. OBTUSI'LOBA (D. C. l. c.) stem arboreous? leaves petiolate, truncately rounded at the base, 5-nerved, coriaceous, glabrous and shining above, but beset with fuscescent dots beneath, 5-cleft: segments obtuse, ovate-oblong; racemes panicled; heads of flowers elliptic-globose. ♄. S. Native in temperate places towards Loxa, at the altitude of 3300 feet. Aràlia obtusíloba, H. B. et Kunth, nov. gen. amer. 5. p. 5. Willd. in Schultes, syst. 6. p. 699. Petals white, glabrous. Styles 4, conniving.

Blunt-lobed-leaved Ivy. Tree or shrub.

24 H. ANGULA'RIS (D. C. prod. 4. p. 263.) stem arboreous; leaves 5-angled, obtuse, tomentose beneath; flowers capitate. ♄. S. Native of South America, Humb. et Bonpl. Aràlia angulàris, Willd. in Schultes, syst. 6. p. 698.

Angular-leaved Ivy. Tree.

25 A. PLATANIFÒLIA (D. C. l. c.) stem arboreous; leaves petiolate, coriaceous, glabrous above and shining, but clothed with rusty tomentum beneath, truncate at the base, 7-nerved, 7-cleft at the apex: lobes or segments oblong, acuminated, quite entire; racemes panicled; heads of flowers globose. ♄. G. Native of Peru, on the western declivity of the Andes. Aràlia platanifòlia, H. B. et Kunth, nov. gen. amer. 5. p. 6. t. 415. Willd. in Schultes, syst. 6. p. 699. Tree 15-20 feet. Styles 4-5. Petals white, tomentose on the outside.

Platanus-leaved Ivy. Tree 15 to 20 feet.

26 H. ACERIFÒLIA (D. C. prod. 4. p. 264.) stem arboreous; leaves 5-lobed, acuminated, quite entire, glabrous, shining lepidotted and of a different colour beneath. ♄. S. Native of South America, Humb. and Bonpl. Aràlia acerifòlia, Willd. in Schultes, syst. 6. p. 699. The rest unknown. This is the same as *H. argentàta*, according to Sprengel.

Maple-leaved Ivy. Tree.

27 H. JATROPHÆFÒLIA (D. C. l. c.) stem arboreous; leaves petiolate, coriaceous, glabrous above, but clothed with fuscescent tomentum beneath, cordate at the base, 7-nerved, deeply 7-cleft: segments or lobes lanceolate-oblong, acuminated, narrowed at the base and quite entire. ♄. S. Native of New Granada. Aràlia jatrophæfòlia, H. B. et Kunth, nov. gen. amer. 5. p. 6. Leaves almost like those of *Mánihot*. This species approaches very near *H. platanifòlia*.

Jatropha-leaved Ivy. Tree.

28 H. RETICULA'TA (D. C. l. c.) stem arboreous; leaves palmately 7-lobed, hoary beneath, and reticulately wrinkled: lobes oblong, acuminated, quite entire. ♄. S. Native of South America, Humb. et Bonpl. Aràlia reticulàta, Willd. in Schultes, syst. 6. p. 699.

Reticulated-leaved Ivy. Tree.

29 H. CHEIROPHY'LLA (D. C. l. c.) stem unknown; leaves palmately 5-cleft, cream-coloured beneath: lobes or segments acuminated, toothed; heads of flowers disposed in racemes, clothed with villous tomentum. ♄. S. Native of South America. Aràlia palmàta, Willd. herb. Aràlia cheirophýlla, Spreng. syst. 1. p. 953.

Hand-leaved Ivy. Tree or shrub.

30 H. FLORIBU'NDA (D. C. l. c.) stem arboreous; leaves petiolate, glabrous above, but clothed with canescent tomentum beneath, 7-9-parted: segments or lobes acuminate, remotely and sharply toothed; racemes panicled; heads elliptically globose. ♄. S. Native of New Granada, in temperate parts, at the altitude of 3600 feet. Aràlia floribúnda, H. B. et Kunth, nov. gen. amer. 5. p. 6. t. 416. Aràlia Humboldtiàna, and A. incìsa, Willd. in Schultes, syst. 6. p. 699. ex Kunth. Styles short, connivent, somewhat diverging after flowering. Leaves so deeply parted as nearly to be compound.

Bundle-flowered Ivy. Tree 15 to 20 feet.

31 H. SCA'NDENS (D. C. prod. 4. p. 264.) stem shrubby, prickly; leaves 5-lobed, on long petioles; umbels simple, lateral. ♄. ب. G. Native of China, Aràlia palmàta, Lour. coch. p. 187. but not of Lam. Aràlia scándens, Poir. suppl. 1. p. 419. Prickles on the stem bent backwards. Flowers white. The bark is used in dropsy and cutaneous disorders.

Climbing Ivy. Shrub cl.

§ 2 *Leaves compound; leaflets divided to the top of the petiole, digitately or palmately disposed.*

32 H. FERRUGI'NEA (D. C. l. c.) stem arboreous; leaves on long petioles, digitate; leaflets 7, petiolate, oblong, acuminately cuspidate, rounded at the base, quite entire, coriaceous, glabrous above, but clothed with fine tomentum beneath: when young clothed with rusty wool; racemes panicled; heads somewhat elliptically globose. ♄. S. Native of South America, in the province of Quito, between Paramo de Saraguru and Ona, at the altitude of 3600 feet. Aràlia ferrugínea, H. B. et Kunth, nov. gen. amer. 5. p. 7. Willd. in Schultes, syst. 6. p. 701.

Rusty-leaved Ivy. Clt. 1826. Tree.

33 H. XALAPE'NSIS (D. C. l. c.) stem arboreous; leaves on long petioles, digitate; leaflets 5-7, glabrous, shining above, but dotted beneath, lanceolate-oblong, acute, narrowed at the base, and quite entire, rather coriaceous; racemes panicled; heads of flowers nearly globose. ♄. G. Native of Mexico, on the mountains near Xalapa, at the altitude of 2000 feet. Aràlia Xalapénsis, H. B. et Kunth, nov. gen. amer. 5. p. 8. Aràlia digitàta, Willd. in Schultes, syst. 6. p. 701. ex Kunth. Petals glabrous. Styles joined in one.

Xalapa Ivy. Tree.

34 H. Echi'nops (Cham. et Schlecht. in Linnæa. 5. p. 174. under Aràlia) leaves membranous, smoothish above, except on the middle nerve, but clothed with lax stellate tomentum beneath; floral leaves entire and lobed: lower leaves compound, of 5 nearly cuneate-obovate, acuminated leaflets; heads of flowers globose. ♄. G. Native of Mexico, in woods near Hacienda de la Laguna. Middle leaflet a foot long and $5\frac{1}{2}$ inches broad.

Globe-thistle-like Ivy. Shrub.

35 H. ela'ta (Hamilt. in D. Don, prod. fl. nep. p. 187.) stem arboreous, unarmed; leaves digitate; leaflets 7, radiant, petiolate, elliptic-oblong, acuminated, coriaceous, quite entire, glabrous, glaucous beneath, rounded at the base; umbels glabrous, racemosely panicled. ♄. G. Native of Nipaul, at Narain-hetty, where it is called *Cailushi* by the natives.

Tall Ivy. Tree.

36 H. undula'tum (Wall. cat. no. 4916.) stem shrubby; leaves on long petioles, digitate; leaflets 3-5, petiolulate, smooth, oblong-lanceolate, acuminated, undulated; panicle diffuse; umbellules few-flowered: lateral ones opposite: terminal ones umbellate. ♄. G. Native of Silhet. Fruit oblong. Style 1, crowned by a capitate stigma.

Undulate-leaved Ivy. Shrub or tree.

37 H. æsculifòlia (Wall. cat. no. 4913.) stem shrubby; leaves digitate; leaflets 7, obovate-oblong, acuminated, clothed with rusty pubescence beneath: outer ones the smallest, all serrated; racemes lateral; umbellules pedunculate, many-flowered. ♄. H. Native of Nipaul.

Horse-chestnut-leaved Ivy. Shrub or tree.

38 H. tomentòsa (Hamilt. in D. Don, prod. fl. nep. p. 187.) stem arboreous, unarmed; leaves digitate; leaflets 7-9, petiolulate, oblong-lanceolate, acuminated, coriaceous, quite entire, acute at the base, densely clothed with tomentum beneath, as well as the peduncles, petioles, and younger stems; umbellules rising in clusters, pedunculate. ♄. F. Native of Nipaul.

Tomentose Ivy. Tree.

39 H. subcorda'ta (Wall. cat. no. 4917.) stem shrubby; leaves on long petioles, trifoliate; leaflets petiolate, membranous, ovate, somewhat cordate at the base and acuminated at the apex; panicles numerous; flowers disposed in long slender racemes. ♄. G. Native of Silhet. Flowers small, spreading.

Subcordate-leafletted Ivy. Shrub or tree.

40 H. floribu'nda (Wall. cat. no. 4912.) stem beset with short, conical prickles; leaves digitate; leaflets 7, on long petiolules, elliptic, acuminated, clothed with rusty tomentum beneath while young; racemes long; umbellules on long peduncles, rusty as well as the rachis. ♄. G. Native of Silhet.

Bundle-flowered Ivy. Shrub or tree.

41 H. aculea'ta (Hamilt. in D. Don, prod. fl. nep. p. 187.) stem arboreous, prickly; leaves digitate; leaflets 7, radiant, elliptic-oblong, acuminated, serrated, puberulous beneath, acute at the base; umbellules tomentose, racemose. ♄. G. Native of Nipaul, at Narain-Hetty. Tree tall and thick. Flowers white.

Prickly Ivy. Clt. 1820. Tree.

42 H. terebintha'cea (Vahl. symb. 3. p. 42.) stem arboreous; leaves petiolate, digitate; leaflets 5-7, radiant, petiolate, elliptic, quite entire; panicle diffuse, terminal; umbellules disposed in racemes. ♄. S. Native of Ceylon, Penang, Silhet, and Nipaul, in groves and woods. Aràlia digitàta, Roxb. Petals 6. Style 1. Fruit angular. Allied to *Unjàla* of Rheed. hort. mal. 7. t. 28.

Turpentine Ivy. Tree.

43 H. rugòsa (D. C. prod. 4. p. 265.) stem shrubby, parasitical; leaves digitate; leaflets 5-7, ovate, or oval-oblong, acuminated, obliquely attenuated at the base, quite entire, rugged, clothed with brown stellate tomentum beneath; panicle terminal, very long; flowers racemose. ♄. S. Native of Java, in woods on Mount Gede. Aràlia rugòsa, Blum. bijdr. 871.

Wrinkled-leaved Ivy. Shrub.

44 H. simi'llima (D. C. l. c.) stem shrubby; leaves digitate; leaflets 5-6, elliptic-oblong, acuminated, rounded at the base, remotely serrulated, reticulate, wrinkled and rather downy from stellate pili beneath; panicle terminal, divaricate; flowers racemose. ♄. S. Native of Java, in woods on the mountains. Allied to *H. rugòsa*. Aràlia simíllima, Blum. bijdr. p. 171.

Very similar Ivy. Shrub.

45 H. aroma'tica (D. C. l. c.) stem shrubby; leaves digitate; leaflets 5-7, elliptic-oblong, acuminated, for the most part obliquely rounded at the base, glabrous; panicles corymbose, lateral; flowers umbellate. ♄. S. Native of Java, on Mounts Salak and Gede, &c. where it is called *Pangang-pugu*. Aràlia aromática, Blum. l. c. p. 871.

Var. β; leafless, longer, serrated. ♄. S. Native of Java, on Mount Salak, where it is called *Kirengdong*. Blum. l. c.

Aromatic Ivy. Shrub.

46 H. lute'scens (D. C. l. c.) stem shrubby; leaves digitate; leaflets 7-9, oblong-lanceolate, long-acuminated, nearly veinless, shining above; racemes crowded, terminal; flowers umbellate. ♄. S. Native of Java, in woods in the province of Bantam. Aràlia lutéscens, Blum. bijdr. p. 872.

Yellowish Ivy. Shrub.

47 H. dispe'rma (D. C. prod. 4. p. 256.) stems shrubby, climbing; leaves digitate; leaflets 5-7, oblong, acuminated, rounded at the base, sharply serrated, glabrous; raceme terminal, scurfy; flowers umbellate; fruit 2-seeded. ♄. S. Native of Java, in the higher woods, on the mountains of Barangrang and Tjerimai. Aràlia dispérma, Blum. l. c. p. 872. Perhaps a species of *Pànax*.

Two-seeded Ivy. Shrub cl.

48 H. glomerula'ta (D. C. l. c.) stem arboreous, spinescent; leaves digitate; leaflets 5-7, rarely 3, oblong, acuminated, acutish at the base, serrulated towards the apex, smoothish; panicle terminal, very long; flowers glomerate; ovaries 2-seeded. ♄. S. Native of Java, on Mount Gede, where it is called *Pangang*. Aràlia glomerulàta, Blum. bijdr. p. 872. Perhaps a species of *Pànax*.

Glomerate-flowered Ivy. Tree.

49 H. heterophy'lla (Wall. cat. no. 4919.) stem shrubby; leaves digitately compound, with the divisions quinate or ternate; leaflets oval-oblong, acuminated, glabrous; umbellules disposed in racemes, many-flowered, with a woolly bractea at the base of each peduncle; rachis woolly. ♄. S. Native of Penang. Fruit angular.

Variable-leaved Ivy. Tree or shrub.

§ 3. *Leaves compound, pinnate.*

50 H. parasi'tica (D. Don, prod. fl. nep. p. 188.) stems rooting, parasitical; leaves pinnate: with 5, elliptic, acute, quite entire, nearly sessile, coriaceous, glabrous leaflets, which are glaucous beneath; umbels glabrous, racemose. ♄. G. Native of Nipaul, at Narain-Hetty. Aràlia parasítica, Hamilt. mss.

Parasitical Ivy. Shrub climbing and rooting.

51 H. glau'ca (Wall. cat. no. 4921.) stem shrubby, much branched; leaves pinnate; leaflets 5, elliptic-lanceolate, acuminated, glaucous beneath, glabrous; umbellules terminal, solitary or twin, many-flowered. ♄. G. Native of Nipaul, at Kamaon. Style simple.

Glaucous-leaved Ivy. Shrub.

52 H. Jackia'na; leaves pinnate: with many pairs of opposite, oblong-lanceolate, petiolulate, quite entire, smooth leaflets, which are oblique at the base; rachis jointed; umbels com-

pound; umbellules few-flowered; fruit oblong. ♄. S. Native of Singapore. Pànax Heyneàna, Wall. cat. no. 4901. Mormoràphis Sumatràna, Jack, mss.

Jack's Ivy. Tree.

Cult. All the species of Ivy are of easy culture. The common ivy and its varieties only require to have slips of them planted where they are intended to remain; or to be grown in pots until they are the size required, and then finally planted out: the other hardy species should be treated in a similar manner. The greenhouse and stove kinds will grow in almost any kind of soil, but the lighter the better; and cuttings of them are easily rooted under a hand-glass.

XII. PARATRO'PIA (*παραπροπη, paratrope*, a bending or crooking; the petioles are kneed and bent). D. C. prod. 4. p. 265.—Aràlia, sect. 3. Paratròpia, Blum. bijdr. p. 875.

Lin. syst. *Pentándria, Monogýnia.* All as in *Aràlia* or *Hédera*, but differs in the stigmas being sessile, at first approximate, and immersed in an epigynous disk.—Shrubs or trees. Leaves compound. Flowers panicled or racemose.

1 P. nodòsa (D. C. prod. 4. p. 265.) stem arboreous; leaves impari-pinnate: with many pairs of leaflets; leaflets on short petioles, crenated, glabrous: lower ones roundish-ovate, the rest oblong; panicle terminal, very long. ♄. S. Native of Java, in woods on the mountains in the western provinces, where it is called *Kilangit.* Aràlia nodòsa, Blum. l. c. Common petioles 5-6 feet long, bent, articulated when dried. Panicle 4-5 feet long. Flowers pentandrous.

Nodose-petioled Paratropia. Tree.

2 P. pergama'cea (D. C. prod. 4. p. 266.) stem shrubby, parasitical; leaves digitate: leaflets 6-12, oval, acute, rounded at the base, in substance like parchment, glabrous; racemes crowded, terminal, scurfy; flowers subfasciculate. ♄. S. Native of Java, on the higher declivities of Mount Gede. Aràlia pergamàcea, Blum. bijdr. 875.

Parchment-leaved Paratropia. Shrub.

3 P. rígida (D. C. l. c.) stem arborescent; leaves digitate: leaflets 6-12, oblong, acute, bluntish at the base, and acutish at the apex, in substance like parchment, glabrous; racemes crowded, terminal, divaricate, rather scurfy; flowers umbellate, octandrous. ♄. S. Native of the western parts of Java, in woods on the mountains, where it is called *Songo-Poana.* Aràlia rígida, Blum. l. c.

Var. β; racemes incurved, densely clothed with scurf. ♄. S. Native of Java, in the province of Bantam, where it is called *Tulak-Tangol.* Blum. l. c.

Stiff Paratropia. Tree.

4 P. longifòlia (D. C. l. c.) stem arborescent, scandent; leaves digitate: leaflets 9-11, rather large, oblong, acute, rounded at the base, glabrous; racemes crowded, densely clothed with tomentum, terminal, straight; flowers umbellate, with 7-9 stamens. ♄. S. Native of Java, in mountain woods, where it is called, along with many other Araliaceous plants, *Ramo-giling.* Sciodaphýllum longifòlium, Blum. bijdr. p. 876.

Long-leaved Paratropia. Shrub cl.

5 P. Cantone'nsis (Hook. et Arn. in Beech. voy. pt. bot. 189.) stem arboreous; leaves on long petioles, digitate: leaflets 5-9, elliptic, acutish at the base, acuminated at the apex, rather coriaceous, glabrous; racemes terminal, furfuraceous; flowers in fascicles, decandrous; stigma sessile, 10-cleft. ♄. G. Native of China, about Canton. Aràlia octophýlla var. Cantonénsis, Lour. coch. p. 187. This species comes very near *P. pergamàcea.*

Canton Paratropia. Tree 10 feet.

Cult. Any light soil will suit the species of *Paratròpia;* and cuttings of them will be easily rooted under a hand-glass in heat.

XIII. ARTHROPHY'LLUM (from *αρθρον, arthron*, a joint, and *φυλλον, phyllon*, a leaf; in reference to the jointed petioles). Blum. bijdr. p. 878. D. C. prod. 4. p. 266.

Lin. syst. *Pentándria, Monogýnia.* Margin of calyx short, obsoletely 5-toothed. Petals 5. Stamens 5, alternating with the petals. Ovarium 1-ovulate. Style short, or nearly wanting: stigma obtuse. Fruit baccate, crowned, containing a one-seeded nucleus. Albumen somewhat corneous. Embryo inverted.—Unarmed Java shrubs. Leaves glabrous, variable, usually bipinnate. Umbels petiolar, compound. Perhaps referrible to the monospermous Araliaceous unarmed genus, incompletely described in Pet. Th. gen. nov. mad. p. 13. under no. 42.

1 A. Java'nicum (Blum. l. c.) leaves bipinnate: leaflets cuneate-obovate, bluntish at the apex, or the upper leaflets are rounded and coriaceous. ♄. S. Native of Java, in mountain woods at Parang.

Java Arthrophyllum. Shrub or tree.

2 A. diversifòlium (Blum. l. c.) leaves impari-pinnate, ternate or bipinnate; leaflets oblong, somewhat acuminated, oblique at the base, membranous. ♄. S. Native of Java, in woods, on Mount Salak.

Diverse-leaved Arthrophyllum. Tree.

3 A. ellípticum (Blum. l. c.) leaves bipinnate: leaflets elliptic-oblong, acute, oblique at the base, coriaceous. ♄. S. Native of Java, in mountain woods.

Elliptic-leafletted Arthrophyllum. Shrub or tree.

Cult. See *Paratròpia* above for culture and propagation.

Order CXXV. HAMAMELI'DEÆ (plants agreeing with *Hamamèlis* in important characters). R. Br. descr. pl. chin. 1818. p. 3. Adr. Juss. dict. class 8. p. 28. Sweet. hort. brit. 371. D. C. prod. 4. p. 267.—Pet. Th. veg. afr. austr. ed. 2. p. 31.

Tube of calyx adhering to the ovarium more or less, 4-lobed (f. 69. *a. g.*) or repandly toothed. Petals 4 (f. 69. *e. i.*), linear, elongated, inserted in the calyx, alternating with the calycine lobes, involutely valvate in æstivation: rarely wanting, but probably sometimes changed into stamina. Stamens inserted with the petals, and double their number (f. 69. *b.*); those alternating with the petals are fertile, and those opposite the petals are sterile and destitute of anthers (f. 69. *g.*); filaments all short. Fertile anthers inserted by the base, 2-celled, dehiscing in various ways. Ovarium adnate at the base, 2-celled: cells 1-seeded; ovula pendulous. Styles 2 (f. 69. *l.*), very rarely 3. Capsule adnate at the base to the permanent tube of the calyx, 2-celled, 2-valved; valves bifid at the apex. Seed pendulous, with a superior hylum. Albumen corneous. Embryo straight, slender, with a superior radicle; and foliaceous flat cotyledons, or having their margins rather involute.—Shrubs. Leaves alternate, bistipulate, petiolate, feather-nerved, entire or sinuately toothed. Flowers axillary, nearly sessile, in fascicles, usually bracteate, sometimes dioecious or polygamous.

Many of the genera of this order were formerly placed among the *Berberídeæ* and *Amementàceæ*, but were constituted a distinct order by R. Brown in 1818; but the place which it should hold in the natural system is still doubtful. According to R. Brown, it is intermediate between *Bruniàceæ* and *Márlea**, (a genus which should have been placed in *Alangièæ*, vol. ii. p. 806. But according to Pet. Thouars, it comes nearest to *Rhámneæ*, and according to Juss. to *Haloragièæ*. But afterwards it was

placed by R. Brown and Pet. Thouars near *Araliàceæ* and *Córneæ*. The order differs from *Alangièæ* in the fruit being capsular, not baccate; and from *Bruniàceæ* in the parts of the flowers being quaternary, in the stamens being double the number of the petals, in the insertion and dehiscence of the anthers, and in the cells of the ovarium being 1-seeded, &c.; it differs from *Araliàceæ* and *Córneæ* in the fruit being capsular, in the number of the parts of the flower, and in the structure of the anthers; and from *Amentàceæ* in the flowers of most of the genera being complete; but the genus *Fothergílla* agrees with *Amentàceæ* in habit, and in the want of petals; but perhaps in this genus the outer series of the stamens represent the petals.

* MA'RLEA (the name of the tree in Silhet). Roxb. cor. 3. p. 283. D. C. prod. 4. p. 267.—Stylídium, Lour. coch. p. 221. but not of Swartz.—Pautsaùvia, Juss. dict. sc. nat. p. 51. p. 158.—Stỳlis, Poir. suppl. 5. p. 260.

Lin. syst. *Octándria, Monogýnia.* Tube of calyx adnate to the ovarium: limb short, bluntly 6-8-toothed. Petals 6-8, linear, alternating with the teeth of the calyx. Stamens 8, adnate to the epigynous disk, and inserted at the top of the calyx; anthers long, linear. Ovarium 2-celled, biovulate. Style short; stigma 4-toothed. Drupe oval, rather fleshy, umbilicate from the teeth of the calyx: containing a 2-celled nucleus. Seed compressed. Albumen fleshy. Embryo with a superior radicle and flat cotyledons.—A small Asiatic tree. Leaves alternate, exstipulate, petiolate, unequally cordate, acuminated, entire, glabrous, except the nerves on the under side. Flowers on axillary peduncles, somewhat corymbose, whitish or yellowish.

1 M. begonifòlia (Roxb. l. c.) ♄. G. Native of the East Indies, in Silhet and Nipaul; and of China, near Canton, where it is called *Pautsau*. Stylídium Chinénse, Lour. l. c. Stỳlis Chinénsis, Poir. l. c. Leaves sometimes acutely bifid, or a little toothed.

Begonia-leaved Marlea. Fl. June, July. Clt. 1824. Shrub 5 to 6 feet.

Cult. This shrub is easily increased by cuttings in sand under a hand-glass. The soil best adapted for it is a mixture of sand, loam, and peat.

Synopsis of the genera.

Tribe I.

Hamame`leæ. *Petals* 4 (f. 69. *e.*). *Stamens* 8, 4 *fertile* (f. 69. *b.*), *and* 4 *sterile* (f. 69. *g.*). *Anthers dehiscing by a valve.*

1 Hamame`lis. Calyx 4-lobed, furnished with 3-4 scales on the outside. Ovarium ending in 2-3 styles at the apex (f. 69. *l.*). Capsule coriaceous, 2-celled (f. 69. *c.*).

2 Dicory'phe. Calyx 4-lobed. Styles 2. Fruit inclosed in the circumcised calyx, umbilicate at the apex, 2-horned, 2-seeded.

3 Trichócladus. Flowers dioecious, intermixed with chaffy scales. Petal 1, convolute. Stamen 1. Female flowers: ovarium villous. Style 1. Capsule 4-celled, 4-valved. Arillus of seed 2-valed.

Tribe II.

Fothergílleæ. *Petals wanting. Stamens* 24, *all fertile. Anthers opening by a semicircular chink at the margin.*

4 Fothergílla. Calyx campanulate, 5-7-toothed. Anthers form of a horse-shoe. Styles 2. Capsule 2-lobed, 2-celled: cells 2-valved at the apex, 1-seeded.

Tribe I.

HAMAME`LEÆ (shrubs agreeing with the genus *Hamamèlis* in important characters). D. C. prod. 4. p. 268. Petals 4. Stamens 8, 4 of which are sterile. Anthers dehiscing by a valve.

I. HAMAME`LIS (ὁμομηλις, *homomelis*, a name under which Athenæus speaks of a fruit resembling an apple; it comes from ομος, *omos*, like, and μηλεα, *melea*, an apple-tree; but the present genus is not in any way analogous to the apple). Lin. gen. no. 169. Juss. gen. p. 288. Lam. ill. t. 88. f. 1. D. C. prod. 4. p. 268.—Trílopus, Mith. act. acad. nat. cur. 8. appendix.

Lin. syst. *Tetrándria, Digy'nia.* Calyx 4-lobed, adhering to the ovarium at the base, furnished with 2-3 scales on the outside. Petals 4 (f. 69. *a.*), long, tongue-shaped, alternating with the teeth of the calyx (f. 69. *e.*). The 4 stamens alternating with the petals, fertile (f. 69. *b.*), with very short filaments: adnate 2-celled anthers; the cells opening by a vertical valve. The 4 sterile stamens (f. 69. *g.*) with very thick filaments and round anthers, one in front of each petal. Ovarium free at the apex, ending in 2 (f. 69. *l.*), rarely in 3 short styles. Capsule coriaceous, half free, 2-celled, 2-valved at the apex; valves bifid. Arils 2 in each capsule, coriaceous, 1-seeded, opening by 2 elastic valves above. Seed oblong, shining, with a superior hylum; albumen fleshy. Embryo with a superior radicle and flat cotyledons.—Small American or Asiatic trees. Leaves alternate, on short petioles, bistipulate, ovate or cuneated, feather-nerved, nearly entire. Flowers nearly sessile, disposed in clusters in the axils of the leaves, girded by a 3-leaved involucrum. Petals yellow.

FIG. 69.

1 H. Virgínica (Lin. syst. nat. p. 333.) leaves obovate, acutely toothed, with a small cordate recess at the base. ♄. H. Native of North America, from Canada to Florida, in stony and dry situations, but frequently near water. Mill. ill. t. 10. Duham. arb. 1. t. 114. Schkuhr, handb. t. 27. Lodd. bot. cab. 598. Guimp. abb. holzart. t. 75. Rafin. med. bot. 1. t. 45.—Catesb. car. 3. t. 2. This singular shrub, which grows about 10 or 12 feet high, begins to show its yellow flowers in autumn, when all others have dropped their leaves, continues to flower all winter, and forms its fruit the spring following. The flowers are either polygamous, varying to dioecious, monoecious, and androgynous; hence the names of Hamamèlis dioíca, monoíca, and andrógyna, Walt. car. 255. The Indians consider this tree as a valuable article in their Materia Medica. They apply the bark, which is sedative and discutient, to painful tumours and external inflammations. A cataplasm of the inner rind is found to be very efficacious in removing painful inflammations of the eyes.

Var. β, parvifòlia (Nutt. gen. amer. 1. p. 107.) leaves smaller, oblong-obovate, upper part undulately and grossly crenated: the under side pubescent, rather hairy; segments of the calyx oblong; stamens and perigynous filaments often nearly equal. ♄. H. From the mountains of Pennsylvania.

Virginian Witch-hazel. Fl. Oct. Feb. Clt. 1736. Shrub 8 to 12 feet.

2 H. macrophy'lla (Pursh. fl. sept. amer. 1. p. 116.) leaves nearly orbicular, cordate, coarsely and bluntly toothed, scabrous from dots beneath. ♄. H. Native of North America, in the

western part of Georgia; and of North Carolina, on the Catabaw Mountains. The large leaves punctated on their under side, with rough tubercles and other marks, give sufficient reason for considering it a distinct species.

Large-leaved Witch-hazel. Fl. May, Nov. Clt. 1812. Shrub 10 to 12 feet.

3 H. Pe'rsica (D. C. prod. 4. p. 268.) leaves oval, acuminated, repandly toothed above, cuneated at the base, equal. ♄. H. Native of Persia, in the province of Lenkeran, where it was collected by Hansen. Adult leaves rather scabrous on the nerves and petioles; the rest glabrous. Flowers unknown. Fruit a little smaller than that of *H. Virgínica*, but similar.

Persian Witch-hazel. Shrub 10 to 12 feet.

4 H. Chine'nsis (R. Br. descr. pl. chin. 1818. p. 4. with a figure,) leaves ovate, quite entire, unequal at the base, grey on both surfaces from stellate down. ♄. H. Native of China, near Nankin, and in the island of Cheusan.—Pluk. amalth. 32. t. 368. f. 2. Petals linear, 3-nerved, very much elongated. Anthers with deciduous valves; hence it is proposed by R. Br. to form it into a distinct section under the name of *Loropétalum*.

China Witch-hazel. Shrub 6 to 10 feet.

Cult. The species of Witch-hazel are well adapted for shrubberies; they will grow in any common soil, and are increased by layers or suckers.

II. DICORY'PHE (from δις, *dis*, twice, and κορυφη, *coryphe*, a vertex; in reference to the two horns on the top of the fruit). Pet. Th. hist. veg. afr. austr. 1. p. 31. t. 7. ed. 2. p. 15. t. 4. and p. 31. nov. gen. mad. p. 12. D. C. prod. 4. p. 269.—Dicory'pha, Spreng. syst. 1. p. 546.

Lin. syst. *Tetrándria*, *Digy'nia*. Tube of calyx oblong, hairy, adhering to the ovarium: limb 4-lobed, circumcised after flowering. Petals 4, inserted in the upper part of the tube of the calyx, joined to the filaments at the base. Stamens 4, fertile, alternating with the petals: filaments broad at the base: anthers oblong, adnate, erect, dehiscing at the sides; and 4 sterile smaller stamens alternating with the first named ones. Styles 2. Pericarp inclosed in the circumcised calyx, umbilicate at the apex, and 2-horned, inclosing 2 1-seeded coriaceous coccula, which open at the apex. Seed ovate, hanging from the top. Albumen fleshy. Embryo with a superior radicle: and flat cotyledons, having revolute edges.—A small shrub, with twiggy weak branches. Leaves alternate, on short petioles, oblong, feather-nerved, entire, furnished with 2 unequal broad foliaceous stipulas at the base. Corymbs terminal, somewhat fasciculate, 7-8-flowered.

1 D. stipula'ta (Jaum. exp. fam. 2. p. 348.) ♄. S. Native of Madagascar, near Foulpointe. Pet. Th. l. c. D. Thouársii, Rœm. et Schultes, syst. 3. p. 485.

Stipulate-leaved Dicoryphe. Shrub.

Cult. A mixture of sand, loam, and peat will be a good soil for this plant; and young cuttings will strike root in sand under a hand-glass, in heat.

III. TRICHO'CLADUS (from θριξ τριχος, *thrix trichos*, a hair, and κλαδος, *klados*, a branch; the branches are clothed with stellate hairs). Pers. ench. 2. p. 597. D. C. prod. 4. p. 269.—Dáhlia, Thunb. diss. (1792) and in edit. gœtt. 1. p. 108. act. soc. hist. nat. hafn. 2. vol. 1. p. 133. t. 4. but not of Cav. 1791.

Lin. syst. *Dioécia*, *Monándria*. Flowers dioecious. Scales paleaceous, distinguished from the capitate flowers. Male flowers. Calyx unknown. Petal 1, convolute. Stamen 1, near the scale and the petal; anthers ovate, double celled from the connate filaments (Thunb.), valves dehiscent (Burch.). Female flowers. Calyx unknown. Petals wanting. Ovarium villous. Style 1. Capsule ovate, 4-valved, 4-celled. Arillus (seed, Thunb.) ovate, glabrous, villous from stellate dots. Leaves opposite, petiolate, oval, acuminated, entire. Flowers in terminal heads, crowded on a common receptacle. The character is taken from the description of the tree by Thunberg.

1 T. crinìtus (Pers. l. c.) ♄. G. Native of the Cape of Good Hope, in the woods of Houtniquas. Dáhlia crinìta, Thunb. ll. cc. and fl. cap. 1. The shrub has the resemblance of a species of *Cròton*.

Hairy Trichocladus. Clt. 1823. Shrub 4 to 8 feet.

Cult. A mixture of loam and sand is a good soil for this shrub; and young cuttings will root readily in sand under a hand-glass.

Tribe II.

FOTHERGI'LLEÆ (this tribe only contains the genus *Fothergílla*). D. C. prod. 4. p. 269. Petals wanting. Stamens 24, all fertile; anthers dehiscing by a chink. This tribe is intermediate between *Hamamèleæ* and *Amentàceæ* from habit.

IV. FOTHERGI'LLA (in memory of John Fothergill, M.D. an eminent physician, and patron of botany; who cultivated a variety of most curious plants in his garden near London). Lin. fil. suppl. p. 42. Lam ill. t. 480. Juss. gen. 408. but not of Aublet. D. C. prod. 4. p. 269.

Lin. syst. *Icosándria*, *Digy'nia*. Calyx campanulate, adhering to the ovarium at the base, somewhat truncate, with 5-7 callous subrepand teeth. Petals wanting. Stamens about 25, inserted in the calyx, club-shaped, exserted; anthers terminal, of the form of a horse shoe, opening by a semi-circular chink at the margin. Ovarium 2-celled, 2-ovulate. Styles 2, filiform. Capsule adnate to the base of the calyx, 2-lobed, 2-celled; cells 2-valved at the apex, 1-seeded. Seed bony, pendulous, with a superior hylum.—A shrub, with alternate, obovate, feather-nerved, bistipulate leaves, clothed with soft starry down; and terminal ovate spikes of flowers, having a solitary bractea under each flower; those bracteas at the base of the spike are trifid, and those at its apex are nearly entire. Flowers white, sweet-scented, sessile. Anthers yellow.

1 F. alnifòlia (Lin. fil. suppl. 267.) ♄. H. Native of North America, from Virginia to Carolina, in shady woods on the sides of hills. Duham. arb. ed. nov. 4. t. 26. Guimp. arb. holzart. t. 16. F. Gardèni, Michx. fl. bor. amer. 1. p. 313. Hamamèlis monoíca, Lin. ex Smith, in Rees' cycl. vol. 17. Flowers appearing before the leaves.

FIG. 70.

Var. α, *obtùsa* (Sims, bot. mag. 1341. Mill. fig. t. 1.) leaves obovate, crenate at the top, when young clothed with fascicles of down beneath. F. màjor, Lodd. bot. cab. t. 1520. (f. 70.)

Var. β, *acùta* (Sims, l. c.) leaves narrow, ovate, acute, nearly entire, white from down beneath. T. Gardèni, Jacq. icon. rar. t. 100.

Var. γ, *màjor* (Sims, bot. mag. t. 1342.) leaves ovate-oblong, somewhat cordate at the base, very blunt and serrated at the apex, sometimes with an acumen; when young tomentose beneath.

Var. δ, *serótina* (Sims, l. c.) leaves oblong, acute, crenately toothed at the top, green beneath.

Alder-leaved Fothergilla. Fl. April, May. Clt. 1765. Shrub 3 to 6 feet.

Cult. All the varieties of this shrub are very handsome while in flower and leaf, and are therefore proper for shrubberies. A peat or vegetable soil answers them best; and they may either be increased by layers put down in spring or autumn, or by seed, which is annually received from America.

Order CXXVI. CO'RNEÆ (this order contains plants agreeing with *Córnus* in important characters). D. C. prod. 4. p. 271. —Caprifoliàceæ Córneæ, Kunth, nov. gen. amer. 3. p. 430.—Genera of Caprifoliàceæ, Juss.

Calyx having the tube adnate to the ovarium; and the limb superior and 4-lobed (f. 71. *c.*). Petals 4, oblong, broad at the base, inserted in the upper part of the tube of the calyx, regular, valvate in æstivation. Stamens 4, inserted with the petals, and alternating with them; anthers ovate-oblong, 2-celled. Style filiform; stigma simple. Drupe baccate, crowned by the vestiges of the calyx, containing a 2-celled nucleus. Seed pendulous, solitary in the cells. Albumen fleshy. Embryo with a superior radicle, which is shorter than the two oblong cotyledons.—Trees and shrubs, rarely herbs. Leaves of all opposite, except in one species of the genus *Córnus*, entire or toothed, feather-nerved. Flowers capitate, umbellate or corymbose, naked or involucrated, rarely dioecious from abortion. Flesh or pulp of fruit edible.

This order agrees with *Hamamelídeæ*, and *Caprifoliàceæ*, tribe *Sambùceæ*; but differs from the first in the æstivation of the petals being truly valvate; in the stamens not being double the number of the petals; in the style being simple, not double; in the fruit being drupaceous, not capsular; and in the albumen being fleshy, not horny, &c. From *Sambúceæ* it differs in the corolla being polypetalous, not gamopetalous; in the parts of the flower being quaternary, not quinary; in the style being exserted, not wanting; in the stigmas being 2, not 3, and in the fruit being drupaceous, not baccate, &c. *Córneæ* differs from *Loranthàceæ* in the stamens alternating with the petals, not opposite them.

All the genera of this order have more or less astringent bark; that of *Córnus flórida* is used in North America in intermittent fevers, as is also that of *Córnus seríсea*, which, according to Barton, is scarcely inferior to quinquina.

Synopsis of the genera.

1 Córnus. Limb of calyx 4-toothed (f. 71. *c.*). Drupe baccate, marked by the vestiges of the calyx, containing a 2-celled, rarely 3-celled nucleus.

2 Votomi'ta. Tube of calyx turbinate; limb 4-toothed. Anthers approximating into a tube, and terminated by a thin membrane. Stigmas 4, oblong. Drupe crowned by the calyx, 1-celled.

3 Mastíxia. Limb of calyx 4-5-toothed. Stamens 4-5; anthers didymous. Style short, girded by a disk; stigma obtuse. Drupe umbilicate, containing a 1-seeded nucleus.

4 Polyósma. Limb of calyx 4-toothed. Petals sometimes joined at the base. Anthers 2-celled. Stigma truncate. Drupe containing a 1-seeded nucleus.

I. CO'RNUS (from *cornu*, a horn; the wood being thought to be as hard and as durable as horn. Its value as a material for warlike instruments has been celebrated by Virgil.—*Bona bello cornus*). Tourn. inst. 641. t. 410. Lin. gen. no. 149. Gærtn. fruct. t. 26. D. C. prod. 4. p. 271.

Lin. syst. *Tetrándria, Monogýnia.* Tube of calyx adhering to the ovarium; limb small, 4-toothed (f. 71. *c.*). Petals 4, oblong, sessile; valvate in æstivation. Stamens 4. Style 1. Drupe baccate, marked by the vestiges of the calyx, containing a 2-celled, rarely 3-celled nucleus. Seed solitary, pendulous. Albumen fleshy. Radicle of embryo shorter than the cotyledons.—Trees and shrubs, sometimes low herbs. Leaves all opposite, except in the first species, entire, feather-nerved. Flowers sometimes capitate and umbellate, involucrated; sometimes corymbose and panicled, without involucra. Petals white, rarely yellow.

§ 1. *Nudiflòræ* (from *nudus*, naked, and *flos*, a flower; in allusion to the flowers being exinvolucrate). D. C. prod. 4. p. 271. *Flowers corymbose or panicled, exinvolucrate.*

* *Leaves alternate.*

1 C. alternifòlia (Lin. fil. suppl. p. 125.) leaves alternate, ovate, acute, hoary beneath; corymbs depressed, spreading; branches warted. ♄. H. Native of North America, from Canada to Carolina, in shady woods on river banks. Lher. corn. no. 11. Guimp. abb. holz. t. 43. Schmidt, arb. 2. t. 70. C. altérna, Marsh. Berries purple, globose, about the size of a grain of pepper. Leaves on long petioles. Branches green or reddish-brown.

Alternate-leaved Dogwood. Fl. May, July. Clt. 1760. Tree 15 to 20 feet.

* * *Leaves opposite.*

2 C. paniculà'ta (Lher. corn. no. 10. t. 5.) branches erect; leaves ovate, acuminated, glabrous, hoary beneath; corymbs thyrsoid; ovarium silky. ♄. H. Native of North America, from Canada to Carolina, rare, in swamps and near rivulets among other bushes. Schmidt, arb. 2. t. 68. C. racemòsa, Lam. dict. 2. p. 116. C. fémina, Mill. dict. no. 4. C. citrifòlia, Hort. par. Branches pale-purplish. Berries roundish, depressed, watery, white, 3 lines in diameter. The dots on the under side of the leaves, which are only seen through a lens, bear bicuspidate short adpressed hairs. Tube of calyx pubescent.

Var. β, álbida (Ehrh. beitr. 4. p. 16.) leaves elliptic-lanceolate.

Var. γ, radiàta (Pursh. fl. amer. sept. 1. p. 109.) racemes sterile, foliiferous.

Panicled-flowered Dogwood. Fl. July, Aug. Clt. 1758. Shrub 4 to 6 feet.

3 C. Tolucce'nsis (H. B. et Kunth, nov. gen. amer. 3. p. 430.) branches dichotomous, spreading; leaves ovate-oblong, narrowly acuminated, puberulous on both surfaces, paler beneath; cymes lateral, naked. ♄. H. Native of Mexico, on the higher plains about the city of Tolucca. Very like *C. paniculàta*. Compare Cham. et Schlecht. in Linnæa. 5. p. 171. in which place there is a species described which was found about Jalapa, and which is probably referrible to the present plant.

Tolucca Dogwood. Tree or shrub.

4 C. oblónga (Wall. in Roxb. fl. ind. 1. p. 432.) leaves oblong, acuminated, acute at the base, glaucous and rather scabrous beneath, with many excavated glands along the axils of the ribs and nerves; corymbs spreading, panicled. ♄. H. Native of Nipaul, about Narainhetty, Katmandu, and the valley of Dhoon. C. paniculàta, Hamilt. ex D. Don, prod. fl. nep. p. 140. Young shoots clothed with short adpressed hair. Leaves 4-6 inches

long, and 1 to 1½ inch broad; petioles about an inch long. Flowers white or pale-purplish, fragrant. Calyx clothed with adpressed silvery hairs, as well as the pedicels and petals. Drupe ovate-oblong. Ovarium 3-celled.

Oblong-leaved Dogwood. Clt. 1818. Tree 10 to 15 feet.

5 C. stri'cta (Lam. dict. 3. p. 116.) branches straight, fastigiate; leaves ovate, acuminated, glabrous, green on both surfaces, when young hardly pubescent beneath; corymbs convex, somewhat panicled. ♄. H. Native of North America, from Carolina to Canada, on the banks of rivers, frequent; also of Mexico, between Tampico and Real del Monte. Lher. corn. no. 9. t. 4. Schmidt, arb. 2. t. 67. C. fastigiàta, Michx. fl. bor. amer. 1. p. 92. C. sanguínea, Walt. but not of Lin. C. cyanocárpos, Gmel. syst. veg. 1. p. 257. C. Canadénsis, Hort. par. C. cærùlea, Meerb. icon. 3. but not of Lam. Branches reddish-brown. Anthers blue. Berries globose, soft, blue on the outside, but white inside.

Var. β, variegàta; leaves variegated with white or yellow.

Straight-branched Dogwood. Fl. June, July. Clt. 1758. Shrub 6 to 10 feet.

6 C. sanguínea (Lin. spec. p. 171.) branches straight; leaves ovate, acute, smooth and green on both surfaces; corymbs flat. ♄. H. Native of Europe and the north of Africa, in hedges and thickets, especially on a chalk and limestone soil, common; plentiful in Britain in like situations. It is also said to grow in North America near the Lakes of Canada and New York, but has probably been introduced there. Smith, engl. bot. t. 249. Fl. dan. 481.—Duham. arb. 1. t. 75.—C. fémina, Raii, syn. 460. Ger. emac. 1467. with a figure. Virga sanguínea, Matth. valgr. 1. p. 236. with a figure. Cam. epit. 159. with a figure. Branches of a dark-red when full grown. Leaves 2-3 inches long. Flowers greenish-white, unpleasantly scented; petals revolute at the sides. Fruit dark-purple, very bitter. Matthiolus records that an oil is obtained from the berries by pressure, after they have first been boiled, which is used for lamps in the country near Trent. The shrub, after a smothered combustion, affords a charcoal, esteemed the best for entering into the composition of gunpowder. It has a variety of names in different parts of the kingdom, as *female cornel*, *dogberry-tree*, *hound's-tree*, *prickwood*, from its use in making skewers, *gaten* or *gaten-tree*, *gater* or *gater-tree*. The wood was formerly made use of for cart timber and rustic instruments, &c. Mr. Miller informs us, that in his time the fruit was often brought to the markets, and sold for those of *buckthorn*.

Bloody-branched Dogwood or Wild Cornel-tree. Fl. June, Britain. Shrub 4 to 5 feet.

7 C. Pu'rshii; branches straight; leaves ovate, green on both surfaces, and pubescent; corymbs spreading. ♄. H. Native of North America, near the lakes of Canada and New York. C. sanguínea, Pursh, fl. amer. sept. 1. p. 109. Schmidt, arb. 2. t. 66. Flowers with yellow anthers. Berries dark-brown. This differs from the *C. sanguínea* of Europe in the leaves being pubescent, and in stature.

Pursh's Dogwood or Cornel. Fl. June, July. Sh. 8 to 12 ft.

8 C. exce'lsa (H. B. et Kunth, nov. gen. amer. 3. p. 430.) branches spreading; branchlets pubescent; leaves ovate, acuminated, pubescent and paler beneath, and with minute scattered pili above; cymes naked, spreading. ♄. H. Native about the city of Mexico. Allied to *C. sanguínea*.

Tall Dogwood. Tree.

9 C. a'lba (Lin. mant. p. 40.) branches recurved; branchlets glabrous; leaves ovate, acute, pubescent, hoary beneath; corymbs depressed. ♄. H. Native of Siberia, at the rivers Oby and Irtysch, among bushes, &c.; North America, from Virginia to Canada, on the banks of rivers and lakes; and of North California. Pall. fl. ross. 1. t. 34. C. stolonífera, Michx. fl. bor. amer. 1. p. 109. C. Sibírica, Lodd. C. Tatárica, Mill. fig. 104.—Amm. ruth. t. 32. Branches of a fine red colour. Berries white or bluish-white.

Var. β, circinnàta; leaves larger, more hairy beneath. ♄. H. Native throughout Canada, and from Lake Huron to north lat. 69°, Newfoundland, and the north-west coast of America. C. circinnàta, Cham. et Schlecht. in Linnæa. 3. p. 139. The berries are lead-coloured according to Dr. Richardson, who further says, they are named by the Crees *musquameena*, because the bears fatten upon them, and *meethquan-peemeenattick* and *meenisan* (red stick berry), and that pigeons are fond of them.

White-berried Dogwood. Fl. May, July. Clt. 1741. Shrub 4 to 10 feet.

10 C. serícea (L'Her. corn. no. 6. t. 2.) branches spreading; branchlets woolly; leaves ovate, acuminated, clothed with rusty pubescence beneath; corymbs depressed, woolly; nucleus compressed. ♄. H. Native of North America, from Canada to Carolina, in swampy woods and on river banks. Schmidt, arb. 2. t. 64. C. lanuginòsa, Michx. fl. bor. amer. 1. p. 92. C. álba, Walt. fl. car. 88. but not of Lin. C. cærùlea, Lam. dict. 2. p. 116. C. amòmum, Duroi, harbk. 1. p. 165. C. rubiginòsa, Ehrh. beitr. 4. p. 15. C. ferrugínea, Hort. par. C. candidíssima, Mill. C. cyanocárpos, Mœnch, but not of Gmel. Berries bright blue, globose.

Var. β, oblongifòlia (D. C. prod. 4. p. 272.) leaves oblong, glabrous above. ♄. H. C. oblongifòlia, Rafin. in litt.

Var. γ, asperifòlia (D. C. prod. 4. p. 272.) leaves oval, acuminated, rough above from minute stiff pubescence, and rather tomentose beneath. ♄. H. Native of Lower Carolina, in shady woods. C. asperifòlia, Michx. fl. bor. amer. 1. p. 93.

Silky Dogwood. Fl. June, July. Clt. 1683. Shrub 5 to 8 feet.

11 C. circinna'ta (L'Her. corn. p. 7. no. 8. t. 3.) branches warted; leaves broadly oval, acuminated, clothed with hoary tomentum beneath; corymbs depressed, spreading. ♄. H. Native of North America, from Canada to Virginia, on the banks of rivers, and probably of California, ex Cham. and Schlecht. in Linnæa. 3. p. 139. Schmidt, arb. 2. t. 69. C. tomentòsula, Michx. fl. bor. amer. 1. p. 91. C. rugòsa, Lam. dict. 2. p. 115. C. Virginiàna, Hort. par. Branches slightly tinged with red. Leaves broad, waved on their edges. Flowers white as in most of the species. Berries globose, at first blue, but at length becoming white.

Rounded-leaved Dogwood. Fl. June, July. Clt. 1784. Shrub 5 to 10 feet.

12 C. macrophy'lla (Wall. in Roxb. fl. ind. 1. p. 433.) branches smooth; leaves broad-ovate, acuminated, rounded at the base, smooth, glaucous and soft beneath, with the axils slightly glandular; corymbs umbellate; flowers racemose along the branches of the corymb, and secund. ♄. H. Native of Nipaul, near Saharumpore and Sirinagur, and at Kamaon. Leaves with adpressed bristles, 6 inches long, and 4 inches broad, pale beneath; the bristles fixed by the centre, and therefore bicuspidate, but are only to be seen through a lens. Ovarium hairy. Berries round, smooth, about the size of a grain of black pepper.

Long-leaved Dogwood. Shrub.

§ 2. *Involucràtæ* (from *involucra*, an involucrum; the heads of flowers are surrounded by an involucrum). D. C. prod. 4. p. 273. *Flowers disposed in heads* (f. 71. *b.*) *or umbels, surrounded by coloured involucra, which are usually composed of* 4 *leaves* (f. 71. *a.*).

* *Trees, with white capitate flowers.*

13 C. capita'ta (Wall. in Roxb. fl. ind. 1. p. 434.) branches

spreading, smooth; leaves lanceolate, acuminated at both ends, on short petioles, rather rough from small adpressed down; flowers sessile, densely aggregate, forming a round head, girded by a 4-leaved scabrous involucrum. ♄. H. Native of Nipaul, in Gosaingsthan, where the tree is called *chungwa;* and about Serampore, where it is called *Bhimowro;* and between Sutley and Jumna. D. Don, prod. fl. nep. 141. Leaves coriaceous, 2 inches long, glaucous and pale beneath: with sometimes pink-coloured nerves, having each a minute gland in their axils. Heads of flowers about the size of a moderate-sized cherry, supported by a club-shaped peduncle, which widens at the upper end into a convex ligneous receptacle for the reception of the flowers. Involucrum yellow, of 4 obovate leaves.

Capitate-flowered Dogwood. Tree 10 to 15 feet.

14 C. disciflòra (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 4. p. 273.) branches smooth; leaves lanceolate, acuminated at both ends, on short petioles; flowers nearly sessile, disposed in capitate umbels; leaves of involucrum joined together into a roundish 4-lobed disk. ♄. H. Native of Mexico, near Jalapa, where it was collected by Berlandier, Deppe, and Schiede. C. grándis, Cham. et Schlecht. in Linnæa. 5. p. 171. Flowers white, many sterile. Fruit ovate. Perhaps C. polýgama, Rafin. fl. lud. p. 78.?

Disk-flowered Dogwood. Tree.

15 C. Japónica (Thunb. fl. jap. p. 63.) arboreous; branches striated; leaves ovate, acuminated, entire at the base, pale beneath; umbels decompound, of 3-5 rays; involucrum of 4 leaves. ♄. H. Native of Japan, near Nagasaki. Vibúrnum Japónicum, Spreng. syst. 1. p. 934. Rœm. et Schultes, syst. 3. p. 320. Stamens 4. Flowers white. Fruit crowned by the very short permanent style, and the trigonal acute stigma, compressed, red, smooth, rather acid, ex Thunb. l. c.

Japan Dogwood. Shrub 5 to 6 feet.

** *Trees, with yellow umbellate flowers.*

16 C. ma's (Lin. spec. 171.) branches smoothish; leaves oval, acuminated, rather pubescent on both surfaces; flowers rising before the leaves; umbels about equal in length to the 4-leaved involucra; fruit elliptic. ♄. H. Native throughout Europe, Britain excepted, and in the north of Asia, in hedges, and among bushes; as in France, Russia, Germany, Switzerland, Austria, Carniola, Piedmont, &c. Blackw. t. 121. Plench. icon. t. 64. C. máscula, L'Her. corn. no. 4. Guimp. abb. t. 2. Hayne, term. bot. t. 35. Fl. græc. t. 151. Schmidt, arb. 2. t. 63. Lam. ill. t. 74. f. 1. Knip, cent. 1. t. 18. Flowers yellow. Fruit elliptic, of a high shining scarlet colour, the size and form of a small olive or acorn, very styptic in its immature state. The Cornelian cherry is very common in plantations of shrubs. If the season be mild, the flowers will come out in the beginning of February; and though there be no great beauty in them, yet they are produced in plenty at a season when few other flowers appear. Formerly it was cultivated for the fruit, which was used to make tarts, and a rob de cornis was kept in the shops. The fruit is gratefully acid, and is called sorbet by the Turks. Cornel, says Evelyn, grows with us of a good bulk and stature, and is exceedingly commended for its durableness in wheel-work, pins, and wedges, in which it lasts like the hardest iron.

Var. β; fruit yellow or yellowish. Duham. arb. 1. p. 182. This variety is to be found but very rare in the gardens.

Var. γ, *variegàta;* leaves edged with white or yellow.

Male Cornel or Cornelian-cherry. Fl. Feb. April. Clt. 1596. Shrub 10 to 15 feet.

17 C. flórida (Lin. spec. 1661.) branches shining; leaves ovate, acuminated, pale beneath, beset with adpressed pili on both surfaces; flowers umbellate, rising after the leaves; leaves of involucrum large, roundish, retuse or nearly obcordate; drupes ovate. ♄. H. Native of North America, from Carolina to Canada, in woods, common; and on the banks of the Columbia near its confluence with the sea. L'Hher. corn. no. 3. Curt. bot. mag. t. 526. Catesb. car. t. 27. Bigel. med. bot. 2. t. 28. Guimp. abb. holz. t. 19. Rafin. med. bot. t. 28. Schmidt, arb. 2. t. 52. Wang. beytr. 1. t. 17. f. 41. This is a beautiful small tree. Leaves of involucrum white. Flowers greenish-yellow. Berries scarlet, about half the size of those of *C. máscula*, ripe in August. The wood is extremely hard, and of a very fine texture. The bark is extremely bitter, and is used in North America for the cure of remittent and intermittent fevers; and is considered not inferior to Peruvian bark. The young branches stripped of their bark, and rubbed with their ends against the teeth, render them extremely white. (Barton, 1. p. 51.) From the bark of the more fibrous roots the Indians obtain a good scarlet colour.

Flowering Dogwood. Fl. April, May. Clt. 1731. Tree 20 to 30 feet.

*** *Herbaceous plants, with subterraneous creeping roots. Stems simple, herbaceous. Flowers white, in umbels.*

18 C. Canade'nsis (Lin. spec. 172.) stems simple, herbaceous; upper leaves in whorles, ovate, acuminated, veiny, on short petioles; flowers umbellate, much shorter than the leaves of the involucrum, which are ovate, and acuminated; drupes globose. ♃. H. Native of North America, on the high mountains, in boggy ground, from New England to Carolina; also of Newfoundland, and the island of Unalaschka; throughout Canada nearly to the Arctic coast, every where as far as pine woods extend, &c. L'Her. corn. no. 2. t. 1. Curt. bot. mag. 880. Begel. fl. bost. ed. 1. p. 37. Cham. and Schlecht. in Linnæa. 3. p. 139. Kerner, t. 636. ex Rœm. et Schultes, syst. 3. p. 319. Flowers purplish-white; involucra white. Berries red, ripe in July. Habit of *Pàris quadrifòlia*.

FIG. 71.

Canadian Dogwood. Fl. May, June. Clt. 1774. Pl. ½ ft.

19 C. Sue'cica (Lin. spec. 172.) stem herbaceous; umbel between two branches, stalked, surrounded by 4 unequal white involucral leaves, tinged with red; leaves opposite, sessile, ovate, almost nerved from the base; drupe globose. ♃. H. Native of Europe and the north of Asia, Kamtschatka, Aleutian Islands, Greenland, Lapland, Canada, Newfoundland, and Labrador, in moist alpine pastures. In Britain in like situations; on the Cheviot hills of Northumberland, abundantly. In the highlands of Scotland, frequent in boggy spots about rivulets. In the Hole of Horcum, near Scarborough. Lin. fl. lapp. ed. 2. p. 38. t. 5. f. 3. Svensk. bot. t. 201. Penn. tour. scotl. p. 39. Smith, engl. bot. t. 310.—Œder, fl. dan. t. 5. Sturm. deutschl. fl. with a figure. C. herbàcea, Huds. angl. 71.—Dill. elth. 108. t. 91.—Raii, syn. 261. Park. theatr. 1461. f. 1. The involucral leaves finally turn green. Flowers dark purple. The berries are red and sweetish, containing a 2-celled nucleus, having the dissepiment between the cells furnished with a large hole; they are supposed by the Highlanders to create an appetite, and hence the Gaelic name, *Lus-a-chrasis*, plant of gluttony.

Var. β; nearly twice the size of the species. ♃. H. Native of North America, at Fort Vancouver, on the Columbia.

Swedish Dogwood or Dwarf-cornel. Fl. June, July. Britain. Pl. ¼ to ½ foot.

† *Species not sufficiently known.*

20 C. ferula'cea (Jacq. ex Steud. nom. 227.) or C. ferulæfòlia, Nocca, syn. pl. p. 38. but is undescribed. Compare Rœm. et Schultes, syst. 3. p. 323.

Fennel-like Dogwood. Shrub.

21 C. latifòlia (Bray. in Steud. nom. phan. 227.) this species is undescribed as far as we know.

Broad-leaved Dogwood. Shrub.

22 C. poly'gama (Rafin. fl. lud. p. 78.) branches straight, smooth, glabrous; leaves opposite, sessile, oblong, entire, obliquely acuminated, hoary beneath; flowers polygamous. ♄. H. Native of Louisiana. Córnus, no. 2. Rob. voy. 456. Shrub 15 feet high. Branches red. Calyx entire. Petals white, acute. Styles shorter than the stamens. Fruit black, edible.

Polygamous Dogwood. Shrub 15 feet.

Cult. All the woody species are desirable for shrubberies; and many of the kinds will grow under the drip of trees, which renders them valuable for thickening strips of plantations which have become naked below. They are easily increased by cuttings, layering, or by suckers. The *C. Suécica* and *C. Canadénsis* should be grown in a border of peat, in a rather shady situation; they are to be increased by dividing when the plants have run considerably at the roots; or they may be planted in pots filled with peat earth, and treated as alpines.

II. VOTOMI'TA (Votomit is the name of the tree in Guiana). Aubl. guian. 1. p. 90. t. 35. D. C. prod. 4. p. 275.—Glóssoma, Schreb. gen. no. 1728.—Guillemínia, Neck. elem. no. 813. but not of Kunth.

Lin. syst. *Pentándria, Monogýnia.* Tube of calyx turbinate, adnate to the ovarium; limb 4-toothed. Petals 4, oblong, acuminated, spreadingly reflexed. Stamens 4, with very short filaments; anthers oblong, approximate into a tube, terminated by a thin membrane. Style filiform, perforating the tube of the anthers; stigmas 4, oblong. Drupe crowned by the calyx, 1-celled. Seed one striated.—A glabrous shrub, having the branches somewhat quadrangular at the apex. Leaves opposite, sessile, ovate, acuminated, stiff, quite entire, furnished within the base of the petioles with 2 deciduous stipulas. Flowers corymbose; corymbs axillary, few-flowered. Corolla white. This genus is not sufficiently known, but is allied to *Córnus* from the description.

1 V. Guiane'nsis (Aubl. l. c.) ♄. S. Native of French Guiana, near the river Sinemari. Poir. dict. 8. p. 698. Glóssoma Votómita, Rœm. et Schultes, syst. 3. p. 318. Glóssoma arboréscens, Willd. spec. 1. p. 664.

Guiana Votomita. Shrub 5 to 6 feet.

Cult. A mixture of loam, peat, and sand will suit this shrub; and cuttings will root readily in sand under a hand-glass in heat.

III. MASTI'XIA (meaning unknown to us). Blum. bijdr. p. 654. D. C. prod. 4. p. 275.

Lin. syst. *Tetra-Pentándria, Monogýnia.* Tube of calyx adnate to the ovarium: limb superior, 4-5-toothed. Petals 4-5, ovate, broadest at the base. Stamens 4-5, opposite the calycine teeth. Anthers didymous, bursting inwards. Ovarium containing a pendulous ovulum. Style short, girded by a disk; stigma obtuse. Drupe baccate, umbilicate, containing a 1-seeded nut. Embryo inverted in the albumen.—Tall trees, natives of Java, with oblong acuminated leaves, and corymbose flowers.

1 M. penta'ndra (Blum. l. c.) leaves alternate, oblong, quite glabrous; corymbs terminal; flowers pentandrous. ♄. S. Native of Java, on the more elevated woods on Mounts Salak and Burangrang, where it is called by the natives *Huru-Lilin.*

Pentandrous Mastixia. Fl. July, Dec. Tree 30 to 50 feet.

2 M. trichótoma (Blum. l. c.) leaves opposite, oblong, puberulous on the under side, as well as the petioles, and the corymbs which are terminal and trichotomous; flowers with a 4-toothed calyx, 4 petals, and 4 stamens. ♄. S. Native of Java, in woods on the mountains along with the preceding species, where it is called *Palaglar burriet* or *Tenjoh.*

Trichotomous-corymbed Mastixia. Tree 50 to 60 feet.

Cult. For culture and propagation see *Votómita* above.

IV. POLYO'SMA (from πολυ, *poly*, much, and οσμη, *osme*, smell; flowers). Blum. bijdr. p. 658. D. C. prod. 4. p. 275.

Lin. syst. *Tetrándria, Monogýnia.* Tube of calyx adnate to the ovarium: limb superior, 4-toothed, permanent. Petals 4, sometimes joined at the base. Stamens 4, free, alternating with the petals; filaments linear, rather membranous; anthers bursting lengthwise inwardly, adnate, 2-celled. Ovarium incompletely 2-celled, many-seeded. Style filiform; stigma truncate, simple. Drupe somewhat baccate, containing a 1-seeded nucleus. Albumen rather horny. Embryo inverted.—Trees and shrubs, native of Java, with opposite exstipulate leaves; and axillary terminal racemes of whitish, very sweet-scented flowers, furnished with 3 bracteoles under each.

1 P. ilicifòlium (Blum. l. c.) stem arborescent; leaves oblong, coarsely and deeply serrated at the top. ♄. S. Native of Java, on the tops of the higher mountains.

Holly-leaved Polyosma. Tree 20 to 30 feet.

2 P. serrula'tum (Blum. l. c.) stem shrubby; leaves oblong, slightly serrulated. ♄. S. Native of Java, in woods on Mounts Gede and Pangurango.

Serrulated-leaved Polyosma. Shrub 5 to 6 feet.

3 P. integrifòlium (Blum. l. c.) stem arboreous; leaves oblong, quite entire. ♄. S. Native of Java, in the higher woods on Mount Burangrang.

Entire-leaved Polyosma. Tree 60 feet.

Cult. See *Votómita* above for culture and propagation.

Order CXXVII. LORANTHA'CEÆ (plants agreeing with *Loránthus* in important characters). D. Don, prod. fl. nep. 142. D. C. coll. mem. vi. with 12 figures, prod. 4. p. 277.—Lorántheæ, Rich. and Juss. in ann. mus. 12. p. 292. exclusive of Rhizophòreæ, Clorántheæ, and some genera of Loranthàceæ. Loranthídeæ, Gray, brit. arr. 2. p. 492.

Flowers hermaphrodite, or of different sexes (f. 73. *a. d.*). Tube of calyx girded at the base by a calyculous, which is adnate to the ovarium; limb short, entire, or lobed. Petals 4-8 (f. 73. *e.*), sometimes distinct from each other, sometimes cohering more or less together, valvate in æstivation. Stamens equal in number to the petals, and opposite them; filaments adnate to the corolla, more or less, or wanting; anthers oscillatory, or erect on the tops of the filaments; or when the filaments are deficient or wanting, they are adnate to the lobes of the corolla. Ovarium ovate or turbinate, adnate to the calyx. Style filiform or wanting; stigma capitate. Berry 1-celled (f. 73. *a. f.*), 1-seeded (f. 73. *c.*), crowned or umbilicate by the calyx (f. 73. *b.*). Tegument membranous, involving the seed. Albumen fleshy. Embryo with a superior radicle, which is thickened or truncate at the apex.—The shrubs contained in this order are almost all parasitical, that is, growing on and deriving their nourishment from other trees: very few of them grow in earth. Leaves opposite, rarely alternate or wanting, coriaceous or more or less fleshy, and always entire. The disposition of the flowers and

the habit of the plants are very variable.—Very few of the plants belonging to this order are cultivatable; they being nearly all genuine parasites, fixed in the bark and wood of trees, on which they grow, and deriving from their juices the whole of their nutriment. The Viscums have little or no beauty, but the other parasitical genera are among the most lovely of plants, hanging in clusters of rich scarlet flowers from the trunks and branches of trees in the tropics, which they often clothe with a beauty not their own. The *Mistletoe* of the Druids is supposed to have been the *Loránthus Europæ'us*, the common *Viscum* never having been seen upon the oak, while the *Loránthus Europæ'us* inhabits no other tree. If this be correct, the latter must have once existed in this country, although now extinct. It has been suggested, that all vestiges of their religion were extirpated with the Druids, which will perhaps account for the *Loránthus* having disappeared wherever that religion formerly held its sway.

This order is very nearly allied to *Caprifoliàceæ*, from which it is easily distinguished by the anthers being opposite the lobes of the corolla. A connection is established between this order and *Araliàceæ* by means of *Aúcuba*. Mr. Brown suggests their relation to *Proteàceæ*. The germination of *Viscum* is exceedingly remarkable; it has afforded a subject of some curious experiments upon the vital energies of vegetables. See Du Trochet sur la Motilité, p. 114.

Synopsis of the genera.

Tribe I. *Parasitical shrubs.*

1 Ví'scum. Flowers dioecious (f. 73. *b. e.*), or monoecious. Margin of calyx obsolete, but in the male flowers wanting. Petals usually 4 (f. 73. *e.*), connected at the base in the male flowers, but free in the female. Stamens 4. Stigma obtuse, sessile.

2 Arceutho'bium. Flowers dioecious. Male flowers sessile, without a calyx, but with a monopetalous 2-3-4-parted corolla, and the same number of sessile 1-celled anthers, and a gland in place of an ovarium. Female flowers pedicellate, with an ovate, fleshy, bidentate calyx, adnate to the ovarium, without any corolla, stamens, or style, but with a small obscurely-lobed stigma. Berry obovate.

3 Misode'ndron. Flowers dioecious: male ones unknown: female ones having a small truncate limb. Capsule oblong, trigonal.

4 Lora'nthus. Flowers dioecious or hermaphrodite. Margin of calyx entire. Petals 5-6, linear, reflexed. Stamens inserted into the middle of the petals; filaments very short. Berry globose, umbilicate by the calyx, immersed in the rachis.

5 Strutha'nthus. Flowers hermaphrodite, nearly all hexamerous. Margin of calyx truncate. Petals linear, at length revolute. Anthers ovate, fixed near the base or beneath the middle of the petals; filaments very short. Berry ovate-elliptic.

6 Psittaca'nthus. Flowers hermaphrodite, for the most part hexamerous. Margin of calyx entire, obsoletely 5-6-toothed or repand. Petals linear-spatulate, erect, spreading, for the most part free to the middle. Filaments filiform from the middle of the petals; anthers fixed by the base or back. Berry ovate.

7 Tri'sterix. Flowers hermaphrodite; each furnished with 3 bracteas. Margin of calyx entire. Petals linear-spatulate, or linear, bearing the stamens in the middle; anthers fixed by the back, incumbent. Berry ovate or elliptic.

8 Dendroptho'e. Flowers hermaphrodite; each furnished with 1 bractea. Margin of calyx entire or toothed. Petals linear-spatulate, bearing the stamens in the middle; anthers fixed by the base. Berry ovate or elliptic.

9 Phthiru'sa. Flowers hermaphrodite, perhaps always 4-parted; each furnished with 3 or more bracteas. Anthers fixed by the back, ovate. Berry ovate.

10 Scu'rrula. Flowers hermaphrodite, tubular, divided into 4-5 short lobes, usually gibbous at the base, and bursting by a longitudinal fissure as in *Lobèlia*. Filaments 4-5, adhering a long way to the corolla; anthers fixed by the base, erect. Style filiform; stigma capitate.

11 Elytra'nthe. Flowers hermaphrodite; petals 4-6-8, joined to the middle, forming a regular 4-6-8-cleft limb. Filaments adnate to the petals at the base, but free at the apex; anthers fixed by the base, erect. Style filiform. Stigma capitate.

12 Notanthe'ra. Flowers hermaphrodite. Petals 5-6-8, but usually 6, sometimes almost free, and sometimes joined at the base. Filaments adnate to the petals at the base, but free at the apex; anthers fixed by the back, versatile or incumbent. Bracteas concave, 1 under each ovarium, but often wanting.

13 Loxanthe'ra. Flowers hermaphrodite. Tube of corolla elongated, kneed at the base, but somewhat clavate and oblique at the apex, and 6-lobed; the lobes somewhat spirally twisted. Filaments stiff and curved at the apex, not attenuated but rather dilated, and the anthers are fixed by the back. Style filiform. Stigma clavate.

Tribe II. *Terrestrial shrubs.*

14 Schoe'pfia. Flowers hermaphrodite. Margin of calyx entire. Limb of corolla 5-cleft, rarely 4-6-cleft. Filaments adnate to the tube; anthers ovate-roundish. Drupe containing a 3-celled, 3-seeded nucleus.

15 Au'cuba. Flowers dioecious. Calyx 5-toothed. Petals 4, ovate-lanceolate. Stamens 4, alternating with the petals? Stigma concrete. Fruit 1-seeded.

Tribe I. *Parasitical shrubs.*

I. VI'SCUM (*viscus*, birdlime, on account of the sticky nature of the berries; called *gui*, in French; *mistl* in German; *visco* in Italian; and *mistletoe* in English). Tourn. inst. p. 609. t. fruct. 1. p. 131. t. 27. Lam. ill. t. 807. D. C. prod. 4. p. 277. 380. Lin. gen. no. 1105. D. C. coll. mem. 6. no. 1. Gærtn.

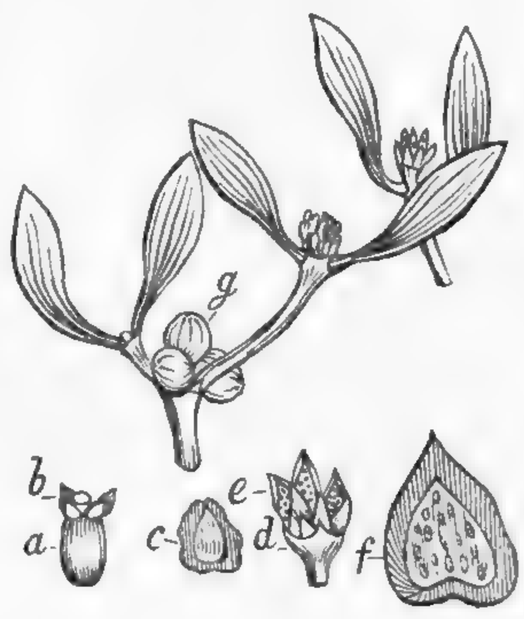
Lin. syst. *Monoècia* or *Dioècia*, *Tetrándria*. Flowers monoecious or dioecious. Calyx a slight border in the male flowers, but rather a more evident border in the female flowers. Corolla in the male flowers gamopetalous, in 4 deep, ovate, acute equal divisions; in the female flower of 4 ovate, equal, deciduous petals, which are dilated at the base. Anthers in the female flowers none, but in the male flower there are 4 compressed, sessile ones, one on the base of each corolline segment, all over pitted or cellular. Ovarium in the female flower inferior, ovate, adnate to the calyx, and crowned by its border. Stigma sessile, obtuse, undivided. Berry globular, smooth, juicy, viscid, of

1 cell. Seed solitary, heart-shaped, compressed, sometimes with a double embryo.—Parasitical on trees, shrubby, branched, all smooth except one species, pale green. Branches terete, tetragonal, or compressed, usually jointed. Leaves opposite, very rarely alternate, simple, undivided, entire, rigid, sometimes wanting or reduced to scales. Flowers in fascicles or spikes, greenish. Berries of various colours. Concerning the very singular germination of *Viscum*, see Malpighi, oper. 140. fig. 105. Duham. phys. arb. vol. 2. p. 220. liv. 5. t. 1. f. 2-10.

§ 1. *Plants with true leaves. Flowers in fascicles or umbels.*

1 V. A'LBUM (Lin. spec. 1451.) stem much branched, forked: with sessile, intermediate heads, of about 5 flowers; branches terete; leaves obovate-lanceolate, obtuse, nerveless. ♄. P. H. Native of Europe, parasitical on trees, especially on the apple-tree and hawthorn; but it is said also to have been found growing on the lime-tree, oak, American locust-tree, elm, fir, pear-tree, service, almond, white willow, walnut, &c. Smith, engl. bot. t. 1470. Mill. fig. 87. Woodv. suppl. t. 270.—Duham. arb. 2. t. 104. Rich. ann. mus. 12. t. 27.—Fuschs. hist. 329. t. 1817. Cam. epit. 555. with a figure. V. álbum of Thunb. and Walt. are distinct from this. Root hard, incorporated deep with the wood of the tree on which it grows, without any radicles, as in all the other species of this genus, as well as of *Loránthus* and the allied genera. Leaves permanent, stiff, with parallel ribs. Flowers yellowish. Berries white, pellucid, the size of a currant, sweet, very glutinous internally, serving to make the best bird-lime, when boiled with a small portion of vegetable oil. *Loránthus Europæ'us* seems to be the original and most common mistletoe, ἰξος of the Greeks, which grows usually on some kind of fir-tree. But our *V. álbum* is sometimes found in Greece, though rarely, growing on the oak; and this has been preferred from the most remote antiquity. Hence, when the superstitions of the East travelled westward, our Druids adopted a notion of the mistletoe of the oak being more holy or efficacious in conjurations or medicine, than what any other tree afforded, the *Loránthus* or ordinary mistletoe not being known here. This superstition actually remains, and a plant of *Viscum* from an oak is preferred by those who rely on virtues, which perhaps never existed in any mistletoe whatever. The Druids sent round their attendant youths with branches of mistletoe to announce the entrance of the new year; and something like the same custom is still continued in France. In England branches of it are hung up in most houses at Christmas, along with other evergreens. The berries are devoured by several birds of the thrush kind, and especially by the mistletoe thrush. The common mistletoe is not difficult to propagate by sticking the berries on thorn or apple trees, after a little of the outer bark has been cut off, and tying a shred of mat over them, to protect them from the birds.

FIG. 73.



White-berried or Common Mistletoe. Fl. May. Britain. Shrub par.

2 V. STELLA'TUM (Hamilt. in D. Don, prod. fl. nep. 142.) much branched; branches whorled, terete; leaves oblong, obtuse, attenuated at the base, 5-nerved beneath; flowers terminal, sessile, 3-5-together in a cluster. ♄. P. H. Native of Upper Nipaul, at Suembu, parasitical on trees. Habit of *V. álbum*. Nerves of leaves acutely prominent on the under surface, but line-formed on the upper surface. The branches are more likely dichotomous or trichotomous than verticillate.

Starry Mistletoe. Shrub parasitical.

3 V. ORIENTA'LE (Willd. spec. 4. p. 737.) branches terete; leaves oblong, obtuse, attenuated at the base, 3-nerved; peduncles axillary, usually 3-flowered. ♄. P. S. Native of the East Indies (ex Wall.), and of Java, on the mountains (ex Blum. bijdr. 666.), and of Palestine upon olive trees, ex Sieb. pl. exsic. pal. Leaves 15-18 lines long, but in the Palestine specimens 20-23 lines long. Berries purple, ex Wall. Perhaps the Indian plant is the same as the Palestine one.

Eastern Mistletoe. Shrub parasitical.

4 V. HEYNEA'NUM (D. C. prod. 4. p. 278.) branches terete; branchlets rather compressed; leaves ovate, acute at both ends, quintuple-nerved; peduncles axillary, aggregate, 3-flowered. ♄. P. S. Native of the East Indies, where it was collected by Heyne. V. orientàle, Heyne, herb. ex Wall, and probably of Willd. The form of the leaves is truly different from the Palestine form of *V. orientàle*, but more of the figure of those of *V. monoícum*.

Heyne's Mistletoe. Shrub parasitical.

5 V. MONOÍCUM (Roxb. hort. beng. p. 105.) branches terete, jointed: branchlets striated; leaves elliptic-oblong, acuminated at both ends, 5-nerved: the 2 lateral nerves hardly conspicuous; fascicles axillary, very short, few-flowered, somewhat spicate. ♄. P. S. Native of the East Indies, at Sunderbund.

Monoecious Mistletoe. Shrub parasitical.

6 V. FALCA'TUM (Wall. cat. no. 492.) branches terete; leaves elliptic-oblong, acuminated, rather falcate, acute at the base, 5-nerved; fascicles of flowers axillary, aggregate, sessile, usually with only 3 flowers in each cluster. ♄. P. S. Native of the East Indies, on the Pundua mountains. Leaves 24-27 lines long, and 9-10 broad. Flowers very small.

Falcate-leaved Mistletoe. Shrub parasitical.

7 V. OVALIFÒLIUM (Wall. cat. no. 489.) branches terete; leaves oval, obtuse, 5-nerved, narrowed into the short petioles at the base; flowers some of them in axillary sessile fascicles, and others are opposite, and somewhat verticillate, along an axillary rachis, disposed in an interrupted spike. ♄. P. S. Native of the East Indies, in the island of Penang. Leaves 3 inches long, and $1\frac{1}{2}$ broad. Rachis not articulated. Berry oval.

Oval-leaved Mistletoe. Shrub parasitical.

8 V. OBTUSA'TUM (Wall. cat. no. 494.) branches terete; leaves oval, obtuse, somewhat cuneated, 5-nerved; flowers axillary, 1-3-together, almost sessile. ♄. P. S. Native of the East Indies, in the kingdom of Ava, on Mount Taong-Dong. Leaves 30 lines long, and 15 lines broad. Flowers small. Berries oval. Lateral nerves of leaves slender.

Bluntish-leaved Mistletoe. Shrub parasitical.

9 V. HETERA'NTHUM (Wall. cat. no. 488.) branches angular, at length terete; leaves elliptic, obtuse, cuneated at the base, 5-nerved beneath; peduncles axillary, 2-5-together, equal in length to the petioles, capitate at the apex, 5-6-flowered, bearing 3-5 involucrate bracteas. ♄. P. S. Native of Nipaul. Berries ovate-globose, solitary in each head, surrounded by the small permanent bracteas. Flowers 5-cleft, one central, the rest disposed in a whorl around the central one, all sessile on the top of the common peduncle.

Variable-flowered Mistletoe. Shrub parasitical.

10 V. PLATYPHY'LLUM (Spreng. cur. post. 47.) branches alternate, angular; leaves alternate, ovate or obovate, petiolate, attenuated at the base, nerved beneath; umbellules usually of 4 flowers, dispersed, pedunculate, solitary or aggregate: involucels 5-cleft, permanent. ♄. P. G. Native of Nipaul, at Bimpedi. V. latifòlium, Hamilt. in D. Don, prod. fl. nep. p. 142. but not of others.

Broad-leaved Mistletoe. Shrub parasitical.

11 V. umbella'tum (Blum. bijdr. p. 666.) branches alternate, angular while young; leaves obovate, 3-nerved: lateral nerves bifid; umbellules pedunculate, axillary, crowded; male flowers pentandrous. ♄. P. S. Native of Java, on trees on Mount Salak.

Umbellate-flowered Mistletoe. Shrub parasitical.

12 V. capitella'tum (Smith, in Rees' cycl. 37. no. 18.) stem branched, rough to the touch; leaves concave, obtuse; peduncles axillary; berries capitate, oval. ♄. P. S. Native of Ceylon. Stems 3 inches high. Leaves an inch long, smooth, thick, fleshy. Heads 4-5-flowered, and under each head there are two thick bracteas.

Capitellate-flowered Mistletoe. Shrub parasitical.

13 V. triflòrum (D. C. prod. 4. p. 279.) branches angular from numerous stripes; leaves oval, bluntish, somewhat undulated, and rather attenuated at the base, 3-nerved beneath; peduncles axillary, 3 times shorter than the leaves, about the length of the berries, 3-flowered, and furnished with 3 bracteas at the apex; flowers 4-cleft, sessile among the bracteas; berries globose. ♄. P. S. Native of the Mauritius. Leaves 6-7 lines long, and 5 lines broad. Peduncles hardly 2 lines long. Flowers 1-2-together, sometimes sessile in the axils of the upper leaves. This species is designated V. rotundifòlium in Bory, voy. 1. p. 320.

Three-flowered Mistletoe. Shrub parasitical.

14 V. venòsum (D. C. l. c.) branches angularly striated; leaves ovate or oval, obtuse, attenuated at the base, on short petioles, 5-veined; veins branched; peduncles axillary, very short, 2-3-flowered; berries globose. ♄. P. S. Native of the Mauritius. V. Capénse, Bory, voy. 1. p. 320.? Plant becoming blackish on drying.

Var. β, lanceolàtum (D. C. l. c.) leaves ovate-lanceolate, somewhat acuminated. ♄. P. S. Native along with the species.

Veiny-leaved Mistletoe. Shrub parasitical.

15 V rotundifòlium (Lin. fil. suppl. p. 426.) stem and branches hexagonal, articulated; leaves sessile, roundish, acute; peduncles 3-flowered, short; bracteas minute, opposite. ♄. P. G. Native of the Cape of Good Hope, on trees. Thunb. fl. cap. 154.

Round-leaved Mistletoe. Shrub parasitical.

§ 2. *Plants with true leaves. Flowers disposed in articulated spikes; the joints sheathed.—American species.*

* *Branches terete.*

16 V. torulòsum (D. C. prod. 4. p. 279.) much branched; branches terete; leaves roundish-ovate or elliptic, oblique, rounded at the apex; spikes axillary, of 2-3 joints; flowers immersed, in 4 rows. ♄. P. S. Native of Quito, on trees near Guayaquil. V. buxifòlium, from South America, Spreng. syst. 1. p. 488. Loránthus torulòsus, H. B. et Kunth, nov. gen. amer. 3. p. 443. Schultes, syst. 7. p. 156. Leaves 30-33 lines long, and 16-20 broad, on petioles, which are 2-3 lines long. Fructiferous spikes $1\frac{1}{2}$ inch long. Flowers unknown

Torulose-spiked Mistletoe. Shrub parasitical.

17 V. trine'rvium (Lam. dict. 3. p. 57.) branches terete, articulated, trichotomous; leaves obovate, obtuse, narrowed at the base, 3-nerved; spikes dense, short, lateral; berries round. ♄. P. S. Native of St. Domingo and Martinico. Plum. ed. Burm. t. 258. f. 2. V. verticillàtum, Lin. exclusive of the syn. Browne, and Sloane. Berry copper-coloured, size of a grain of pepper.

Three-nerved-leaved Mistletoe. Shrub parasitical.

18 V. buxifòlium (Lam. dict. 3. p. 56.) branches terete, articulated: joints short, thickish; leaves obovate, obtuse, 1-nerved, sessile; spikes axillary, solitary or twin, length of the leaves. ♄. P. S. Native of St. Domingo, in the district of Leogane. Willd. spec. 4. p. 738.—Plum. ed. Burm. t. 258. f. 3. There are varieties with both white and purple berries.

Box-leaved Mistletoe. Shrub parasitical.

19 V. sauruoìdes (D. C. prod. 4. p. 36.) branches terete; leaves ovate, acute or acuminated, on very short petioles, beset with dot-like tubercles beneath, having the middle nerve rather prominent, and the lateral veins hardly perspicuous; spikes axillary, twin, shorter than the leaves, very slender. ♄. P. S. Native of Cayenne. V. latifòlium, Lam. dict. 3. p. 57. but not of Swartz, Don, nor Plum. V. racemòsum, Aubl. guian. 2. p. 895.? Leaves 4 inches long, and $2\frac{1}{2}$ broad, on petioles which are a line long. Spikes an inch long, with bifid sheaths. Flowers in 4, 3-flowered whorls between the sheaths.

Saururus-like Mistletoe. Shrub parasitical.

20 V. tereticau'le (D. C. l. c.) branches terete, smooth; leaves ovate, acute, nerveless, veinless, on very short petioles; spikes axillary, twin or solitary, shorter than the leaves; female flowers trifid. ♄. P. S. Native of Jamaica, on trees. V. latifòlium, Swartz, fl. ind. occ. 1798. but not of Lam. nor Don.

Var. β, Cubénse (D. C. l. c.) leaves having the middle nerve rather prominent, but with few veins in the dried state; the margins rather undulated. ♄. P. S. Native of Cuba. Lower spikes 2-3. Perhaps the same as the Jamaica plant.

Terete-stemmed Mistletoe. Shrub parasitical.

21 V. Martinice'nse (D. C. l. c.) plant glabrous; branches terete; leaves ovate-lanceolate, acuminated, 3-nerved, on very short petioles, thick; spikes axillary, solitary, 3 times shorter than the leaves; flowers 4 in a whorl, between the sheaths in each joint of the rachis of the spike. ♄. P. S. Native of Martinico. Sieb. fl. mart. no. 227. Leaves 3 inches long, and an inch broad, having the middle nerve rather prominent.

Martinico Mistletoe. Shrub parasitical.

22 V. flave'scens (Pursh, fl. amer. sept. 1. p. 114.) branches terete, opposite, and verticillate; leaves cuneate-obovate or lanceolate, obtuse, 3-nerved; spikes axillary, solitary, a little shorter than the leaves, interrupted. ♄. P. H. Native of North America, from Pennsylvania to Carolina, and probably of Louisiana, on oak trees. V. álbum, Walt. car. 241. Muhl. cat. no. 91. V. verticillàtum, Nutt. gen. amer. 2. p. 235. Ell. sketch. 2. p. 677. V. leucocárpum, Rafin. fl. lud. 79. Berries white, diaphanous. Male flowers mostly trifid.

Yellowish Mistletoe. Shrub parasitical.

23 V. crassifòlium (Pohl. in litt. ex D. C. prod. 4. p. 280.) branches terete; leaves broad-oval, attenuated at both ends, nerveless, on short petioles; spikes axillary, twin or tern, 4-6 in a whorl, 7 times shorter than the leaves, articulated: with truncate sheaths, and short joints; flowers disposed in 4 rows; berry ovate-globose. ♄. P. S. Native of Brazil, where it was collected by Pohl. Leaves 4 inches long, and $2\frac{1}{2}$ broad. Spikes 6-8 lines long.

Thick-leaved Mistletoe. Shrub parasitical.

24 V. leptosta'chyum (D. C. prod. 4. p. 280.) branches terete; leaves oblong-lanceolate, acute at both ends, 3-nerved; spikes trichotomous, elongated, somewhat panicled, slender, jointed: with cushion-shaped sheaths; berries ovate-roundish, not immersed. ♄. P. S. Native of St. Domingo, where it was collected by Bertero. V. macrostàchyum, ex Hispaniola, Spreng. syst. 1. p. 487. V. aphýllum baccis aureis, Plum. ed. Burm. t. 258. f. 1. and therefore V. opuntioìdes var. β, Lam. dict. 3. p. 56.

Slender-spiked Mistletoe. Shrub parasitical.

25 V. Perrotte'tii (D. C. prod. 4. p. 280.) branches terete; leaves lanceolate, obliquely falcate, bluntish at the apex, cuneated at the base, 5-7-nerved: nerves branched a little; spikes axillary, solitary, opposite, one-half shorter than the leaves, jointed: with bifid sheaths. ♄. P. S. Native of French Guiana. Leaves

5-6 inches long and 1½ broad. Spikes 2 inches long, erect, constantly of 5 joints. Flowers in 6 rows, many of which are abortive. Immature berries nearly globose, half immersed.

Perrottet's Mistletoe. Shrub parasitical.

26 V. BRACHYSTA'CHYUM (D. C. l. c.) branches terete; leaves oblong, obtuse, attenuated at the base, finely 5-nerved; spikes axillary, solitary, opposite, sessile, ovate, few-flowered; berries ovate-globose. ♄. P. S. Native of Mexico, between Tampico and Real del Monte, where it was collected by Berlandier. Leaves 12-15 lines long, and 3-4 broad. Spikes 3-4 lines long.

Short-spiked Mistletoe. Shrub parasitical.

27 V. RU'BRUM (Lin. spec. 1451.) stems terete, simple; leaves oblong, obtuse, tapering into the petiole at the base; spikes axillary, one-half shorter than the leaves, somewhat interrupted; flowers tripartite; berries globose. ♄. P. S. Native of the Bahama Islands, parasitical upon mahogany and other trees. Berries red. Leaves opposite, of a shining green colour.

Red-berried Mistletoe. Shrub parasitical.

28 V. BERTERIA'NUM (D. C. prod. 4. p. 281.) branches terete, dichotomous; leaves oblong-lanceolate, attenuated at both ends, acute at the base, on very short petioles, having the middle nerve rather distinct, and with 2 rather oblique veins rising from the middle; spikes axillary, solitary, opposite, one-half shorter than the leaves, jointed, with bifid sheaths. ♄. P. S. Native of St. Domingo. V. dichótomum, Spreng. syst. 1. p. 448. exclusive of the synonymes, but not of D. Don. Leaves 3 inches long, and an inch broad. Spikes 1-2 inches long. Berries globose. Flowers disposed in 4 rows on the spikes.

Bertero's Mistletoe. Shrub parasitical.

29 V. SCHÓTTII (Pohl, in litt. ex D. C. prod. 4. p. 281.) branches terete; leaves oblong-lanceolate, attenuated at both ends, and somewhat acuminated, having the middle nerve rather distinct, but the rest of the leaf veinless; racemes axillary, solitary or twin, opposite or verticillate, 2 or 3 times shorter than the leaves, articulated: with trifid sheaths; berries ovate; flowers trifid. ♄. P. S. Native of Brazil, where it was collected by Schott. Leaves 2-3 inches long, and 8-9 lines broad. Spikes 9-12 lines long. Allied to *V. Berteriànum*.

Schott's Mistletoe. Shrub parasitical.

30 V. MACROSTA'CHYUM (Jacq. coll. 2. p. 109. t. 5. f. 3.) branches terete; leaves linear-lanceolate, nearly sessile, obtuse, veinless; spikes axillary, solitary, filiform, much longer than the leaves, articulated: with bowl-shaped sheaths; corolla tripartite. ♄. P. S. Native of Martinico and Trinidad, on trees. Sieb. fl. trin. no. 357. Spikes 3-6 inches long: ultimate ones subpanicled. Flowers small. Leaves an inch long, and 3 lines broad.

Long-spiked Mistletoe. Shrub parasitical.

31 V. FA'LCIFRONS (Hook. et Arn. in bot. misc. 3. p. 356.) branches terete, but when young compressed; leaves narrow-lanceolate, bluntish, recurvedly falcate, tapering into the petiole at the base, obscurely 3-5 veined; spikes axillary, solitary, opposite, almost one-half shorter than the leaves; sheaths of spikes truncate. ♄. P. S. Native of Brazil, upon laurels by the river Uraguay. The sheaths of the spikes are here formed of 2 opposite and equal portions, which are truncate at the apex. In *V. Liga* they are keeled on the back, and acute at the extremity.

Sickle-leaved Mistletoe. Shrub parasitical.

32 V. PIPEROI'DES (D. C. prod. 4. p. 281.) plant pendulous, dichotomous, much branched; branches terete, articulated: joints bidentate at the apex; leaves oblong, narrowed at the apex, and obtuse, somewhat ensiform; spikes 2-3, axillary, articulated; flowers in 4 series, somewhat immersed in the rachis. ♄. P. S. Native of South America, near Carthagena and Popayan. V. dichótomum, var. ex Amer. austr. Spreng. syst. 1. p. 488. Loránthus piperoìdes, H. B. et Kunth, nov. gen. amer. 3. p. 443. Schultes, syst. 7. p. 156. Leaves 3 inches long, 12-14 lines broad, on petioles 2 lines long. Fruit bearing spikes an inch long. Flowers unknown.

Pepper-like Mistletoe. Shrub parasitical.

33 V. ANGUSTIFÒLIUM (D. C. prod. 4. p. 281.) much branched; branches terete, in whorles; leaves petiolate, linear-lanceolate, somewhat ensiform, narrowed at the apex and obtuse; spikes 1-3-together, axillary, articulated; flowers in 4 series, immersed in the rachis. ♄. P. S. Native of Peru, in the temperate regions of the Andes, between Ollera and Mount Aipate. Leaves 4-5 inches long, and half an inch broad; petioles 3-4 lines long. Spikes 12-18 inches long. Flowers unknown. V. stenophyllum, Spreng. syst. 1. p. 487. Loránthus piperoìdes, H. B. et Kunth, nov. gen. amer. 3. p. 442. Schultes, syst. 7. p. 155.

Narrow-leaved Mistletoe. Shrub parasitical.

34 V. AFFÌNE (Pohl, in litt. ex D. C. prod. 4. p. 281.) branchlets rather tetragonal; branches terete; leaves linear-lanceolate, obtuse, attenuated at the base, finely 5-nerved; spikes axillary, solitary or twin, twice or thrice longer than the leaves, articulated: with small sheaths; berries ovate, exserted. ♄. P. S. Native of Brazil, where it was collected by Pohl. Leaves nearly 2 inches long, and 3-4 lines broad. Spikes 9-10 lines long.

Allied Mistletoe. Shrub parasitical.

35 V. LÌGA (Gill. mss. ex Hook. bot. misc. 3. p. 355.) branches terete, while young compressed; leaves straight, linear-oblong, obtuse, hardly apiculated, attenuated at the base, 3-nerved, somewhat feather-veined in the middle; spikes solitary, axillary, opposite, 2 or 3 times shorter than the leaves; sheaths of spikes keeled, acute; berries ovate, exserted. ♄. P. G. Native of Chili, on trees near Los Cerillos de San Juan, where it is called *Liga* by the natives. This species seems very nearly allied to V. affìne, Pohl.

Liga Mistletoe. Shrub parasitical.

36 V. ENSIFÒLIUM (Pohl, in litt. ex D. C. prod. 4. p. 281.) branches terete; leaves linear-oblong, acuminated at both ends, petiolate, finely 3-5-nerved at the base; spikes axillary or terminal, many, verticillate, articulated, length of the petioles: with the sheaths bifid; flowers in 6 rows; berries globose. ♄. P. S. Native of Brazil, where it was collected by Pohl. Leaves coriaceous, 6-7 inches long, and 8-9 lines broad; petioles 8 lines long.

Sword-leaved Mistletoe. Shrub parasitical.

37 V. VELÙTÌNUM (D. C. prod. 4. p. 281.) branches terete, velvety from short down; leaves linear-oblong, attenuated at both ends and acute, 3-5-nerved at the base, rather velvety when young, but glabrous in the adult state; spikes axillary, solitary or twin, 3 times shorter than the leaves, articulated: with bifid ciliated sheaths; berries in 4? rows. ♄. P. G. Native of Mexico, in the valley of Tolucca, where it was collected by Berlandier. Leaves 4 inches long, and 6 lines broad. Spikes 9-15 lines long. The plate in Catesb. car. t. 81. lower figure, agrees pretty well with the present species.

Velvety Mistletoe. Shrub parasitical.

38 V. TOMENTÒSUM (D. C. prod. 4. p. 670.) branches terete, while young rather compressed; leaves obovate, obtuse, a little attenuated at the base, clothed with velvety, somewhat deciduous tomentum on both surfaces, as well as the branchlets; spikes axillary, interruptedly articulated, solitary or twin, rather shorter than the leaves: with small nearly entire sheaths. ♄. P. S. Native of Mexico, in the plains at Real de Ratone, beyond the range of Mimosas, where it was collected by Berlandier.

Tomentose Mistletoe. Shrub parasitical.

* * *Branchlets 2-edged or compressed, but at length becoming terete.*

39 V. INTERRU'PTUM (D. C. prod. 4. p. 282.) branches compressed while young, but at length becoming terete; leaves oblong-lanceolate, obtuse, attenuated at the base, petiolate, almost nerveless, with 3-5 fine veins; spikes axillary, 1-2: with the sheaths rather truncate at the apex: joints naked at the base, and fructiferous at the apex. ♄. P. S. Native of Brazil, where it was collected by Pohl. V. lanceolato-ellípticum, Pohl, in litt. Leaves 4 inches long, and 8-10 lines broad. Petioles 4 lines long. Spikes 1½ inch long, interrupted, constantly of 3-4 joints. Perhaps sufficiently distinct from *V. rùbrum*.

Interrupted-spiked Mistletoe. Shrub parasitical.

40 V. A'NCEPS (Spreng. syst. 1. p. 487.) branches 2-edged, but in the adult state they are nearly terete; leaves oblong-lanceolate, obtuse, attenuated at the base, having 3 veins rising from the base; spikes axillary, opposite, one-half or more shorter than the leaves. ♄. P. S. Native of Porto-Rico and Hispaniola, where it was collected by Bertero. Leaves 3-4 inches long, and 9 lines broad; petioles 4 lines long. Spikes an inch long or a little more.

Two-edged-branched Mistletoe. Shrub parasitical.

41 V. HEXA'STICHUM (D. C. prod. 4. p. 282.) branches 2-edged, but at length becoming nearly terete; leaves elliptic, tapering at both ends, bluntish at the apex, and acute at the base, petiolate, feather-nerved; spikes axillary, solitary, opposite, articulated: with the sheaths truncate; berries globosely depressed, disposed in 6 rows. ♄. P. S. Native of the island of Cuba, near Havannah. Leaves coriaceous, 3 inches long, and about 15-16 lines broad; petioles 4 lines long. This species is very like *V. Perrottètii*.

Six-ranked Mistletoe. Shrub parasitical.

42 V. UNDULA'TUM (Pohl, in litt. ex D. C. prod. 4. p. 282.) branchlets 2-edged; branches terete; leaves oval or oblong, tapering at the base, and bluntish at the apex, undulated, thickish, having the middle nerve rather tumid, and the rest of the leaf veinless; spikes axillary, twin, articulated, 3 times shorter than the leaves: having the sheaths rather truncate, and the joints short. ♄. P. S. Native of Brazil, where it was collected by Pohl.

Undulated-leaved Mistletoe. Shrub parasitical.

43 V. MACROPHY'LLUM (Spreng. syst. 1. p. 488.) branches nearly terete; branchlets compressed at the apex; leaves broadly ovate or oval, petiolate, with the middle nerve rather thick, and the lateral veins perspicuous; spikes 2-4 from each axil, one-half shorter than the leaves, somewhat tetragonal; berries ovate, half immersed. ♄. P. S. Native of the West India Islands, as of St. Domingo (Plum. ed. Burm. t. 258. f. 4.), and Porto-Rico (Bertero). Leaves 6 inches long, and 3½ broad; petioles 6-8 lines long. Spikes 2½ inches long, interrupted. Fruit disposed in 4 rows on the spike, and each row composed of 4 berries. Sheaths of spike truncate.

Long-leaved Mistletoe. Shrub parasitical.

44 V. SCHIEDEA'NUM (D. C. prod. 4. p. 670.) trunk terete; branches 2-edged, dilated under the forks; leaves fleshy, 3-5-nerved, falcate, obtuse: female spikes 1-3-together, axillary; flowers 6 in a whorl. ♄. P. G. Native of Mexico, on trees near Jalapa. Fruit a little smaller than hemp seed. V. falcàtum, Cham. et Schlecht. in Linnæa. 5. p. 172. but not of Wall.

Schiede's Mistletoe. Shrub parasitical.

45 V. FLA'VENS (Swartz, fl. ind. occ. p. 266.) branches 2-edged, at length terete; leaves ovate, somewhat attenuated at the apex, obtuse, 5-nerved at the base, on very short petioles; spikes axillary, twin or tern, 3 times shorter than the leaves, articulated; berries ovate. ♄. P. S. Native of Jamaica (Swartz), and Porto-Rico (Bertero), on the branches of trees. The figure of Plumier, cited for this plant by several authors, has here been omitted in consequence of the leaves in the figure being feather-nerved, and not 5-nerved at the base, as in this species.

Yellowish Mistletoe. Shrub parasitical.

* * * *Branches and branchlets tetragonal.*

46 V. TETRAGÒNUM (D. C. prod. 4. p. 282.) branches opposite, and are, as well as the branchlets, tetragonal; leaves elliptic-lanceolate, attenuated at the base, and obtuse at the apex, 3-nerved or 5-nerved, the 2 lateral nerves being hardly evident; spikes axillary, solitary, 3 or 4 times shorter than the leaves. ♄. P. S. Native of Porto-Rico and Guadaloupe, on trees by the sea side. V. angustifòlium, Spreng. syst. 1. p. 487.? V. myrtilloìdes and Loránthus séssilis, Spreng. in herb. Balb. Leaves 12-16 lines long, and 5-8 lines broad; petioles a line long. Spikes 2-3 lines long. Perhaps the same as V. myrtilloìdes, Willd. spec. 4. p. 739.?

Tetragonal-branched Mistletoe. Shrub parasitical.

47 V. MUCRONA'TUM (D. C. l. c.) branches tetragonal, 2-edged while young, but nearly terete in the adult state; leaves oblong-lanceolate, attenuated at the base, obtuse, and mucronate at the apex, having the middle nerve and one on each side of it distinct; spikes axillary, solitary, 4 times shorter than the leaves. ♄. P. S. Native of St. Domingo. V. myrtilloìdes, Spreng. in herb. Balb., and hence it is the V. myrtilloìdes from Hispaniola of Spreng. syst. 1. p. 488. Leaves nearly an inch long, and 4 lines broad; petioles 1-2 lines long. Spikes 2-3 lines long.

Mucronate-leaved Mistletoe. Shrub parasitical.

48 V. PENNIVE'NIUM (D. C. l. c.) branches tetragonal, nearly terete; leaves somewhat alternate, oval on short petioles, obtuse: having the middle nerve rather prominent beneath, and with the lateral veins pinnate and branched, hardly perspicuous above; spikes axillary, solitary, one half shorter than the leaves; berries oblong. ♄. P. S. Native of French Guiana.

Feather-veined Mistletoe. Shrub par.

49 V. KUNTHIA'NUM (D. C. prod. 4. p. 283.) plant much branched; branches tetragonal, articulated; leaves nearly sessile, obliquely oblong, 3-5-nerved, rounded at the apex and cuneated at the base; spikes axillary, 2-3 together, articulated; berries globose, immersed in the rachis. ♄. P. S. Native of Quito, near Guayaquil, on trees. Leaves 18-24 lines long, and 7-9 lines broad. Spikes nearly an inch long. V. trinérvium, Spreng. syst. 1. p. 488. exclusive of the syn. of Lam. Loránthus viscifòlius, H. B. et Kunth, nov. gen. amer. 3. p. 443. Schultes, syst. 7. p. 156.

Kunth's Mistletoe. Shrub par.

50 V. QUADRANGULA'RE (D. C. prod. 4. p. 283.) plant much branched; branches tetragonal, almost winged; leaves lanceolate-oblong, obtuse, almost ensiform, 5-nerved; spikes axillary, twin? articulated; berries globose, disposed in 4 series, sessile. ♄. P. S. Native of the temperate parts of New Granada, parasitical on *Guazùma*. V. rùbrum, var. from New Granada. Spreng. syst. 1. p. 488. Loránthus quadrangulàris, H. B. et Kunth, nov. gen. amer. 3. p. 444. Schultes, syst. 7. p. 156. Leaves 24-27 lines long, and 6-7 broad; petioles a line long. Fruit bearing spikes an inch and a half long.

Quadrangular-stemmed Mistletoe. Shrub parasitical.

51 V. OBLONGIFÒLIUM (D. C. prod. 4. p. 283.) branches tetragonal; leaves oblong, obtuse, attenuated at the base, nearly nerveless, or somewhat 1-nerved at the base; spikes axillary, solitary, 2 or 3 times shorter than the leaves. ♄. P. S. Native of Guadaloupe, on the mountains. Allied to *V. tetragònum* and *V. mucronàtum*, but differs in the leaves being longer and nerveless. Leaves 12-14 lines long and 3-4 broad. Fruit bearing spikes an inch and a half long.

Oblong-leaved Mistletoe. Shrub par.

52 V. MICROPHY'LLUM (Pohl, in litt. ex D. C. prod. 4. p. 283.) branches tetragonal, when young rather compressed, but in the adult state nearly terete; leaves linear-oblong, obtuse, attenuated at the base, nerveless; spikes axillary, solitary, much shorter than the leaves, articulated: with small sheaths, and short, usually 4-flowered joints. ♄. P. S. Native of Brazil, where it was collected by Schott. Leaves an inch long and 2 lines broad. Spikes 3 lines long, constantly of 3-4 joints.

Small-leaved Mistletoe. Shrub parasitical.

§ 3. *Plants without leaves. Branches articulated.*

53 V. CAPE'NSE (Lin. fil. suppl. p. 426.) plant leafless; stems bluntly tetragonal, much branched, articulated; branches decussate; flowers usually 6 in a whorl, sessile: female ones 4-parted; berry globose. ♄. P. G. Native of the Cape of Good Hope, parasitical on some species of *Rhús*. Male flowers 2-4-cleft. Thunb. prod. p. 31. fl. cap. p. 154. Razomówskia Capénsis, hort. mosc. In the racemes of a plant under this name, collected by Mr. Burchell, the branches are terete, it is therefore perhaps a distinct species.

Cape Mistletoe. Shrub parasitical.

54 V. ANGULA'TUM (Heyne, herb. ex Wall. cat. no. 497. D. C. prod. 4. p. 283.) plant leafless; branches angular, tetragonal, articulated; flowers unknown. ♄. P. S. Native of the East Indies, where it was collected by Heyne. From the imperfect specimens examined, it appears to be very distinct from the other species of this genus, but it is hardly known.

Angular-branched Mistletoe. Shrub parasitical.

55 V. AMBI'GUUM (Hook. et Arn. in bot. misc. 3. p. 356.) plant leafless; branches terete, without joints and without sheaths; spikes alternate towards the tops of the branches, oblong-linear, without sheaths; flowers sessile, a little longer than the concave obtuse scales. ♄. P. G. Native of Brazil, upon myrtles by the river Uraguay. The two lateral petals are carinate, and the dorsal one nearly plain. In *Viscum* the margin of the calyx in the female flowers is usually conspicuous, but in this species it is so entirely wanting, as almost to induce a belief that the 3 petals, which are apparently of the same texture as the tube of the calyx, form its limb; and if this really were so, it ought to form a genus next to Tupèia, Cham. et Schlecht. in Linnæa. 3. p. 203., which seems in the same predicament.

Ambiguous Mistletoe. Shrub parasitical.

56 V. TÆNICI'DES (Comm. ex Pet. Th. mel. obs. p. 43.) plant leafless, much branched; stem and branches compressed, articulated, linear-oblong; sheaths truncate; flowers sessile, 2 opposite or 4 in a whorl, situated in the axils of the sheaths. ♄. P. S. Native of the Mauritius and Bourbon. Joints 3 lines long, and a line broad, but not striated. Flowers small. Plant becoming wholly black in drying. Habit almost of *Salicórnia*.

Wreath Mistletoe. Shrub parasitical.

57 V. JAPÓNICUM (Thunb. ex Steud. D. C. prod. 4. p. 283.) plant leafless; stem proliferous, branched, compressed. ♄. P. G. Native of Japan. V. opúntia, Thunb. fl. jap. p. 64. V. opuntioìdes, var. Spreng. syst. 1. p. 487. Perhaps the same as *V. dichótomum*.

Japan Mistletoe. Shrub par.

58 V. DICHÓTOMUM (Hamilt. D. Don, prod. fl. nep. 147. but not of Spreng.) plant leafless; branches compressed, articulated; joints oval-oblong, striated lengthwise, 5 times longer than its breadth; flowers by threes, sessile at the tops of the joints or branches. ♄. P. G. Native of Nipaul, about Narain-hetty. V. Nepalénse, Spreng. cur. post. Bractea membranous, cupular, under the fruit, which is oval. Branches usually opposite, hence dichotomous.

Dichotomous Mistletoe. Shrub parasitical.

59 V. ELONGA'TUM (Wall. cat. no. 495. D. C. prod. 4. p. 284.) plant leafless; branches compressed, articulated: joints linear-oblong, somewhat attenuated at the base, 7 times longer than their breadth; fascicles of flowers somewhat verticillate, sessile, containing 1-3 flowers each, placed at the tops of the joints. ♄. P. S. Native of the East Indies, on the Pandua mountains, in Silhet. Joints 20-22 lines long, and 3 lines broad. Branchlets usually opposite.

Elongated Mistletoe. Shrub parasitical.

60 V. FRA'GILE (Wall. cat. no. 498. D. C. prod. 4. p. 284.) plant leafless; branches compressed, articulated; joints linear-oblong, striated a little, thickish in the middle, six times longer than their breadth; fascicles of flowers opposite, sessile, containing 1-3 flowers, placed at the tops of the branches. ♄. P. S. Native of the East Indies, at Martaban and Tavoy. Branchlets usually opposite. Perhaps sufficiently distinct from *V. dichótomum*.

Brittle Mistletoe. Shrub parasitical.

61 V. ATTENUA'TUM (D. C. prod. 4. p. 284.) plant leafless; branches compressed, articulated; joints gradually attenuated both at the base and apex, linear-cuneated, somewhat striated, sometimes longer than their breadth; fascicles of flowers at the tops of the joints opposite, sessile, containing each 3-5 flowers. ♄. P. S. Native of the East Indies, where it was collected by Heyne. V. opuntioìdes, Heyne, herb. Branches usually in whorles, or somewhat dichotomous.

Attenuated-jointed Mistletoe. Shrub parasitical.

62 V. ARTICULA'TUM (Burm. fl. ind. p. 311.) plant leafless; branches compressed, articulated; joints elongated, striated a little, 10 times longer than broad; fascicles of flowers at the tops of the branches opposite, sessile, containing 1-3 flowers. ♄. P. S. Native of Java, parasitical upon some species of *Annòna*. Joints of branches an inch long, and a line or a little more in breadth. Stems nearly terete at the base.

Var. β, *Timoriénse* (D. C. prod. 4. p. 284.) branches nearly herbaceous; ultimate joints of branches acute at the apex. ♄. P. S. Native of Timor. Perhaps the same as V. compréssum, Poir. suppl. 2. p. 861., which was collected in Amboyna. The berry, according to Poir, is small and yellow.

Jointed Mistletoe. Shrub parasitical.

63 V. MONILIFÓRME (Blum. bijdr. p. 667.) plant leafless; stems terete at the base; branches 2-edged, articulated; joints naked; flowers in whorles, sessile. ♄. P. S. Native of Java, on trees about Buitenzorg, very common, and is called by the natives *Mengando* along with other species.

Necklace-formed Misseltoe. Shrub parasitical.

64 V. TUNÆFÓRME (D. C. prod. 4. p. 284.) plant leafless; branches compressed, articulated, trichotomous, elongated; joints of branches 4 times longer than broad, striated lengthwise; flowers nearly sessile, by threes at the tops of the joints. ♄. S. Native of Brazil, where it was collected by Pohl. P. articulàtum, Pohl, in litt. but not of Burm. Allied to *V. dichótomum*, but differs in the joints being longer, branches much less branched, branchlets elongated, and the flowers not in whorles.

Tuna-formed Mistletoe. Shrub parasitical.

65 V. OPUNTIOÌDES (Lin. spec. 1452.) plant leafless; branches compressed, articulated; joints broadly ovate; spikes jointed, at the tops of the branches or articulations, bearing 2 rows of opposite flowers, and margined by a membrane. ♄. P. S. Native of Jamaica. Sloane, hist. jam. 2. p. 93. t. 201. f. 1. V. monstròsum, Bertero, ined. V. opuntioìdes, Willd. spec. 4. p. 740. exclusive of the synonyme of Plumier. Spreng. syst. 1. p. 487. exclusive of the Japan plant. Berries like those of the common misseltoe.

Var. β. *angústius* (D. C. prod. 4. p. 284.) joints oblong, somewhat attenuated at the base. ♄. P. S. Native of Jamaica.

Berries oval-oblong; flowers 3-cleft. Perhaps the present variety is the female plant, and that called the species the male.

Indian-fig-like Mistletoe. Shrub parasitical.

66 V. VAGINA'TUM (Humb. et Bonpl. in Willd. spec. 4. p. 740.) plant leafless; stem tetragonal; branches teretely compressed; joints bearing sheaths, which are bidentate at the apex; flowers 2, opposite, sessile in the recess of the sheath. ♄. P. S. Native of Mexico, in pine woods, on the high mountain called Cofre de Perote. H. B. et Kunth, nov. gen. amer. 3. p. 445.

Sheathed Mistletoe. Shrub parasitical.

67 V. CUPULA'TUM (D. C. prod. 4. p. 285.) plant leafless; stem tetragonal; branches compressed; sterile joints elongated: fertile ones very short, usually bearing 2 fruit each; sheaths very short; flowers spicate, sessile, opposite; bractea cupulate, membranous, orbicular under each berry; berries ovate. ♄. P. S. Native of St. Domingo, where it was collected by Bertero. V. vaginàtum ex Hispaniola, Spreng. syst. 1. p. 447.

Cupulate-bractead Mistletoe. Shrub parasitical.

68 V. DOMINGE'NSIS (Spreng. syst. 1. p. 487.) plant leafless; stem and branches terete; sheaths large, bowl-shaped, bifid, with white rather scarious margins. ♄. P. S. Native of St. Domingo. Spikes opposite, flexuous.

St. Domingo Mistletoe. Shrub parasitical.

69 V. GRA'CILE (D. C. prod. 4. p. 285.) stem terete; branches rather compressed, articulated; joints linear, elongated, 12 times longer than broad; spikes terminal, compressed, articulated, with the flowers disposed along the margins on both sides in distant rows. ♄. P. S. Native of the West Indies, but in what island is unknown.

Slender Mistletoe. Shrub parasitical.

70 V. CHILE'NSE (Hook. et Arn. in Beech. bot. p. 25.) stem terete, branched; branches and branchlets opposite, articulated, leafless; flowers 2-3-together, sessile at the knees of the branches. ♄. P. G. Native of Chili, at Conception.

Chili Mistletoe. Shrub parasitical.

† *Species not sufficiently known.*

71 V.? PURPU'REUM (Lin. spec. 1451.) branches terete; leaves obovate, obtuse, petiolate; racemes axillary, a little longer than the leaves; flowers opposite, distant, 3-6 pairs; berries obovate, on short pedicels, terminated by the long style. ♄. P. G. Native of the Bahama Islands, parasitical upon *Hippomàne Mancenilla*. Catesb. carol. 2. p. 95. t. 95. lower figure. Perhaps a species of *Loránthus*.

Purple Mistletoe. Shrub par.

72 V. VERTICILLA'TUM (Lam. dict. 3. p. 57.) stem terete, striated; branches verticillate, terete. ♄. P. S. Native of Jamaica, parasitical on the branches of trees. Sloane, jam. hist. 2. p. 93. t. 201. f. 2. Perhaps a species of *Rhipsalis*.

Whorled-branched Mistletoe. Shrub par.

73 V. PAUCIFLÒRUM (Lin. fil. suppl. 246.) stem striated; branches alternate; leaves alternate, sessile, oblong; flowers scattered, solitary, on short peduncles. ♄. P. G. Native of the Cape of Good Hope. From the leaves being alternate, this is perhaps a true species of *Viscum*.

Few flowered Mistletoe. Shrub.

74 V. OBSCU'RUM (Thunb. prod. p. 31. fl. cap. p. 154.) stem erect, wrinkled; branches alternate; leaves opposite, elliptic, veinless, unequal. ♄. P. G. Native of the Cape of Good Hope. Flowers and fruit unknown.

Obscure Mistletoe. Shrub.

75 V. ANTA'RCTICUM (Forst. prod. no. 370.) branches unknown; leaves oblong or ovate, narrowed at both ends, obtuse, nerveless; racemes terminal, articulated, usually containing 5 flowers. ♄. P. G. Native of New Zealand, parasitical on trees. Willd. spec. 4. p. 39.

Antarctic Mistletoe. Shrub par.

76 V. KŒMPFE'RI (D. C. prod. 4. p. 285.) ♄. P. G. Native of Japan, at Mikawaksei, Kœmpf. am. ex. 785. where it is called *Gami Maatz*. V. álbum, Thunb. jap. p. 64. but it differs from *V. álbum* in the spikes being axillary, in the berries being reddish, and in the leaves being 1-nerved.

Kœmpfer's Mistletoe. Shrub par.

N. B. V. RU'BRUM, Burm. fl. ind. 311. is certainly not a species of *Viscum*, but perhaps one of *Hédera*. V. CAPILLA'RE and V. LIGULA'TUM, Blum. bijdr. 667. are species of *Psilòtis*. V. TERRES'TRE, Lin. spec. 1452. is *Lysimàchia stricta*. V. FLAVE'SCENS, Comm. is *Misodéndron punctulàtum*.

Cult. None of the species of Mistletoe are cultivable in gardens, except the common Mistletoe, whose culture and propagation are treated of under that species.

II. ARCEUTHO'BIUM (from *αρκευθος*, *arkeuthos*, the juniper, and *βιοω*, *bioo*, to live; in reference to the plant being parasitical on *Juníperus Oxycèdrus*). Bieb. fl. taur. suppl. p. 629. Hook. fl. bor. amer. 1. p. 277.—Víscum species, D. C. fl. fr. ed. 3. no. 3400.

LIN. SYST. *Dioécia*, *Di-Tetrándria*. Flowers dioecious. Male ones sessile; calyx none; corolla monopetalous, 2-3, rarely 4-parted, tough, and fleshy: segments ovate, concave, spreading; stamens 2-3-4; anthers sessile, fixed in the middle of the segments, free, nearly globose, 1-celled, membranous, dehiscing transversely; ovarium none, but in its stead there is a small 2-3-4-lobed gland. Female flowers on short pedicels; calyx oval, compressed, fleshy, bidentate, almost covering the ovarium, which is one ovulate, and adnate to it; corolla, style, and stamens none; stigma small, obscurely lobed. Berries narrow, obovate, terete, 1-seeded, on short pedicels. Seed immersed in viscid pellucid pulp, fixed to the upper part of the cell, pendant, obovately cylindrical, acuminated at the base; integument thin; albumen fleshy. Embryo immersed, slender, cylindrical, placed towards the base of the seed; radical turned to the hilum of the seed.—A small, leafless, rather fleshy, proliferous branched shrub, parasitical on resiniferous trees, in Middle Europe and North America; branches opposite, bluntly tetragonal, articulated in the manner of *Salicórnia;* joints sheathing above, and somewhat pelviform. Flowers terminal and lateral, usually by threes, small, and conspicuous.

1 A. OXYCE'DRI (Bieb. fl. taur. suppl. p. 629. Hook. fl. bor. amer. 1. p. 278. t. 99.) ♄. P. H. Native from Spain, near Lescurial, to Iberia, near Tiflis and Gandscha, on *Juníperus Oxycèdrus;* and of North America, on the west side of the Rocky Mountains, on *Pìnus ponderòsa;* and from the Spoken River to the west side of the Rocky Mountains, on *Pìnus Banksiàna*, in lat. 47°, to the Rocky Mountains and thence to Hudson's Bay on the east, in lat. 57°. In America the female plants grow on *Pìnus Banksiàna*, and the male ones on *Pìnus ponderòsa*. Razoumówskia Caucásica, Hoffm. hort. mosq. 1808. intr. no. 1. f. 1. Víscum Oxycèdri, D. C. fl. fr. ed. 3. no. 3400. Stev. soc. mosq. 4. p. 71. Bieb. fl. taur. 2. p. 406.—Víscum in Oxycèdro, Clus. hist. 1. p. 39. Lob. icon. 2. p. 223. f. 2. This is a very singular parasitical plant. The American plants become yellowish when dried, and the European ones become blackish-green.

Red-cedar Arceuthobium. Shrub par.

Cult. This curious plant is not cultivable, unless the trees or shrubs on which it grows could be imported with the plant growing upon them.

III. MISODE'NDRUM (from *μισος*, *misos*, disdain, and *δενδρον*, *dendron*, a tree; trees with neither appearance nor beauty). Banks, ined. D. C. coll. mem. 6. no. 2. t. 11 and 12. prod. 4. p. 285.

Lin. syst. *Dioècia, Tetrándria?* Flowers dioecious; male ones unknown; female ones having the tube of the calyx adnate to the ovarium, and furnished with 3 long plumose bristles on the outside, alternating with 3 bracteas, which are adnate to the calyx; limb of calyx minute, truncate. Fruit an oblong triquetrous indehiscent utriculus, crowned by the permanent limb of the calyx. Seed one; albumen fleshy.—Small smooth parasitical shrubs, with the habit of *Viscum*.

§ 1. *Plant leafless.*

1 M. punctula'tum (Banks, mss. ex D. C. prod. 4. p. 286.) plant leafless; branches terete, rugged from dots; bracteas alternate along the branches, half stem-clasping, ovate, obtuse; flowers 1-2, sessile in the axils of the bracteas. ♄. P. S. Native of America, on trees. D. C. coll. mem. vi. t. 11.

Var. α, Magellánicum. ♄. P. H. Native of the Straits of Magellan. Viscum flavéscens, Comm. herb.

Var. β, subumbellàtum. ♄. P. G. Native of the north-west coast of America, in Statenland. It differs from var. α in the branches being thicker and somewhat umbellate.

Dotted-branched Misodendron. Shrub par.

§ 2. *Plants furnished with leaves. Branches alternate, bearing each one articulated leaf at the apex.*

2 M. brachysta'chyum (D. C. coll. mem. vi. t. 12. f. 1.) branches alternate, bearing each an obovate or oval obtuse leaf at the apex; spiklets few-flowered, bractless, rising from the branchlets beneath the leaves; fruit ovate. ♄. P. H. Native of the north-west coast of America, in Statenland. Leaves 3-5 lines long, and 2-3 broad, flat, nerveless. Flowers and fruit not sufficiently known, and therefore the genus is doubtful.

Short-spiked Misodendron. Shrub par.

3 M.? quadriflòrum (D. C. coll. mem. iv. t. 12. f. 2.) branchlets alternate, each bearing an oblong-obovate subserrulated leaf at the apex, and 4 sessile unilateral flowers on the upper side. ♄. P. H. Native of North America, in Statenland. This is very like the preceding species in habit, but differs in the flowers and fruit being unilateral. Calyx triquetrous, dehiscing at the sides.

Four-flowered Misodendron. Shrub par.

§ 3. *Plants furnished with leaves. Leaves alternate. Branches floriferous at the apex.*

4 M. oblongifòlium (D. C. prod. 4. p. 671.) branches clothed with fine velvety down; leaves oblong-lanceolate, cuneated at the base, 3-nerved, glabrous; spikes bearing each one leaf at the base, conforming to the others. ♄. P. G. Native of Chili (Bertero), and of Chiloe (Cuming). Genus novum, no. 1. Pœpp. pl. exsic. no. 813. Flowers bractless, with 8-10 distant ones in each spike.

Oblong-leaved Misodendron. Shrub par.

5 M. linearifòlium (D. C. prod. 4. p. 671.) plant glabrous; leaves linear, acute; flowers sessile, solitary at the axils of the leaves in the flowering branches. ♄. P. G. Native of Chili, where it was collected by Poeppig. Genus novum, no. 2. Poepp. pl. exsic. no. 800.

Linear-leaved Misodendron. Shrub par.

6 M. microphy'llum (Hook. et Arn. in bot. misc. 3. p. 357.) leaves minute, linear; flowers sessile, solitary at the axils of the leaves; branches pubescent. ♄. P. G. Native of Chili, in the province of Maule. Closely allied, but apparently quite distinct from the preceding species.

Small-leaved Misodendron. Shrub par.

Cult. These are singular shrubs, similar to the Mistletoe, but are not cultivable in gardens.

IV. LORA'NTHUS (from *lorum*, a lash made of leather, and *ανθος*, *anthos*, a flower; alluding to the long linear shape and leathery substance of the petals). Mart. in D. C. prod. 4. p. 671.—Loránthus species of Lin. and others.

Lin. syst. *Penta-Hexándria, Monogýnia.* Flowers dioecious or hermaphrodite. Calyx cup-shaped, adnate, with an entire border. Petals 5-6 (f. 74. *a. d.*), linear, reflexed. Stamens inserted into the middle of the petals; filaments short; anthers globose, didymous, having the cells dehiscing in front towards the connecting part. Style thickish; stigma simple. Berry globose (f. 74. *e.*), umbilicate by the calyx, 1-celled, 1-seeded as in the rest of the genera, broken off from the present.—Parasitical shrubs. Spikes axillary and terminal, simple. Flowers immersed in the fleshy rachis, each propped by a somewhat orbicular bractea at the base.

1 L. Europæ'us (Lin. spec. 1672.) plant glabrous, much branched; branches terete; leaves opposite, petiolate, oval-oblong, obtuse, somewhat attenuated at the base; racemes terminal, simple; flowers dioecious, of 6 petals; anthers adnate in the male flowers. ♄. P. H. Native of Austria, Hungary, Italy, and Upper Siberia, parasitical on oak and sweet-chestnut trees. Jacq. fl. austr. t. 30. Schkuhr, handb. t. 94. Sturm, fl. germ. with a figure. Plench. icon. t. 248. Habit of *Viscum álbum*. Flowers greenish. Berries oval, white or yellowish. This is the Víscum or Mistletoe of the ancients.

FIG. 74.

European Loranthus. Shrub par.

2 L. odora'tus (Wall. in Roxb. fl. ind. 2. p. 215.) glabrous; branches terete; leaves nearly opposite, ovate-lanceolate, fleshy: spikes axillary, subfascicled, with a foveolate fleshy rachis, and jointed sessile subimmersed spreading 6-petalled hexandrous flowers; anthers ovate, inserted by the base; style shorter than the petals. ♄. P. G. Native of Nipaul, on the mountains of Chandigiri and Sheopore, parasitical on trees. D. Don, prod. fl. nep. p. 143. Schultes, syst. 7. p. 101. D. C. prod. 4. p. 294. Leaves pale green, at length becoming yellowish, from 4 to 6 inches long. Spikes shorter than the leaves, many flowered, almost sessile. Flowers small, nearly white, very sweet-scented, at first clavate, but at length spreading; petals cuneate, slightly concave at the apex. Ovarium supported by no other bractea than the acute margin of the foveola of the rachis.

Sweet-scented-flowered Loranthus. Shrub par.

3 L. Lambertia'nus (Schultes, syst. 7. p. 118.) glabrous, dichotomously branched; leaves opposite, on very short petioles, ovate-lanceolate, narrowed at both ends, acute, nerved; spikes terminal, solitary; flowers half immersed in the foveolate rachis, 5-petalled; anthers fixed by the back. ♄. P. G. Native of Nipaul. Habit of *L. Europæ'us*.

Lambert's Loranthus. Shrub par.

Cult. The species have the habit of common mistletoe, but are not cultivable in gardens on account of their being parasitical.

V. STRUTHA'NTHUS (from *στρουθος*, *strouthos*, a sparrow, and *ανθος*, *anthos*, a flower; some of the species are called *Erva de Passerinho* and *Herba dos Passeros*, i. e. Sparrow-plant, in South America). Mart. in D. C. prod. 4. p. 671.—Loránthus species of authors.

Lin. syst. *Hexándria, Monogýnia.* Flowers hermaphrodite, almost always 6-parted (except in one species, which is 4-parted

and dioecious, and in another 5-parted). Calyx angular, small, hemispherical, with an extenuated truncate margin. Petals linear, distinct from each other a long way at the base, and at length revolute at the apex; anthers ovate, fixed by the back near the base or beneath the middle; filaments short, inserted beneath the middle of the petals. Ovarium ovate-globose. Style subclavate. Berry ovate-elliptic.—Parasitical shrubs. Racemes terminal or lateral, solitary or aggregate in the axils, having the rachis for the most part angular or 2-edged. To this genus belongs the greater part of the sections *Stachyánthus* and *Protostelìdes* of *Loránthus*, D. C. prod. 4. p. 287 and 289. particularly the Brazilian species.

Sect. I. Stachya'nthus (from *σταχυς*, *stachys*, a spike, and *ανθος*, *anthos*, a flower; flowers sessile, disposed in spikes). Flowers sessile along the rachis, and sometimes immersed in pits on it, spicate, solitary or by threes, usually furnished with 3 bracteas each.

1 S. alveola'tus; plant glabrous, much branched; branches terete; leaves petiolate, roundish-ovate, rather oblique, obtuse, somewhat coriaceous; spikes axillary, 1-3-together, without joints, somewhat tetragonal; flowers disposed in 4 rows on the spikes, immersed in pits in the rachis; petals linear-lanceolate. ♄. P. S. Native of South America, near Popayan and Carthagena, parasitical on *Crescéntia Cujète*. Loránthus alveolàtus, H. B. et Kunth, nov. gen. amer. 3. p. 444. Loránthus rotundifòlius, Bonpl. herb. Schultes, syst. 7. p. 154. Leaves 2 inches long, and 1½ broad, on petioles 2 lines long. Spikes an inch or an inch and a half long. Corolla greenish white. Perhaps a true species of *Loránthus*.

Alveolate-spiked Struthanthus. Shrub par.

2 S. pterygopus; plant glabrous; branches compressed at the apex; leaves opposite, on short petioles, ovate, acuminated, coriaceous; spikes axillary, solitary, longer than the leaves; peduncles compressed, winged; flowers by threes, sessile; petals 6, linear-lanceolate. ♄. P. S. Native of Brazil, in the provinces of Minas Geraes and Bahia, on trees in the woods. Loránthus pterýgopus, Mart. in Schultes, syst. 7. p. 153. Flowers semi-linear. Anthers roundish-ovate.

Wing-stalked Struthanthus. Shrub par.

3 S. Uragua'nsis; plant glabrous, erect; branches terete; leaves alternate, oblong-lanceolate, cuspidate by a point at the apex, attenuated into the petiole at the base; peduncles 1-2, axillary, equal in length to the leaves, forked above the middle; pedicels furnished with 3 bracteas and 3 flowers at the apex; flowers sessile; petals 6, linear, nearly free; filaments shorter than the petals; anthers ovate, erect; stigma capitate; berries egg-shaped. ♄. P. G. Native of South America, upon laurels and myrtles, on the banks of the Uraguay. Loránthus Uraguénsis, Hook. et Arn. in bot. misc. 3. p. 358. In many points it resembles Loránthus flagellàris, Cham. et Schlecht.

Uraguay Struthanthus. Shrub par.

4 S. podo'pterus; plant glabrous, erect; branches terete, when young angularly compressed; leaves elliptic, attenuated at both ends, feather-nerved, reticulated above; spikes axillary and terminal, flexuous, pedunculate; flowers by threes, immersed in the rachis, which is winged; corolla 6-parted, with linear lobes; anthers inserted by the base; stigma capitate. ♄. P. S. Native of Brazil. Loránthus podópterus, Cham. et Schlecht. in Linnæa. 3. p. 218. Loránthus acùtus, Pohl, in litt. Leaves 3½ inches long, and 1½ broad, on petioles 2 lines long. Corolla a line long.

Winged-peduncled Struthanthus. Shrub par.

5 S. oblo'ngus; plant glabrous; branches terete; branchlets compressed; leaves oblong, nearly elliptic, obtuse, cuneated at the base, and 3-5-nerved: nerves slender, reticulately branched; spikes axillary, very short, few-flowered. ♄. P. S. Native of Brazil. Loránthus oblóngus, Schott. and Pohl, in litt. ex D. C. prod. 4. p. 287. Leaves 2 inches long, and 8 lines broad; petioles and spikes about 2-3 lines long. The nervation of the leaves is very distinct from the other species, but the young flowers are not described. It is probably a species of *Viscum*.

Oblong-leaved Struthanthus. Shrub par.

6 S. occidenta'lis; branches terete, scabrous; leaves ovate-roundish or elliptic, marginate, glabrous, feather-nerved at the base, on very short petioles; spikes axillary, simple, shorter than the leaves, nearly terete; flowers almost sessile, furnished with a small very blunt bractea each; petals 6, rather connate at the base; stamens 6, 3 fertile and 3 sterile. ♄. P. S. Native of Jamaica, on trees, and of many other of the West Indian Islands. Loránthus occidentàlis, Lin. amœn. 5. p. 396. Swartz, obs. 138. Schultes, syst. 7. p. 146. Sloan. jam. 2. t. 100. f. 2. Scúrrula 2. Brown, jam. 197. Leaves 15-16 lines long, and 8-9 broad. Spikes an inch long. Flowers 2 lines long. Berries roundish.

Western Struthanthus. Shrub par.

7 S. polysta'chyus; plant glabrous; branches terete, but compressed at the articulations; leaves petiolate, ovate-lanceolate, acute, thick, veiny; spikes axillary, by threes, one-half shorter than the leaves, diverging; flowers by threes, sessile, opposite; petals 6. ♄. P. G. Native of Peru, in groves on the Andes upon trees and shrubs. Loránthus polystàchyus, Ruiz et Pav. fl. per. 3. p. 50. Schultes, syst. 7. p. 155. Leaves as in many other species about 2 hands long. Flowers small, purple. Bracteas semiannular, hardly conspicuous. Berries oval, brownish-yellow.

Many-spiked Struthanthus. Shrub par.

8 S. Patri'sii; plant glabrous; branches terete, but when young compressed; leaves opposite, petiolate, oval-oblong, obtuse at the base, acuminated at the apex, of the consistence of parchment, feather-nerved; spikes axillary, simple, shorter than the leaves: ultimate ones disposed in a terminal panicle; flowers distant along the rachis, sessile, bractless; fruit oblong, spreading, truncate at the apex. ♄. P. S. Native of French Guiana, where it was collected by Patris. Loránthus Patrìsii, D. C. prod. 4. p. 288. Leaves 4-5 inches long, and 1-2 broad, rather glaucous above, and rufescent beneath, on petioles 2 lines long. Berries tetragonally compressed while young, 3 lines long. Flowers unknown, therefore it is doubtful whether it belongs to this genus or not.

Patris's Struthanthus. Shrub par.

9 S. amplexicau'lis; plant glabrous; branches terete; leaves sessile, stem-clasping, reniform, coriaceous; spikes axillary, twin, not jointed, nearly sessile; berries half immersed in the rachis, ovate. ♄. P. S. Native of the temperate parts of Caraccas. Loránthus amplexicaúlis, H. B. et Kunth, nov. gen. amer. 3. p. 445. Schultes, syst. 7. p. 154. Flowers unknown. Said to be nearly allied to *S. alveolàtus*. Perhaps a true species of *Loránthus*.

Stem-clasping-leaved Struthanthus. Shrub par.

10 S. emargina'tus; plant glabrous, somewhat scandent; branches terete, when young compressed; leaves ovate-cuneated, emarginate, on very short petioles, without any lateral nerves; spikes axillary and terminal, tetragonal, rather shorter than the leaves; flowers opposite, bractless, nearly sessile; petals 6, lanceolate, distinct; anthers 6, 3 of which are acuminated and sterile, and the 3 fertile ones roundish. ♄. P. S. Native of Hispaniola, Porto-Rico, and Guadaloupe, on the mountains, parasitical on trees. Loránthus emarginàtus, Swartz, prod. p. 58. fl. ind. occ. p. 625. Schultes, syst. 7. p. 152. Berries black, elongated.

Emarginate-leaved Struthanthus. Shrub par.

11 S. spica'tus; plant glabrous; branches terete; leaves ob-

ovate or oval, attenuated at the base, somewhat palmately veined, obtuse; spikes axillary, thick, tetragonal, shorter than the leaves, bearing flowers almost from the base; flowers decussate; petals 6, concrete at the very base: berry ovate-oblong. ♄. P. S. Native of South America, amongst the bushes and woods of Carthagena. Loránthus spicàtus, Jacq. amer. p. 97. t. 68. Flowers small, red. Berries green, red at the apex. Schultes, syst. 7. p. 151.

Var. β, *athroánthus* (E. Meyer, nov. act. bonn. 12. p. 788.) lower spikes axillary, superior ones crowded in racemes, leafless. ♄. P. S.

Spiked-flowered Struthanthus. Shrub par.

12 S. LEPTOSTA'CHYUS; plant glabrous; branches somewhat tetragonal; leaves petiolate, ovate-elliptic, acuminated, rounded at the base, rather coriaceous; spikes axillary, twin or tern, 2 or 3 times shorter than the leaves; flowers sessile, scattered, distant; rachis compressed, rather quadrangular; petals 6, lanceolate-linear, spreading. ♄. P. S. Native of the Andes of Quindiu, between Carthagena and Buga. Loránthus leptóstàchyus, H. B. et Kunth, nov. gen. amer. 3. p. 440. Schultes, syst. 7. p. 154. Leaves 5 inches long, and $2\frac{1}{2}$ broad. Spikes $1\frac{1}{2}$ to $2\frac{1}{2}$ inches long. Flowers hardly 2 lines long.

Slender-spiked Struthanthus. Shrub par.

13 S. OVALIFÒLIUS; plant glabrous, herbaceous; stem terete, quite simple, erect; leaves oval, thick, nearly veinless, on short petioles, obtuse or emarginate; spikes axillary, 1-2, twice the length of the petioles; flowers sessile, bractless; petals 6, linear, retroflexed at the apex. ♃. P. S. Native of Peru, on the Andes in groves, upon trees and shrubs. Loránthus ovalifòlius, Ruiz et Pav. fl. per. 3. p. 50. t. 277. f. b. Schultes, syst. 7. p. 151. Herb a foot high. Flowers much crowded, small, purple. Berry oval, of an obscure purple colour.

Oval-leaved Struthanthus. Shrub par.

14 S. MARGINA'TUS (Lam. dict. 3. p. 596.) plant glabrous; branches terete; leaves ovate-lanceolate, acuminated, petiolate, with scarious margins, having the middle nerve rather prominent, and the lateral ones wanting; spikes axillary, solitary, opposite, shorter than the leaves; flowers by threes in a fascicle along the rachis, bracteolate; corolla 6-parted, with linear segments; anthers very caducous; stigma capitate. ♄. P. S. Native of Brazil. Loránthus marginàtus, Lam. dict. 3. p. 596. Schultes, syst. 7. p. 137. L. àvium, Pohl, in litt. Leaves 2 inches long, and 9-10 lines broad; petioles 2-3 lines long. Corolla 2-3 lines long.

Marginate-leaved Struthanthus. Shrub par.

15 S. CONCI'NNUS; plant glabrous; branches slender, terete; leaves opposite, lanceolate, acuminated, membranous, shining above; spikes axillary and terminal, solitary, interrupted, shorter than the leaves; flowers by threes, opposite, sessile, somewhat verticillate, bracteate; petals 6, linear, reflexed. ♄. P. S. Native of Brazil, in the province of Rio Negro, in woods at Ega. Loránthus concínnus, Mart. in Schultes, syst. 7. p. 150. Flowers a line and a half long, clavate in the unexpanded state. Anthers ovate.

Neat Struthanthus. Shrub par.

16 S. NÍTENS; plant glabrous; branches terete, rooting on one side; leaves alternate, ovate-lanceolate, acuminated, shining, membranous; spikes racemose, interrupted, lower ones axillary, solitary: superior ones panicled; flowers by threes, sessile, bracteate; petals 6, linear-lanceolate. ♄. P. S. Native of Brazil, in the province of Rio Negro, in woods. Loránthus nítens, Mart. in Schultes, syst. 7. p. 150. Flowers a line long, ovate-club-shaped in the unexpanded state. Anthers ovate, excavated at the side of the filaments.

Shining Struthanthus. Shrub par.

17 S. SUBCAMPE'STRIS; branches terete, beset with rusty dots at the apex, compressed; leaves opposite, ovate-elliptic, obtuse, coriaceous, nerved, glabrous; spikes 1-2, axillary, interrupted, one-half shorter than the leaves; flowers nearly opposite, by threes, sessile, bracteate, small; petals 6, linear-lanceolate. ♄. P. S. Native of Brazil, in the province of Minas Geraes. Flowers half a line long. Anthers ovate. Loránthus subcampéstris, Mart. in Schultes, syst. 7. p. 151.

Field Struthanthus. Shrub par.

18 S. AFFÌNIS; branches terete, compressed at the apex, and beset with rusty dots; leaves nearly opposite, ovate-elliptic, acuminated, coriaceous, nerved, glabrous; spikes axillary, solitary, interrupted, not half so long as the leaves; flowers by threes, sessile, retroflexed, bracteate, small. ♄. P. S. Native of Brazil, in the woods of Japura, in the province of Rio Negro. Loránthus affìnis, Mart. in Schultes, syst. 7. p. 151. Very like the preceding species.

Allied Struthanthus. Shrub par.

19 S. A'NCEPS; branches compressed, 2-edged, green; leaves on short petioles, elongated, ovate-obtuse; spikes on short peduncles, solitary, axillary, much shorter than the leaves; flowers small, somewhat imbricate. ♄. P. S. Native of Guiana. Loránthus ánceps, Desv. in Hamilt. prod. p. 33. Schultes, syst. 7. p. 153. The rest unknown.

Two-edged-branched Struthanthus.

SECT. II. PROTOSTELÌDES (meaning unknown to us). Loránthus, sect. 3. Protostelìdes, D. C. prod. 4. p. 289. Flowers of 6 petals, racemose or panicled; the branches of the panicles or racemes usually bearing 3 flowers and 3 bracteas at the apex. —Species all natives of South America.

20 S. RU'FUS; branches terete; leaves nearly opposite, on short petioles, ovate-oblong, long-acuminated, coriaceous; spikes terminal, panicled; rachis beset with rufous dots; pedicels very short, bearing 3 flowers and 3 bracteas each; petals 6, linear; anthers roundish-ovate. ♄. P. S. Native of Brazil, in the province of Rio Negro, in the woods of Japura. Loránthus rùfus, Mart. in Schultes, syst. 7. p. 130. Flowers a line and a half long, white.

Rufous-branched Struthanthus. Shrub par.

21 S. AVICULA'RIUS; plant glabrous; young branches tetragonal; leaves nearly opposite, ovate, rather acuminated, coriaceous; panicles axillary and terminal, solitary, diffuse, longer than the leaves; peduncles opposite, bracteate at the base; flowers by threes, sessile, 3 bracteated; petals 6, linear-lanceolate. ♄. P. S. Native of Brazil, frequent, where it is called *Erva de Passerinho*. Loránthus aviculàrius, Mart. in Schultes, syst. 7. p. 132. Flowers a line and a half long. Filaments of stamens excavated on the side at the apex.

Knot-grass-like Struthanthus. Shrub par.

22 S. THEOBRÒMÆ; branches tetragonal, but at length becoming terete, rather radicant; leaves ovate, acuminated, on short petioles; panicles axillary and terminal, longer than the leaves; pedicels very short, 3-flowered at the apex. ♄. P. S. Native of Brazil, at Para, upon trees of *Theobròma Cacào*, where it is called *Herva dos Passeros*. Loránthus Theobròmæ, Willd. rel. ex Schultes, syst. 7. p. 132. According to Schultes, this is probably the same as the preceding species.

Cacao Struthanthus. Shrub par.

23 S. VIRGA'TUS; plant glabrous; branches radicant, tetragonal at the apex; leaves opposite, ovate, acuminated, complicate, rather coriaceous; panicles axillary, solitary, twiggy, 3 times longer than the leaves: having the branches tetragonal, and bracteate at the base, and the branchlets short and bearing 3 flowers at the apex, and 3 bracteas; petals 6, linear-lanceolate. ♄. P. S. Native of Brazil, in the province of Rio Negro, in woods about Japura. Loránthus virgàtus, Mart. in Schultes,

syst. 7. p. 132. Flowers half a line long. Filaments of stamens excavated at the side at the apex.

Twiggy Struthanthus. Shrub par.

24 S. DEPPEA'NUS; glabrous; branches rather radicant; leaves almost opposite, petiolate, ovate-lanceolate, acuminated, somewhat 3-nerved; racemes 1-2, axillary; peduncles 3-flowered, bractless; flowers pedicellate; anthers linear, fixed by the base. ♄. P. S. Native of Mexico, near Jalapa. Loránthus Deppeànus, Cham. et Schlecht. in Linnæa. 5. p. 172. Style twisted in a circinate manner at the apex.

Deppe's Struthanthus. Shrub par.

25 S. ERYTHROCA'RPUS; plant glabrous; branches terete; leaves nearly opposite, ovate-lanceolate, acuminated, attenuated at the base, coriaceous, veiny; racemes 1-3 together, rather spicate, interrupted, axillary, and terminal: having very short branchlets, which bear 3 flowers and 3 bracteas at the apex; petals 6, linear. ♄. P. S. Native of Brazil, in the province of Rio Negro, on trees. Loránthus erythrocárpus, Mart. in Schultes, syst. 7. p. 138. Anthers ovate. Berries orange-coloured.

Red-fruited Struthanthus. Shrub par.

26 S. CITRÍCOLA; plant glabrous; branches terete; leaves rather alternate, ovate, somewhat acuminated, and obtuse, subemarginate, veiny; racemes axillary and terminal, shorter than the leaves: superior ones solitary, but the lower ones are somewhat verticillate; branches of racemes short, opposite, bearing each 3 flowers at the apex and 3 bracteas. ♄. P. S. Native of Brazil, near Rio Janeiro, on trees of the orange tribe, where it is called *Herva de Passerinho*. Loránthus citrícola, Mart. in Schultes, syst. 7. p. 137. Perhaps the same as *S. marginàtus*.

Orange Struthanthus. Shrub par.

27 S. FLEXICAU'LIS; plant glabrous; branches sarmentose, radicant; leaves almost alternate, oblong, obtuse, with a mucrone, tapering at the base, flat, reflexed; racemes 1-2 together, axillary, erect, shorter than the leaves: having short, opposite, 3-flowered, tribracteate branchlets; petals 6, linear, spreading above the middle. ♄. P. S. Native of Brazil, in the fields of Taboleira, in the province of Minas Geraes. Loránthus flexicaúlis, Mart. in Schultes, syst. 7. p. 139. Flowers yellowish, a line long, clavate in the unexpanded state.

Bent-stemmed Struthanthus. Shrub par.

28 S. POLYRHÌZOS; plant glabrous; branches scandent, rooting; leaves subalternate, obovate, emarginate, flat, veiny; racemes axillary, solitary, compound, erect, one-half shorter than the leaves: having the branchlets tetragonal, and bearing 3 flowers at the apex and 3 bracteas; petals 6, reflexed from the middle. ♄. P. S. Native of Brazil, in the province of Bahia, in the woods. Loránthus polyrhìzos, Mart. in Schultes, syst. 7. p. 139. Flowers 2 lines long, green. Anthers ovate.

Many-rooted Struthanthus. Shrub par.

29 S. TETRA'QUETER; plant glabrous; branches compressedly tetragonal, scandent, rooting; leaves nearly opposite, ovate, obtuse, reflexed, rather coriaceous; racemes 2-3, axillary: having very short, nearly opposite 3-flowered tribracteate branchlets; petals 6, linear, hardly reflexed, spreading. ♄. P. S. Native of Brazil, in the province of Minas Geraes, on trees. Loránthus tetráqueter, Mart. in Schultes, syst. 7. p. 140. Flowers hardly a line long, roundish in the unexpanded state.

Four-sided-branched Struthanthus. Shrub par.

30 S. STAPHYLI'NUS; plant glabrous; branches compressed at the apex; leaves nearly opposite, obovate or emarginate, attenuated at the base, flat, coriaceous, nerved; racemes axillary, solitary, longer than the leaves: having short bent branchlets, each bearing 3 flowers and 3 bracteas at the apex; petals 6, linear, reflexedly spreading. ♄. P. S. Native of Brazil, in the province of Rio Negro. Loránthus staphylìnus, Mart. in Schultes, syst. 7. p. 290. Flowers a line long. Anthers roundish-ovate.

Staphylea-like Struthanthus. Shrub par.

31 S. CUSPIDA'TUS; plant glabrous; branches rooting, terete; leaves nearly opposite, obovate, attenuated at the base, cuspidate at the apex, coriaceous, glaucous; racemes axillary, solitary, about equal in length to the leaves, few-flowered: having the branchlets 3-flowered at the apex, and tribracteate; petals 6, linear, reflexed from the middle. ♄. P. S. Native of Brazil, in the woods about Pianhia. Loránthus cuspidàtus, Mart. in Schultes, syst. 7. p. 140. Flowers 2 lines long, clavate in the unexpanded state. Anthers ovate.

Cuspidate-leaved Struthanthus. Shrub par.

32 S. LONGIPEDUNCULA'TUS; plant glabrous; branches terete; leaves opposite, oblong-ovate, acuminated, attenuated at the base, rather coriaceous, nerved; racemes axillary, solitary, longer than the leaves: with few branchlets, bearing each 3 flowers at the apex and 3 bracteas; petals 6, linear, spreading above the middle. ♄. P. S. Native of Brazil, in the province of Bahia. Flowers 4 lines long, of a pale greenish colour. Anthers ovate. Loránthus longipedunculàtus, Mart. in Schultes, syst. 7. p. 141.

Long-peduncled Struthanthus. Shrub par.

33 S. SYRINGÆFÒLIUS; plant glabrous; branches unknown; leaves opposite, petiolate, ovate, rather coriaceous, ending in a long taper point; racemes axillary, solitary, panicled, shorter than the leaves; peduncles compressedly tetragonal: with the branchlets short, thick, and bearing 3 flowers at the apex and 3 bracteas; petals 6, linear. ♄. P. S. Native of Brazil, in the province of Rio Negro, in the woods. Loránthus syringæfòlius, Mart. in Schultes, syst. 7. p. 141. Racemes $1\frac{1}{2}$ to 2 inches long. The unexpanded flowers dilated into a somewhat hexagonal club. Anthers erect, hastate at the base.

Syringa-leaved Struthanthus. Shrub par.

34 S. PA'TENS; plant glabrous; branches terete; leaves opposite, lanceolate, thin, ending in a long taper point; racemes axillary, solitary, spreading, exceeding the leaves a little: pedicels 3-flowered; flowers pedicellate; bracteas very minute, orbicular; petals 6, nearly linear, reflexed above the middle. ♄. P. S. Native of Brazil, in the province of Minas Geraes. Loránthus pàtens, Mart. in Schultes, syst. 7. p. 142. Flowers $4\frac{1}{2}$ lines long, tubularly club-shaped in the unexpanded state. Anthers ovate.

Spreading Struthanthus. Shrub par.

35 S. E'LEGANS; plant glabrous; branches terete at the base, but compressed at the apex; leaves nearly opposite, somewhat ovate, rather coriaceous, terminating in a short reflexed acumen; racemes axillary, solitary, twice the length of the leaves: having the branchlets opposite, and bearing 3 flowers at the apex, without any bracteas; petals 6, linear-lanceolate. ♄. P. S. Native of Brazil. Loránthus élegans, Mart. in Schultes, syst. 7. p. 144. Flowers white, a line and a half long, of a roundish club-shaped form at the apex in the unexpanded state. Anthers ovate.

Elegant Struthanthus. Shrub par.

36 S. RU'BENS; plant glabrous; branches terete, radicant; leaves opposite, somewhat reflexed, lanceolate, attenuated at both ends, nerved, somewhat undulated; racemes shorter than the leaves: and the peduncles are trifid: branchlets short, nearly opposite, bearing 3 flowers at the apex, and 3 bracteas. ♄. P. S. Native of Brazil, in the province of Rio Negro, in the woods of Japura. Loránthus rùbens, Mart. in Schultes, syst. 7. p. 144. Flowers unknown. Berries ovate-oblong, umbilicate, 3-4 lines long.

Reddish Struthanthus. Shrub par.

37 S. POLYA'NTHOS; plant glabrous; branches terete; leaves opposite, lanceolate, mucronately acuminated, flat, coriaceous;

racemes axillary, many-flowered, about equal in length to the leaves: branchlets 3-flowered at the apex, and tribracteate; bracteas ovate, acute; petals linear, reflexed from the middle. ♄. P. S. Native of Brazil, in the province of Bahia, in the woods called Catingas. Loránthus polyánthos, Mart. in Schultes, syst. 7. p. 145. Flowers yellowish, 2 lines long. Anthers ovate.

Many-flowered Struthanthus. Shrub par.

38 S. PANICULA'TUS; plant glabrous; branches terete; floriferous branches tetragonal; leaves petiolate, ovate-elliptic, acute at both ends, rather coriaceous; panicles terminal, branched, diffuse: branchlets very short, bearing 3 flowers and 3 bracteas at the apex. ♄. P. S. Native of South America, on trees near Cumana, where it is called *Paxarito.* Loránthus paniculàtus, H. B. et Kunth, nov. gen. amer. 3. p. 442. Flowers unknown. Berries oblong. Loránthus tetragònus, Willd. rel. in Schultes, syst. 7. p. 131. Perhaps the same as *S. Orinocénsis.*

Panicled Struthanthus. Shrub par.

39 S. ORINOCE'NSIS; plant glabrous; branches somewhat tetragonal; leaves petiolate, ovate-elliptic, acuminated, rounded at the base, and somewhat complicate, rather coriaceous; racemes axillary and terminal, exceeding the leaves, paniculately disposed, diffuse: branchlets short, bearing 3 bracteas and 3 flowers; flowers sessile; petals 6, linear-lanceolate, 3 of which are cohering; filaments broad; anthers adnate. ♄. P. S. Native on the banks of the Orinoco, parasitical on trees. Loránthus Orinocénsis, Spreng. syst. 1. p. 129. Schultes, syst. 7. p. 136. Loránthus marginàtus, H. B. et Kunth, nov. gen. amer. 3. p. 442. t. 299. exclusive of the syn. of Lam. Leaves $2\frac{1}{2}$ inches long and $1\frac{1}{2}$ broad; on petioles about 5 lines long. Flowers hardly 3 lines long.

Orinoco Struthanthus. Shrub par.

40 S. PHYLLIRÆOÌDES; plant glabrous; branches elongated, filiform; leaves oblong, acute, rather coriaceous, running into the short petiole at the base, veinless, with the middle nerve rather prominent beneath; peduncles axillary, rather dichotomous, 2-3 times shorter than the leaves; flowers sessile, usually by threes, tribracteate; petals 6, linear, spreading; anthers adnate, mucronate. ♄. P. S. Native of South America, parasitical on trees, near Cumana, where it is called by the natives *Guate-Paxarito.* Loránthus phylliræoìdes, H. B. et Kunth, nov. gen. amer. 3. p. 439. Schultes, syst. 7. p. 122. Leaves 9-10 lines long, and 2-3 broad. Flowers small.

Phylliræa-like Struthanthus. Shrub par.

41 S. MICROPHY'LLUS; plant clothed with hairy pubescence; branches terete; branchlets very short, bearing leaves and flowers at the apex: leaves oblong, obtuse, rather mucronate, sessile, thickish, canescent; flowers sessile, crowded, axillary, and terminal; petals 6-7, lanceolate-linear, rather concrete at the base; filaments adnate to the petals, nearly to the apex; anthers adnate, mucronate. ♄. P. S. Native of Mexico, near Guernacava, on the mountains. Loránthus microphýllus, H. B. Kunth, nov. gen. amer. 4. p. 291. Leaves 4 lines long and $1\frac{1}{2}$ broad. Flowers hardly 2 lines long, pubescent on the outside.

Small-leaved Struthanthus. Shrub par.

42 S. PARVIFÒLIUS; plant glabrous; branches terete, while young angularly compressed; leaves attenuated at the base, on short petioles, obtuse at the apex, nerveless; peduncles axillary, opposite, trifid, 3-flowered, 3 times shorter than the leaves; petals 6, lanceolate, acute; stamens shorter than the petals; ♄. P. S. Native of the higher mountains of Jamaica, upon the branches of trees. Loránthus parvifòlius, Swartz, prod. p. 58. fl. ind. occ. p. 628. Schultes, syst. 7. p. 120. Leaves 6 lines long, and 3 broad. Corolla 2 lines long. Berry oblong, black.

Small-leaved Struthanthus. Shrub par.

43 S. ROTUNDIFÒLIUS; stems diffuse; leaves roundish, glabrous; flowers axillary, crowded, bracteate, hexandrous; peduncles short, many-flowered. ♄. P. S. Native of Brazil, among bushes about Rio Janeiro. Loránthus rotundifòlius, St. Hil. pl. rem. bras. intr. p. 21. Schultes, syst. 7. p. 121.

Round-leaved Struthanthus. Shrub par.

44 S. PYRIFÒLIUS; glabrous, pendulous; branches terete, compressed at the nodi; leaves petiolate, oblong, obtuse, acute at the base, rather membranous, complicated; racemes axillary and terminal: branchlets very short, nearly opposite, tribracteate, 3-flowered; flowers sessile; petals 6, lanceolate. ♄. P. S. Native of South America, near Carthagena, growing on Crescéntia Cujète. Loránthus pyrifòlius, H. B. et Kunth, nov. gen. amer. 3. p. 441. Schultes, syst. 7. p. 139. Leaves 2-3 inches long, and 13-15 lines broad, on petioles 3 lines long. Racemes 3 inches long. Flowers small. Berries ovate.

Pear-leaved Struthanthus. Shrub par.

45 S. SUBROTU'NDUS; plant glabrous, twining; branches terete; leaves alternate or opposite, petiolate, ovate-orbicular, ending in a short mucronate acumen, feather-nerved, shining above, coriaceous; racemes axillary, solitary, about equal in length to the leaves, or twin one shorter than the other: branchlets opposite, bearing 3 sessile flowers and 3 bracteas at the apex; petals 6, linear, somewhat concrete at the base; filaments a little shorter than the petals, anthers ovate, erect. ♄. C. S. Native of Brazil, where it was collected by Schott. Loránthus subrotúndus, Pohl, in litt. ex D. C. prod. 4. p. 292. Leaves 15-18 lines long, and 10-12 broad; petioles 5-6 lines long. Corolla 3 lines long. Style filiform; stigma simple, not capitate.

Roundish-leaved Struthanthus. Shrub par.

46 S. GLOMERA'TUS: plant glabrous; branches terete, radicant; leaves opposite, on short petioles, ovate, ending in a short acumen, glaucous, coriaceous; peduncles very short, axillary, glomerate, bifid; flowers by threes, sessile, tribracteate; petals 6, linear, reflexed from the middle; anthers ovate; style equal in length to the petals. ♄. P. S. Native of Brazil, in the provinces of the Mines. Loránthus glomeràtus, Mart. in Schultes, syst. 7. p. 121. Flowers yellowish green, 2 lines long.

Glomerate-flowered Struthanthus. Shrub par.

47 S. CONFE'RTUS; plant glabrous; branches radicant, terete; leaves opposite, ovate or roundish, obtuse, with a short acumen, coriaceous, nerved: peduncles axillary, crowded, dichotomous, simple; flowers by threes, sessile, tribracteate; petals 6, spreadingly reflexed, linear; anthers ovate; style one half shorter than the petals. ♄. P. S. Native of Brazil, on trees of the orange tribe. Loránthus confértus, Mart. in Schultes, syst. 7. p. 121.

Crowded-peduncled Struthanthus. Shrub par.

48 S. PERROTTE'TII; plant glabrous; branches terete, but rather compressed in the young state; leaves petiolate, ovate, or oval, obtuse, coriaceous, feather-nerved; racemes twin, unequal, simple, axillary: with the branchlets bearing each 3 small concrete bracteas, and 3 sessile flowers; flower-buds ovate, small; berry oval. ♄. P. S. Native of French Guiana. Loránthus Perrottètii, D. C. prod. 4. p. 292. Racemes, petioles, and rachi of racemes rufous, appearing velvety at first sight. Flowers small. Leaves 2-3 inches long and $1\frac{1}{2}$ broad. Racemes sometimes equal in length to the leaves, but sometimes twice the length

Perrottet's Struthanthus. Shrub par.

49 S. INTERRU'PTUS; glabrous, pendulous; branches terete; leaves oblong, acute, running into the petiole at the base, rather coriaceous; racemes axillary and terminal: with short, nearly opposite, distant branches, bearing each 3 sessile flowers at the apex, without bracteas. ♄. P. S. Native of Mexico, near

Ario, on trees of Annòna Humbóldtii. Loránthus interrúptus, H. B. et Kunth, nov. gen. amer. 3. p. 440. Schultes, syst. 7. p. 138. Flowers and fruit not sufficiently known. Leaves nearly 2 inches long and 9 lines broad; petioles 3-4 lines long.

Interrupted-spiked Struthanthus. Shrub par.

50 S. ADU'NCUS; plant glabrous; branches terete, knotted, scandent; branchlets angular; leaves opposite, oblong-roundish, apiculated by a hooked point, veiny, petiolate; racemes axillary, trichotomous, or simple; flowers sessile, 3-6 together, propped by a subtriangular bractea; petals 6, linear; anthers oblong. ♄. P. S. Native of Guiana, on trees. Loránthus adúncus, Meyer. prim. esseq. p. 149. Schultes, syst. 7. p. 147. Perhaps the racemes ought to be called spikes; or perhaps the flowers are sessile on the tops of the branchlets, not on a rachis.

Hooked-leaved Struthanthus. Shrub par.

51 S. MAGDALE'NÆ; plant glabrous; branches terete, rather sarmentose; leaves petiolate, ovate, acute, complicate, feather-nerved, rather coriaceous; panicles axillary, longer than the leaves, spreadingly branched; peduncles distant, bearing 3 flowers and 3 bracteas at the apex; petals 6, linear; anthers erect, inserted by the base, 3 of which are drawn out in a horn? ♄. P. S. Native of South America, on the banks of the river Magdalena, where it was collected by Bertero. Loránthus Magdalènæ, Cham. et Schlecht. in Linnæa 3. p. 219. Wéihea Magdalènæ, Spreng. in herb. Balb. but not of his syst. Leaves 20-22 lines long and 12-15 lines broad; petioles 4-5 lines long. Corolla 2 lines long.

Magdalena Struthanthus. Shrub par.

52 S. SE'SSILIS; glabrous; leaves ovate; spikes simple, solitary; flowers sessile, by threes; pedicels thick, 3-flowered at the top. ♄. P. S. Native of South America, in the woods of Carthagena. Loránthus séssilis, Jacq. amer. 99. Berries of reddish dirty green colour. Perhaps Loránthus séssilis, Meyer. prim. esseq. 4. p. 149. is the same as that of Jacquin.

Sessile-flowered Struthanthus. Shrub par.

53 S. STE'LIS; glabrous; branches spreading; leaves ovate or oblong, coriaceous, nearly sessile; peduncles numerous, axillary, spreading, trigonal, bifid: having the branchlets bearing 3 equal, sessile, hexandrous flowers. ♄. P. S. Native of Cumana, upon trees. Loránthus Stèlis, Lin. spec. 331. Schultes, syst. 7. p. 147. Stèlis, no. 1. Lœfl. itin. 187. Plant not sufficiently known, and Stèlis, no. 2. Lœfl. is still more obscure.

Mistletoe Struthanthus. Shrub par.

54 S. PEDUNCULA'TUS; glabrous; branches shining; leaves cordate-ovate, ending each in a short taper point, coriaceous, shining, petiolate, feather-veined; racemes axillary, solitary, shorter than the leaves: having the rachis compressed and the branchlets 3-flowered, and the flowers pedicellate; petals 6, obtuse; stamens some of them sterile. ♄. P. S. Native of South America, in the woods of Carthagena, especially on the sea coast. Loránthus pedunculàtus. Jacq. amer. p. 98. Schultes, syst. 7. p. 145. . Leaves 2 inches long. Flowers small, white.

Pedunculate-flowered Struthanthus. Shrub par.

55 S. PSILOBÓTRYS; glabrous; branches terete; branchlets angularly compressed; leaves oblong, acutish, attenuated at the base, on short petioles, nerveless, except the middle nerve; racemes axillary, 4 times longer than the leaves, 2-edged, especially at the base; pedicels nearly opposite, 1-flowered; bracteas 3, concrete, resembling a 3-cleft cupula under each flower. ♄. P. S. Native of St. Domingo, where it was collected by Bertero. Loránthus psilobótrys, D. C. prod. 4. p. 293. Loránthus uniflòrus, Spreng. in herb. Balb. but it is very different from the true L. uniflòrus. Alabastra oval, a line long. Racemes 6-7 inches long. Leaves 15 lines long and 4 broad.

Naked-racemed Struthanthus. Shrub par.

56 S. DOMINGE'NSIS; branches 2 edged, green; leaves obovate-oblong, mucronulate, fleshy, running down the petiole at the base; racemes simple or tern; flowers remote. ♄. P. S. Native of St. Domingo. Loránthus Domingénsis, Desf. in Hamilt. prod. p. 33. Schultes, syst. 7. p. 147. The rest unknown.

St. Domingo Struthanthus. Shrub par.

57 S. LAXIFLÒRUS; branches terete, brownish; leaves roundish-ovate, finely marginated, running into the petiole at the base; racemes for the most part solitary, greyish, on long peduncles; flowers remote; pedicels elongated. ♄. P. S. Native of Hispaniola. Loránthus laxiflòrus, Desf. in Hamilt. prod. p. 33. The rest unknown.

Lax-flowered Struthanthus. Shrub par.

58 S. UNIFLÒRUS; glabrous; branches terete; leaves obovate or oval, on short petioles, obtuse at the apex, emarginate, and rather mucronate, feather-veined, rather membranous; racemes axillary, solitary or twin, simple; pedicels 1-flowered, a little longer than the flowers, girded by a trifid involucrum; petals 6, obtuse; alternate anthers sterile. ♄. P. S. Native of St. Domingo, upon trees and bushes in the woods. Loránthus uniflòrus, Jacq. amer. 98. t. 69. Schultes, syst. 7. p. 146. Loránthus parviflòrus, Lam. dict. 3. p. 595. Leaves 1-2 inches long. Flowers purple, 2 lines long. Berries cylindrical, dark.

One-flowered Struthanthus. Shrub par.

59 S. PORTORICE'NSIS; glabrous; stem terete, rooting, dichotomous; branchlets compressed; leaves petiolate, lanceolate, acute, glaucous, veinless, except the middle nerve, which is conspicuous at the base but hardly evident at the apex; corymbs dichotomous, few-flowered, terminal, one half shorter than the leaves; fruit oval, crowned by the teeth of the calyx. ♄. P. S. Native of Porto Rico, parasitical upon trees, where it was collected by Bertero. Loránthus Portoricénsis, D. C. prod. 4. p. 293. Loránthus Braziliénsis, Spreng. in herb. Balb. Flowers smaller than in the rest of the species. Leaves 8 lines long and 3 lines broad.

Porto Rico Struthanthus. Shrub par.

60 S. PAUCIFLÒRUS; glabrous; branches terete, spreading; leaves obovate-roundish, veiny, on very short petioles; racemes axillary, solitary, tripartite, shorter than the leaves; flowers nearly sessile, decussate; bractea concave; petals 6, lanceolate, contiguous at the base; anthers 6, ovate. ♄. P. S. Native of the interior of Jamaica, and of Cayenne, parasitical on trees. Loránthus pauciflòrus, Swartz, prod. p. 58. fl. ind. occ. 677. Schultes, syst. 7. p. 147. Loránthus occidentàlis, Aubl. guian. p. 310. ex Swartz. Allied to *S. occidentàlis*, but differs in the raceme or spike being tripartite, not simple.

Few-flowered Struthanthus. Shrub par.

61 S. GUADALUPE'NSIS; glabrous; branches terete; leaves ovate, rather cordate at the base, acuminated at the apex, on very short petioles, veinless except the middle nerve; peduncles terminal, trichotomous and corymbose at the apex, about the length of the leaves; bracteas small; calyx denticulated; berry oval. ♄. P. S. Native of Guadaloupe, where it was collected by Bertero. Loránthus Guadalupénsis, D. C. prod. 4. p. 294. Loránthus pedunculàtus, Spreng. in herb. Balb.

Guadaloupe Struthanthus. Shrub par.

62 S. QUERCI'COLA; glabrous; branches terete; leaves almost opposite, petiolate, ovate, acuminated, papery, reticulately veined; racemes 1-2, axillary; flowers almost sessile, by threes, opposite: anthers orbicular, fixed by the base. ♄. P. S. Native of Mexico, near Jalapa, parasitical on oak and other trees. Flowers minutely bracteolate. Corolla a line and a half long. Loránthus quercícola, Cham. et Schlecht. in Linnæa. 5. p. 173.

Oak Struthanthus. Shrub par.

63 S. RETROFLE'XUS; glabrous; branches terete; leaves ovate, acute, deflexed, rather coriaceous, on short petioles; panicles axillary and terminal: with an angular rachis: and retroflexed branchlets, bearing ovate, concave, deciduous bracteas, and 2-4 flowers, which stand on short pedicels; petals 6, linear, reflexed at the apex. ♄. P. S. Native of Peru, in groves on the Andes, upon trees. Loránthus retrofléxus, Ruiz, et Pav. fl. per. 3. p. 49. t. 279. f. a. Schultes, syst. 7. p. 138. Leaves usually an inch and a half long and 2 inches broad; on petioles 2-3 lines long. Flowers small, purple. Berries oval, of a yellowish glaucous colour.

Retroflexed-petalled Struthanthus. Shrub par.

Cult. All the species of this beautiful genus being parasitical, they are consequently not cultivable in gardens. They have something of the aspect of *Lonicèra* or honeysuckle.

VI. PSITTACA'NTHUS (ψιττακος, *psittacos*, a parrot, and ανθος, *anthos*, a flower; perhaps from the bright colour of the flowers). Mart. in D. C. prod. 4. p. 671. Loránthus section Oscillatòriæ Callánthæ. D. C. prod. 4. p. 308.—Loránthus species of authors.

LIN. SYST. *Hexándria, Monogýnia.* Flowers hermaphrodite, for the most part hexamerous. Calyx cup-shaped, hemispherically cyathiform, with a contracted mouth: having the border sometimes entire, and sometimes obsoletely 5-6-toothed or repand. Petals 6, linear-spatulate, in most of the species distinct to the middle, erect, spreading, often furnished with a linear scale in the middle. Filaments filiform, rising from the middle of the petals; anthers linear or oblong, fixed by the base, therefore erect: or by the back, then they are incumbent. Ovarium ovate. Style filiform; stigma capitate. Berry ovate.—Panicles dichotomous or trichotomous, expanded or corymbose; peduncles articulately inserted, bracteate; pedicels extended into a cup-shaped bracteole each. Flowers large, thick, deeply coloured.

1 P. RAMIFLÒRUS; glabrous; branches terete; branchlets angular; leaves ovate, bluntish, attenuated at the base; peduncles opposite, trifid, 6-flowered, spreadingly deflexed, rising beneath the leaf-bearing branches; alabastra conical; petals lanceolate-linear, acuminated; anthers versatile. ♄. P. G. Native of Mexico, parasitical on trees, on the mountains of Mahuitzola. Loránthus ramiflòrus. Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 4. p. 308. Leaves 1½ inch long, and 6-7 lines broad; on very short petioles. Corolla 10 lines long, conical.

Branch-flowered Psittacanthus. Shrub par.

2 P. CALYCULA'TUS; glabrous; branches nearly terete; leaves opposite, ovate, or lanceolate, hardly petiolate, coriaceous, veinless; corymbs terminal, trichotomous, shorter than the leaves: having a cup-shaped bractea under each flower, as in all the rest of the species; petals 6, linear, acute; anthers versatile. ♄. P. S. Native of Mexico, about Cuarcavara, where it was collected by Berlandier. Loránthus calyculàtus, D. C. coll. mem. vi. t. 101. Larger leaves 2 inches long and 1½ broad, the rest rather smaller. Flowers of a yellowish scarlet colour, almost 2 inches long. There are 2 oblong floral leaves under each lateral branch of the corymb. Limb of calyx truncate. Allied to *P. cæ'sus.* Perhaps the same as Loránthus Quauchitli of Moc. et Sesse, fl. mex.

Calyculate Psittacanthus. Shrub par.

3 P. JACQUI'NI; glabrous; branches terete; leaves obovate or oval, coriaceous, shining, on short petioles, veinless; peduncles axillary and terminal, cymose, shorter than the leaves: ultimate ones trifid: having an urceolate, small bractea under each flower; petals 6, contiguous at the base, linear, revolute at the apex; alabastra curved a little; anthers oblong, versatile. ♄. P. S. Native of Jamaica, Martinico, and Brazil, parasitical on trees. Loránthus Jacquìni, D. C. prod. 4. p. 308. L. Americànus, Jacq. amer. p. 97. t. 67. exclusive of the synonymes. Lin. spec. 331. exclusive of the synonyme of Cham. and Schlecht. in Linnæa. 3. p. 210. but not of Lin. amœn. nor Swartz.

Var. β, *longifòlius* (D. C. prod. 4. p. 308.) leaves oblique, lanceolate, attenuated at the base. ♄. P. S. Native of Jamaica. Calyx cup-shaped. Flowers sometimes of 4 petals.

Jacquin's Psittacanthus. Shrub par.

4 P. BRASILIE'NSIS; glabrous; branches terete, compressed while young; leaves petiolate, lanceolate-ovate, obliquely nerved, thickish, shining above; peduncles trichotomous, terminal, and in the upper axils: branchlets 5-flowered; alabastra club-shaped; petals 6, linear; anthers versatile. ♄. P. S. Native of Brazil. Loránthus Brasiliénsis, Desr. in Lam. dict. 3. p. 596. Schultes, syst. 7. p. 127. Habit of *Avicénnia tomentòsa*, but is perfectly glabrous. Leaves 3 or 3½ inches long, and 12-15 lines broad, on petioles 3-4 lines long. Corolla an inch and a half long.

Brazilian Psittacanthus. Shrub par.

5 P. CI'NCTUS; branches terete; leaves opposite and alternate, on very short petioles, oblong-ovate, obtuse, thick, marginated; racemes axillary and terminal, compound: peduncles nearly opposite, 2-flowered; bracteas cup-shaped; flowers tomentose on the outside, clavate at the apex in the unexpanded state; petals 6, nearly linear, glandular at the base. ♄. P. S. Native of Brazil, in the province of Rio Negro, in the woods of Japura. Loránthus cínctus, Mart. in Schultes, syst. 7. p. 134. Corolla 1 or 1½ inch long, densely clothed with coloured tomentum. Anthers oblong. Style equal in length to the petals. Stigma capitate.

Girded Psitticanthus. Shrub par.

6 P. SPECIÒSUS; glabrous; leaves oblong-elliptic, or lanceolate, bluntish, cuneated at the base, coriaceous: having the middle nerve hardly conspicuous, and the lateral veins wanting; racemes unknown; alabastra cylindrical; petals 6, linear, hardly concrete at the base; anthers versatile; stigma not capitate. ♄. P. S. Native of Brazil. Loránthus speciòsus, Pohl, in litt. but not Dietr. nor Wall. Leaves 3 inches long and an inch broad; petioles hardly any. Corolla 3 inches long. It differs from *P. Brasiliénsis*, Lam. in the alabastra not being clavate.

Showy Psitticanthus. Shrub par.

7 P. DICHRO'OS; glabrous; branches terete; leaves opposite, obovate, emarginate, coriaceous, hardly veined; peduncles solitary, axillary, dichotomous: the branches 2-3-flowered; bractea cup-shaped, shorter than the ovarium, 1-toothed; petals 6, linear, spreadingly reflexed from the middle; anthers linear-oblong. ♄. P. S. Native of Brazil, in the province of Rio Janeiro. Loránthus dichròos, Mart. in Schultes, syst. 7. p. 122. Flowers 18-20 lines long, scarlet, but green at the apex.

Two-coloured-flowered Psittacanthus. Shrub par.

8 P. GRANDIFLÒRUS; branches terete; leaves opposite, on short petioles, ovate-lanceolate, acuminated, thick; peduncles dichotomous: terminal ones 3-4: axillary ones solitary; flowers pedicellate by threes, tomentose; bractea cup-shaped, unidentate; petals 6, linear, bearing each a scale on the inside at the base. ♄. P. S. Native of Brazil, in the province of Rio Negro, in the woods about Japura. Loránthus grandiflòrus, Mart. in Schultes, syst. 7. p. 124. Corolla 1½ to 2 inches long, purplish? Stigma globose-capitate.

Great-flowered Psittacanthus. Shrub par.

9 P. BITERNA'TUS; branches terete, rather velvety; leaves nearly opposite, petiolate, elliptic, obtuse, thick, glaucous; peduncles axillary and terminal: lower ones solitary, dichotomous: superior ones sub-panicled; flowers pedicellate, pubescent;

bracteas ovate; petals 6, linear, bearing each a scale on the inside at the base; anthers oblong, versatile. ♄. P. S. Native of Brazil. Loránthus biternàtus, Hoffmanseg, in Schultes, syst. 7. p. 124. Corolla 12-18 lines long. Three of the stamens are shorter than the rest. Style bent, with 2 knees; stigma capitate.

Biternate Psittacanthus. Shrub par.

10 P. ROBU'STUS; glabrous; branches tetragonal; leaves opposite, decussate, on short petioles, oblong-obovate, obtuse, thick; peduncles terminal, and corymbosely crowded in the axils of the upper leaves, 3-flowered; flowers erect, angular; bracteas nearly orbicular, short. ♄. P S. Native of Brazil, in the province of Rio Negro, in woods about Japura. Loránthus robústus, Mart. in Schultes, syst. 7. p. 125. Corolla yellow, 2-3 inches long, glabrous on the outside. Style filiform; stigma capitate. Anthers linear.

Robust Psittacanthus. Shrub par.

11 P. FURCA'TUS; glabrous; branches tetragonal at the apex; leaves opposite, obovate, emarginate or obtuse, coriaceous, almost nerveless; peduncles axillary and terminal, 1-3 together, those in the forks bearing 2-6 flowers; bracteas ovate, acutish; petals 6, cohering at the base, but spreadingly reflexed at the apex. ♄. P. S. Native of Brazil, in woods, at the river St. Francisco. Loránthus furcàtus, Mart. in Schultes, syst. 7. p. 126. Corolla 1 or 1½ inch long, scarlet at the base, but paler towards the apex, and yellow inside. Anthers oblong, probably versatile.

Forked-peduncled Psittacanthus. Shrub par.

12 P. BICALYCULA'TUS; branches terete; leaves opposite, ovate-cordate, obtuse, somewhat stem-clasping, thick, glaucous; panicle terminal, dichotomous, bracteate; peduncles 2-3-flowered, tomentose; bracteas cup-shaped, girding the ovarium; calyx 6-toothed; petals linear. ♄. P. S. Native of Brazil, in the province of Bahia, in woods. Loránthus bicalyculàtus, Mart. in Schultes, syst. 7. p. 128. Corolla 14 lines long, tomentose on the outside, scarlet. Style longer than the stamens; stigma capitate.

Bicalyculate-flowered Psittacanthus. Shrub par.

13 P. CORDA'TUS; glabrous; branches terete; leaves opposite, cordate at the base, stem-clasping, coriaceous, ending in a long acumen, triple or quintuple-nerved; flowers racemosely panicled on the tops of the branches, and in the axils of the upper leaves; peduncles 2-flowered; rather tomentose; bracteas cup-shaped; petals 6, linear, spreading above the middle. ♄. P. S. Native of Brazil. Loránthus cordàtus, Hoffmanseg in Schultes, syst. 7. p. 128. Corolla 12-16 lines long. Anthers oblong. Stigma capitate.

Cordate-leaved Psittacanthus. Shrub par.

14 P. FALCIFRO'NS; glabrous; branches terete; leaves opposite, sessile, oblong-lanceolate, rather falcate, triple or quintuple-nerved, coriaceous; panicles terminal and axillary, somewhat dichotomous; flowers by threes, glabrous; pedicels equal in length to the bracteas, which are drawn out into a cup, around the ovaria, and much longer than them; petals 6, linear. ♄. P. S. Native of Brazil, in the province of Rio Negro, in woods about Japura. Loránthus falcifróns, Mart. in Schultes, syst. 7. p. 129. Corolla golden-yellow, 14-18 lines long. Anthers oblong, yellow.—There is a variety of this species having shorter, ovate-oblong, hardly falcate leaves.

Sickle-leaved Psittacanthus. Shrub par.

15 P. ACINA'RIUS; glabrous; leaves lanceolate, acuminated, oblique, rather falcate, thick, hardly veined; cymes 5-parted, with the branchlets 3-flowered; flowers pedicellate; bracteas cup-shaped, large, truncate, nearly entire; calyx 6-toothed; petals 6, linear. ♄. P. S. Native of Brazil, in woods in the province of Piauhia. Loránthus acinàrius, Mart. in Schultes, syst. 7. p. 130. Corolla 1½ inch long, club-shaped at the apex in the unexpanded state. Anthers oblong. Stigma rather oblique.

Acinarious Psittacanthus. Shrub par.

16 P. CUCULLA'RIS; glabrous; branches terete, nodose at the joints; leaves broad-lanceolate, falcate, 5-nerved, opposite, on short petioles; peduncles axillary and terminal, bifid or subpaniculate, nearly one-half shorter than the leaves: with 1-3-flowered branches; bracteas large, concave, cordate, acuminated; flowers sessile; petals 6, linear; anthers versatile. ♄. P. S. Native of French Guiana. Loránthus cucullàris, Lam. journ. hist. nat. 1. p. 144. t. 23. Schultes, syst. 7. p. 130.

Cucullar-bracted Psittacanthus. Shrub par.

17 P. MEXICA'NUS; glabrous; leaves ovate-lanceolate, rather falcate, running down the short petiole in a cuneate manner at the base, 5-7-nerved, rather coriaceous; panicles axillary and terminal: with thick branchlets, bearing 3 flowers at the apex; pedicels shorter than the bracteas, which are drawn out into ovate cupula, much exceeding the ovaria; petals 6, linear, acute, velvety on the outside; anthers oblong. ♄. P. S. Native of Mexico, where it was collected by Hænke. Loránthus Mexicànus, Presl, in herb. Hænke, and in Schultes, syst. 7. p. 129. Leaves 5 inches long and 1½ broad. Flowers 18-20 lines long, golden yellow in the dried state. The leaves are very similar to those of *P. cucullàris*, but differs in the bracteas being much smaller.

Mexican Psittacanthus. Shrub par.

18 P.? DESTRU'CTOR; glabrous; branches tetragonal, warted; leaves petiolate, oblong, acute, coriaceous, having the middle nerve rather prominent beneath, the rest of the leaf veinless; racemes terminal, having the branchlets 3-flowered, approximate, secund, and bractless; flowers pedicellate; petals 6, linear; anthers incumbent. ♄. P. S. Native of Quito, on trees near Villa de Ibarra, where it is called *Matapalo*. Loránthus destrúctor, H. B. et Kunth, nov. gen. amer. 3. p. 485. Schultes, syst. 7. p. 135. Leaves 2 inches long and 8-9 lines broad; petioles 3 lines long. Flowers about an inch long, orange-coloured. Berries globose, black. It is very doubtful whether this is a species of the present genus from the want of bracteas.

Destructive Psittacanthus. Shrub par.

19 P. FORMÒSUS; quite glabrous; branches compressedly angular at the nodi; leaves elliptic-lanceolate, obtuse, on short petioles, coriaceous, feather-veined; umbels 3, 1 terminal, and 2 axillary, pedunculate; bracteas irregular; calyx repandly truncate; corolla 6-parted, with linear lobes; anthers versatile. ♄. P. S. Native of Brazil. Loránthus formòsus, Cham. et Schlecht. in Linnæa. 3. p. 211. An intermediate species between *P. Jacquìni* and *P. Mutìsii*. Leaves almost alternate or opposite, 3-4 inches long, and 1-2 broad. Corolla 4 inches long, showy.

Beautiful Psittacanthus. Shrub.

20 P. CUNEIFÒLIUS; glabrous; branches terete; leaves nearly sessile, cuneiform, small, ending in a short acumen, fleshy, shining; peduncles 1-3 together, axillary, 1-flowered, 3 times shorter than the leaves; bracteas cup-shaped, one under each flower; petals 6, linear-spatulate, concrete at the base; anthers versatile. ♄. P. S. Native of Brazil and Peru, on trees and shrubs; of Chili, in valleys in the Andes of Mendoza, Cordillera of Chili, on *Accàcia Cavènia* at Llayllay, and upon willows at Banda Oriental. Loránthus cuneifòlius, Ruiz et Pav. fl. par. 3. p. 46. t. 276. f. b. Cham. et Schlecht. in Linnæa. 3. p. 212. Schultes, syst. 7. p. 118. Loránthus Montevidénsis, Spreng. syst. 2. p. 128. Leaves hardly an inch long, some of them emarginately retuse at the apex. Corolla scarlet, an inch and a half long. Berries roundish, black, crowned by the urceolate calyx.

Cuneiform-leaved Psittacanthus. Shrub par.

21 P. CUPU'LIFER; glabrous; branches terete; leaves nearly sessile, obliquely ovate-oblong, narrowed at the apex and obtuse, reticulately many veined, somewhat membranous; peduncles axillary, 2-3-flowered, unibracteate; pedicels furnished with a large cup-shaped bractea under the flower; petals 6, linear, spreading, revolute at the apex; anthers incumbent. ♄. P. S. Native of Peru, near Loxa. Loránthus cupúlifer, H. B. et Kunth, nov. gen. amer. 3. p. 438. Schultes, syst. 7. p. 120. Leaves 5 inches long and 2 inches broad, on very short petioles. Flowers 1 or $1\frac{1}{2}$ inch long, on very short pedicels. Berry elliptic, about the length of the cup-shaped bractea.

Cup-bearing Psittacanthus. Shrub par.

22 P. PLUMIE'RI; glabrous; branches terete; leaves ovate (3-nerved ex Lam.) 5-7-nerved at the base, coriaceous; peduncles axillary, trichotomously corymbose, shorter than the leaves; petals 5, linear, contiguous at the base; alabastra a little curved; anthers versatile. ♄. P. S. Native of the West India Islands, parasitical on trees. Loránthus Plumièri, Cham. et Schlecht. in Linnæa. 3. p. 311. Lonicèra, Plum. nov. gen. 17. t. 37. pl. amer. ed. Burm. t. 166. f. 1. Loránthus, Vaill. act. acad. par. 1722. p. 201. Plumier says the flowers of his plant are composed of 6 petals, but the number of the parts of the flower is unknown.

Plumier's Psittacanthus. Shrub par.

23 P. EUCALYPTIFÒLIUS; glabrous; branches terete; leaves petiolate, ovate, rounded at the apex, coriaceous, almost veinless; peduncles axillary, 3-flowered, shorter than the leaves; pedicels furnished with a cup-shaped bractea each under the flower; petals 6, linear, a little dilated at the apex, hardly cohering at the base; anthers incumbent. ♄. P. S. Native of South America, in the province of Caraccas, at Villa de Cura. Loránthus eucalyptifòlius, H. B. et Kunth, nov. gen. amer. 3. p. 433. Leaves 3 inches long, and nearly 2 broad. Flowers yellow, glabrous, about $1\frac{1}{2}$ inch long. Schultes, syst. 7. p. 120.

Eucalyptus-leaved Psittacanthus. Shrub par.

24 P. CRASSIFÒLIUS; branches terete, dotted with brown at the apex; leaves opposite, broad-ovate, obtuse, with subrevolute margins, coriaceous; peduncles axillary, 1-3-together, dichotomous; flowers twin or tern, pedicellate, tubular: the tube ventricose above the middle, and spreading at the apex, and having the throat constricted; bracteas cup-shaped, one under each flower. ♄. P. S. Native of Brazil, in the province of Rio Grande, in woods about Japura. Loránthus crassifòlius, Mart. in Schultes, syst. 7. p. 123. Corolla purplish, 2 and $2\frac{1}{2}$ inches long. Anthers linear.

Thick-leaved Psittacanthus. Shrub par.

25 P. DICHÓTOMUS; glabrous; branches terete, dichotomous, 3 or 4 in a whorl; leaves usually in whorles, ovate-elliptic, rounded at the apex, coriaceous; peduncles axillary, twin, bifurcate, pendulous in the flower-bearing state, but erect in the fruit-bearing state; limb of calyx truncate; bracteas cup-shaped, one under each flower; petals 6, linear, concrete at the base, revolutely spreading at the apex; anthers incumbent. ♄. P. S. Native of Peru, on the Andes, in groves about Muna. Loránthus dichótomus, Ruiz et Pav. fl. per. 3. p. 45. t. 274. f. a. Schultes, syst. 7. p. 123. Loránthus clusiæfòlius, Willd. rel. ex Schultes, syst. l. c. Leaves 2 hands long, and a hand and a half broad. Corolla about a hand and a half long, scarlet at the base, and yellow at the top. Petioles very short.

Var. β, *Balthasàreus* (D. C. prod. 4. p. 311.) petioles 8-9 lines long; margins of leaves somewhat revolute, shining above, and rather glaucescent; flowers red, 3 inches long; petals a little dilated at the apex. ♄. P. S. Native of South America, on the banks of the Orinoco, near Balthasar. Loránthus dichótomus, H. B. et Kunth, nov. gen. amer. 3. p. 433. Perhaps sufficiently distinct from the species.

Dichotomous-peduncled Psittacanthus. Shrub par.

26 P. NODÒSUS; glabrous; branches terete, dichotomous, articulated at the nodi; leaves opposite, petiolate, ovate-roundish, coriaceous, somewhat 7-nerved at the base; peduncles axillary, and in the forks of the branches, in fascicles, 1-2-flowered, nearly the length of the petioles; bracteas semicircular; alabastra terete, acute; petals 6, linear-lanceolate; filaments adnate a long way to the petals. ♄. P. S. Native of Peru. Loránthus nodòsus, Desr. in Lam. dict. 2. p. 601. Schultes, syst. 7. p. 119. Leaves $3\frac{1}{2}$ to 4 inches long, and $2\frac{1}{2}$ to 3 inches broad. Corolla 3 or $3\frac{1}{2}$ inches long.

Knotted-branched Psittacanthus. Shrub par.

27 P. MUTÍSII; glabrous; branches terete; leaves 3 in a whorl, sessile, somewhat obliquely elliptic-oblong, or obovate, rounded at the apex, coriaceous; peduncles axillary, few-flowered, bractless; petals 6, linear, glabrous, concrete at the base? ♄. P. S. Native of South America, near Santa Fe de Bogota. Loránthus Mutísii, H. B. et Kunth, nov. gen. amer. 3. p. 439. Schultes, syst. 7. p. 124. Loránthus longifòlius, Mutis, ined. ex Bonpl. Leaves $2\frac{1}{2}$ to 3 inches long, and $1\frac{1}{2}$ broad. Flowers half a foot long.

Mutis's Psittacanthus. Shrub par.

28 P. DIVARICA'TUS; glabrous; branches terete, divaricate; leaves petiolate, oblong or elliptic, rounded at the apex, coriaceous, glaucescent; peduncles panicled on the tops of the branches, 3-flowered, bractless; pedicels expanded into an entire cupula under each flower; petals 6, linear, glabrous; anthers incumbent. ♄. P. S. Native of South America, on the banks of the Orinoco. Loránthus divaricàtus, H. B. et Kunth, nov. gen. amer. 3. p. 433. Schultes, syst. 7. p. 127. Flowers more than an inch long. Leaves 10-15 lines long, and 5-9 broad. Peduncles axillary and terminal.

Divaricate Psittacanthus. Shrub par.

29 P. ACUTIFÒLIUS; glabrous; branches terete; leaves petiolate, lanceolate, very acute; racemes axillary, one-half shorter than the leaves, having the branchlets 1-3-flowered; flowers pedicellate, furnished with a common acute bractea each; petals 6, linear, somewhat spatulate, erect to the middle, and conniving. ♄. P. S. Native of Peru, parasitical on trees, and in hedges at Huanaco. Loránthus acutifòlius, Ruiz et Pav. fl. per. 3. p. 48. t. 274. f. b. Schultes, syst. 7. p. 142. Leaves 2-3 inches long, and nearly an inch broad; petioles 2-3 lines long. Corolla white, 4-5 lines long. Berry oval, blackish.

Var. β, *Chilénsis* (D. C. prod. 4. p. 314.) racemes dense-flowered, almost bractless; petals erect beneath the middle, and conniving, linear and acute at the apex. ♄. P. G. Native of Chili, where it was collected by Hænke. Loránthus acutifòlius, Presl, in herb. Hænke. Perhaps a distinct species.

Acute-leaved Psittacanthus. Shrub par.

30 P.? ESCHSCHOLZIA'NUS; branches terete, or a little angular, rough; leaves subalternate, on very short petioles, rough, ovate or roundish, obtuse, glabrous, coriaceous; peduncles corymbosely racemose, terminal and axillary, erect, for the most part 3-flowered: the middle flower sessile; bracteas ovate, fringed at the apex, equal in length to the ovaria; corolla 5-cleft, clavate; anthers fixed by the back. ♄. P. G. Native of Chili. Loránthus Eschscholziànus, Mart. in Schultes, syst. 7. p. 117. Ovarium oblong. Corolla 3 lines long.

Eschscholz's Psittacanthus. Shrub par.

31? P. THYRSIFLÒRUS; glabrous; branches dichotomous or trichotomous; leaves broad-lanceolate, acutish or acuminated, with pellucid cartilaginous margins; racemes terminal and axillary: flowers 2-3, sessile at the tops of the branchlets; bracteas ovate, acute, one under each flower; corolla 6-parted, with linear lobes; anthers versatile. ♄. P. S. Native of Brazil. Loránthus thyrsiflòrus, Cham. et Schlecht. in Linnæa. 3. p. 214.

Leaves 2 inches long, and 8-9 lines broad; petioles 6-9 lines long. Flowers 5 lines long. Limb of calyx very narrow, truncate.

Thyrse-flowered Psittacanthus. Shrub par.

32 P.? FLAGELLA'RIS; glabrous, sarmentose; branches terete; leaves sessile, linear, acute, coriaceous, with the middle nerve hardly conspicuous; racemes terminal, naked, erect; lower pedicels 3-flowered, superior ones 1-flowered; bracteas deciduous, one under each flower; calyx lacerated, truncate; corolla 5-6-parted, having the lobes linear and dilated at the apex; anthers versatile. ♄. P. S. Native of Brazil; of Chili, near La Punta de San Luis, at El Aquadita, and on the banks of El Rio Chorillo. Loránthus flagellàris, Cham. et Schlecht. in Linnæa. 3. p. 213. Like Loránthus cuneifòlius and sarmentòsus, Ruiz et Pav. in fl. per. Corolla fine red, 6 lines long. Style attenuated at the apex. Leaves 20 lines long and $1\frac{1}{2}$ broad.

Whip Psittacanthus. Shrub par.

33 P. BERTERÒI; glabrous; branches terete; leaves alternate, broad, elliptic, obtuse, tapering into the short petioles at the base, coriaceous, with somewhat revolute margins; peduncles terminal, in dense corymbose racemes; the partial peduncles 2-5-flowered; flowers tubular, with 6 linear-spatulate, nearly free segments; filaments equal in length to the petals; anthers linear-oblong, oscillatory; style filiform, angular; stigma hardly capitate; ovarium roundish, exceeding the unilateral bractea, which is roundish and denticulated at the apex. ♄. P. G. Native at Juan Fernandez, growing on *Mýrtus Fernandesiànus*. Hook. et Arn. Loránthus Berteròi, Hook. et Arn. in bot. misc. 3. p. 358. Loránthus venètus, Bertero, but not of Kunth. The partial peduncles are simple, and bear 2 flowers, or are forked, and then bear 3 or 5 flowers. The flowers are about an inch long. It is probably a species of *Struthánthus*.

Bertero's Psittacanthus. Shrub par.

34 P. SCHIEDEA'NUS; plant glabrous; branches subalately tetragonal, dilated at the nodi; leaves nearly opposite, on short petioles, ovate-lanceolate, obliquely falcate, feather-veined, and somewhat triple-nerved; corymbs terminal; bracteas cup-shaped, one under each flower; limb of calyx truncate. ♄. P. S. Native of Mexico, near Jalapa. Loránthus Schiedeànus, Cham. et Schlecht. in Linnæa. 5. p. 172. Allied to *P. Jacquìni*, but differs in the flowers being more slender, and about 2 inches long.

Schiede's Psittacanthus. Shrub par.

Cult. The flowers of all the species of this genus are very showy, and comparatively large. The habit is that of honeysuckle. Being all parasitical shrubs, they are not cultivable.

VII. TRI'STERIX (from τρεις, *treis*, three, and πτεριξ, *pterix*, a wing; in reference to the 3 bracteas to the flowers). Mart. in D. C. prod. 4. p. 671.—Loránthus species of authors.

LIN. SYST. *Tetra-Hexándria, Monogýnia*. Flowers hermaphrodite, each propped by 3 bracteas. Calyx cup-shaped or cylindrical, with an entire border. Petals linear-spatulate, or linear, bearing the stamens in the middle; anthers fixed by the back, incumbent, linear-oblong or ovate. Style filiform; stigma capitate. Berry ovate or elliptic. Racemes brachiate, lateral or terminal.

1 T. VIRIDIFLÒRUS; glabrous; primary branches subverticillate, rather compressed when young; leaves opposite, on short petioles, lanceolate, attenuated at both ends; racemes axillary, 2-4 in a fascicle, shorter than the leaves; pedicels remote, 1-flowered; bracteas 3 under each flower, rather concrete; corolla 6-cleft, having the middle of the tube angular, and the lobes spreadingly reflexed; stamens 6. ♄. P. S. Native of Nipaul, upon trees. Loránthus viridiflòrus, Wall. in Roxb. fl. ind. 2. p. 219. Corolla green, 3-4 lines long. Anthers adnate, ex Wall.

Green-flowered Tristerix. Shrub par.

2 T. TETRA'NDRUS; branches terete, and are, as well as the petioles and nerves of leaves, pubescent; leaves ovate, bluntish, rather cordate, coriaceous, glabrous in the adult state; corymbs nearly sessile, dense, many flowered; pedicels very short, pubescent, having 3 bracteas under each flower; corolla glabrous, 4-parted: lobes shell-formed at the apex and acute; stamens 4; anthers versatile. ♄. P. G. Native of Chili, about Talcaquano, Conception, El Valle del Rio Tingririca, and Valparaiso, parasitical on Guevìna and other trees, along with Loránthus buxifòlius, Cham. et Schlecht. in Linnæa. 3. p. 206. Schultes, syst. 7. p. 103. Loránthus tetrándrus, Ruiz et Pav. fl. per. 3. p. 48. t. 275. The vernacular name of this species is *Quintral* ex Bertero.

Tetrandrous Tristerix. Shrub par.

3 T. APHY'LLUS; much branched; branches nearly terete, glabrous, short, leafless; flowers pedicellate, somewhat corymbose; bracteas 3 under each flower, somewhat concrete; corolla glabrous, 4-parted: lobes linearly cochleate at the apex; stamens 4; anthers versatile. ♄. P. G. Native of Chili, parasitical upon *Cèreus Peruviànus* at Rancagua, Coquimbo, Guardia del Maypu, Villavicenzio in the Andes of Mendoza, Cordillera of Chili, &c. Loránthus aphýllus, Miers, ex Bert. in litt. 829. Loránthus cactòrum, Hook. et Arn. in Beech. voy. part. bot. 1. p. 25. Flowers like those of the preceding species. The vernacular name of this plant is *Quintral de Quisco*.

Leafless Tristerix. Shrub par.

4 T. REINWARDTIA'NUS; leaves opposite, oblong, attenuated at both ends, coriaceous, veinless beneath; peduncles crowded, axillary, 1-flowered; flowers pentandrous or tetrandrous; tube of corolla very long, curved: lobes linear, secund, at length circinnately revolute at the top. ♄. P. S. Native of Java, in woods on the mountains. Loránthus Reinwardtiànus, Schultes, syst. 7. p. 105. Loránthus coccíneus, Reinw. in Blum. bijdr. p. 664. but not of Jack.

Reinwardt's Tristerix. Shrub par.

Cult. The species of this genus, like the rest of the genera of this order, are not cultivable in gardens. Their habit is that of *Lonicèra*.

VIII. DENDROPHTHO'E (from δενδρον, *dendron*, a tree, and φθοη, *phthoe*, corruption; the plants kill the trees upon which they grow). Mart. in D. C. prod. 4. p. 671.—Loránthus species of authors.

LIN. SYST. *Tetra-Pentándria, Monogýnia*. Flowers hermaphrodite, each furnished with one bractea; bracteas sometimes lateral, and sometimes cupular and oblique. Calyx cup-shaped or campanulate, with an entire or toothed border. Petals linear-spatulate, bearing the stamens in the middle. Anthers fixed by the base, erect, linear. Style filiform; stigma capitate. Berry ovate or elliptic.—Racemes for the most part lateral, subcorymbose.

§ 1. *Flowers of 4-5 petals, having a cucullate bractea under each flower.*

1 D. LIGUSTRI'NUS; branches terete, when young, as well as the new leaves, peduncles, bracteas, and flowers pubescent; leaves petiolate, lanceolate, acuminated, coriaceous, at length glabrous; peduncles many, axillary, cymosely corymbose; bractea lateral, cucullate under each flower: limb of calyx almost entire; corolla tetragonal; petals 4, linear, at length spreading; flowers pentandrous. ♄. P. G. Native of Nipaul, in woods in the great valley. Loránthus ligustrìnus, Wall. in Roxb. fl. ind. 2. p. 219. D. Don, prod. fl. nep. p. 143. Schultes, syst. 7. p. 101. Leaves 2 inches long, and 6-9 lines broad; petioles 2 lines long. Corolla 4-6 lines long, reddish.

Privet-like Dendrophthoe. Shrub par.

2 D. WALLICHIA'NUS; glabrous; branches terete; leaves rather alternate, ovate, obtuse, acute at the base; racemes axillary, 1-3-together, one-half shorter than the leaves, simple, in fascicles round the base of the branches; flowers small, pedicellate; bracteas lateral cucullate, one under each flower; petals 4, linear-cuneated: alabastra nearly terete; berry subglobose, reflexed; flowers tetrandrous. ♄. P. S. Native of the East Indies, where it was detected by Heyne. Loránthus Wallichiànus, Schultes, syst. 7. p. 100. Loránthus polystàchyus, Wall. in Roxb. fl. ind. 2. p. 217. but not of Ruiz et Pav. Corolla deep purple, 4 lines long.

Wallich's Dendrophthoe. Shrub par.

3 D. PU'LCHER; glabrous; branches terete; leaves nearly opposite, on short petioles, ovate-elliptic, acuminated, coriaceous, glaucous; racemes axillary, simple, many flowered, length of the leaves; bracteas cucullate, lateral, one under each flower; alabastra cylindrically pentagonal; petals 5, free to the base, linear; flowers pentandrous. ♄. P. S. Native of Penang. Loránthus púlcher, D. C. prod. 4. p. 295. Loránthus speciòsus, Wall. mss. but not of Pohl, nor Perr. nor Dietr. Leaves 4 inches long, and 2 broad. Corolla 2 lines long. Style filiform; stigma simple. Calyx truncate.

Fair Dendrophthoe. Shrub par.

4 D. PE'NDULUS; glabrous; branches terete; leaves opposite, petiolate, long-linear, acutish, coriaceous, with 5 subparallel veins, which are hardly conspicuous; corymbs axillary, 1-2-together, pedunculate, trifid; branches 3-flowered; bracteas ovate-roundish, lateral, one at the outer side of each flower; limb of calyx truncate; alabastra terete, clavate; petals 5, linear, somewhat dilated at the apex; flowers pentandrous; anthers oblong, erect. ♄. P. G. Native of New Holland. Loránthus péndulus, Sieb. fl. nov. holl. no. 241. Schultes, syst. 7. p. 157. D. C. coll. mem. vi. t. 1. Leaves 6-8 inches long, and 5 lines broad; petioles 10 lines long. Corolla 15 lines long. Berry ovate. Style filiform.

Pendulous Dendrophthoe. Shrub par.

5 D. CONGE'NER; glabrous; branches terete; leaves oblong, obtuse, attenuated at the base, on short petioles, coriaceous, veinless; racemes axillary, shorter than the leaves, subcorymbose; peduncles 3-flowered; flowers pedicellate; bracteas ovate, acute, lateral, one under each flower; limb of calyx truncate; alabastra terete, somewhat club-shaped; petals 5, linear, acute; flowers pentandrous; anthers linear, inserted by the base. ♄. P. G. Native of New Holland. Loránthus congèner, Sieb. nov. holl. no. 243. Schultes, syst. 7. p. 114. D. C. coll. mem. vi. t. 2. Leaves 2 inches long, and 4-5 lines broad. Corolla nearly an inch long. Style filiform.

Congener Dendrophthoe. Shrub par.

6 D. FORSTERIA'NUS; glabrous; branches terete; leaves opposite, petiolate, ovate, obtuse, veiny, thin; cymes axillary, solitary, shorter than the leaves; peduncles 3-flowered; bracteas ovate, obtuse, lateral, one under each flower; calyx truncate; corolla pentagonal, subclavate in the young state. ♄. P. G. Native of the Society Islands. Loránthus Forsteriànus, Schultes, syst. 7. p. 114. Loránthus stèlis, Forst. prod. ex specimen in herb. Screb. from Schultes obs. Perhaps this species does not belong to the present genus.

Forster's Dendrophthoe. Shrub par.

7 D. GAUDICHA'UDI; glabrous; branches terete; leaves opposite, linear, obtuse, thickish, attenuated at the base; peduncles axillary, much shorter than the leaves, divaricately bifid at the apex, 2-4-flowered; parts of flowers equal; flowers tetrandrous; petals spatulate; anthers ovate, inserted by the base. ♄. P. G. Native of New Holland, where it was collected by Gaudichaud. Loránthus Gaudichàudi, D. C. prod. 4. p. 295. Leaves 10-12 lines long, and 2 lines broad. Flowers 5-6 lines long. Style filiform.

Gaudichaud's Dendrophthoe. Shrub par.

8 D. TETRAPE'TALUS; leaves opposite, nearly sessile, oblong, or elliptic, coriaceous; flowers tetrandrous, one on each side of each leaf, and therefore there are 4 at each joint, disposed in a whorl; petals 4, linear. ♄. P. G. Native of New Zealand. Loránthus tetrapétalus, Lin. fil. suppl. 211. Forst. prod. no. 156. Schultes, syst. 7. p. 96. Calyx nearly entire. Style a little longer than the petals, filiform; stigma capitate. Bracteas probably wanting.

Four-petalled Dendrophthoe. Shrub par.

9 D. LUZONE'NSIS; glabrous; branches terete, dichotomous or whorled, knotted at the joints; leaves opposite or verticillate, oval-oblong, coriaceous, sessile, almost veinless; peduncles terminal, cymosely corymbose at the apex, pubescent; bracteas ovate, acute, lateral, rather concave, one under each flower; limb of calyx truncate; corolla of 4 linear acute petals, which are somewhat concrete at the base (sometimes joined by pairs); style filiform. ♄. P. S. Native of Luzon, one of the Philippines. Loránthus Luzonénsis, Presl, in herb. Hænke, and in Schultes, syst. 7. p. 104. Leaves 11-15 lines long, and 6-7 broad. Corolla 15 lines long, hardly pubescent on the outside.

Luzon Dendrophthoe. Shrub par.

10 D. PENTAPE'TALUS; glabrous, much branched; leaves opposite, petiolate, lanceolate-ovate or oval-cordate, obliquely attenuated, smooth; racemes 1-2, axillary, simple, stiff, length of the leaves; flowers very numerous, on short pedicels; bractea oblique, oval, adpressed to the ovarium; limb of calyx nearly entire; petals 5, swelled out at the base into a fleshy triquetrous body, recurved at the apex; stamens 5; anthers obovate; style angular; berry oblong. ♄. P. S. Native of the East Indies. parasitical on trees, in Silhet. Loránthus pentaphýllus, Roxb. fl. ind. 2. p. 211. Schultes, syst. 7. p. 109. Wall. pl. rar. asiat. 3. t. 225. Flowers regular, small, red. Berry greenish yellow. Leaves 3-4 inches long; petioles 6 lines long. Racemes 6-8 inches long, red. Anthers inserted by the base.

Five-petalled Dendrophthoe. Shrub par.

11 D.? RACEMI'FERUS; branches terete, glabrous, clothed with rufous villi in the young state, as well as the peduncles; leaves opposite or alternate, on short petioles, oblong-lanceolate, bluntish at the base, and acutish at the apex, glabrous; racemes axillary, spicate, simple, length of leaves; bracteas cucullate, lateral, one under each flower; petals 4, triquetrous at the base. ♄. P. S. Native of the East Indies, in the Burman empire, at Amherst and Tavoy. Loránthus racemíferus. Wall. mss. Very like *D. pentapétalus*, but differs in the flowers being tetrandrous.

Raceme-bearing Dendrophthoe. Shrub par.

12 D. COCCÍNEUS; glabrous; branches elongated; leaves alternate, on short petioles, oblong-ovate, obtuse, somewhat cordate at the base; spikes axillary, 1-2-together, erect, longer than the leaves; flowers sessile, with one bractea under each; limb of calyx nearly entire; corolla tubular; petals 4, linear, dilated at the base; anthers adnate; flowers tetrandrous. ♄. P. S. Native of the East Indies, in Singapore. Loránthus coccíneus, Jack, mal. misc. 1. p. 8. and in Roxb. fl. ind. 2. p. 215. Schultes, syst. 7. p. 102. Corolla scarlet. Berry ovate. Said to be allied to *D. pentapétalus*.

Scarlet-flowered Dendrophthoe. Shrub par.

§ 2. *Flowers tubular, slender, 4-cleft, disposed in racemes, with one bractea under each flower. Many of the plants in this section are probably species of Scúrrula.*

13 D. OBTE'CTUS; branches terete; branchlets compressed, velvety, as well as the young leaves; leaves opposite, on short

petioles, elliptic-lanceolate, at length glabrous; flowers in fascicles from the axils of the leaves, velvety from dense rufous pubescence, as well as the racemules and peduncles; bracteas lateral, ovate, one under each flower; limb of calyx hardly any; corolla tubular, arched: lobes 4, oblong; anthers erect. ♄. P. S. Native of the Burmese Empire, on Mount Taong-Dong, near Ava. Loránthus obtéctus, Wall. mss. Leaves 2 inches long and an inch broad; petioles 1½ inch long. Corolla 4-cleft, 10-11 lines long. Stigma hardly capitate.

Covered Dendrophthoe. Shrub par.

14 D. recu'rvus; branches terete, adult ones glabrous; leaves alternate, petiolate, elliptic, obtuse, acute at the base, smoothish; peduncles axillary and lateral, branched, 2-3-flowered, and are, as well as the flowers, velvety; flowers recurved; bracteas broad, obliquely cupulate, one under each flower; limb of calyx cup-shaped, toothed; alabastra terete; lobes 5, oblong; flowers tetrandrous. ♄. P. G. Native of the East Indies, on the Nelligherry mountains, where it was collected by Noton. Loránthus recúrvus, Wall. mss. Leaves 2 inches long and 15 lines broad; petioles 3-4 lines long. Alabastra 6 lines long. Anthers oblong, inserted by the base. Style filiform. Stigma hardly capitate.

Recurved-flowered Dendrophthoe. Shrub par.

15 D. lepta'nthus; branches terete, while young as well as the leaves white from velvety down; leaves opposite, or rather alternate, petiolate, oval, obtuse at both ends, at length glabrous; racemes short, axillary, and are, as well as the flowers, velvety from white tomentum; tube of corolla long, terete, somewhat incurved: lobes 4, nearly equal, spreading; flowers tetrandrous. ♄. P. S. Native of the Burmese empire, at the river Irrawaddy, near Yenangenn. Loránthus leptánthus, Wall. mss. var. rotundifòlia, D. C. coll. mem. vi t. 5. Corolla 4-cleft, 15-17 lines long. Anthers linear, erect. The species is allied to *D. pulveruléntus*.

Delicate-flowered Dendrophthoe. Shrub par.

16 D. ferrugi'neus; branches long, pendulous, densely clothed with ferruginous down when young, as well as the under side of leaves, pedicels, calyxes, and corollas; leaves opposite, on short petioles, elliptic, obtuse, coriaceous, glabrous above; peduncles 1-4 together in the axils of the leaves, 2-6-flowered; bracteas small, adpressed to the ovaria, one to each; corolla tubular, deeply 4-parted; berry ovate; flowers tetrandrous. ♄. P. S. Native of the East Indies, in Pulo-Penang, Singapore. and Sumatra. Loránthus ferrugíneus, Roxb. fl. ind. 2. p. 207, Jacq. mal. misc. 1. p. 9. Schultes, syst. 7. p. 98. Corolla densely clothed with rusty hairs, 7 lines long.

Rusty Dendrophthoe. Shrub par.

17 D. graciliflòrus; branches compressed, at length terete, glabrous; leaves opposite, on short petioles, elliptic-oblong, acute at both ends, at length glabrous; racemules axillary, 5-7-flowered, somewhat umbellate; bracteas lateral, small, acute, one under each flower; corolla whitish from velvety down, slender, 4-lobed: lobes linear. ♄. P. S. Native of the East Indies, in Silhet. Loránthus graciliflòrus, Wall. mss. Loránthus gracilifòlius, Schultes, syst. 7. p. 99. Leaves an inch and a half long, and 6-9 lines broad. Corolla 5 lines long, 4-cleft, with the tube tetragonal at the base. Anthers inserted by the base. Allied to *D. ligustrìnus*.

Slender-flowered Dendrophthoe. Shrub par.

18 D. He'ynei; branches terete, glabrous in the adult state; leaves opposite, on short petioles, oval, bluntish, rather velvety beneath from rufescent down; peduncles axillary, in fascicles, or branched, much shorter than the leaves, and are, as well as the flowers, clothed with rufous velvety down; bracteas lateral, small, one under each flower; corolla very slender, tubular, terete, 4-lobed: lobes oblong, short. ♄. P. S. Native of the East Indies. Loránthus Héynei, Wall. mss.

Heyne's Dendrophthoe. Shrub par.

19 D. atropurpu'reus: branches nearly terete, somewhat canescent; leaves nearly opposite, oval, obtuse at both ends, rather oblique at the base, obsoletely and undulately repand, white from scurf beneath; racemes crowded, axillary; limb of calyx quite entire, very short; flowers 4-parted; fruit subconical. ♄. P. S. Native of Java, upon trees. Loránthus atropurpùreus, Blum. bijd. p. 669. fl. jav. 2. t. 1. exclusive of var. β, batav. verhandl. 1823. p. 186. ex litt. 1829. Flowers small, clothed with white scurf on the outside, but dark purple inside.

Dark-purple Dendrophthoe. Shrub par.

20 D. repa'ndus; branchlets somewhat compressed, clothed with rusty lepidotted down; leaves nearly opposite, oval or obovate, obtuse, equal at the base, repand, clothed with lepprous fuscescent down beneath; racemules crowded, axillary; corolla slender, 4-toothed, covered with brown scurf on the outside: lobes or teeth short, equal. ♄. P. S. Native of Java, about Batavia, on trees. Loránthus repándus, Blum. in litt. 1829. Blum. fl. jav. 2. t. 3. This species comes very near *D. atropurpùreus*, but differs in the leaves being more attenuated at the base, and in the flowers being smaller.

Repand-leaved Dendrophthoe. Shrub par.

21 D. Schulte'sii; branches terete, clothed with lepidotted rusty down at the top; leaves nearly opposite, obtuse at both ends, or rather cordate at the base, pale, and ochraceously lepidotted beneath; racemes crowded, axillary; flowers 4-parted, rusty on the outside. ♄. P. S. Native of the interior of Java, in temperate places. Loránthus lepidòtus, Schultes, syst. 7. p. 100. but not of Blume. Loránthus melanostèmon, Reinw. ined. ex Schultes, syst. 7. p. 100. Loránthus Schultèsii, Blume, in litt. 1829. fl. jav. 2. t. 2. Flowers brownish. Anthers black.

Schultes's Dendrophthoe. Shrub par.

22 D. sphenoídes; branches terete, glabrous; leaves nearly opposite, cuneiform, roundly obtuse, when young covered with rusty scurf, at length glabrous on both surfaces; peduncles crowded, axillary, bearing 3-5 flowers, in fascicles; alabastra terete, globose at the apex, hardly 4-toothed. ♄. P. S. Native of Java, in the province of Bantam, on trees. Loránthus sphenoìdes, Blum. in litt. 1829. fl. jav. 2. t. 4. Loránthus atropurpùreus var. cuneàtus, Blum. bijdr. p. 660. Very nearly allied to *D. atropurpùreus*, but differs in the figure of the leaves, and in the shorter more crowded peduncles.

Sphenoid-flowered Dendrophthoe. Shrub par.

23 D. cinnamòmeus; branches terete, when young velvety from rufous down, as well as the peduncles and flowers; leaves opposite, on short petioles, lanceolate, acute, glabrous; flowers 3-5 in a fascicle in the axils of the leaves, on short pedicels; corolla clavate, truncate at the apex; style clavate. ♄. P. S. Native of the East Indies, in Silhet. Loránthus cinnamòmeus, Wall. mss. D. C. coll. mem. vi. t. 6. Leaves 27 lines long and 10-11 broad. Corolla 6-7 lines long.

Cinnamon-coloured Dendrophthoe. Shrub par.

24 D. chrysa'nthus; branches terete, glabrous, compressed when young; leaves oval, on short petioles, blunt at both ends, or rather cordate at the base, covered with fuscous scurf; but when young clothed with dense ferruginous tomentum, as well as the branches and flowers; peduncles solitary or crowded, axillary, bearing 3-5 flowers; corolla cylindrical, truncate; anthers 4. ♄. P. S. Native of Java, on the mountains in the province of Bantam. Loránthus chrysánthus, Blum. in litt. 1829. ex D. C. prod. 4. p. 300. Allied to *D. cinnamòmeus*, but the flowers are shorter.

Golden-flowered Dendrophthoe. Shrub par.

25 D. cunea'tus; branches terete, velvety from rufous down while young, as well as the leaves and flowers; leaves opposite or alternate, obovate-cuneated, very blunt, at length glabrous;

peduncles axillary, 3-5-flowered; bracteas lateral, cucullate, one to each flower; corolla cylindrical, truncate at the apex; style clavate. ♄. P. S. Native of the East Indies, at Martaban, on the banks of the Irrawaddy. Loránthus cuneàtus, Wall. mss. Heyne, ex Roth, nov. spec. p. 193. Anthers probably 5, but in the younger flowers they are glued together, and with the stigma. Corolla 6 lines long, velvety on the outside. This, with the preceding species, may hereafter form a distinct genus, or at least a separate section.

Cuneated-leaved Dendrophthoe. Shrub par.

Cult. Like the rest of the genera of this order, the species are not cultivable in gardens. They are showy plants, with the habit of honeysuckle.

IX. PHTHIRU'SA (from *φθειρω*, *phtheiro*, to destroy; the species destroy the trees on which they grow), Mart. in D. C. prod. 4. p. 672. Loránthus, sect. Clandestìni, D. C. prod. 4. p. 287.

Lin. syst. *Tetrándria, Monogýnia.* Flowers hermaphrodite, 4-parted, furnished with 3 jagged bracteas each, some of them crowded in the axils of the leaves. Anthers fixed by the back, ovate. Styles short; stigma capitate. Berry ovate. Flowers small, axillary, sessile, or in axillary racemes.

1 P. clandesti'na; glabrous; branches compressedly tetragonal while young; leaves opposite, obovate, coriaceous; flowers axillary, solitary, sessile, small; petals 4, concave; anthers ovate; berries oblong. ♄. P. S. Native of Brazil, in the province of Para, in woods. Loránthus clandestìnus, Mart. in Schultes, syst. 7. p. 96. Flowers hardly half a line long. Bracteas suborbicular, jagged, one under each flower. Stamens shorter than the petals, but equal in length to the style. The anthers are said to be almost sessile.

Clandestine-flowered Phthirusa. Shrub par.

2 P.? salicifòlia; branches compressedly tetragonal above; leaves opposite, lanceolate, acuminated, glaucous, coriaceous; racemes solitary, axillary, 3 times shorter than the leaves; pedicels 3-flowered, short, bearing 3 bracteas at the apex; petals 4, linear-lanceolate; anthers roundish-ovate. ♄. P. S. Native of Brazil, in the province of Minas Geraes. Loránthus salicifòlius, Mart. in Schultes, syst. 7. p. 102. Flowers small, probably dioecious.

Willow-leaved Phthirusa. Shrub par.

3 P.? Lucarque'nsis; plant glabrous, much branched; branches terete; leaves petiolate, roundish-elliptic, acute, rounded at the base, somewhat membranous, veiny, with the middle nerve rather prominent; racemes axillary and terminal, few-flowered; flowers almost sessile, scattered, bractless; petals 4, oblong, rather concave; anthers unknown. ♄. P. S. Native of Peru, in temperate parts near Lucarque. Loránthus Lucarquénsis, H. B. et Kunth, nov. gen. amer. 3. p. 440. Schultes, syst. 7. p. 102. Leaves an inch long, and 9-10 lines broad; petioles 4-5 lines long. Racemes 3 lines long. Flowers minute, of a whitish yellow colour.

Lucarque Phthirusa. Shrub par.

Cult. The species of this genus do not possess any beauty, and are not cultivable in the gardens.

X. SCU'RRULA (a diminutive of *Scúrra*, a parasite; plants parasitical on trees). Loránthus, sect. iii. Scúrrula, D. C. prod. 4. p. 301.

Lin. syst. *Tetra-Pentándria, Monogýnia.* Flowers hermaphrodite. Petals 4-5, joined together into a long tube, which is divided at the apex into 4 or 5 short unilateral lobes, usually gibbous at the base, opening by a longitudinal fissure as in *Lobèlia*. Stamens 4-5; filaments adhering a long way to the corolla, but free at the apex; anthers fixed by the base, seldom by the back, to the top of the filaments, oblong, erect. Style filiform or clavate; stigma capitate. Peduncles axillary, few-flowered, or racemose, having a solitary bractea under each flower, which is usually pressed to the ovarium.

§ 1. *Flowers tetrandrous. Corolla 4-parted.*

1 S. Roxbu'rghii; branches terete, glabrous; leaves opposite, ovate, subcordate, white from soft down beneath; peduncles crowded in the axils of the leaves, very short, simple or branched, 1 or few-flowered; bractea adpressed to the ovarium, which is turbinate; alabastra cylindrical, 4-lobed at the apex, and having the tube cleft longitudinally. ♄. P. S. Native of Malabar, and probably of China, if the synonyme of Linnæus does not appertain to S. Chinénsis. Loránthus Scúrrula, Lin. spec. 472. Roxb. cor. 2. t. 140. Corolla of a rusty grey colour and mealy on the outside, but dark purple inside.

Roxburgh's Scurrula. Shrub par.

2 S. Chine'nsis; branchlets and young leaves clothed with rusty villi: the rest glabrous; leaves opposite, ovate, on short petioles, coriaceous, obtuse, cuneated at the base; peduncles axillary, very short, bearing 2-5 umbellate pedicellate flowers; bractea ovate, small, under the ovarium; limb of calyx truncate; corolla clavate, and curved in the bud, cleft longitudinally on one side; lobes of corolla 4, linear, short, reflexed. ♄. P. G. Native of China, where it was collected by Sir George Staunton. Loránthus Chinénsis, D. C. coll. mem. vi. t. 7.

Chinese Scurrula. Shrub par.

3 S. pulverule'nta; the younger parts of the plant are clothed with mealy stellate tomentum; branches terete; leaves opposite, petiolate, broad-ovate, acute, at length glabrous; racemes lateral, tomentose, in fascicles; flowers pedicellate; tube of corolla long, terete, curved, cleft at the apex into 4 short unilateral reflexed lobes. ♄. P. G. Native of Nipaul, on trees at Hetounra, and along the banks of the river Rapti. Loránthus pulveruléntus, Wall. in Roxb. fl. ind. 2. p. 221. Schultes, syst. 7. p. 99. Petioles an inch long. Leaves 5-7 inches long. Corolla more than an inch long, mealy outside. Berry large, club-shaped, mealy.

Powdered Scurrula. Shrub par.

4 S. fasciula'ta; glabrous; branches terete; leaves opposite, or somewhat verticillate, obovate, veiny above, but veinless beneath, coriaceous; fascicles lateral, few-flowered; lobes of corolla 4, reflexed, secund; style longer than the exserted stamens. ♄. P. S. Native of Java, near Linga Jattie, in the province of Cheribon, on trees. Loránthus fasciculàtus, Blum. bijdr. p. 661. Loránthus odoràtus, Blum. bijdr. p. 663. does not differ from this species according to the author.

Fascicled-flowered Scurrula. Shrub par.

5 S. fu'sca; glabrous; branches terete, rather angular in the young state; leaves opposite, on short petioles, obovate, and oval, acute at the base, coriaceous, beset with rusty dots beneath while young; peduncles axillary, 1-2-flowered; corolla cleft on one side, having 4 erect lobes. ♄. P. S. Native of Java, on Mounts Salak and Gede, on trees. Loránthus fúscus, Blum. bijdr. p. 660. Genitals dark purple. Stigma capitate. See Blum. bat. verhandl. 1823. p. 190.

Fuscous Scurrula. Shrub par.

6 S. umbe'llifer; glabrous; branches terete; leaves opposite, oblong-lanceolate, on short petioles, acute at the base; peduncles in fascicles, axillary, and lateral, pubescent, 3-flowered, subumbellate; corolla very long, slender, cleft into 4 linear reflexed segments at the apex; stigma clavate. ♄. P. S. Native of Nipaul, on Mount Sheopore. Loránthus umbéllifer, Schultes, syst. 7. p. 97. Loránthus umbellàtus, Wall. in Roxb. fl. ind. 2. p. 222. but not of Roth. Corolla of a bright red colour, curved, pubescent. Peduncles clothed with ferruginous tomentum.

Umbel-bearing Scurrula. Shrub par.

7 S. cordifòlia; branches terete, villous, mealy while young;

leaves opposite, ovate-cordate, obtuse, villous on both surfaces, petiolate; racemes fascicled, villous, axillary; corolla tubular, clavate, villous, cleft at the apex into 4 short lanceolate lobes. ♄. P. G. Native of the East Indies, at Shreenagur. Loránthus cordifòlius, Wall. in Roxb. fl. ind. 2. p. 222. Schultes, syst. 7. p. 100. D. Don, prod. fl. nip. p. 143. New shoots, as well as all the tender parts of the plant, covered with pale or white stellate tomentum. Petioles an inch long. Corolla an inch long.

Cordate-leaved Scurrula. Shrub par.

8 S. BUDLEIOÌDES; branches terete, velvety when young; leaves usually opposite, ovate, on short petioles, glabrous above, and clothed with fine velvety down beneath; fascicles of flowers axillary, on short peduncles, hardly longer than the petioles; bracteas ovate, small, one under each flower; tube of corolla arched, clothed with rusty velvety down, cleft into 4 linear-cuneated unequal lobes. ♄. P. S. Native of the East Indies. S. budleioìdes, Desr. in Lam. dict. 3. p. 600. Schultes, syst. 7. p. 97.

Budleia-like Scurrula. Shrub par.

9 S. BIFLÒRA; glabrous; branches terete; leaves petiolate, ovate-roundish, thickish; peduncles axillary, 1-2, bifid, a little shorter than the petioles; bractea ovate, girding the base of the ovarium; bud of corolla slender, somewhat clavate at the apex, arched, clothed with rufous velvety down. ♄. P. S. Native of the East Indies. Loránthus biflòrus, Desr. in Lam. dict. 3. p. 600. Schultes, syst. 7. p. 119. Corolla 4-lobed.

Two-flowered Scurrula. Shrub par.

10 S. PHILIPPE'NSIS; branches terete, velvety from short down when young, as well as the peduncles, bracteas, calyxes, and corollas; leaves on short petioles, oval, rather pubescent, obtuse at both ends; flowers few, in fascicles, axillary, on short pedicels; bractea ovate, concave, small, under the ovarium; limb of calyx truncate; corolla cylindrical, cleft into 4 linear nearly equal lobes at the apex; style filiform. ♄. P. S. Native of the Philippine Islands. Loránthus Philippénsis, Cham. et Schlecht. in Linnæa. 3. p. 204. Leaves 3 inches long and an inch broad. Corolla 7-8 lines long. Stigma small, capitate. Anthers linear, erect.

Philippine Scurrula. Shrub par.

11 S. VESTI`TA; branches terete; branchlets, petioles, under side of leaves, peduncles, bracteas, and flowers, clothed with rusty, mealy, velvety, stellate tomentum; leaves oblong-lanceolate, acute, shining above, and glabrous; fascicles of flowers numerous, on short peduncles in the axils of the fallen leaves; bractea concave, small under the ovarium; limb of calyx somewhat 4-toothed; corolla cylindrical, 4-cleft; lobes of corolla 4, linear, unilateral, reflexed. ♄. P. G. Native of Nipaul, on the mountains of Chandagiri and Sheopore. Loránthus vestìtus, Wall. in Roxb. fl. ind. 2. p. 218. D. Don, prod. fl. nep. p. 143. Wall. pl. rar. asiat. 3. t. 230. Plant stout. Fascicles numerous, few-flowered, in the axils of the fallen leaves. Corolla cylindrical, with a subglobular apex before expansion, afterwards its limb bursts into 4 linear reflexed segments. On the outside the flower is rust or cinnamon coloured, and within purple and smooth. Berry oblong, tomentose.

Clothed Scurrula. Shrub par.

12 S. LÆVIGA`TA; branches terete, glabrous, when young compressed; leaves petiolate, opposite, elliptic-oblong, obtuse, glabrous, smooth; peduncles axillary, branched, 7-8-flowered, 4 times shorter than the leaves, and are, as well as the flowers, rather velvety from rusty down; bractea lateral, small; tube of corolla terete, cleft on one side: lobes 4, oblong. ♄. P. S. Native of the East Indies, at Tavoy, in the Burmese Empire. Loránthus lævigàtus, Wall. mss. Flowerbud 7-8 lines long, regular while young. Anthers erect. Stigma rather capitate.

Smooth Scurrula. Shrub par.

13 S. RUFI'DULA; branches terete, glabrous in the adult state, but when young angularly subcompressed; leaves opposite, petiolate, elliptic-oblong, acutish, glabrous, or clothed with rufous velvety down on the nerves beneath; bractea lateral, small, concave; corolla with a terete tube, and 4 oblong lobes. ♄. P. S. Native of the East Indies, at Tavoy, in the Burmese Empire. Loránthus rigídulus, Wall. mss. This is hardly distinct from *S. lævigàta*.

Small-rufous Scurrula. Shrub par.

14 S. LEPIDÒTA; branches terete, compressed while young, beset with velvety dots at first, but at length glabrous; leaves nearly opposite, oval, beset with rusty dots beneath; corolla 4-cleft, curved, elongated, covered with rusty dots: lobes reflexed, unilateral. ♄. P. S. Native of the western parts of Java, on the higher ranges of mountains. Loránthus lepidòtus, Blum. bijdr. p. 660. bat. verh. 1823. p. 192. but not of Schultes.

Lepidoted Scurrula. Shrub par.

15 S. RUGULÒSA; glabrous; branchlets rather compressed, but at length terete; leaves opposite or alternate, on very short petioles, oblong-lanceolate, obtuse, glaucous, reticulately wrinkled, with smooth cartilaginous margins; racemes axillary, opposite, simple, shorter than the leaves; bracteas concave, one at the side of each ovarium; corolla tubular, arched: limb of 4 lanceolate lobes. ♄. P. S. Native of the East Indies. Loránthus rugulòsus, Roth, nov. spec. p. 194. Schultes, syst. 7. p. 101. Corolla nearly an inch and a half long.

Wrinkled-leaved Scurrula. Shrub par.

16 S. CORYNI`TIS; leaves opposite, broad-lanceolate; flowers axillary, few, aggregate, tetrandrous; corolla irregular, 4-cleft; berry clavate. ♄. P. S. Native of the East Indies, in Silhet, parasitical on *Averrhòa Carambòla*. Loránthus corynìtis, Spreng. cur. post. p. 140. Loránthus clavàtus, Roxb. fl. ind. 2. p. 210. but not of Lam. The rest unknown.

Club-flowered Scurrula. Shrub par.

17 S.? OBOVA`TUS; leaves nearly opposite, obovate, glabrous; racemules crowded, axillary; flowers tetrandrous; tube of corolla elongated. ♄. P. S. Native of Java, about Linga Jattie, on trees. Loránthus obovàtus, Blum. bijdr. p. 663.

Obovate-leaved Scurrula. Shrub par.

§ 2. *Flowers pentandrous. Corolla 5-lobed.*

* *Species natives of Africa.*

18 S. THONNI'NGII; branches terete, compressed at the apex; leaves petiolate, ovate, somewhat acuminated, coriaceous, glabrous and dark green above, somewhat canescent beneath from almost imperceptible down, as well as the branchlets; peduncles 1-3, axillary, short, bearing each 3-4 umbellate flowers on short pedicels; bracteas small, ovate, lateral, one under each pedicel; fruit ovate. ♄. P. S. Native of Guinea, where it was collected by Thonning. Loránthus Thonníngii, D. C. prod. 4. p. 303. Loránthus clavàtus, Thonn. mss. but not of Lam. Flowers unknown.

Thonning's Scurrula. Shrub par.

19 S. RUFE'SCENS; branches terete, rather compressed at the apex; young leaves, peduncles, and flowers clothed with rusty down; leaves petiolate, oval, obtuse at both ends, coriaceous; peduncles 1-3 together, shorter than the petioles, bearing 2-3 1-flowered pedicels; bracteas lateral, oblong, 1 under each pedicel; flower-bud pentagonal at the apex; fruit ovate. ♄. P. S. Native of Senegambia, near Nghianga, on trees. Loránthus rufèscens, D. C. prod. 4. p. 303. Alabastra 3 lines long. Calyx truncately urceolate. Very nearly allied to *S. Thonníngii*.

Rufescent Scurrula. Shrub par.

20 S. SESSILIFÒLIA; glabrous; branches terete, simple; leaves sessile, opposite, ovate-roundish, cordate at the base; flowers

many in the axils, fascicled, sessile, deflexed; corolla tumid at the base, narrowed above, cleft longitudinally, hence it is expanded into a 5-lobed ligula on one side. ♄. P. S. Native of Africa, at Koto or Keta. Loránthus sessilifòlius, Beauv. fl. d'ow. 2. p. 8. t. 23. Schultes, syst. 7. p. 108. The anthers are delineated in the figure versatile.

Sessile-leaved Scurrula. Shrub par.

21 S. Belvì'sii; glabrous; branches simple, terete; leaves on short petioles, nearly opposite and alternate, broad ovate-lanceolate, acute; peduncles very short, axillary, numerous, fascicled, 1-flowered, deflexed; corolla tumid at the base, narrowed above, cleft laterally, expanded into a 5-lobed ligula at the apex; anthers somewhat versatile. ♄. P. S. Native of Africa, in the kingdom of Waree, at Chama or Sama. Loránthus Belvìsii, D. C. prod. 4. p. 303. Loránthus lanceolàtus, Beauv. fl. d'ow. 2. p. 8. t. 64. Schultes, syst. 7. p. 108. but not of Ruiz et Pav.

Belvis's Scurrula. Shrub par.

22 S. pentagònia; glabrous; branches terete; leaves on short petioles, ovate or lanceolate, coriaceous, almost veinless, glaucous; flowers 4-5, in the axils of the leaves, sessile, crowded; bractea calyciform under the ovarium; corolla tumid at the base, and contracted under the middle, clavate, and pentagonal at the apex before expansion, but at length expanded into a 5-lobed ligula; filaments inflexed; style tumid and pentagonal under the apex; stigma capitate. ♄. P. S. Native of Senegal, on trees. Loránthus pentagònia, D. C. coll. mem. vi. t. 8. This species is easily distinguished from the rest in the form of the style and flower-bud. It is very like *S. Belvìsii*.

Pentagonal-flowered Scurrula. Shrub par.

23 S. dodoneæfòlia; glabrous; branches terete; leaves on short petioles, elongated, oblong-linear, obtuse, attenuated at the base, thick and coriaceous, glaucous, almost nerveless; flowers 2-3 together, sessile, crowded; bracteas cup-shaped, one under each ovarium; alabastra cylindrical; corolla tumid at the base, but somewhat constricted above, expanded into a 5-lobed ligula at the apex; filaments inflexed; style tumid at the apex and pentagonal; stigma capitate. ♄. P. S. Native of Senegal, on the trunks of tamarind trees. Loránthus dodoneæfòlius, D. C. coll. mem. vi. t. 9. Allied to *S. pentagònia*.

Dodonæa-leaved Scurrula. Shrub par.

24 S. glau'ca; glabrous; branches terete; leaves alternate, opposite, and 3 in a whorl, oblong or ovate-oblong, obtuse, covered with a glaucous bloom; peduncles axillary, erect, bearing each 3 flowers at the apex, on short pedicels; corolla rather tumid at the base, constricted in the middle, and divided at the apex into 5 linear revolute lobes; anthers linear, erect. ♄. P. G. Native of the Cape of Good Hope. Loránthus glaúcus, Thunb. fl. cap. p. 295. but not Ruiz et Pav. Schultes, syst. 7. p. 104. Moquínia rùbra, Spreng. ex Zeyh. in herb. Moricand. Habit almost of *S. oleæfòlia*, but differs in the anthers being long and linear, not oval, and in the stamens being free, not concrete.

Var. β, *Burchéllii* (D. C. prod. 4. p. 303.) leaves more remote and narrower, and less glaucous in the dried state. ♄. P. G. Native of the Cape of Good Hope. Burch. cat. pl. afr. austr. no. 2887.

Glaucous Scurrula. Shrub par.

25 S. oleæfòlia; branches terete; leaves opposite, oblong, silky, bluntish, feather-nerved; peduncles axillary, very short, bearing each 3 almost sessile flowers at the apex; corolla tumid at the base, and narrowed above, tubular, 5-lobed: lobes short, deflexed; stamens monadelphous; anthers oblong, fixed by the base. ♄. P. G. Native of the Cape of Good Hope. Loránthus oleæfòlius, Cham. et Schlecht. in Linnæa. 3. p. 209. Lichtensteìnia oleæfòlia, Wendl. coll. 2. p. 4. t. 39. Loránthus speciòsus, Dietr. Corolla red. Ovarium 1-celled; cell pentagonal, 1-seeded, ex Cham. et Schlecht. not 5-seeded.

Olive-leaved Scurrula. Shrub par.

26 S. cane'scens; every part of the plant is canescent; leaves oval, obtuse, small. ♄. P. S. Native of the Cape of Good Hope, in arid places on the branches of Lỳcium. Loránthus canéscens, Burch. cat. geogr. 1119. trav. afr. 2. p. 90.

Canescent Scurrula. Shrub par.

27 S. clava'ta; glabrous; branches terete; leaves opposite, on short petioles, oval, obtuse, coriaceous, almost veinless, rusty beneath; peduncles many, crowded, very short, in the axils of the leaves, dilated under the apex into a somewhat discoid bractea; limb of calyx 5-toothed; alabastra cylindrical, clavate; corolla at length cleft laterally, 5-lobed; style striately angular. ♄. P. S. Native of Madagascar. Loránthus clavàtus, Lam. dict. 3. p. 598. but not of Roxb. Schultes, syst. 7. p. 106. Filaments of stamens adnate a long way to the corolla; anthers oblong, erect, terminal.

Clavate-flowered Scurrula. Shrub par.

* * *Species natives of Asia.*

28 S. Hænkea'na; glabrous; branches terete; leaves petiolate, lanceolate-oblong, obtuse or acuminated, coriaceous, obsoletely veined; peduncles from the forks of the branches erect, bearing 3-flowered pedicels; bracteas ovate, concave, one under each ovarium; calyx pubescent, entire; corolla tubular, cleft laterally on one side: lobes 5, linear, reflexed. ♄. P. S. Native of the island of Luzon. Loránthus Hænkeànus, Presl, in herb. Hænke, ex D. C. prod. 4. p. 304. Schultes, syst. 7. p. 113. Leaves 3-6 inches long, and $1\frac{1}{2}$ to 2 inches broad, on petioles 8-10 lines long. Corolla 3-4 lines long, glabrous. Calyx reddish.

Hænke's Scurrula. Shrub par.

29 S. malifòlia; glabrous; branches terete; leaves ovate, acute, petiolate, coriaceous, obsoletely veined; peduncles axillary, solitary, reflexed, bearing a dense umbel of flowers; pedicels and calyxes clothed with rusty pubescence; limb of calyx nearly entire; corolla 5-cleft beyond the middle, and somewhat laterally cleft; lobes linear, reflexed. ♄. P. S. Native of the island of Luzon. Loránthus malifòlius, Presl, in herb. Hænke, ex D. C. prod. 4. p. 304. Schultes, syst. 7. p. 113. Perhaps sufficiently distinct from *S. Hænkeàna*.

Apple-leaved Scurrula. Shrub par.

30 S. longiflòra; glabrous; leaves oval-oblong, obtuse, veiny, coriaceous: upper ones rather cordate at the base; racemes axillary, simple, short, subcorymbose; bracteas concave, one under each ovarium; limb of calyx entire: corolla long, clavate, contracted beneath the limb: lobes 5, unequal, cuneated. ♄. P. S. Native of Malabar and Pondicherry. Loránthus longiflòrus, Desr. in Lam. dict. 3. p. 498. Wall. in Roxb. fl. ind. 2. p. 217. Schultes, syst. 7. p. 112. Walli-Iti-canni, Rheed. mal. 10. p. 5. t. 4. Flowers purple, curved, 20 lines long. Anthers linear, inserted by the base.

Long-flowered Scurrula. Shrub par.

31 S. incarna'ta; plant while young beset with deciduous stellate down; leaves alternate, on short petioles, broad-ovate, acute, nerved; racemes rising beneath the leaves, hoary from wool; flowers nearly sessile, each furnished with 1 bractea; limb of calyx 5-toothed; tube of corolla gibbous at the base, but constricted a little above the base: limb 5-parted: lobes reflexed; stigma clavate. ♄. P. S. Native of the East Indies, in the island of Pulo Nias. Loránthus incarnàtus, Jack, in Roxb. fl. ind. 2. p. 213. Schultes, syst. 7. p. 111. Leaves 9 inches long. Corolla above 2 inches long, slightly tomentose without, pale rosy, with a greenish limb; tube gibbous below, contracted a little above the base, then widening upwards till it suffers a

second contraction before expansion into the limb, which is about a fourth the length of the tube, 5-parted, with reflexed segments. Berry mealy, ovate, 1-seeded. This is a beautiful species.

Flesh-coloured-flowered Scurrula. Shrub par.

32 S. E'LEGANS; glabrous; branches terete; leaves opposite, or nearly alternate, oblong, obtuse, somewhat cuneated at the base, with undulated margins, almost veinless, coriaceous; racemes axillary, short, twin or tern, erect, 5-7-flowered; corolla terete, somewhat incurved, 5-lobed: lobes linear, spreadingly reflexed, nearly equal; style exserted beyond the anthers. ♄. P. S. Native of the East Indies, near Yenangenn. Loránthus élegans, Wall. cat. no. 530. Leaves 2 inches long, and 9 lines broad. Corolla glabrous, an inch and a half long, red. Anthers linear, erect. Calyx truncate. Bracteas lateral, small, one under each ovarium.

Elegant Scurrula. Shrub par.

33 S. CYLI'NDRICA; glabrous; leaves alternate, petiolate, lanceolate, acute at both ends, smooth, nerved; racemes axillary, stiff, length of the leaves; flowers pedicellate, rather distant from each other, each girded at the base by a bractea on the outer side; limb of calyx almost entire; limb of corolla much longer than the tube, which is cylindrical, with reflexed segments. ♄. P. S. Native of Sumatra. Loránthus cylíndricus, Jack, in Roxb. fl. ind. 2. p. 213. Schultes, syst. 7. p. 110. D. C. prod. 4. p. 305. Leaves 4-5 inches long; petioles about an inch long. Corolla red, perfectly cylindrical, before expansion, 5-petalled; limb reflexed, 3 times as long as the tube; petals linear, separating almost to the base. Ovarium cylindrical, 1-seeded. Flowers sometimes tetrandrous.

Cylindrical-flowered Scurrula. Shrub par.

34 S. I'NDICA; glabrous; branches terete; leaves nearly opposite, ovate-oblong, on short petioles, bluntish, feather-nerved; racemes axillary, or nearly terminal, solitary, simple, shorter than the leaves; flowers on short peduncles, each peduncle bearing 1-3 sessile flowers at the top, each flower propped by an ovate bractea; petals 5, linear, acute, hardly concrete at the base: the border reflexed; anthers linear, erect. ♄. P. S. Native of the island of Timor, and probably elsewhere in India. Loránthus I'ndicus, Desr. in Lam. dict. 3. p. 601. Schultes, syst. 7. p. 149. D. C. prod. 4. p. 305. Lonicèra Zeylánica, Gærtn. fruct. 1. p. 137. t. 27.? Corolla purple, glabrous, 7-8 lines long. Leaves 3 inches long, 1 or $1\frac{1}{2}$ broad, on petioles, which are 2-3 lines long. Berry ovate.

Indian Scurrula. Shrub par.

35 S. TURBINA'TA; glabrous; branches terete; leaves subalternate, on short petioles, oval or oblong, obtuse or acutish, thick; peduncles axillary, 2-3-cleft, much shorter than the leaves; bracteas ovate, one under each ovarium, which is turbinate; limb of calyx unequally and bluntly 5-toothed. ♄. P. S. Native of the East Indies, on the Nelligherry mountains, where it is called *Mandjil*, along with other species, by the natives. Loránthus turbinàtus, D. C. prod. 4. p. 305. Leaves 3 inches long, and 12-16 lines broad; petioles 3-6 lines long. Corolla unknown, and is only judged to belong to the present section of the genus in the calyx being said to be 5-parted.

Turbinate-fruited Scurrula. Shrub par.

36 S. BI'COLOR; glabrous; leaves nearly opposite, on short petioles, from oval to lanceolate, thick, undulated, hardly veined; racemes axillary, simple, solitary, many flowered; bracteas concave, cordate, small, one adpressed to each ovarium on the outer side; calyx cup-shaped, with an entire border; corolla long, tubular, a little curved, swelling from the bottom to within a third of the mouth, then contracting a little, with a 5-parted border: upper fissure much the deepest; lobes linear, reflexed towards one side; stigma clavate; berry oblong, smooth, 1-celled, 1-seeded. ♄. P. S. Native of the East Indies, frequent on trees. Loránthus bícolor, Roxb. cor. 2. p. 19. t. 139. fl. ind. 2. p. 205. Schultes, syst. 7. p. 109. D. C. prod. 4. p. 305. Flowers the size and appearance, and much like those of a honeysuckle, red at the base, and green at the apex, nearly $1\frac{1}{2}$ inch long. Anthers exserted, linear, fixed by the base. Leaves from 3-5 inches long, and from $\frac{1}{2}$ to 1 inch in breadth.

Two-coloured-flowered Scurrula. Shrub par.

37 S. FALCA'TA; glabrous; branches terete; leaves opposite, on short petioles, linear, glaucous, coriaceous, obtuse, laterally falcate; racemes axillary, few-flowered; bracteas short, one under each ovarium on one side; alabastra falcate, cylindrical, pentagonal at the apex: lobes of corolla 5; anthers linear-oblong, inserted by the base. ♄. P. S. Native of Madras. Loránthus falcàtus, Lin. fil. suppl. 211. Schultes, syst. 7. p. 150. The flowers are fulvous according to Linnæus.

Falcate-flowered Scurrula. Shrub par.

38 S. VENÒSA; glabrous; branches terete; leaves subalternate or opposite, oval, attenuated at both ends, coriaceous, having the veins blood coloured beneath; racemes axillary, much shorter than the leaves, rather canescent; limb of calyx somewhat 5-toothed; tube of corolla more or less cleft on one side: lobes 5, reflexed, unilateral; berries oblong-conical. ♄. P. S. Native of Java, at Buitenzorg, upon trees. Loránthus venòsus, Blum. bijdr. p. 668. bat. verhandl. 1823. p. 188. Corolla 4-5 lines long. Leaves variable in form. Style a little longer than the stamens; stigma capitate. Anthers linear, adnate. Blum. l. c.

Veiny Scurrula. Shrub par.

39 S. PENTA'NDRA (Lin. mant. p. 63.) glabrous; branches terete; leaves alternate, on short petioles, oblong, bluntish, thickish; racemes axillary, solitary, few-flowered, and are, as well as the flowers, covered with velvety mealy down; bracteas ovate, one under each ovarium; limb of calyx bluntly 5-toothed; bud of corolla cylindrical; petals 5, linear. ♄. P. S. Native of Java, on trees. Loránthus pentándrus, Lin. mant. p. 63. Blum. bijdr. p. 661. Schultes, syst. 7. p. 110. D. C. prod. 4. p. 305. Leaves 4 inches long, and an inch broad. Corolla 7 lines long, purplish inside. Anthers erect.

Var. β, flàvus (Blum. bijdr. p. 661. under *Loránthus*) racemes crowded; tube of corolla inflated. ♄. P. S. Native of Java, on trees, about Buitenzorg.

Pentandrous Scurrula. Shrub par.

40 S. AMPLEXIFÒLIA; glabrous; branches terete; leaves sessile, opposite, cordate at the base, orbicular, coriaceous, marginate; flowers racemose; bracteas rather concave, orbicular, one under each ovarium on one side; corolla cylindrical, contracted under the apex; lobes oblong. ♄. P. S. Native of the East Indies, on the Nelligherry mountains, where it was collected by Noton. Loránthus amplexifòlius, D. C. prod. 4. p. 305. Loránthus amplexicaúlis, Wall. mss. but not of Kunth. Corolla 15 lines long, of a brownish purple colour. Anthers linear, erect. Calyx truncate. Upper leaves 2 inches in diameter.

Clasping-leaved Scurrula. Shrub par.

41 S. HETERA'NTHA; glabrous; branches terete, angular while young; leaves alternate, on short petioles, elliptic or lanceolate, somewhat attenuated at both ends, thick, and coriaceous; racemes axillary, length of the leaves; pedicels twice the length of the calyx; bracteas convex, short, one under each ovarium on the outside; bud of corolla nearly straight, somewhat pentagonal: with 5 linear lobes; anthers erect, linear, twice the length of the filaments. ♄. P. S. Native of the East Indies, at Martaban. Loránthus heteránthus, Wall. cat. no. 537. Leaves 4 inches long, and 15-18 lines broad. Flowers 8-10 lines long. Calyx truncate.

Variable-flowered Scurrula. Shrub par.

42 S. PRÆLO'NGA; leaves alternate, oval, obtuse, tapering a little at the base, glabrous, of the consistence of parchment; racemes axillary; flowers secund; tube of corolla very long, clavate, angular. ♄. P. S. Native of Java, near Tjiradjas. Loránthus prælóngus, Blum. bijdr. p. 664. Schultes, syst. 7. p. 112. Allied to *S. clavàta* and *S. longiflòra*. Tube of corolla yellow, nearly 3 inches long: lobes linear, channelled inside, greenish.

Longest-flowered Scurrula. Shrub par.

43 S. CURVA'TA; leaves opposite or alternate, oblong, bluntish, acute at the base, coriaceous, rather veiny, glabrous; racemes axillary, solitary; tube of corolla elongated, curved: lobes reflexed. ♄. P. S. Native of Java, on Mount Salak, parasitical on trees. Loránthus curvàtus, Blum. bijdr. p. 665. Schultes, syst. 7. p. 110. Tube of corolla nearly 1½ inch long, yellow, but having the limb of a pale orange colour. Anthers adnate, elongated.

Curved-flowered Scurrula. Shrub par.

44 S. BRACTEA'TA; every part of the plant clothed with grey starry tomentum; branches terete; leaves small, alternate, obovate, obtuse, tapering to the base, on rather long petioles; umbels axillary, 5-flowered; bracteas oblong, tongue-shaped, one under each ovarium; corolla long, slender, cylindrical at the base, but widening at the apex, with the throat contracted: lobes linear, unilateral, much shorter than the tube. ♄. P. S. Native of the East Indies. Loránthus bracteàtus, Heyne, in Roxb. fl. ind. 2. p. 220. Loránthus Heyneànus and L. tomentòsus, Schultes, syst. 7. p. 105 and 106. Loránthus tomentòsus, Roth, nov. spec. p. 191. Umbels densely villous; pedicels one-third of an inch long.

Bracteate Scurrula. Shrub par.

45 S. GOODENIÆFÒLIA; branches terete, glabrous; leaves alternate, obovate-cuneated, obtuse, somewhat emarginate, tapering into the petioles at the base, rather veiny, glabrous in the adult state, but canescent in the young state from stellate deciduous down; peduncles axillary, 2-3-flowered; bracteas ovate, acute, one under each ovarium; tube of calyx pubescent, with 5 rather ciliated teeth; corolla cylindrical, cleft on one side: lobes 5, linear, reflexed, unilateral; style filiform. ♄. P. S. Native of the East Indies, on the Nelligherry mountains, where it is called *Mandjil*, and where it was collected by Leschenault. Loránthus goodeniæ fòlius, D. C. prod. 4. p. 306. Very nearly allied to *S. lobeliæflòra*.

Goodenia-flowered Scurrula. Shrub par.

46 S. LOBELIÆFLÒRA; glabrous; branches terete; leaves obovate-cuneated, obtuse, tapering into the petioles, sparingly veined; pedicels 1-2, axillary, 1-flowered, very short, spreading; bracteas ovate, acute, one under each ovarium; tube of calyx cylindrical, cleft on the inner side: lobes 5, linear, reflexed, unilateral; style filiform. ♄. P. S. Native of the south of India, where it is called *Vira-marum* and *pile-rivi* by the natives, and where it was collected by Leschenault. Loránthus lobeliæflòrus, D. C. prod. 4. p. 306. Leaves an inch long, and 4 lines broad. Corolla an inch long, red in the dry state. Loránthus cuneàtus, Roth, nov. spec. p. 193.?

Lobelia-flowered Scurrula. Shrub par.

47 S. ELA'STICA; glabrous; branches strong, columnar: internodes short; leaves sessile, thick, ovate, acutish, obscurely 5-nerved; flowers almost sessile, in fascicles about the joints; tube of corolla cylindrical: having the limb beaked before expansion: segments linear, short, separating from the base upwards, revolute. ♄. P. S. Native of Malabar. Loránthus elásticus, Desr. in Lam. dict. 3. p. 599. Wall. in Roxb. fl. ind. 2. p. 217. Schultes, syst. 7. p. 107. Belutta-Itti-cani, Rheed. mal. 10. p. 7. t. 3. The leaves are remarkably thick, and appear both trinerved and triple-nerved.

Elastic-flowered Scurrula. Shrub par.

48 S. REINWARDTIA'NA; leaves opposite, oblong, attenuated at both ends, coriaceous, veinless beneath; peduncles crowded, axillary, 1-flowered; tube of corolla very long, curved: lobes linear, unilateral, at length circinnately revolute. ♄. P. S. Native of Java, on the mountains. Loránthus Reinwardtiànus, Schultes, syst. 7. p. 105. Loránthus coccíneus, Reinw. in Blum. bijdr. p. 664. but not of Jack.

Reinwardt's Scurrula. Shrub par.

49 S. KŒNIGIA'NUS; glabrous; leaves nearly opposite, on short petioles, elliptic, veiny; racemes axillary; pedicels deflexed; calyx rather truncate; corolla 5-cleft, clavate. ♄. P. S. Native of the East Indies. Loránthus Kœnigiànus, Agardh, in Schultes, syst. 7. p. 108.

Kœnig's Scurrula. Shrub par.

Cult. The species of this genus are easily distinguished from the rest that are broken off from the old genus *Loránthus* in the tube of the corolla being curved, and bulged at the base on one side, as in *Lobèlia*, cleft longitudinally on the upper side, and the segments all leaning to the lower side, and reflexed. The plants have the habit of honeysuckle, but are not cultivable.

XI. ELYTRA'NTHE (from ελυτρον, *elytron*, a case or sheath, and ανθος, *anthos*, a flower; in reference to the joined bracteas forming a sheath under the flower). Lepeostegères and Elytránthe species of Blum. in litt. 1829. Loránthus species of authors. Loránthus, sect. iii. Symphyánthus, § 1-3-4 and 5. D. C. prod. 4. p. 296—299.

LIN. SYST. *Penta-Hexándria, Monogýnia.* Flowers hermaphrodite, pentamerous or hexamerous. Petals 5-6, joined together into a tube to the middle, and therefore divided to the middle into a 5-6 cleft regular limb. Stamens 5-6: filaments adnate to the petals at the base, and free at the apex; anthers fixed by the base, erect. Style filiform; stigma obtuse. Racemes axillary: flowers bracteate.—This genus differs from *Struthánthus* in the corolla being gamopetalous, and from *Dendrophthòe*, to which it comes nearest, in the flowers being racemose, not corymbose, and in each flower being usually furnished with more bracteas than one, which are not cup-shaped nor oblique, as in that genus: it also differs from *Scúrrula* in the limb of the corolla being regular, not as in that genus unilateral; and from *Loxanthèra* in the anthers not being oscillatory.

§ 1. *Anguliflòri* (from *angulus*, an angle, and *flos*, a flower; the flowers are more or less hexagonal from crests at the base). *Flowers tubular, usually tumid at the base, and more or less hexagonal from crests, dividing into 6 lobes to the middle; anthers erect. Bracteoles 3, joined together under each flower.*

1 E. RETU'SA; glabrous; leaves opposite, on short petioles, obovate-oblong, coriaceous, retuse, or emarginate, with the lateral nerves indistinct; racemes short, usually solitary, rising from the axils of the fallen leaves; flowers pedicellate, each furnished with 1-2 bracteas at the base; limb of calyx entire; tube of corolla clavate, gibbous, and angular, contracted at the limb: lobes 5-6, lanceolate, reflexed. ♄. P. S. Native of the Island of Singapore. Loránthus retùsus, Jack, in Roxb. fl. ind. 2. p. 212. Schultes, syst. 7. p. 112. The plant fastens itself by long runners to trees. Leaves smooth, about 3 inches long. Margin of calyx entire. Tube of corolla clavate, gibbous, and angled above, rosy, suddenly contracted at the limb, which is yellowish green, having the lobes or segments shorter than the tube.

Retuse-leaved Elytranthe. Shrub par.

2 E. AMPULLA'CEA; glabrous; leaves opposite, on short petioles, oblong, polished; racemes axillary, solitary or in pairs, much shorter than the leaves; flowers opposite, on short pedi-

cels; bracteas ovate, one at the base of each pedicel, and 2 others pressing the base of the germ, like an inferior bilabiate calyx; limb of calyx entire, rotate; corolla with a gibbous tube, and a 6-cleft regular border, the divisions revolute, and rather spatulate; anthers ovate; style longer than the corolla: stigma large; berry long, oval. ♄. P. S. Native of the East Indies, in the forests of Silhet, but seems to prefer the Mango trees to all others. Loránthus ampullàceus, Roxb. fl. ind. 2. p. 209. Schultes, syst. 7. p. 149. Leaves 3-4 inches long, and rather less than 2 inches broad. Flowers pretty large, greenish yellow. Berry yellow, size of a currant.

Ampullaceous Elytranthe. Shrub par.

3 E. CARINA'TULA; glabrous; leaves opposite, petiolate, elliptic, somewhat acuminated; racemes spiked, 7-flowered, 3 times longer than the petioles; bracteas 2, subconcrete under each flower; limb of calyx hardly any; tube of corolla inflated, hexagonal: lobes 6, oblong; style shorter than the corolla. ♄. P. S. Native of the East Indies, at Martaban, and at Cheppedon. Loránthus carinátulus, Wall. mss. D. C. coll. mem. vi. t. 3. Very like *E. ampullàcea*.

Little-keeled Elytranthe. Shrub par.

4 E. VIRIDIFLÒRA; glabrous; primary branches somewhat verticillate, rather compressed while young; leaves opposite, on short petioles, lanceolate, tapering at both ends; racemes axillary, and from the cicatrices of the fallen leaves, 2-3-together, sessile, one-third shorter than the leaves; pedicels 1-flowered, remote; bracteas 3, rather concrete under each ovarium; tube of corolla slightly ventricose, bluntly 6-cornered: having the limb divided regularly into 6, rarely into 5 linear-clavate reflexed segments, which are nearly as long as the tube, their inside rugose, their extremity broadish, concave, acute. ♄. P. S. Native on trees in the forest of Gonkurrun, in the valley of Nipaul. Loránthus viridiflòrus, Wall. in Roxb. fl. ind. 2. p. 219. Leaves smooth, about 3 inches long, rather conspicuously reticulated, less coriaceous than in most other species. Flowers green, rather remote, with the tube an inch and a half long. Filaments attached to the segments of the corolla, running down to their base. Style filiform; stigma rugose. Berry small, ovate.

Green-flowered Elytranthe. Shrub par.

5 E. SUBGLOBÒSA; glabrous; branches terete; leaves opposite, linear-oblong, on very short petioles, attenuated at both ends; peduncles axillary, simple, 4 times shorter than the leaves; bracteas trifid, or 3 concrete ones under each flower: tube of corolla inflated, ovate, hexagonal: the limb divided into 6 linear-oblong erect segments. ♄. P. S. Native of the East Indies, on the banks of the Irawaddy, parasitical on trees. Loránthus subglòbosus, D. C. prod. 4. p. 297. Leaves 3 inches long, and 8 lines broad. Corolla 8 lines long, and the tube 3 lines in diameter. Anthers erect. Stigma small, capitate.

Subglobose-flowered Elytranthe. Shrub par.

6 E. PA'LLENS; glabrous; branches terete, compressed while young; leaves opposite, on short petioles, ovate, ending in a short blunt acumen, coriaceous, rather glaucous; racemes axillary, short, few-flowered; bracteas lateral, ovate, small, one under each ovarium; flower-bud hexagonal at the base, having the tube at length broadly obconical: lobes 6, reflexed from the middle. ♄. P. S. Native of the island of Pulo-Penang. Loránthus pállens, Wall. cat. no. 523. Leaves 3 inches long, and usually about 2 inches broad.

Pale Elytranthe. Shrub par.

7 E. OLEOÌDES; glabrous; branches terete, when young rather compressed; leaves oblong, attenuated at both ends, opposite, on short petioles, stiff, rather glaucous; peduncles axillary, short, few-flowered; flowers unknown; bracteas lateral, roundish, one under each ovarium; berries ovate. ♄. P. S. Native of the island of Pulo-Penang. Loránthus oleoìdes, D. C. prod. 4. p. 297. Loránthus oleifòlius, Wall. mss. but not of Cham. et Schlecht. Allied to E. pállens, ex Wall.

Olive-like Elytranthe. Shrub par.

8 E. GLOBÒSA; plant glabrous, branched; leaves opposite, though sometimes alternate, and 3 in a whorl, oblong, coriaceous, smooth, almost veinless; racemes or spikes axillary, or between the leaves, or from the axils of the fallen leaves, generally solitary, but sometimes 2-3 together, much shorter than the leaves; flowers sessile, opposite, from 3-6 pairs on each spike; bracteas no other than the perianth of the fruit, but according to D. C. they are cordate; limb of calyx truncate; tube of corolla gibbous, 6-sided: limb 6-parted: segments regular, reflexed; berry round-oval, size of a pea. ♄. P. S. Native of the East Indies, throughout Bengal on trees. Loránthus globòsus, Roxb. fl. ind. 2. p. 206. Leaves 2-3 inches long. Flowers small, of a greenish orange colour. Perianth of the fruit inferior, 2-leaved, the under and exterior cordate, the inner bidentate: that of the flower no other than the circular margin of the pit, which receives the flower. Filaments inserted at the base of the segments of the corolla. Berry smooth, size of a pea, when ripe the pulp is yellow, clammy, and elastic.

Globose-flowered Elytranthe. Shrub par.

9 E. FORMÒSA; glabrous; branches terete; leaves nearly opposite, ovate-oblong, coriaceous, almost veinless; racemules crowded, lateral; tube of corolla very long, clavate, angular. ♄. P. S. Native of Java, upon trees on Mount Salak. Loránthus formòsus, Blum. bijdr. p. 664. Schultes, syst. 7. p. 149. Flowers scarlet, showy: segments of corolla revolute, somewhat secund, with dark purple margins. Anthers linear, adnate. Stigma obtuse. Corolla nearly 2 inches long. Perhaps a species of *Scúrrula*.

Showy Elytranthe. Shrub par.

10 E. SPHÆROCA'RPA; glabrous; branches terete; leaves on short petioles, opposite, ovate-oblong, coriaceous, veinless beneath; racemes axillary, solitary or twin; flowers angular. ♄. P. S. Native of Java, about Buitenzorg, Batavia, &c. on trees, where it is called *Mengando*, as well as many other species, by the natives. Loránthus sphærocárpus, Blum. bijdr. p. 661. and bat. verhandl. 1823. p. 189. Schultes, syst. 7. p. 149. Tube of corolla angular: flower-bud 5 lines long.

Round-fruited Elytranthe. Shrub par.

11 E. PA'TULA; glabrous; leaves opposite, petiolate, elliptic-ovate, coriaceous, smooth, acutish; panicles axillary, or rising beneath the leaves, shorter than the leaves; bracteas 2 or 3, embracing the ovarium; limb of calyx entire; tube of corolla acutely 6-angled, equal in length to the segments of the limb, which are 6, narrow, and revolute. ♄. P. S. Native of the interior of Bencoolen, on trees. Loránthus pátulus, Jack, in Roxb. fl. ind. 2. p. 214. Schultes, syst. 7. p. 135. Leaves about 3 inches long. Corolla green, tipped with light red, and with a purplish tinge towards the base: having the tube clavate and dilated upwards. Stigma capitate. Berry subglobose.

Spreading-panicled Elytranthe. Shrub par.

12 E. COCHINCHINE'NSIS; glabrous, much branched; leaves opposite, ovate-lanceolate, acute; peduncles axillary, many-flowered, crowded, furnished with 3 concrete bracteas under each flower; tube of corolla hexagonal, with 6 linear-lanceolate lobes, which burst elastically, and become revolute; stigma capitate; berries ovate. ♄. P. G. Native of Cochin-china, on trees in gardens. Loránthus Cochinchinénsis, Lour. coch. p. 195. Flowers greenish yellow. Berry yellowish red.

Cochin-china Elytranthe. Shrub par.

13 E. AVE'NIS; glabrous; branches terete; leaves opposite, narrow-lanceolate, coriaceous, glabrous, veinless: peduncles crowded, axillary, usually 2-flowered; flowers angular, hexan-

drous. ♄. P. S. Native of Java, on Mounts Salak and Gede, &c. Loránthus avènis, Blum. bijdr. p. 663. and bat. verhandl. 1823. p. 191. Loránthus Blumeànus, Schultes, syst. 7. p. 119.

Veinless-leaved Elytranthe. Shrub par.

14 E. TETRAGÒNA; glabrous; branches tetragonal; leaves opposite, sessile, oval, acute or obtuse, of the consistence of parchment, glabrous; racemes crowded, axillary; flowers angular, hexandrous. ♄. P. S. Native of Java, on trees about Tjiradjas, in the province of Krawang. Loránthus tetragònus. Blum. bijdr. 663. Schultes, syst. 7. p. 149. Corolla 3 lines long.

Tetragonal-branched Elytranthe. Shrub par.

15 E. SUBUMBELLA'TA; leaves opposite, oblong-lanceolate, long-acuminated, coriaceous, glabrous; racemes crowded, axillary; ultimate pedicels subumbellate; flowers hexandrous. ♄. P. S. Native of Java, on trees near Tjiradjas, in the province of Krawang. Loránthus subumbellàtus, Blum. bijdr. p. 662. Schultes. syst. 7. p. 148. Allied to *E. sphærocárpa*, and is, as well as it, called *Mengando* by the natives of Java.

Subumbellate-flowered Elytranthe. Shrub par.

§ 2. *Rigidiflòra* (from *rigidus*, stiff, and *flos*, a flower; flowers stiff). *Flowers pentandrous, tubular, cleft into 5 parts beyond the middle, having the lobes reflexed from the middle; tube obconical, hardly pentagonal. Anthers erect. Bracteas one under each flower.*

16 E. RI'GIDA; glabrous; branches terete, rather compressed when young; leaves opposite, petiolate, elliptic-lanceolate, acuminated; racemes axillary, simple, 7-flowered; flowers on short pedicels; bracteas ovate, lateral, one under each ovarium; calyx repand, somewhat denticulated; tube of corolla ovate at the base: lobes linear-oblong, reflexed from the middle. ♄. P. S. Native of the East Indies, at Amherst. Loránthus rígidus, Wall. cat. no. 531. Leaves 2-3 inches long, and 12-18 lines broad. Corolla 9 lines long, finely velvety, as well as ovarium. Anthers linear. Flower-bud pentagonal at the apex.

Stiff Elytranthe. Shrub par.

17 E. FARINÒSA; glabrous; branches terete; leaves alternate, smooth, coriaceous, ovate, obtuse, on thick short petioles; racemes in axillary fascicles, clothed with much mealy stellate whitish tomentum; tube of corolla ventricose, divided two-thirds of its length into 5 linear semi-recurved segments; berry large, ovate, slightly tomentose. ♄. P. S. Native of the East Indies, at Singapore. Loránthus farinòsus, Desr. in Lam. dict. 3. p. 597. Wall. in Roxb. fl. ind. 2. p. 221. Schultes, syst. 7. p. 111. D. C. coll. mem. vi. t. 4. Leaves nearly as large as a hand, with unequal margins, having the nerves remote and a little elevated. Flowers of a bright red colour, densely clothed with stellate tomentum, which is easily rubbed off; they are about an inch long, having the tube wide.

Mealy Elytranthe. Shrub par.

§ 3. *Cupulàti* (from *cupula*, an acorn cup; in reference to the shape of the bractea, which surrounds the ovarium). *Flowers small; bud of corolla equal at the base, terete, but globose and pentagonal at the apex; limb of 5 equal regular lobes. Anthers ovate, truncate, inserted by the base, dehiscing laterally. Stigma capitate. Bracteas cup-shaped, one girding or surrounding each ovarium.*

18 E. CUPULA'TA; branches terete, somewhat compressed at the apex; young petioles, leaves, peduncles, and flowers clothed with rusty down; leaves petiolate, ovate or oblong, acutish, coriaceous, more or less cordate at the base; peduncles very short, branched, umbellately many-flowered; bracteas cup-shaped, one girding each ovarium. ♄. P. S. Native of Casamania, on the trunks of trees. Loránthus cupulàtus, D. C. prod. 4. p. 298. Flowers 2-3 lines long. Branches clothed with rusty villi. Leaves variable in size and form. Berry obovate-globose. Lower part of the tube of the corolla cylindrical.

Cupular-bractead Elytranthe. Shrub par.

§ 4. *Involucràti* (the flowers are involucrated with bracteas). *Flowers tubular, 5-6-cleft. Anthers erect. Bracteas many, crowded, constituting an involucrum around the flowers, which are subcapitate.*

19 E. INVOLUCRA'TA; glabrous; branches shining; leaves opposite, on short petioles, ovate-cordate, smooth; umbels axillary, nearly sessile, much shorter than the leaves, 4-flowered, involucrated by 4 bracteas; bracteas ovate-lanceolate, smooth, entire; calyx villous, with a 5-toothed border; tube of corolla villous, widening towards the mouth: limb regular, 5-parted, with linear-revolute segments; anthers oval; stigma 2-lobed. ♄. P. S. Native of the East Indies, on the eastern border of Bengal: parasitical on trees. Loránthus involucràtus, Roxb. fl. ind. 2. p. 209. Schultes, syst. 7. p. 106. Leaves 3-4 inches long. Flowers pentandrous. Stamens equalling the segments of the corolla, and inserted on them below the middle. Ovarium silky. Style rather longer than the corolla.

Var. β, hebéclada (D. C. prod. 4. p. 298. under *Loránthus*) branchlets angular, velvety from pale rusty down. ♄. P. S. Native of Silhet. Wall. in fl. ind. p. 209. Corolla 6 lines long, villous on the outside, not gibbous at the base; lobes 5, equal. Anthers oval, inserted by the base.

Involucrate-flowered Elytranthe. Shrub par.

20 E. GEMMIFLÒRA; glabrous; branches tetragonal; leaves opposite, broad-ovate, or oval, obtuse, coriaceous; buds (imbricated involucra) axillary, solitary, sessile, many-flowered. ♄. P. S. Native of Java, in woods on the mountains. Loránthus gemmiflòrus, Blum. bijdr. p. 665. Schultes, syst. 7. p. 159. Lepeostégeres gemmiflòrus, Blum. in litt. This species is called *Mengando* by the Javanese. Flowers in capitate heads, sessile, densely crowded upon the dilated tops of the peduncles. Anthers subulate, ex Blum. and the berries are pedicellate.

Bud-flowered Elytranthe. Shrub par.

21 E. LONICEROÌDES; glabrous; leaves almost sessile, ovate to lanceolate, attenuated, obtuse, rounded at the base; peduncles opposite, longer than the petioles, bearing each a head of a few sessile, hexandrous flowers, and each head supported by 4 broad-ovate, acute, concave bracteas; corollas long, tubular, slender, having the limb irregularly cleft into 5 cuneated spreading segments. ♄. P. S. Native of the East Indies. Loránthus loniceroìdes, Lin. spec. 473. exclusive of the synonyme of Plukenet. Wall. in Roxb. fl. ind. 2. p. 216. Loránthus coriàceus and loniceroìdes, Schultes, syst. 7. pp. 107 and 108. Loránthus coriàceus, Desr. in Lam. dict. 3. p. 597. The flowers, according to Wallich, are hexandrous, but according to Lamarck pentandrous. It is perhaps a species of *Scúrrula*, on account of the irregular flowers.

Honey-suckle-like Elytranthe. Shrub par.

22 E. ? UMBELLA'TUS; leaves opposite, ovate-lanceolate; umbels axillary, opposite, on short peduncles, few-flowered; bracteas opposite, orbicular under each flower; limb of calyx truncate; corolla tubular: with 6 linear obtuse segments; anthers linear. ♄. P. S. Native of the East Indies. Loránthus umbellàtus, Roth. nov. spec. p. 192. but not of Wall. Schultes, syst. 7. p. 158. Flowers deep purple, glabrous, coriaceous. Berry ovate.

Umbellate-flowered Elytranthe. Shrub par.

§ 5. *Elytránthes* (from ελυτρον, *elytron*, a sheath or case, and ανθος, *anthos*, a flower; in reference to the large bracteas

forming a sheath to the flowers). *Flowers tubular, 6-cleft, hexandrous; lobes of limb linear, acute. Flower-buds nearly terete. Anthers erect. Flowers sessile, and decussate along the rachis of the spikes, furnished each with 3 bracteas, one under the flower and two opposite lateral combined ones; all large, concave, and deciduous.*

23 E. álbida (Blum. in litt. 1329.) glabrous; branches compressed; leaves opposite, oval-oblong, acute, coriaceous; spikes axillary, on short peduncles, sub-capitate, each bearing 4 decussate, tribracteate flowers. ♄. P. S. Native of Java, in woods on the mountains. Loránthus álbidus, Blum. bijdr. p. 665.

Whitish Elytranthe. Shrub par.

24 E.? obmunìtus; branches terete, straight; leaves spatulately linear, thickened at the apex; peduncles nutant, somewhat secund. ♄. P. S. Native of Brazil, on the banks of the Rio Grande. Loránthus obmunìtus, Spreng. cur. port. 139. Each ovarium is supported by a cup-shaped bractea, or by 3 concrete ones.

Clothed Elytranthe. Shrub par.

Cult. Like the rest of the genera of the present order, the species are not cultivable. The plants have much the habit of *Lonicèra*.

XII. NOTANTHE'RA (from *νωτος, notos*, the back, and *ανθηρα, anthera*, an anther; the anthers are fixed by the back to the filaments; hence they are oscillatory). Loránthus, sect. iv. Notanthèra, exclusive of § 1. Tetrámera and § 3. Calánthæ, D. C. prod. 4. p. 307.—Loránthus species of authors.

Lin. syst. *Penta-Hexándria, Monogýnia.* Flowers hermaphrodite. Petals 5-6-7-8, but usually 6, sometimes almost distinct to the base, and sometimes equally joined together at the base, linear or lanceolate. Stamens equal in number to the petals; filaments adnate to the corolla at the base, but free at the apex; anthers fixed by the back, oscillatory or incumbent. Style filiform. Stigma clavate. Berries ovate.—Parasitical shrubs, natives of South America, except one from Asia. Peduncles corymbose or racemose; branchlets usually bearing 3 flowers and 3 bracteas; sometimes the pedicels are 1-flowered, and with a bractea under each flower.

§ 1. *Pentámeræ* (from *πεντε, pente*, five, and *μερις, meris*, a part; the flowers are pentamerous or divided into 5 parts). *Flowers pentamerous and pentandrous, large, from* 1-8 *inches long.*

1 N. grandiflòrus; shrub glabrous, dependent; stems terete; leaves on short petioles, oval, thick; racemes terminal, subcorymbose, few-flowered; pedicels bearing each 1 flower and 1 bractea; bracteas ovate, concave, length of fruit; petals 5, linear, joined to the middle; anthers versatile. ♄. P. G. Native of Peru, parasitical on trees, where it is called *Hatun Mecmá*. Loránthus grandiflòrus, Ruiz, et Pav. fl. per. 3. p. 45. t. 273. f. a. Schultes, syst. 7. p. 115. Corolla very long. Berry blue, size of an olive.

Great-flowered Notanthera. Shrub par.

2 N. longibractea'tus; glabrous; branches terete; leaves scattered, lanceolate, or ovate-lanceolate, acute, sessile, coriaceous, veinless; spikes terminal; bracteas foliaceous, linear-lanceolate; flowers adhering to the bracteas at the base; flower-bud clavate; petals 5, linear; anthers versatile. ♄. P. G. Native of Peru. Loránthus longibracteàtus, Desr. in Lam. dict. 3. p. 599. Schultes, syst. 7. p. 117. Leaves 18-24 lines long, and 8-9 lines broad. Corolla $2\frac{1}{2}$ inches long.

Long-bractead Notanthera. Shrub par.

3 N. verticilla'tus; branches terete, 3 in a whorl; leaves also usually 3 in a whorl, lanceolate, nerveless, glaucous, usually secund; flowers terminal, secund, crowded into heads; bracteas ovate, concave, 1 under each flower; petals 5, joined at the base, spatulately-lanceolate and revolute at the apex; anthers oblong. ♄. P. G. Native of Chili, upon trees and shrubs on the banks of the river Andalien. Loránthus verticillàtus, Ruiz, et Pav. fl. per. 3. p. 47. Schultes, syst. 7. p. 117. Berry oval, blackish purple.

Whorled Notanthera. Shrub par.

4 N. cæ'sius; glabrous; branches terete; leaves on short petioles, ovate-lanceolate, or lanceolate, thickish, veinless; peduncles 1-flowered, disposed in terminal racemes, bearing under each flower an oblong bractea, which is 3 times longer than the ovarium; petals 5, joined to the middle, and spreading at the apex, linear; anthers incumbent. ♄. P. G. Native of the Andes of Peru, upon trees. Loránthus cæ'sius, Spreng syst. 1. p. 132. Loránthus glaúcus, Ruiz, et Pav. fl. per. 3. p. 45. t. 275. f. b. H. B. et Kunth, nov. gen. amer. 3. p. 438. but not of Thunb. Loránthus corymbòsus, Dietr. gart. lex. 4. p. 468. Schultes, syst. 7. p. 115. Leaves an inch or more long, and half an inch broad; petioles 2 lines long. Flowers an inch long, red at base and apex, but yellow in the middle. Berry oval, dark purple. This species is nearly allied to *N. longebracteàtus*.

Grey Notanthera. Shrub par.

5 N. Poeppi'gii; glabrous; branches terete, rather glaucous; leaves opposite, on short petioles, lanceolate, thickish, veinless; peduncles 1-flowered, disposed in a terminal raceme, bearing an ovate, acute bractea under each flower, which is one-half shorter than the ovarium; limb of calyx truncate; petals 5, joined together a little beyond the middle; anthers fixed by the back to the filaments. ♄. P. G. Native of Chili, where it was collected by Poeppig. Leaves an inch long. Flowers 2 inches long.

Poeppig's Notanthera. Shrub par.

6 N. Sternbergia'nus; glabrous; branches terete; leaves ovate or oval, obtuse, coriaceous, veinless above; peduncles many, short, 1-flowered, crowded, corymbose, rising from the axils of the upper leaves and the tops of the branches: bracteas ovate, one under each ovarium, and shorter than it; petals 5, linear, hardly concrete at the base; anthers versatile. ♄. P. G. Native of Chili, near La Guardia, and Aconcagua, and on the Cordillera of Chili. Loránthus Sternbergiànus, Schultes, fil. in herb. Hænke, and syst. 7. p. 116. Loránthus glaúcus, Gill. but not of Ruiz and Pav. nor Thunb. Leaves 12-15 lines long, and 8-10 broad; petioles $1\frac{1}{2}$ line long. Allied to *N. cæ'sius*, but differs in the bracteas being one half shorter than the ovaries, not 3 times longer.

Sternberg's Notanthera. Shrub par.

7 N.? Pöhlii; glabrous; branches terete; leaves oval, obtuse at both ends, on short petioles, thick, coriaceous, glaucous; the middle nerve hardly distinct at the base, the rest of it obsolete; peduncles axillary, solitary, shorter than the leaves, opposite, dichotomously corymbose, few-flowered; petals 5, linear, thick, almost distinct, bearing each a ligula beneath the stamens; anthers versatile. ♄. P. S. Native of Brazil, where it was detected by Pohl. Loránthus glaúcus, Pohl. in litt. but not of others. Loránthus Pöhlii, D. C. prod. 4. p. 308. Leaves 12-15 inches long, and 8-9 broad. Corolla an inch long. Bracteas small, very blunt, one under each flower. Perhaps a species of *Psittacánthus*.

Pohl's Notanthera. Shrub par.

§ 2. *Micránthæ* (from *μικρος, micros*, small, and *ανθος, anthos*, a flower; flowers of the species small). *Flowers small, usually hexamerous or divided into 6 parts, but in a very few they are divided into 4-5-7 parts, disposed in racemes; the branches of the raceme usually bearing 3 flowers and 3 bracteas each.—Species all natives of America.*

* *Racemes axillary.*

8 N. SARMENTÒSUS; glabrous, rather scandent, hence the branches throw out roots on one side; branches angular; leaves petiolate, oblong-lanceolate, acute, somewhat complicate and keeled: having the middle nerve rather prominent; racemes axillary, about equal in length to the leaves: having their branchlets short and angular, and bearing 3 bracteas and 3 sessile flowers each at the apex; petals 6, linear-spatulate; anthers ovate, incumbent. ♄. P. G. Native of Peru, at Munna: parasitical on trees. Loránthus sarmentòsus, Ruiz et Pav. fl. per. 3. p. 49. t. 278. f. a. Schultes, syst. 7. p. 145. Corolla yellowish, 3-4 lines long. Berry oblong, greyish. Leaves 1½ inch long, and an inch broad; petioles 2 lines long.

Sarmentose Notanthera. Shrub par.

9 N. ACUMINA'TUS; glabrous; branches angular, somewhat sarmentose; leaves petiolate, remote, ovate, long-acuminated; racemes axillary, one half shorter than the leaves: having the branchlets brachiate, and bearing each 3 ovate, concave, acute bracteas, and 3 sessile flowers; petals 6, linear; anthers ovate. ♄. P. G. Native of the Andes of Peru, in groves. Loránthus acuminàtus, Ruiz et Pav. fl. per. 3. p. 49. Schultes, syst. 7. p. 144. Very nearly allied to *N. sarmentòsus*, but differs in the leaves being flat, in the stigma being peltate, and the berries being brownish yellow.

Acuminated-leaved Notanthera. Shrub par.

* * *Racemes terminal and axillary.*

10 N. SELLOWIA'NUS; glabrous; branches tetragonally terete, radicant; leaves obovate, retuse, or emarginate, ending in a recurved mucrone, cartilaginous, feather-nerved, tapering into the short petioles; racemes axillary and terminal, naked, shorter than the leaves: having the branchlets bearing 3 flowers and 3 bracteas; limb of calyx lax; corolla 6-parted: with linear lobes; anthers versatile. ♄. P. S. Native of Brazil. Loránthus Sellowiànus, D. C. prod. 4. p. 312. Loránthus retùsus, Cham. et Schlecht. in Linnæa. 3. p. 215. but not of Jack. Leaves 20 lines long, and 15-16 lines broad; petioles 4 lines long. Corolla 3 lines long. Stigma thickish.

Sello's Notanthera. Shrub par.

11 N. RADI'CANS; glabrous; branches terete, elongated, radicant; leaves ovate, oblong, or lanceolate, acuminated, ending in a subulate point, feather-veined, with cartilaginous margins, running down the petioles at the base; spikes axillary and terminal; flowers and bracteas by threes; corolla 6-parted, with linear lobes; anthers versatile. ♄. P. S. Native of Brazil. Loránthus radìcans, Cham. et Schlecht. in Linnæa. 3. p. 207. Leaves 5 inches long and 1½ broad; petioles hardly 5 lines long. Corolla 3 lines long. Flowers disposed in something like whorls of fives.

Rooting Notanthera. Shrub par.

12 N. BUXIFÒLIUS; branchlets rather angular, and rather hispid from stiff short hairs; branches terete, and are as well as the petioles and leaves glabrous; leaves oval, coriaceous; racemes terminal and axillary, erect; pedicels bearing each 3 flowers and 3 bracteas; corolla tubular, 4-5-6-parted: having the lobes dilated and concave at the apex; anthers versatile. ♄. P. G. Native of Chili, near Talcahuano: parasitical on various trees. Loránthus buxifòlius, Cham. et Schlecht. in Linnæa. 3. p. 207. Loránthus Eschscholziànus, Mart. in Schultes, syst. 7. p. 117. Leaves rough in the young state. Bracteas fringed at the apex. The root, according to Chamisso, creeps under the bark of the trees on which the plant grows. Style acute at the apex. Corolla 3-4 lines long. This comes very near to *N. heterophýllus*; and appears only to differ in the branches being covered with short rigid hairs.

Box-leaved Notanthera. Shrub par.

13 N. HETEROPHY'LLUS; branches terete, slender, scabrous, rusty; leaves scattered, on short petioles, cordate or oval, mucronate, coriaceous, glabrous; racemes terminal and axillary, angular; pedicels short, bearing each 3 bracteas and 3 flowers; the 2 lateral flowers stalked: and the middle one sessile; bracteas small; petals 6, linear-spatulate; anthers incumbent. ♄. P. G. Native of Chili: parasitical upon trees, especially myrtaceous trees. Loránthus heterophýllus, Ruiz et Pav. fl. per. 3. p. 48. t. 273. f. b. Schultes, syst. 7. p. 135. The old branches are smooth: the younger ones are angled, glabrous, or sometimes roughish from minute rust-coloured tubercles. Petals 4-5, concave, and dilated at the apex. Leaves 6-12 lines long, and 4-9 lines broad: petioles 2 lines long. Corolla purplish white, 4-5 lines long.

Variable-leaved Notanthera. Shrub par.

14 N. ELLI'PTICUS; glabrous; branches terete, slender, angular; leaves petiolate, elliptic, somewhat acuminated, thick-coriaceous, veinless, shining above; peduncles axillary and terminal, racemose; pedicels short, bearing each 3 bracteas and 3 sessile flowers at the apex; petals 7, linear-spatulate, joined together to the middle; anthers versatile. ♄. P. S. Native of Peru, in groves, in high frigid places on the Andes near Pozuzo. Loránthus ellípticus, Ruiz et Pav. fl. per. 3. p. 47. t. 276. f. a. Schultes, syst. 7. p. 159. Leaves an inch long, and half an inch broad; petioles 2 lines long. Corolla yellow, 4 lines long. Perhaps a species of *Gaiadéndron*.

Elliptic-leaved Notanthera. Shrub par.

15 N. LIGUSTRIFÒLIUS; glabrous; branches terete; leaves oblong-lanceolate, acuminated, coriaceous; corymbs axillary and terminal, one half shorter than the leaves, solitary; pedicels crowded, bractless, bearing 2-3 flowers; petals 6, linear, somewhat dilated and concave at the apex; anthers ovate, versatile. ♄. P. G. Native of Peru, or Chili, where it was collected by Hænke. Loránthus ligustrifòlius, Schultes, fil. in herb. Hænke, and in syst. 7. p. 135. Loránthus ligustrìnus, Willd. herb. ex Schultes, but not of Wall. Leaves 2 inches long, and 9-10 lines broad; petioles 2 lines long. Corolla 4-5 lines long, black in the dried state.

Privet-leaved Notanthera. Shrub par.

16 N. VE'GETUS; glabrous; branches scandent, terete; leaves elliptic-oblong, obovate, rounded at the apex, thick-coriaceous, glaucescent, on short petioles; racemes axillary, solitary; pedicels short, bractless, bearing each 3 sessile flowers at the apex, drooping in the fructiferous state. ♄. P. G. Native of Mexico, near Cuernavaca. Loránthus végetus, D. C. prod. 4. p. 313. H. B. et Kunth, nov. gen. amer. 3. p. 434. Leaves 2 inches long, and 10-12 lines broad. Flowers unknown. Berries ovate-oblong.

Lively Notanthera. Shrub par.

17 N. ORBICULA'RIS; glabrous; branches tetragonal; leaves petiolate, orbicular, acutish, thick-coriaceous, obsoletely veined; racemes axillary, solitary; pedicels short, bearing each 3 sessile flowers at the apex; petals 6, glabrous; anthers ovate. ♄. P. S. Native of Quito, near Guayaquil, on trees. Loránthus orbiculàris, H. B. et Kunth, nov. gen. amer. 3. p. 434. Schultes, syst. 7. p. 143. Leaves 18 lines long and 16-17 broad; petioles 3-4 lines long. Flowers 4 lines long, green on the outside, and white on the inside.

Orbicular-leaved Notanthera. Shrub par.

18 N. SALICIFÒLIUS; plant glabrous, pruinose? branches terete, compressed at the nodi; leaves oblong-lanceolate, acuminated, marginate, petiolate; racemes axillary, solitary or twin, erect, sessile; pedicels very short, bearing each 3 flowers and 3 bracteas; corolla 4-parted, with linear lobes, which are shell-formed at the apex; anthers versatile; stigma capitate. ♄. P. S.

Native of Brazil. Loránthus salicifòlius, Cham. et Schlecht. in Linnæa. 3. p. 216. Leaves 4½ inches long and ½ inch broad; petioles 6 lines long. Flowers a line long.

Willow-leaved Notanthera. Shrub par.

19 N. LANCEOLA'TUS; glabrous; branches terete, slender, rather angular; leaves on short petioles, lanceolate-oblong; peduncles racemose, axillary, and terminal; pedicels short, bearing each 3 bracteas and 3 sessile flowers at the apex; petals 7-9, linear-spatulate, joined at the base; anthers incumbent. ♄. P. G. Native of Peru, on the Andes at Pillao. Loránthus lanceolàtus, Ruiz et Pav. fl. per. 3. p. 47. t. 278. f. b. but not of Beauv. Loránthus lancifòlius, Poir. ex Schultes, syst. 7. p. 142. Leaves 2 inches long and an inch broad; petioles 2-3 lines long. Corolla yellow, half an inch long. Berries oblong.

Lanceolate-leaved Notanthera. Shrub par.

20 N. OXYPHY'LLUS; glabrous; branches terete, but somewhat compressed at the apex; leaves lanceolate-oblong, tapering into the petioles at the base, and much acuminated at the apex, feather-nerved: having the middle nerve rather prominent; racemes axillary, solitary, shorter than the leaves; pedicels opposite, bearing each 3 bracteas and 3 sessile flowers at the apex; petals 6, linear, acute, hardly joined together at the base, longer than the filaments; anthers ovate, erect, incumbent. ♄. P. S. Native of Brazil, where it was collected by Pohl. Loránthus oxyphýllus, Pohl. ex D. C. prod. 4. p. 314. Loránthus acuminàtus, Pohl. in litt. Leaves 2 inches long. Flower-bud sub-clavate. Style thickish; stigma truncate.

Sharp-leaved Notanthera. Shrub par.

21 N. SUAVE'OLENS; glabrous; branches terete; leaves petiolate, ovate-oblong, acuminated, rounded at the base, coriaceous; racemes 2-4 together; pedicels short, approximate, bractless, bearing each 3 stalked flowers at the apex; petals 6, linear, spreading; anthers incumbent. ♄. P. S. Native of Peru, in groves near Gonzanama. Loránthus suavèolens, H. B. et Kunth, nov. gen. amer. 3. p. 435. Schultes, syst. 7. p. 143. Leaves 26-27 lines long and an inch broad; petioles 2-3 lines long. Flowers 3 lines long, white, glabrous.

Sweet-scented Notanthera. Shrub par.

22 N. CONDUPLICA'TUS; glabrous; branches tetragonal; leaves petiolate, ovate, acuminated, acute at the base, rather coriaceous, conduplicately recurved; panicle terminal, much branched, leafy: having the branches twin, and are as well as the rachis tetragonal; pedicels very short, bearing 3 flowers and 3 bracteas at the apex; petals 6, linear. ♄. P. S. Native of Cumana and Cumanocoa, on trees. Loránthus conduplicàtus, H. B. et Kunth, nov. gen. amer. 3. p. 441. Loránthus ánceps, Will. rel. in Schultes, syst. 7. p. 131. Leaves 24-27 lines long, and 14-17 lines broad: petioles 4-5 lines long. Flowers hardly 2 lines long.

Conduplicate-leaved Notanthera. Shrub par.

23 N. ATTENUA'TUS; plant glabrous, twining; branches terete; leaves rather alternate, obovate-oblong, cuneated at the base, and tapering into the petioles, and mucronate at the apex; mucrone deciduous; racemes axillary, twin or tern, shorter than the leaves: pedicels short, bearing each 2-3 bracteas and 2-3 sessile flowers at the apex; petals 6, linear, hardly connected at the base, longer than the filaments; anthers ovate-roundish, fixed by the base. ♄. P. S. Native of Brazil. Loránthus attenuàtus, Pohl. in litt. ex D. C. prod. 4. p. 315. Leaves 12-15 lines long and 6-7 broad. Corolla 1½ line long. Stigma not capitate.

Attenuated-leaved Notanthera. Shrub par.

24 N. A'NCEPS; glabrous; branches terete; branchlets and peduncles compressed and 2-edged; leaves alternate or opposite, oblong-elliptic, petiolate, ending in very short mucrones, feather-nerved; racemes axillary, solitary, or twin, and terminal, subcorymbose, unequal; pedicels short, bearing each 3 bracteas and 3 sessile flowers at the apex; anthers ovate, erect. ♄. P. S. Native of Brazil, where it was detected by Pohl. Loránthus ánceps, D. C. prod. 4. p. 315. Loránthus oblóngo-ellípticus, Pohl. in litt. Leaves an inch long and 5-6 lines broad; petioles 3 lines long. Corolla 2 lines long. Allied to *Loránthus paucifòlius*.

Two-edged-branched Notanthera. Shrub par.

25 N. OVA'TUS; glabrous; branches unknown; leaves ovate, acute, somewhat acuminated, petiolate, coriaceous: having the middle nerve rather prominent, and the lateral ones hardly conspicuous; racemes a little shorter than the leaves; pedicels short, bearing 3 bracteas and 3 sessile flowers at the apex; petals 6, linear, distinct, acutish, a little longer than the filaments; anthers erect, fixed by the base. ♄. P. S. Native of Brazil. Loránthus ovàtus, Pohl. in litt. ex D. C. prod. 4. p. 315. Leaves 2½ inches long and 1½ broad; petioles 2-3 lines long. Branchlets racemose, 2 lines long. Ovarium glaucescent. Petals 2 lines long. Style thickish, equal at the apex. Perhaps this and the preceding belong to *Struthánthus*.

Ovate-leaved Notanthera. Shrub par.

Cult. The species are not cultivable, and have the habit of those of the other parasitical genera of the order.

XIII. LOXANTHE'RA (from λοξος, *loxos*, oblique, and ανθηρα, *anthera*, an anther; in reference to the filaments being curved at the apex). Blum. in litt. Loránthus, sect. ii. Loxanthèra, D. C. prod. 4. p. 316.

LIN. SYST. *Hexándria, Monogýnia.* Flowers hermaphrodite. Tube of corolla geniculated at the base, but clavate, and rather oblique at the apex, with a 6-lobed limb; lobes oblong, attenuated at the base, and somewhat spirally twisted. Filaments stiffly curved at the apex, not attenuated, but somewhat dilated; anthers inserted by the back. Style longer than the stamens. Stigma clavate.—Parasitical shrubs.

1 L. SPECIÒSA (Blum. in litt. 1829.) glabrous; leaves oblong, obtuse or bluntly acuminated, coriaceous, 1-nerved, veinless; peduncles axillary, few-flowered; tube of corolla elongated. ♄. P. S. Native of Java, in woods. Loránthus loxanthèra, D. C. prod. 4. p. 316. Bud of corolla 4 inches long, scarlet, but yellowish inside. Stigma blood-coloured.

Showy Loxanthera. Shrub par.

2 L.? SPIRO'STYLIS; glabrous; branches terete, tetragonally compresséd at the apex; leaves somewhat alternate, petiolate, oblong-lanceolate, coriaceous, having the middle nerve rather prominent, the rest veinless; racemes solitary or twin, axillary, shorter than the leaves; rachis angular; petals 6, linear; anthers fixed by the back to the filaments; style spirally twisted. ♄. P. S. Native of Mexico, at Acapulco. Loránthus spiróstylis, D. C. prod. 4. p. 315. Spiróstylis Hænkeàna, Presl, ex Schultes, syst. 7. p. 164. Flowers 2 lines long. This is perhaps a distinct genus, as it differs from all the others in the twisted style; and from the present in the filaments not being curved at the apex, and in the petals not being spirally twisted.

Screw-styled Loxanthera. Shrub par.

Cult. The species of this genus have the habit of the other parasitical genera of the order, and are not cultivable like them.

† *Plants referred to the old genus Loránthus by authors, but the number of the parts of the flowers and their structure being unknown, it is impossible to refer them to any of the genera broken off from that genus; therefore they must stand under the names originally given.*

1 L. FLORULE'NTUS (Rich. act. soc. hist. nat. par. p. 107.) branches opposite, spreading, quadrangular; leaves oblong-ovate, very blunt; peduncles solitary and sessile in all the axils.

ħ. P. S. Native of Cayenne. Schultes, syst. 7. p. 157. The rest unknown.

Flowering Loranthus. Shrub par.

2 L. BRACTEA'TUS (Rich. l. c.) leaves oblong, rather falcate, nerved; peduncles bifid; bractea terminal, cordate, 3-flowered. ħ. P. S. Native of Cayenne. Schultes, syst. 7. p. 161. The rest unknown.

Bracteate-flowered Loranthus. Shrub par.

3 L. TERNIFLÒRUS (Willd. rel. ex Schultes, syst. 7. p. 161.) branches terete; leaves oblong, petiolate, acute; racemes axillary; peduncles 3-flowered. ħ. P. S. Native of Caraccas.

Three-flowered Loranthus. Shrub par.

4 L. LAURÌNUS (Willd. rel. ex Schultes, syst. 7. p. 162.) leaves coriaceous, oblong, acute, tapering into the petioles; flowers terminal, aggregate. ħ. P. S. Native of South America.

Laurel-like Loranthus. Shrub par.

5 L. CARDIPHY'LLUS (Willd. rel. ex Schultes, syst. 7. p. 162.) leaves ovate-cordate, stem-clasping, obtuse; flowers terminal, spicately aggregate. ħ. P. S. Native of South America.

Heart-leaved Loranthus. Shrub par.

6 L. TUBULÒSUS (Willd. rel. ex Schultes, syst. 7. p. 162.) leaves lanceolate, acute; flowers tubular, somewhat spicate, terminal. ħ. P. S. Native of South America.

Tubular Loranthus. Shrub par.

7 L. GNEOROI'DES (Willd. rel. ex Schultes, syst. 7. p. 162.) leaves lanceolate, attenuated at the base, obtuse, glaucous, much longer than the spikes; spikes axillary and terminal. ħ. P. S. Native of South America.

Gneorum-like Loranthus. Shrub par.

8 L. MULTIFLÒRUS (Willd. rel. ex Schultes, syst. 7. p. 162.) leaves ovate, acuminated, longer than the racemes; racemes axillary; peduncles 3-flowered. ħ. P. S. Native of South America.

Many-flowered Loranthus. Shrub par.

9 L. ALTERNA'TUS (Willd. rel. ex Schultes, syst. 7. p. 162.) leaves oblong, attenuately acuminated at the apex; flowers axillary and terminal, panicled. ħ. P. S. Native of South America.

Alternate-leaved Loranthus. Shrub par.

10 L. OBVALLA'TUS (Schultes, syst. 7. p. 162.) leaves oblong, obtuse, coriaceous; flowers terminal, racemosely panicled; pedicels 3-flowered; bracteas ovate, longer than the calyx. ħ. P. S. Native of South America. Loránthus bracteàtus, Willd. rel. but not of Roxb.

Environed Loranthus. Shrub par.

11 L. MICRO'STACHYS (Willd. rel. ex Schultes, syst. 7. p. 162.) leaves elliptic-roundish, petiolate; racemes cymose, axillary, 4 times smaller than the leaves. ħ. P. S. Native of South America. The rest unknown.

Small-spiked Loranthus. Shrub par.

12 L. MACRO'STACHYS (Willd. rel. ex Schultes, syst. 7. p. 162.) leaves oblong, attenuated at both ends, bluntish, coriaceous; spikes sessile, longer than the leaves, verticillate. ħ. P. S. Native of South America. The rest unknown.

Long-spiked Loranthus. Shrub par.

13 L. MEMBRANA'CEUS (Willd. rel. ex Schultes, syst. 7. p. 162.) leaves ovate, drawn out at the apex, attenuated, membranous, nerved; flowers twin, 2 inches long. ħ. P. S. Native of South America. The rest unknown.

Membranous-leaved Loranthus. Shrub par.

14 L. CELTIDIFÒLIUS (Willd. rel. ex Schultes, syst. 7. p. 161.) leaves ovate, oblique, glaucous beneath; peduncles axillary, aggregate. ħ. P. S. Native of Guinea. The rest unknown.

Celtis-leaved Loranthus. Shrub par.

15 L. MACULA'TUS (Blum. bijdr. p. 662.) leaves opposite or alternate, elliptic-oblong, obtuse, acute at the base, spotted with black, coriaceous, glabrous; flowers unknown. ħ. P. S. Native of Java, in the province of Bamtam.

Spotted-leaved Loranthus. Shrub par.

16 L. EUCALYPTOÌDES (D. C. prod. 4. p. 318.) glabrous; branches terete, dichotomous; leaves opposite, petiolate, lanceolate-linear, acutish, thick-coriaceous, almost veinless. ħ. P. G. Native of New Holland. L. eucalyptifòlius, Sieb. fl. nov. holl. no. 242. but not of Kunth. Leaves 3-4 inches long, and 6-7 lines broad. Petioles 6 lines long. Flowers and fruit unknown. Schnltes, syst. 7. p. 163.

Eucalyptus-like Loranthus. Shrub par.

17 L. HOFFMANSEGGIA'NUS (Willd. in Schultes, syst. 7. p. 113.) leaves ovate-oblong, acute; racemes axillary, usually twin; flowers verticillate. ħ. P. S. Native of Brazil, at Para. Lor. verticillàtus, Hoffmansegg in herb. Willd. Flowers pentandrous.

Hoffmansegg's Loranthus. Shrub par.

†† *Species only known by name.*

1 *L. acàciæ-Nilólicæ*, Oudh. in Brown, append. 2. 2 *L. calycìnus*, R. Brown, in Salt, abyss. 3 *L. congéstus*, R. Br. l. c. 4 *L. læ'tus*, R. Br. l. c. 5 *L. serrulàtus*, Roxb. ex Steud.

N. B. *Asclèpias lactífera*, Burm. fl. ind. p. 61. is a species of *Loránthus* not known.

Tribe II.—*Terrestrial shrubs.*

XIII. *a* GAIADE'NDRON (from γαια, *gaia*, the earth, and δενδρον, *dendron*, a tree; these trees grow in earth and not parasitical, like other genera broken off from *Loránthus*). Loránthus species of authors.

LIN. SYST. *Hexa-Octándria*, *Monogýnia*. Calyx 6-8-toothed. Petals 6-8, narrow, sometimes free and sometimes joined at the base. Stamens 6-8, inserted in the petals. Style filiform; stigma simple. Ovarium oblong-cylindrical.—Terrestrial trees, with obovate leaves and racemes of yellow flowers.

1 G. EUGENIOÌDES; arboreous; branches terete; leaves ovate-oblong, acuminated, running down the petioles at the base, rather coriaceous; racemes axillary and terminal, solitary or twin; pedicels short, approximate, 3-flowered, bractless; flowers pedicellate; corolla 5-6-parted; lobes linear-acute; anthers incumbent. ħ. G. Native of Peru, on the Andes, near Guamcabamba; and of Brazil. Loránthus eugenioìdes, H. B. et Kunth, nov. gen. amer. 3. p. 435. Schultes, syst. 7. p. 135. Çham. et Schlecht. in Linnæa. 3. p. 214. Loránthus attenuàtus, Willd. herb. but not of Pohl. Flowers about half an inch long, white, sweet-scented. Racemes $1\frac{1}{2}$ to 3 inches long.

Eugenia-like Gaiadendron. Tree 15 to 20 feet.

2 G. TA'GUA; arboreous; branches terete; leaves oblong, acute, running down the petioles at the base, coriaceous, shining above and dotted beneath; racemes axillary, solitary; pedicels short, usually 3 together, approximate, bearing each 3 bracteas and 3 flowers; flowers on short pedicels; petals 7, spreading, linear, acute. ħ. G. Native about Santa Fe de Bogota. Loránthus Tàgua, H. B. et Kunth, nov. gen. amer. 3. p. 436. Schultes, syst. 7. p. 159. Loránthus arbòreus, Mutis mss. Leaves $3\frac{1}{2}$ inches long, and 14-18 lines broad; petioles 6 lines long. Flowers 9 lines long. Berry ovate-oblong. Very like *N. punctàtus*.

Tagua Gaiadendron. Tree 15 to 20 feet.

3 G. LAURIFÒLIUM; arboreous; glabrous; branchlets angular; leaves elliptic-oblong, bluntish, running into the petioles at the base, coriaceous, shining above; racemes axillary and solitary, terminal, and panicled; pedicels short, usually by threes, approximate, bearing each 3 bracteas and 3 sessile flowers;

petals 7-8, linear, rather dilated at the apex; anthers incumbent. ♄. G. Native about Santa Fe de Bogota. Loránthus laurifòlius, H. B. et Kunth, nov. gen. amer. 3. p. 436. Schultes, syst. 7. p. 160. Leaves 2½-3 inches long, and 12-15 lines broad; petioles 3 lines long. Flowers 9 lines long, glabrous.

Laurel-leaved Gaiadendron. Tree 15 to 20 feet.

4 G. NI'TIDUM; arboreous, glabrous; branches terete; leaves petiolate, oblong, obtuse at both ends, coriaceous, shining above, veinless, having the middle nerve obsolete; corymbs terminal; peduncles bearing each 2-3 flowers and 3 bracteas; flowers sessile; petals 8, linear; anthers incumbent. ♄. G. Native of the Andes of Quito, in Paramo de Saraguru, in temperate parts. Loránthus nítidus, H. B. et Kunth, nov. gen. amer. 3. p. 437. Schultes, syst. 7. p. 160. Leaves 2 inches long, and 10 lines broad; petioles 4 lines long. Flowers sweet-scented, about an inch long, yellow, glabrous. Berries ovate.

Shining-leaved Gaiadendron. Tree 15 to 20 feet.

5 G. Puracénse; arboreous, glabrous; branches terete; leaves lanceolate-oblong, acutish, running into the petioles at the base, coriaceous, shining above, and beset with black spots beneath; racemes terminal; peduncles short, 3-5-together, approximate, each bearing 3 bracteas, and from 1-3 flowers; petals 6-8, linear. ♄. G. Native on the Andes, about Popayan, in Paramo de Purace. Loránthus Puracénsis, H. B. et Kunth, nov. gen. amer. 3. p. 437. Schultes, syst. 7. p. 160. Leaves 22-27 lines long, and 9-10 broad; petioles 4 lines long. Racemes 4-6 inches long. Corolla yellow. Perhaps sufficiently distinct from *N. Tàgua*.

Purace Gaiadendron. Tree 10 to 15 feet.

6 G. punctàtum; arboreous, glabrous; branches terete: leaves obovate or oval, somewhat attenuated at the base into the short petioles, coriaceous, beset with black dots beneath, having the middle nerve rather prominent; racemes long, terminal, and from the axils of the superior leaves; peduncles somewhat verticillate, bearing each 3 bracteas and 3 sessile flowers at the apex; petals 6, linear-spatulate; anthers incumbent, fixed by the back near the base to the filaments. ♄. G. Native of the Andes of Peru, in cold places in groves. Loránthus punctàtus, Ruiz et Pav. fl. par. 3. p. 47. t. 177. f. a. Presl, in herb. Hænke, Schultes, syst. 7. p. 134. Leaves 2 inches long, and 1 broad; petioles 2-3 lines long. Corolla yellow, almost an inch long before expansion. Berry ovate-roundish, crowned by the limb of the calyx, which is truncate.

Dotted-leaved Notanthera. Tree par.

Cult. For culture and propagation see *Nuytsia*.

XIII. *b* NUY'TSIA (named after Peter Nuyts, a celebrated Dutch navigator, and discoverer of that part of New Holland called Nuytsland). R. Br. in geogr. soc. trans. vol. 1.

Lin. syst. *Hexándria, Monogýnia.* Teeth of calyx 3-5, unequal. Petals 6-7, linear, distinct. Stamens 6-7, inserted towards the middle of the petals; anthers versatile, sub-hastate, 2-celled. Ovarium turbinate, rather trigonal. Style subulate; stigma acute. Fruit 1-seeded, covered by pulp or glutin, and of a different texture from the rest of the Loranthaceous genera. —A terrestrial tree, native of New Holland.

1 N. floribu'nda; arboreous, glabrous; branches terete; leaves alternate, linear, obtuse, thick; racemes elongated, simple; peduncles longer than the flowers, bearing each 3 bracteas and 3 flowers at the apex. ♄. G. Native of New Holland, in Van Lewin's Land. Loránthus floribúndus, Labill. nov. holl. 1. p. 87. t. 113. Schultes, syst. 7. p. 133. Loránthus celastroìdes, Sieb. fl. nov. holl. exsic. no. 244. Leaves 2-3 inches long, and 4-5 lines broad. Racemes 6-8 inches long, crowded at the tops of the branches. Corolla 9-10 lines long, sulphur-coloured.

Bundle-flowered Nuytsia. Clt. 1831. Tree 15 to 25 feet.

Cult. A mixture of sand, loam, and peat will be a good soil for this singular tree. Cuttings will probably root if planted in sand under a hand-glass.

XIV. SCHO'EPFIA (named after John Schœpf, a German botanist, who has written upon the plants in the neighbourhood of Ulm). Schreb. gen. no. 323. D. Don, prod. fl. nep. 145. Wall. in Roxb. fl. ind. 2. p. 188. D. C. coll. mem. vi.—Codònium, Vahl, act. soc. hist. nat. hafn. 1. p. 206. t. 6.—Hæ'nkea, Ruiz et Pav. fl. per. 3. p. 8. but not of their prod.

Lin. syst. *Pentándria, Monogýnia.* Flowers hermaphrodite. Margin of calyx entire; tube adnate to the ovarium, very narrow, calyculate at the base. Corolla gamopetalous, tubular, with a 5-cleft limb, rarely with a 4-6 cleft limb; lobes valvate in æstivation. Stamens equal in number to the lobes of the corolla, and situated in front of them, and having the filaments adnate to the tube; anthers ovate or roundish, dehiscing laterally by a double chink. Style erect, truncate; stigma capitate or 3-lobed. Ovarium 3-celled, with a solitary ovulum in each cell. Drupe containing a 3-celled 3-seeded nucleus, or only 1-seeded from abortion. Embryo minute, placed in the vertex of the albumen, which is amygdaline: with a turbinate radicle.—Small smooth terrestrial trees. Leaves alternate, petiolate, entire, feather-nerved. Peduncles axillary, usually many flowered. —This genus comes near to *Caprifoliàceæ* from the gamopetalous corolla and 3-celled fruit; but differs from it, and agrees with *Loranthàceæ*, in the stamens being in front of the lobes of the corolla, and in the flowers being calyculate. It also agrees with the order *Symplocíneæ* in the 3-celled fruit.

* *Tube of corolla ovate, with a naked throat.—American species.*

1 S. arbore'scens (Rœm. et Schultes, syst. 5. p. 160.) leaves ovate; peduncles axillary, usually twin, 1-3-flowered. ♄. S. Native of the islands of Santa Cruz, Montserrat, ex Rohr; and of Guadaloupe, ex Bertero; but in Rohr's specimen the leaves are obtuse, while in that of Vahl's they are acuminated: they are therefore probably distinct species. Codònium arboréscens, Vahl. act. soc. hafn. 2. pt. 1. p. 206. t. 6. symb. bot. 3. p. 36. S. Schrebèri, Lam. ill. 2. p. 51. S. Americàna, Willd. spec. 1. p. 996. Flowers yellow.

Arborescent Schœpfia. Tree 8 to 10 feet.

2 S. flexuòsa (Rœm. et Schultes, syst. 5. p. 160.) leaves ovate-lanceolate, acute; racemes axillary, solitary, 4-5-flowered; tube of corolla ovate: lobes acute: throat naked. ♄. G. Native of Peru, on the Andes, on the mountains at Pillao and St. Antonio de Playa Grande. Hæ'nkea flexuòsa, Ruiz et Pav. fl. per. 3. p. 8. t. 231. Leaves 3-4 inches long. Branches flexuous, diffuse. Corolla yellow.

Flexuous-branched Schœpfia. Tree 10 to 12 feet.

** *Tube of corolla terete, having the throat furnished with fascicles of hairs at the origin of the stamens.—Species natives of Asia.*

3 S. fra'grans (Wall. in Roxb. fl. ind. 2. p. 188.) leaves lanceolate or elliptic-oblong, attenuated at both ends; racemes axillary, solitary, many-flowered; corolla infundibuliform, with a long cylindrical tube: segments of corolla lanceolate, acute. ♄. G. Native of Nipaul, in less elevated situations from Becheako as far as the valley, where it is rather common; it has also been found in more northern situations. Wall. tent. fl. nep. 1. p. 18. t. 9. D. Don, prod. fl. nep. 145. Symphoricárpos? odoràta, Ham. ex D. Don, l. c. Bark of tree thick and spongy, yellowish. Leaves deep green above. Flowers yellow,

exquisitely fragrant, even after being dried, disposed in racemes, which are about half the length of the leaves. Ovarium supported by a calyciform bractea like the rest of the species, which is divided into 2 or 3 unequal acute segments. Corolla rather fleshy; tube nearly an inch long. Drupe pale yellow, almost white, about the size of an olive, 1-seeded from abortion. The perfume of the flowers is of a most delightful kind, and may be perceived on steeping them in warm water even long after they have been dried.

Fragrant Schœpfia. Tree 10 to 15 feet.

4 S. acumina'ta (Wall. cat. no. 486.) leaves ovate, acuminated, obtuse at the base; racemes axillary, many flowered; tube of corolla terete: lobes bluntish. ♄. G. Native of Nipaul, on the Pundua mountains. Flowers yellow?

Acuminated-leaved Schœpfia. Tree 10 to 12 feet.

Cult. A mixture of loam, peat, and sand will suit these trees; and young cuttings of them will be easily rooted if planted in sand, and placed under a hand-glass.

XV. AU'CUBA (the Japanese name of the shrub). Thunb. fl. jap. p. 4. Lam. ill. t. 759. D. C. prod. 4. p. 274.—Aúkuba, Kœmpf. amœn. 5. p. 775.—Eubàsis, Salisb. prod. p. 68.

Lin. syst. *Dioècia*, *Tetrándria*. Flowers dioecious. Calyx closely adhering, with the margin a little elevated and 4-toothed: teeth obtuse, very short. Petals 4, deciduous, alternating with the calycine teeth, inserted in the margin of the elevated flesh, 4-angled disk ovate, acuminated, fleshy, with the margin truncate on one side, and minutely papillose on both surfaces, valvate in æstivation, induplicate at the apex. Stamens 4, opposite the petals? Ovarium cylindrical, adhering closely to the tube of the calyx, 1-celled, containing one ovulum. Style very short, thick, terete: stigma capitate, thick, fleshy, viscid, obsoletely 2-lobed. Berry fleshy, 1-seeded, crowned by the permanent style. The rest unknown.—A small evergreen tree, native of Japan; branches dichotomous or verticillate in the manner of *Loránthus* and *Víscum*. Leaves opposite, petiolate, broad, ovate-lanceolate, acuminated, toothed, coriaceous, glabrous, shining, pale green, beautifully spotted with yellow, having the mid-rib rather prominent, the rest of the leaf reticulately veined. Petioles cylindrical. Flowers small, panicled. Panicles many, spike-formed, pedunculate; peduncles rather villous. Bracteas lanceolate, membranous, pale, caducous. Calyx beset with adpressed villi. Petals dark blood coloured. The buds are large, angular, imbricated from conduplicate stipulas; the leaves are large, toothed, and veiny, and the petioles are articulated with the branches and dilated at the base; hence there is some analogy in the genus to *Fráxinus*. This genus was included by Jussieu in the order *Rhámni;* but from its having no affinity whatever to either of the families into which that order has been since divided, its place in the natural system has remained undetermined; and perhaps also from its want of novelty, the plant has been despised by botanists, and its characters and affinities consequently overlooked. Like the *Sàlix Babylónica*, or weeping-willow, too, we possess only one sex of the tree in Europe, and that the female, which circumstance has likewise prevented its being accurately examined. The structure of the female flower agrees so exactly with that of *Viscum*, that, notwithstanding the different mode of growth of the two genera, and the absence of more accurate details respecting the male blossoms, and the ripe fruit, its arrangement among the *Loranthàceæ* appears fully justified. It will ultimately be found the connecting link between the *Araliàceæ* and the present family.

1 A. Japónica (Thunb. fl. jap. p. 64.) ♄. H. Native of Japan. Banks, icon. Kœmpf. t. 6. Thunb. icon. fl. jap. t. 12 and 13. Sims, bot. mag. 1197. Eubàsis dichótomus, Salisb. prod. p. 68. The Aúcuba is a well known laurel-like evergreen shrub, having the leaves mottled with yellow; but in Japan the leaves are said to be sometimes green by Thunberg. According to Kœmpfer, the fruit is a red oblong drupe, like a laurel-berry, with a white sweetish pulp, and a kernel with a bitter taste. The shrub is called in the gardens *aucuba* or *spotted-leaved laurel*.

Japan Aucuba. Fl. May, July. Clt. 1783. Shrub 6 to 10 feet.

Cult. This is a showy evergreen shrub, well adapted for shrubberies and small gardens. It is easily increased by cuttings from the young wood planted in autumn under a hand-glass or by layers. The shrub will grow in any soil.

Order CXXVIII. CHLORA'NTHEÆ (plants agreeing with *Chloránthus* in particular characters). R. Br. in bot. mag. 2190. (1821) and in Parry, voy. 1824. Lindl. coll. bot. 17. (1821). Blum. fl. jav. (1829) vol. 1.

Flowers disposed in spikes, hermaphrodite or unisexual; with a supporting tridentate calyx. Stamens lateral; if more than one connate definite; anthers 2-4-celled, bursting lengthwise, each adnate to a fleshy connective, which coheres laterally in various degrees; filaments slightly adhering to the ovarium, which is 1-celled; stigma simple, sessile; ovulum pendulous. Fruit drupaceous, indehiscent. Seed pendulous. Embryo minute, placed at the apex of a fleshy albumen; having the radicle inferior, and consequently remote from the hilum; cotyledons divaricate.—Herbaceous plants or under shrubs, with an aromatic taste. Stems jointed, tumid under the articulations. Leaves opposite, simple, with sheathing petioles, and minute intervening stipulas. Flowers disposed in terminal loose slender spikes.

This order is nearly allied to *Loranthàceæ*, from which it differs in the tridentate calyx, in the want of petals, in the fewer stamens, in the structure of the anthers, and in the inferior radicle, &c. It is said to be nearly allied to *Sarùreæ* and *Piperàceæ*, from both of which it differs in the want of a sack to the embryo, and in the pendulous ovulum, and opposite leaves with intermediate stipulas. The anthers consist of a fleshy mass, upon the face of which the cell lies that bears the pollen; whether their anthers are 1 or 2-celled is a matter of doubt, one botanist considering those that have 2 cells to be double anthers, another understanding those with 1 cell to be half anthers. This order comes nearest in affinity to *Rubiàceæ*, tribe *Opercularíneæ*.

The whole plant of *Chloránthus officinàlis* has an aromatic fragrant smell, which is gradually dissipated in drying; but its roots retain a fragrant camphorated smell, and an aromatic somewhat bitter flavour. They are found to possess very nearly the properties of *Aristolòchia serpentària*, and in a high degree. There seems to be no doubt but that it is a stimulant of the highest order.

Synopsis of the genera.

1 Chlora'nthus. Flowers hermaphrodite. Anther seated on the side of the ovarium, undivided and 2-celled, or trilobed and 4-celled. Ovarium 1-ovulate. Drupe 1-seeded.

2 Ascari'na. Spikes dioecious. Filament short; anther oblong, 4-furrowed, and probably 4-celled. Stigma 3-lobed. Drupe 1-seeded.

3 Hedyósmum. Flowers monoecious. Male aments oblong, naked; anthers numerous, closely imbricated. Female flowers in racemes, with a tridentate calyx. Drupe trigonal, 1-seeded, clothed by the baccate calyx.

I. CHLORA'NTHUS (from χλωρος, *chloros*, green, and *ανθος*, *anthos*, a flower; the flowers are green). Swartz, in phil. trans. 77. p. 359. Lher. sert. angl. 1. p. 35. R. Brown, in bot. mag. 2190. Blum. fl. jav. 1. p. 7.—Nigrìna, Thunb. nov. gen. p. 58. fl. jap. p. 65.—Crèodus, Lour. coch. p. 89. Ascarìna species, Blum. enum. pl. jav. 1. p. 79.—Cryphæ'a, Hamilt. in edinb. phil. journ. 1825. vol. 2. p. 9.

Lin. syst. *Monándria, Monogýnia,* R. Br. *Gynándria, Triándria,* Spreng. Calyx tridentate or wanting. Corolla wanting. Anther seated on the side of the ovarium, undivided, and 2-celled, or trilobed and 4-celled: in the latter case the middle lobe alone is perfect and 2-celled, while the 2 lateral lobes are imperfect and only 1-celled. Ovarium 1-seeded: ovulum pendulous; stigma capitate. Drupe 1-seeded.—Small subherbaceous shrubs: with opposite toothed leaves, and slender spikes of inconspicuous flowers.

1 C. officina'lis (Blum. enum. pl. jav. 1. p. 79. fl. jav. 1. p. 10. t. 1.) stem suffruticose; leaves oval-oblong, or lanceolate, the superior ones more acuminated than the rest; spikes branched, terminal; anther 3-lobed: middle lobe perfect and 2-celled: lateral ones imperfect and 1-celled. ♄. G. Native of Java, in high mountain woods. Straòpha Noronha, ined. Berries white. The plant has an aromatic and fragrant smell, and is a stimulant of the highest order. It is used in medicine by the Javanese.

Officinal Chloranthus or Chu-Lan. Shrub 3 to 4 feet.

2 C. brachy'stachys (Blum. fl. jav. 1. p. 13. t. 2.) stem suffruticose; leaves oblong-lanceolate, acuminated at both ends, serrated; spikes branched, terminal; anther undivided, 2-celled. ♄. G. Native of Java, in the provinces of Bamtam and Krawang, in woods on the higher mountains. Ascarìna serràta, Blum. enum. pl. jav. 1. p. 180.

Short-spiked Chloranthus or Chu-Lan. Shrub 2 to 3 feet.

3 C. mono'stachys (R. Br. in bot. mag. t. 2190. Lindl. coll. t. 171.) stem suffruticose; leaves elliptic, serrated, acuminated; spikes solitary, simple; flowers alternate; anther incurved, 3-lobed: the middle lobe 2-celled and perfect, and the lateral lobes 1-celled and imperfect. ♄. G. Native of China. Flowers yellowish.

One-spiked Chloranthus or Chu-Lan. Fl. Feb. May. Clt. 1819. Shrub 1 to 2 feet.

4 C. inconspícuus (Swartz, in phil. trans. vol. 77. p. 359. t. 15.) suffruticose; leaves ovate-oblong, obtuse, serrated, pale beneath; spikes axillary, branched: branches alternate; flowers opposite; anther 3-lobed: middle lobe perfect and 2-celled, the lateral ones imperfect and 1-celled. ♄. G. Native of China and Japan. Nigrìna spicàta, Thunb. fl. jap. p. 65.

Inconspicuous Chloranthus or Chu-Lan. Fl. April, Sept. Clt. 1781. Shrub 1 foot.

5 C. mona'nder (R. Br. in bot. mag. under no. 2190.) spikes brachiate; flowers opposite? anther undivided, 2-celled, perfect. ♄. G. Native of China.

Monandrous Chloranthus or Chu-Lan. Fl. June. Clt. 1817. Shrub 1 to 1½ foot.

6 C. ela'tior (R. Br. l. c.) shrubby; leaves oblong-lanceolate, serrated, petiolate: spikes slender, long, reflexed, crowded, nearly terminal; anther 3-lobed, the middle lobe perfect, 2-celled, the lateral lobes imperfect and 1-celled. ♄. G. Native of China and Cochinchina. Crèodus odorífer, Lour. coch. p. 89. Flowers small, yellow, sweet-scented. Branches long, somewhat scandent. In Cochinchina this plant is grown in gardens for the sake of the scent of the flowers.

Taller Chloranthus or Chu-Lan. Shrub 6 feet.

7 C. serra'tus (Rœm. et Schultes, syst. 3, p. 461.) leaves ovate-oblong, acute, doubly serrated; spikes brachiate, axillary. ♄. G. Native of Japan, in the interior of the islands. Nigrìna serràta, Thunb. act. ups. t. 7. p. 142. t. 5. f. 1. Stem simple, about a foot high. Leaves a hand long, having the serratures acute.

Serrated-leaved Chloranthus or Chu-Lan. Pl. 1 foot.

Cult. A mixture of loam, sand, and a little peat, is a good soil for the species of *Chloránthus*; and they are easily increased by cuttings under a hand-glass, or by suckers.

II. ASCARI'NA (from *ασκαρις*, *ascaris*, ascarides, or small round worms; the name is applied to this genus because the anthers are formed like small worms). Forst. char. gen. t. 59.

Lin. syst. *Monándria, Monogýnia.* Spikes filiform, dioecious. Perianthium a very short scale. Filament short; anther oblong, 4-furrowed, and probably 4-celled. Style wanting: stigma somewhat 3-lobed, adnate to the ovarium.—A tree, with oblong-serrated stalked leaves, and sheathing stipulas at the base of the petioles.

1 A. polysta'chya (Forst. l. c.) ♄. G. Native of the Society Islands.

Many-spiked Ascarina. Tree.

Cult. See *Chloránthus* above for culture and propagation.

III. HEDYO'SMUM (from ἡδυ, *hedy*, sweetness, and *οσμη*, *osme*, a smell; the plants are sweet-scented). Humb. et Bonpl. nov. gen. 7. p. 634, 635. Swartz, fl. ind. 2. p. 957. t. 8. Schreb. gen. 2. p. 1453.—Tafálla, Ruiz et Pav. fl. per.

Lin. syst. *Polyándria, Monogýnia.* Flowers monoecious. Male aments oblong, naked, without scales and perianthia. Filaments none; anthers numerous, closely imbricated, oblong, 2-celled, furnished with a mucronate process. Female flowers with a monophyllous tridentate calyx. Style very short, triquetrous: stigma simple, obtuse. Drupe trigonal, 1-seeded, covered by the baccate calyx.—Small shrubs, with opposite branches and leaves. Leaves serrated. Flowers monoecious, male ones disposed in aments, and the female ones in racemes.

1 H. nu'tans (Swartz, fl. ind. occid. 2. p. 959. prod. p. 84.) frutescent; branches lax; leaves lanceolate, acuminated; petioles short, connate on both sides from stipulaceous membranous sheaths at the base, which are retuse and ciliated on the margins. ♄. G. Native of Jamaica, in woods, on the highest mountains. Shrub branched. Branchlets tetragonal, jointed, rising from the axils of the sheaths of the petioles. Leaves serrated, pale green. Male aments pedunculate, oblong, nutant, filiform, rising from the sheaths of the petioles. Female racemes terminal and axillary from the same axils as the male ones, usually tripartite. Calyx tridentate. Drupe triquetrous, hard, shining, brown, clothed by the roundish, scarlet, fleshy calyx. The whole plant has a grateful smell, and an aromatic hot taste.

Nodding-spiked Hedyosmum. Shrub 1 to 4 feet.

2 H. racemòsa; leaves oblong, serrated, short-acuminated; female peduncles twin, racemose, flexuous. ♄. G. Native of Peru, at Cuchero and Pillao, where it is called *Carpales* and *Aytacupi*. Tafálla racemòsa, Ruiz et Pav. fl. per. syst. p. 271. There is a white pellucid sweet-scented resin issues from this plant, which has the scent of gum-anime.

Racemose-flowered Hedyosmum. Tree 15 feet.

3 H. arbore'scens (Swartz, fl. ind. occ. 2. p. 961. prod. p. 84.) arborescent; branches straight, erect; leaves ovate-lanceolate; sheaths of petioles cucullate, bidentate; male aments oblong, usually twin; female racemes tripartite. ♄. G. Native

of Jamaica and Martinico, on the higher mountains. Branches angular near the sheaths of the petioles, kneed, rather fleshy. Leaves serrated, attenuated and obtuse at the apex, brownish green, shining. Stipulaceous sheaths large, cucullate, bidentate at both sides. Female flowers crowded on the racemes by threes, sessile. Scales 3-4 under the flowers. Ovarium trigonal. Style triquetrous: stigma obtuse. Fruit white, rather diaphanous. Calyx baccate, like that of the first species.

Arborescent Hedyosmum. Shrub 12 to 16 feet.

4 H. HIRSU'TUM (H. B. et Kunth, nov. gen. amer. 7. p. 164.) sheaths and leaves oblong, serrated, hairy beneath. ♄. S. Native of New Granada.

Hairy-leaved Hedyosmum. Shrub.

5 H. GLABRA'TUM (H. B. et Kunth, nov. gen. amer. 7. p. 165. t. 635.) leaves oblong-lanceolate, serrated, rough; aments and strobiles tern. ♄. S. Native of Peru, in Pati and Muna, where it is called *Aytacupi*; and New Granada. Tafálla scàbra, Ruiz et Pav. fl. per. syst. p. 270.

Smooth Hedyosmum. Tree 20 feet.

6 H. BONPLANDIA'NUM (H. B. et Kunth, nov. gen. 7. p. 164. t. 634-635.) leaves oblong, acuminated, glabrous, serrated; male peduncles twin, 3-spiked: those of the female branched. ♄. S. Native of Peru, in the mountains of Cuchero and Acomago, where it is called *Ayacupi* and *Almacijas;* and New Granada. Tafálla glaûca, Ruiz et Pav. fl. per. syst. p. 271.

Bonpland's Hedyosmum. Tree 25 feet.

Cult. For culture and propagation see *Chloránthus*, p. 434. with the exception that the species require more heat. They are shrubs of no beauty.

ORDER CXXIX. CAPRIFOLIA'CEÆ (this order agrees with *Caprifòlium* or Honeysuckle). Juss. gen. p. 110. (exclusive of sects. 2 and 4.) Rich. dict. class. 3. p. 172. D. C. prod. 4. p. 321.

Calyx having the tube adhering to the ovarium (f. 77. *c.*), and the limb free and 5-lobed (f. 77. *d.* f. 78. *a.*). Corolla gamopetalous (f. 77. *b.* f. 78. *b.* f. 79. *b.*), inserted in the calyx, with the tube short (f. 77. *b.*), or long (f. 78. *b.*), and the limb 5-lobed (f. 77. *b.*), and sometimes irregular (f. 78. *b.* f. 79. *b.*), not valvate in æstivation. Stamens inserted in the calyx, and adnate to the corolla at the base (f. 82. *f.* f. 79. *c.*), and alternating with its lobes, and equal in number to them (one of which is sometimes abortive), sometimes exserted (f. 79. *c.* f. 78. *c.*), sometimes inclosed (f. 82. *f.* f. 81. *b.*); filaments subulate; anthers ovate, 2-celled. Ovarium adnate to the calyx, while young 3-celled (f. 77. *e.*). Style exserted (f. 78. *c.*) or wanting; stigmas 3, sometimes distinct, sometimes combined into a head. Berry crowned by the limb of the calyx (f. 77. *d.* f. 81. *g.*), usually pulpy, rarely almost dry, many-celled in the adult state, but often 1-celled from the dissepiments, which are very thin, having vanished. Seeds inverted, solitary, twin, or numerous in the cells, but sometimes many of them are abortive; spermaderm crustaceous. Embryo in the centre of a fleshy albumen; with a superior radicle, and 2 ovate-oblong cotyledons.—Shrubs, rarely herbs or trees. Leaves opposite, exstipulate (rarely furnished with 2 small stipulas at the base of each petiole) simple, undivided, toothed, rarely pinnate, feather-nerved. Flowers terminal, corymbose, or axillary.

Taking *Lonicèra* for the type of the order, there will be found a striking affinity with *Rubiàceæ*, Tribe *Cinchonàceæ* in the monopetalous tubular corolla, definite stamens, inferior ovarium, and opposite leaves, an affinity which is confirmed by the corolla of the latter being occasionally regular or irregular. With *Apocýneæ* it has an intimate alliance for the same reasons, differing chiefly in their qualities, with the non-connivance of the anthers, the æstivation of the corolla, and the structure of the fruit. To *Loranthàceæ* they also approach, in the structure of the flowers and berries. Besides these points of affinity, *Caprifoliàceæ* probably tends towards *Umbelliferæ* through *Sambùcus*, from the fetid divided leaves and half herbaceous habit. The genus *Triósteum* appears to be a link between this order and *Rubiàceæ*. The fragrance and beauty of the honeysuckle tribe have been the theme of many a poet's song. They consist either of twining or erect shrubs, with clusters of trumpet-shaped, fragrant, white, scarlet, or yellow flowers; or of fine bushes: having cymes of white blossoms. The honeysuckle is the representative of the former and the elder of the latter. Here too is found the modest and delicate *Linnæ'a boreàlis*, which, however inferior its attractions for the vulgar eye may be to those of its more ostentatious neighbours, yields to none of them in elegance or interest for the botanist; but independently of such recommendations, they possess properties of considerable interest. Their bark is generally astringent; that of *Lonicèra corymbòsa* is used for dying black in Chili. The flowers of the elder are fragrant, soporific, and sudorific, its leaves and inner bark fetid, emetic, and a drastic purgative, qualities which are also possessed by the honeysuckle. The fruit of *Vibúrnum* is destitute of these properties, but has instead an austere, astringent pulp, which becomes eatable after fermentation, and is made into a sort of cake by the American Indians. *Triósteum perfoliàtum* is a mild cathartic; in large doses it produces vomiting; and its dried or roasted berries have been used as coffee. All caprifoliaceous plants love shady and cool places in both hemispheres, but few have been found in such as endure a very severe climate.

Synopsis of the genera.

TRIBE I.

SAMBU'CEÆ. *Corolla gamopetalous, regular, rotate* (f. 74. *a.* f. 75. *a.*); *petals* 5, *only connected a little at the base, rarely tubular. Style wanting. Stigmas* 3, *sessile.*

1 SAMBU'CUS. Limb of calyx 5-cleft. Corolla rotate (f. 74. *a.*), urceolate. Berry roundish, pulpy, 1-celled, 3-4-seeded (f. 74. *b.*), hardly crowned (f. 74. *e.*).

2 VIBU'RNUM. Limb of calyx 5-cleft (f. 76. *a.*), permanent. Corolla rotate (f. 75. *a.* f. 76. *b.*), sub-campanulate or tubular. Berry ovate or globose, 1-seeded from abortion, crowned by the calycine teeth.

TRIBE II.

LONICE'REÆ. *Corolla gamopetalous* (f. 77. *b.* f. 78. *b.*) *more* (f. 78. *b.*) *or less* (f. 77. *b.*) *tubular, usually irregular* (f. 78. *b.* f. 79. *b.*). *Style filiform* (f. 78. *c.*), *crowned by* 3 *distinct or concrete stigmas.*

3 Triósteum. Calyx with an ovate tube and a 5-parted permanent limb (f. 77. *a.*). Corolla gibbous at the base, almost equally 5-lobed (f. 77. *b.*). Stamens inclosed. Stigmas oblong, thick. Berry coriaceous, obovately triquetrous (f. 77. *c.*), crowned by the calyx (f. 77. *d.*), 3-celled (f. 77. *e.*), 3-seeded.

4 Diervílla. Calyx bibracteate at the base, with an oblong tube and a 5-parted limb. Corolla funnel-shaped, 3-cleft. Stigma capitate. Capsule oblong, not crowned, 1-celled, many-seeded. Seeds minute.

5 Lonicèra. Tube of calyx 5-toothed (f. 78. *a.*). Corolla tubular (f. 78. *b.* f. 79. *b.*), funnel-shaped (f. 79. *b.*), or campanulate (f. 80. *a.*), with a 5-parted, usually irregular limb (f. 78. *b.* f. 79. *b.*). Stigma capitate (f. 78. *c.*). Berry 3-celled; cells few-seeded.

6 Leyceste'ria. Calyx with an ovate tube, and a 5-parted irregular limb, ciliated with glands. Corolla funnel-shaped, with the tube gibbous at the base, and the limb 5-parted and campanulate. Stigma capitate. Berry roundish, 5-celled, crowned by the calyx; cells many-seeded.

7 Symphorica'rpos. Calyx with a globose tube (f. 81. *c.*), and a small 4-5-toothed limb. Corolla funnel-shaped (f. 81. *e.*), with an almost regular 4-5-lobed limb. Stigma semi-globose. Berry crowned by the calyx (f. 81. *g.*), 4-celled, 2 of them empty, and the other 2 containing 1 seed each.

8 Abe'lia. Calyx with oblong tube; and a 2-5-parted foliaceous limb. Corolla funnel-shaped, 5-lobed, regular. Stamens 4, somewhat didynamous. Stigma capitate. Ovarium 2-celled; cells 2-seeded. Fruit 1-seeded, crowned by the limb of the calyx.

9 Linnæ'a. Calyx with an ovate tube (f. 82. *a.*), and a 5-parted limb (f. 82. *b.*). Corolla turbinate (f. 82. *d.*), somewhat campanulate, 5-lobed (f. 82. *d.*). Stamens 4, 2 long and 2 short, inclosed. Stigma globose (f. 82. *e.*). Berry almost dry, small, ovate-globose, 3-celled.

† *Genera allied to the present order, but not sufficiently known.*

10 Ai'dia. Limb of calyx 5-toothed. Corolla hypocrateriform, with a woolly throat and a 5-parted limb. Anthers 5, linear, inserted into the incisures of the corolla. Style equal to the corolla; stigma ovate-oblong. Berry ovate, umbilicate, 1-seeded.

11 Valentia'na. Limb of calyx 8-cleft. Corolla tubular, with a 5-cleft, nearly equal limb. Stamens 4, epipetalous. Style filiform; stigma 2-lobed. Fruit 2-celled.

12 Karpa'ton. Limb of calyx 4-toothed. Corolla tubular, 4-cleft, bilabiate. Stamens 2; anthers 2-lobed. Style under the superior lip of the corolla; stigma simple. Capsule crowned by the calyx, 1-celled, 4-seeded.

Tribe I.

SAMBU'CEÆ (containing shrubs agreeing with *Sambùcus* in the want of the style). H. B. et Kunth, nov. gen. amer. 3. p. 487. D. C. prod. 4. p. 321.—Sambucíneæ, Batsch, tab. aff. p. 238. A. Rich. dict. class. 3. p. 173. Corolla gamopetalous, regular, rotate, 5-lobed, or the petals are 5, and concrete at the base, rarely tubular. Style wanting; stigmas 3, sessile.

I. SAMBU'CUS (from *σαμβυκη*, which the Latins have changed to *sambuca*, a musical instrument, which is believed to have been made of elder-wood: this wood has always been renowned for its hardness). Tourn. inst. 376. Lin. gen. no. 372. Gærtn. fruct. t. 27. Lam. ill. t. 211. Schkuhr, handb. t. 83. D. C. prod. 4. p. 321.—Phyteùma, Lour. coch. p. 138. but not of Lin.

Lin. syst. *Pentándria, Trigýnia.* Calyx small, but divided into 5 deep segments, permanent. Corolla rotate (f. 74. *a.*), urceolar, 5-lobed; lobes obtuse. Stamens 5 (f. 74. *b.*), about the length of the corolla; filaments awl-shaped; anthers roundish, heart-shaped. Style none; stigmas 3, obtuse. Berry globular (f. 74. *e.*), pulpy, of 1 cell, containing 3-5 seeds (f. 74. *b.*), which are convex on the outside and angular inside.—Shrubs, rarely herbaceous; having a strong disagreeable scent; stems with a solid spongy pith. Leaves opposite, stalked, pinnate; leaflets toothed, pinnate, or jagged, bi-stipellate or bi-glandular at the base. Flowers white or purplish, disposed in terminal cymes, which are in some flat and in others thyrsoid. Berries purplish, cathartic. Those plants of the genus which have pinnate or jagged leaflets are not true species but only varieties, all the true species having only toothed leaflets.

* *Leaves pinnate. Flowers cymose or corymbose.*

1 S. E'bulus (Lin. spec. p. 385.) root fleshy, creeping; stems herbaceous, simple, deeply and unequally furrowed; leaflets ovate-lanceolate, acute, sharply serrated, unequal at their base; stipulas foliaceous, cut; cymes of 3 main branches; flowers all hermaphrodite. ♃. H. Native of Europe, even to Caucasus, in waste ground about hedges. In Britain, in like situations, but not common either in England or Scotland. Smith, engl. bot. t. 475. Curt. lond. 3. t. 18. Woodv. med. bot. suppl. t. 260. Oed. fl. dan. t. 1156.—Mill. ill. t. 226. S. hùmilis, Lam. fl. fr. 3. p. 370.—E'bulus, Math. valgr. 2. p. 608. with a figure. Cam. epit. 979. with a figure. Leaflets 4-5 inches long, nearly smooth. Flowers all stalked, of a dull purplish hue, with thick white filaments, whose anthers are reddish. Berries globose, black, not always perfected, 3-4-seeded.

FIG. 74.

Our ancestors evinced a just hatred of their brutal enemies the Danes, in supposing this nauseous, fetid, and noxious plant to have sprung from their blood; hence it was formerly called Dane-wort. Its qualities are violently purgative, sometimes emetic; yet a rob of the fruit is said to have been taken with safety, as far as an ounce. The foliage is not eaten by cattle, nor will moles come where these leaves, or those of any of the species are laid. They also drive away mice from granaries, and the Silesians strew them where their pigs lie, under the persuasion that they prevent some of the diseases to which swine are liable. The specific name is from *ευβολη, eubole,* an eruption.

Var. β, *hùmilis* (Mill. dict. no. 5.). Mr. Miller makes this a distinct species. He says that the roots do not creep so much; that the stems do not rise so high; that the leaves have seldom more than 7 leaflets, and towards the top only 5, longer and narrower than in the common dwarf elder, deeply cut on their edges, and ending with winged acute points. ♃. H. Savi collected this variety about Pisa.

Dwarf-elder or Dane-wort. Fl. July. Brit. Pl. 4 to 5 feet.

2 S. CHINE'NSIS (Lindl. hort. trans. 6. p. 297.) root creeping; stems herbaceous, warted, with dark furrows; leaves pinnate; leaflets 7-9, oblong-lanceolate, crenately serrated, naked on both surfaces; flowers monoecious: female ones cup-shaped, apetalous and fleshy. ♃. H. Native of China. A strong, rough herbaceous plant, very like *S. E'bulus*. The male flowers are white and numerous, with brownish-purple anthers.

China Dwarf-elder. Fl. Sept. Clt. 1822. Pl. 5 to 6 feet.

3 S. PALME'NSIS (Link. in Buch. can. p. 151.) stems unknown; leaves pinnate; leaflets lanceolate, serrated; petioles, nerves of leaves, and peduncles, densely hairy. ♄.? H. Native of the island of Palma, one of the Canaries, near Sauces.

Palma Elder. Shrub?

4 S. ADNA'TA (Wall. cat. no. 482.) stems suffruticose; leaves pinnate; leaflets 5-7, oblong-lanceolate, sharply serrated, pubescent along the nerves, unequal at the base: the lower side decurrent; cymes trichotomous; berries ovate, striated, almost dry. ♄. H. Native of Nipaul, at Gosaingsthan. Flowers white?

Adnate-leafletted Elder. Shrub.

5 S. JAVA'NICA (Reinw. in Blum. bijdr. p. 657.) stem suffruticose; stipulas foliaceous; leaves pinnate; leaflets oblong-lanceolate, acuminated, oblique at the base, sharply and glandularly serrulated; corymbs with 3-5 main branches. ♄. G. Native of Java, frequent on the mountains, where it is called *Kitespon*.

Java Elder. Shrub.

6 S. GAUDICHAUDIA'NA (D. C. prod. 4. p. 322.) stem suffruticose; leaves pinnate, glabrous; leaflets ovate-lanceolate, acuminated, equal at the base, sharply serrated; stipulas ovate, foliaceous, serrated; corymb pedunculate, umbellate, of 5 main rays or branches. ♄. H. Native of New Holland, at Port Jackson, where it was collected by Gaudichaud. According to the description this appears to be nearly allied to *S. Javánica*. Berries ovate-globose, small.

Gaudichaud's Elder. Shrub 8 to 10 feet.

7 S. MEXICA'NA (Presl. in herb. Hænke, ex D. C. prod. 4. p. 322.) stem suffruticose? leaves pinnate; leaflets 7, ovate or oblong-lanceolate, acute, serrated, rather hairy beneath as well as on the petioles and branches; corymb of 5 principal rays or branches. ♄. H. Native of Mexico. S. subalpìna, Cham. et Schlecht. in Linnæa. 5. p. 171.

Mexican Elder. Shrub 5 to 8 feet.

8 S. CANADE'NSIS (Lin. spec. 385.) frutescent, glabrous; leaves pinnate or sub-pinnate: leaflets about 4 pairs, oblong-oval, stiffish, acuminated, more or less pubescent beneath, sometimes appendiculated at the base; cymes of 5 main branches. ♄. H. Native of North America, from Carolina to Canada, in swamps and near hedges, and throughout Canada, as far as the Saskatchawan. Schmidt, arb. 2. t. 142. Flowers said to be almost inodorous. Berries deep bluish-black.

Canadian Elder. Fl. Ju. Aug. Clt. 1761. Sh. 6 to 10 ft.

9 S. NÌGRA (Lin. spec. 385.) arboreous; leaves pinnate; leaflets usually 5, smooth, deep green, ovate or oblong-oval, acuminated, the lower leaflets sometimes ternate; cymes with 5 main branches. ♄. H. Native throughout the whole of Europe, Caucasus, Siberia, and probably of Japan, in hedges, coppices, and woods, common; plentiful in Britain, in like situations; the varieties rare, except in gardens. Duham. arb. 2. t. 65. ed. nov. 1. t. 55. Hayn. term. bot. t. 32. f. 2. Smith, engl. bot. t. 476. Woodv. med. bot. t. 78. Fl. dan. t. 545. Branches, after a year's growth, clothed with smooth grey bark, and filled with a light spongy pith. Flowers cream-coloured, with a sweet but faint smell. Berries globular, purplish black; their stalks reddish. It may be remarked that our uncertain summer is established by the time the elder is in full flower, and entirely gone when its berries are ripe. The tree is, as it were, a whole magazine of physic to rustic practitioners, nor is it quite neglected by more regular ones. The berries make a useful and agreeable rob, of a slightly purgative quality, and very good for catarrhs, sore throats, &c. The inner bark is more actively cathartic, and is thought beneficial in rustic ointments and cataplasms for burns. The dried flowers serve for fomentations, and make a fragrant but debilitating tea, useful perhaps in acute inflammations, but not to be persisted in habitually. An infusion of the leaves proves fatal to the various insects which thrive on blighted or delicate plants; nor do many of this tribe, in the caterpillar state, feed upon them: cattle scarcely touch them, and the mole is driven away by their scent. A wine is made from the berries, to be taken warm, with spices and sugar; and they are said to frequently enter into the composition of a less innocent beverage—artificial or adulterated port. An infusion of the inner green bark of the trunk in wine, or the expressed juice of the berries, in the dose of half an ounce, is said to purge moderately, and in small doses to prove deobstruent. The expressed juice of the berries, inspissated to the consistence of a rob, proves an useful aperient medicine, and if continued for a sufficient length of time, is of considerable service in various chronical disorders. The young leaf-buds are strongly purgative, and act with so much violence as to be accounted unsafe. The flowers have an agreeable aromatic flavour, like that of Frontignac wine, which they yield in distillation to water, and impart, by infusion, to vinous and spirituous liquors and oils. Sydenham recommends as an effectual hydragogue diuretic 3 handfuls boiled in a quart of milk and water till only a pint remains, of which one half is to be taken night and morning, and repeated several days. Boerhaave gave its expressed juice in doses from a drachm to half an ounce. It is said also that if sheep who have the rot can get the bark they will soon cure themselves. An infusion of the leaves is useful for gardeners to sprinkle over the buds of such flowers as they wish to preserve from minute caterpillars, for few insects can bear the elder. In Scotland the tree is called *Bountry*.

Var. β, viréscens (D. C. prod. 4. p. 322.) fruit green. ♄. H. S. viréscens, Desr. arb. fr. 1. p. 348.

Var. γ, leucocárpa; fruit white. ♄. H.

Var. δ, laciniàta; leaflets cut into fine segments. ♄. H. S. laciniàta, Mill. dict. no. 2.—Lob. icon. 2. t. 164. f. 2. Called *Parsley-leaved elder*.

Var. ε, rotundifòlia; leaves ternate; leaflets petiolate, roundish, serrated; corymbs few-flowered. ♄. H. Cultivated in Chelsea garden.

Var. ζ, monstròsa; branches striped; flowers of from 5-15 parts, and with from 5-15 stamens; stigmas 5-12; berries irregular. ♄. H. S. monstròsa, Hort.

Var. ι, variegàta; leaves variegated with yellow or white. ♄. H.

Common or *Black*-berried Elder. Fl. June. Britain. Shrub 10 to 15 feet.

10 S. PERUVIA'NA (H. B. et Kunth, nov. gen. amer. 3. p. 429.) arboreous; leaves pinnate; leaflets 7, oblong, acuminated. obtuse at the base, nearly equal; petioles glabrous; corymbs somewhat trichotomous; berries usually 5-seeded. ♄. H. Native of Peru, on the Andes, in cultivated places, at the elevation of 4000 feet. S. suavèolens, Willd. in Schultes, syst. 6. p. 441. Flowers white. Berries black.

Peruvian Elder. Shrub 12 to 20 feet.

11 S. AUSTRA'LIS (Cham. et Schlecht. in Linnæa. 3. p. 140.) shrubby; leaves pinnate; stipulas glabrous; leaflets 11-13, ovate-lanceolate, usually unequal at the base; corymbs brac-

teate: stigmas 5, sessile; berries 5-celled. ♄. H. Native of Brazil, and cultivated at Talcahuano in Chili. Flowers cream-coloured? There is a variety of this having 4 stigmas and a 4-celled berry.

Southern Elder. Shrub 5 to 10 feet.

** *Leaves pinnate. Flowers panicled.*

12 S. racemòsa (Lin. spec. 386.) shrubby; leaves pinnate; leaflets 5, membranous, oblong, acuminated, serrated, unequal at the base; petioles glabrous; panicle ovate. ♄. H. Native of middle and south Europe, and Siberia on the mountains. Jacq. icon. rar. 1. p. 59. Duham. arb. t. 66. and ed. nov. 1. t. 56. S. montàna, Cam. epit. 976. S. cervìni, Tabern. t. 1029. —Lob. icon. t. 163. Leaves pale green, pretty smooth. Flowers of a whitish green colour. Fruit red or scarlet when ripe.

Var. β, *laciniàta* (Koch, in D. C. fl. fr. suppl. p. 500.) leaflets jagged. ♄. H. Native of the Palatinate of the Rhine.

Racemose-flowered Elder. Fl. April, May. Clt. 1596. Shrub 10 to 12 feet.

13 S. pu'bens (Michx. fl. bor. amer. 1. p. 181.) shrubby; leaves pinnate; leaflets 5, membranous, ovate-lanceolate or oblong, acuminated, serrated, pubescent, but chiefly on the under side; panicle thyrsoid. ♄. H. Native from Carolina to Canada, on the highest mountains, as far as the Saskatchawan. S. racemòsa, Hook, fl. bor. amer. 1. p. 279. but not of Lin. Berries red. Flowers whitish. Resembles *S. racemòsa* very much.

Var. β, *heptaphýlla;* leaves larger than those of the species; leaflets 7. ♄. H. Native of North America, on the east side of the Rocky Mountains: and shores of the Columbia, near Fort Vancouver, and at its confluence with the sea. The Rocky Mountain specimens, and, more especially those from the Pacific, are remarkable for the great size and length of their leaflets, and there being almost constantly seven upon eac hrachis.

Downy Elder. Fl. May, June. Clt. 1812. Sh. 6 to 10 ft.

*** *Leaves bipinnate.*

14 S. ebuloìdes (Desv. in herb. mus. par.) suffruticose; leaves bipinnate; leaflets lanceolate, serrated; panicle composed of racemes. ♄. H. Native of China, in the suburbs of Canton. Phyteùma bipinnàta, Lour. coch. 138. Branches angular and furrowed. Flowers white. Fruit perforated, 3-celled, many-seeded.

Danewort-like Elder. Shrub 5 to 6 feet.

15 S. phyteumoìdes (D. C. prod. 4. p. 323.) suffruticose; leaves bipinnate; leaflets lanceolate, serrated, wrinkled; peduncles many-flowered, divaricate. ♄. H. Native of Cochinchina, on the mountains. Phyteùma Cochinchinênsis, Lour. coch. 139. Flowers white. Berry roundish, pertuse, small, 1-celled, many-seeded. Very nearly allied to *S. ebuloìdes*.

Phyteuma-like Elder. Shrub 5 feet.

† *Doubtful species, to be inquired into or excluded from the order.*

16 S.? Loureiria'na (D. C. prod. 4. p. 323.) arboreous; leaves pinnate; leaflets 5, broad-lanceolate, quite entire, glabrous. ♄. H. Native of China, on the mountains. S. nìgra, Lour. coch. p. 181. but not of Lin. Cymes 5-parted and 3-parted; peduncles long, nearly equal. Fruit a round, small, reddish-brown, 3-seeded inferior berry. The berries are used by the Chinese in coldness of the extremities, as they are of a heating nature, from which quality, and the quite entire leaflets, it is not likely to be a species of *Sambùcus*, but probably a species of *Turpínia*.

Loureiro's Elder. Shrub 8 feet.

17 S.? Japónica (Thunb. fl. jap. p. 125.) shrubby; leaves impari-pinnate, with 3-7 pairs of leaflets and an odd one; leaflets ovate, acute, cartilaginously serrated, glabrous; flowers disposed in panicled, trichotomous cymes. ♄. H. Native of Japan. Ovarium superior and style filiform, for which reason it ought evidently to be excluded from the genus: it is probably also a species of *Turpínia*. Stipulas none. Stigmas capitate, white.

Japan Elder. Shrub.

18 S.? Thunbe'rgii; shrubby; cymes 5-parted; leaves somewhat bipinnate. ♄. H. Native of Japan, near Nagasaki and elsewhere, where it is called by the Japanese *Sokusoso* and *Saki-Teki*. Shrub perishing just above the earth every year. S. Canadénsis, Thunb. fl. jap. p. 126. This plant is hardly known as well as the S. nìgra, Thunb. l. c.

Thunberg's Elder. Shrub.

Cult. All the species of elder are of the most easy culture, and will thrive in any soil or situation. The perennial herbaceous species creep much at the root, and are difficult to extirpate, having once got hold in the ground. The shrubby and arboreous kinds are easily increased by cuttings, stuck in the ground in autumn or spring. Those species, natives of warmer climates, will require a little protection in severe weather in winter.

II. VIBU'RNUM

(this name is derived, according to Vaillant, from the Latin word *vieo*, to tie; on account of the pliability of the branches of some species). Lin. gen. p. 370. Gærtn. fruct. 1. t. 27. Adans. fam. 2. p. 501. Schkuhr, handb. t. 81. D. C. prod. 4. p. 323.—O'pulus, Vibúrnum, and Tìnus, Tourn. inst. p. 607. t. 376 and 377.—Vibúrnum and O'pulus, Mœnch. meth. p. 505.

Lin. syst. *Pentándria, Trigýnia.* Limb of calyx small, 5-cleft (f. 76. *a.*), permanent. Corolla rotate (f. 75. *a.* f. 76. *b.*), somewhat campanulate, or tubular, with a 5-lobed limb (f. 76. *b.*). Stamens 5, equal (f. 75. *b.*). Stigmas 3, sessile. Berry ovate or globose, 1 seeded from abortion, crowned by the calycine teeth. Seeds compressed.—Shrubs. Leaves opposite, petiolate. Corymbs of flowers terminal. Flowers usually white, but sometimes verging to a rose colour.

Sect. I. Lenta'go (from *lento*, to make pliant; in reference to the pliability of the branches of some species). D. C. prod. 4. p. 324.—Vibúrnum, Mœnch. meth. p. 505.—Vibúrnum and Tìnus, Tourn. l. c. Borkh. in Rœm. arch. 1. p. 20. Corymbs not radiant, having the flowers all fertile, and equal in shape and size. Corolla rotate, or hardly somewhat bell-shaped. Seed oval.

§ 1. *Leaves quite entire or toothed. Style almost wanting; stigmas 3, sessile.*

1 V. Tìnus (Lin. spec. 383.) leaves ovate-oblong, quite entire, permanent: having the ramifications of the veins beneath, as well as the branchlets, furnished with glandular hairs. ♄. H. Native of the south of Europe, in the region of the olives, and of the north of Africa, as of Portugal, Spain, Italy, the south of France, and Algiers. Duh. arb. ed. nov. 2. t. 37. Curt. bot. mag. t. 38. V. laurifórme, Lam. fl. fr. 3. p. 363. Tìnus, Tourn. inst. p. 607. t. 377. Tìnus laurifòlius, Borkh.

FIG. 75.

in Rœm. arch. 1. pt. 2. p. 20. Corymbs flat. Flowers white, but rose-coloured before expansion, and sometimes afterwards for a little time. Berries dark blue. The *Laurestine* or *Laurestinus* is one of the most ornamental of evergreen shrubs, with shining leaves and showy white flowers, which appear during the winter months. The name of *Laurestinus* was given to the shrub by old authors, they supposing it to be a kind of bay or laurel. The berries are very hot, and inflame the fauces violently, like those of Mizereon; and they are also violently purgative, according to Parkinson; but some kinds of birds are said to eat them greedily.

Var. α, hírtum (Ait. hort. kew. 2. p. 166.) leaves oval-oblong, hairy beneath and on the margins. ♄. H. Native of Portugal and Spain, and the country of Nice. V. Tìnus, Mill. dict. no. 4.—Clus. hist. 1. p. 49. no. 1. The flowers of this variety appear in autumn and continue all the winter. It is the most hardy and most common sort, called *Hairy Laurestine*. V. lùcidum, Mill. Pers. and Schultes.—Clus. hist. 1. p. 49. no. ii.

Var. β, lùcidum (Ait. l. c.) leaves ovate-oblong, glabrous on both surfaces, shining. ♄. H. Native about Algiers and on Mount Atlas. The cymes as well as the flowers are larger than the common sort; these seldom appear till the spring, and when the winters are sharp the flowers are killed, and never open unless they are sheltered. Called *Shining Laurestine*.

Var. γ, virgàtum (Ait. l. c.) leaves oblong-lanceolate, pilose on the margins as well as on the veins beneath. ♄. H. Native of Italy, about Rome and Tivoli, &c.—Clus. hist. no. iii. with a figure. Called *Common Laurestine*.

Laurestine. Fl. Dec. Mar. Clt. 1596. Shrub 4 to 6 feet.

2 V. RUGÒSUM (Pers. ench. 1. p. 326. exclusive of the syn. of Ait.) leaves broad, ovate, wrinkled, hairy, permanent; universal involucrum 7-leaved; berries ovate-oblong. ♄. F. Native of the Canary Islands, in woods. Ker, bot. reg. t. 376. Lodd. bot. cab. t. 859. Sims, bot. mag. t. 2082. V. Tìnus δ, stríctum, Ait. hort. kew. ed. 2. vol. 2. p. 167. V. rígidum, Vent. malm. t. 98. Desf. arb. 1. p. 344. V. stríctum, Link. enum. 1. p. 288. Very like *V. Tìnus*, but differs in the leaves being larger, and hairy all over. Flowers white.

Wrinkled or Large-leaved Laurestine. Fl. Dec. March. Shrub 4 to 6 feet.

3 V. TINOÌDES (Lin. fil. suppl. p. 184.) leaves elliptic-glabrous, quite entire; branches terete, and are as well as the corymbs hairy. ♄. G. Native of South America, where it was collected by Mutis.

Tinus-like Laurestine. Fl.? Clt. 1820. Sh. 4 to 6 feet.

4 V. GLABRA'TUM (H. B. et Kunth, nov. gen. amer. 3. p. 428.) leaves ovate-oblong, acuminated, rounded at the base, quite entire, and very glabrous; petioles naked; branches canescent and powdery; corymbs involucrated. ♄. F. Native of South America, in woods on the Andes, about Popayan, at the altitude of 3000 or 4000 feet. V. glàbrum, Willd. in Schultes, syst. 6. p. 639. Calyx bluntly 5-toothed. Flowers white.

Smooth Laurestine. Tree 15 to 20 feet.

5 V. AYAVACE'NSE (H. B. et Kunth, nov. gen. amer. 3. p. 428.) leaves ovate, acute, cordate, quite entire, glabrous, shining above, but with the axils of the veins beneath furnished with stellate hairs, as well as the branchlets and corymbs; petioles naked. ♄. G. Native of Peru, near Ayavaca, in temperate places, at the elevation of 4000 or 5000 feet. Teeth of calyx roundish-ovate, acute, ciliated. Flowers white? Perhaps the same as *V. tinoìdes*.

Ayavaca Laurestine. Shrub 4 to 6 feet.

6 V. INTEGE'RRIMUM (Wall. cat. no. 457. D. C. prod. 4. p. 324.) leaves oval, acute at the base, acuminated, quite entire, glabrous, rather coriaceous, dotless; petioles, branchlets, and peduncles hairy; corymbs loose, terminal; fruit oval, compressed. ♄. S. Native of the island of Pulo-Penang. This species agrees with *V. Tìnus* on the one hand and *V. punctàtum* on the other. Calycine teeth erect, exceeding the berries.

Quite-entire-leaved Laurestine. Shrub 4 to 6 feet?

7 V. CHINE'NSE (Hook. et Arn. in Beech. voy. pt. bot. p. 190.) leaves membranous, broad-elliptic, acute, coarsely and unequally toothed, glabrous above while young, puberulous and dotless beneath; corymbs terminal, pubescent. ♄. G. Native of China.

China Laurestine. Shrub.

8 V. PUNCTA'TUM (Hamilt. in D. Don, prod. fl. nep. p. 142.) leaves oval-oblong, quite entire, mucronulate, glabrous on both surfaces, beset with dots beneath; corymbs terminal, smooth, spreading, sessile. ♄. H. Native of Nipaul, at Suemba, where it is called *Hemu-swa* by the Nawar people. Teeth of calyx obtuse. Flowers white.

Dotted-leaved Laurestine. Shrub.

9 V. ACUMINA'TUM (Wall. cat. no. 465. D. C. prod. 4. p. 325.) leaves elliptic, acuminated at both ends, glabrous, coriaceous, dotted beneath; branchlets, petioles, and peduncles beset with scurfy dots; corymbs terminal, trichotomous, shorter than the leaves; berries oval-oblong. ♄. H. Native of the East Indies, on the Nellighery Mountains, where it was collected by Notan. Very nearly allied to *V. punctàtum*.

Acuminated-leaved Laurestine. Shrub.

10 V. PREMNA'CEUM (Wall. cat. no. 461. D. C. prod. 4. p. 325.) leaves elliptic-oblong, acuminated, glabrous above and dotless beneath, and downy along the nerves, having 1-3 coarse serratures on each side; petioles short, and are as well as the branchlets and peduncles clothed with villous tomentum; corymbs terminal, with 5 main branches, involucrated by 5 elliptic leaves. ♄. G. Native of the East Indies, on the Pundua mountains. Leaves 3-3½ inches long, and 1½ inch broad, feather-nerved; but the 2 lower lateral nerves rise from the base and give the leaf the appearance of being 3-nerved.

Premna-like Laurestine. Shrub 5 to 7 feet.

11 V. NERVÒSUM (Hook. et Arn. in Beech. voy. pt. bot. p. 190.) evergreen; leaves elliptic-lanceolate, glabrous, acute at the base and apex, dotless beneath, with a few serratures towards the apex on both sides; nerves impressed above, but prominent beneath, glabrous in the axils, and with numerous transverse conspicuous veins between them; peduncles and petioles short and glabrous; corymbs terminal. ♄. G. Native of China. This is closely allied to *V. premnàceum*, Wall. in which plant is observed, besides the character given by D. C. that the axils of the leaves are furnished with a tuft of short hairs, which is totally absent from the present species.

Nerved-leaved Viburnum. Shrub.

12 V. COLEBROOKEA'NUM (Wall. cat. no. 460. D. C. prod. 4. p. 325.) leaves elliptic, acuminated, hardly obtuse at the base. regularly serrate-toothed, glabrous, dotless: petioles, branches, and peduncles scurfy from stellate down; corymbs axillary, pedunculate, without any involucra. ♄. G. Native of the East Indies, on the Pundua Mountains. The corymbs are not truly axillary, but are borne on short leafless, axillary branchlets or peduncles, which are furnished with 2 leaves at the base. Flowers white.

Colebrooke's Laurestine. Shrub 4 to 6 feet.

13 V. FŒ'TIDUM (Wall. cat. no. 466. D. C. prod. 4. p. 325.) leaves elliptic-oblong, cuneated at the base, coarsely and sinuately toothed, glabrous above, but villous along the nerves beneath; petioles, branchlets, and peduncles villous; corymbs terminal, pedunculate, of 6 main branches, without any involucra; fruit almost sessile, oval. ♄. S. Native of the Burman Empire, on Mount Taong-Dong, near Ava. Leaves 2

inches long, and half an inch broad, on petioles 2-3 lines long. Flowers white.

Fetid Viburnum. Shrub 4 to 6 feet.

14 V. SAMBU'CINUM (Reinw. in Blum. bijdr. p. 656.) leaves elliptic-oblong, attenuated at both ends, almost quite entire, puberulous on the ribs beneath; corymbs terminal, divaricate, puberulous. ♄. S. Native of Java, among bushes on the mountains. Flowers white.

Var. β; leaves oval, acute at both ends, smoothish, serrated at the top. ♄. S. Native of Java, at the foot of Mount Salak.

Elder-scented Viburnum. Shrub 4 to 6 feet.

15 V. LUTE'SCENS (Blum. bijdr. p. 655.) leaves oblong, bluntly acuminated, acutely and coarsely serrated at the base, coriaceous, shining, paler beneath; corymbs terminal, divaricate, puberulous. ♄. S. Native of Java, in the provinces of Krawang and Tjanjor, among other bushes on the mountains.

Yellowish Viburnum. Shrub 4 to 6 feet.

16 V. PRUNIFÒLIUM (Lin. spec. 383.) leaves roundish-obovate and oval, glabrous, rather membranous, crenately serrated, ending in a short acumen; petioles marginate, glabrous; cymes sessile; berries ovate or roundish. ♄. H. Native of North America, from New England to Carolina, in hedges and fields; also of Canada about Lake Huron. Wats. dendr. t. 23.—Pluk. alm. 46. f. 2.—Duham. 2. t. 38. Flowers white as the rest of the species. Berries dark blue. This species appears to be very nearly allied to *V. nùdum*, but the leaves are broader and more membranous.

Plum-leaved Viburnum. Fl. May, June. Clt. 1731. Shrub 8 to 10 feet.

17 V. PYRIFÒLIUM (Poir. dict. 5. p. 658.) leaves ovate, acutish, glabrous, subserrated; petioles smooth; corymbs somewhat pedunculate; fruit ovate-oblong. ♄. H. Native of Pennsylvania, New Jersey, &c. on the banks of rivers. Flowers white. Berries black. Resembles the preceding species, but is not so straggling in its growth.

Pear-leaved Viburnum. Fl. May, June. Shrub 5 to 8 feet.

18 V. LENTA'GO (Lin. spec. p. 384.) leaves broad-ovate, acuminated, sharply serrated, glabrous; petioles with narrow curled margins; corymbs terminal, sessile. ♄. H. Native of North America, from New England to Carolina, among hedges, and on the borders of woods. Throughout Canada to the Saskatchawan. Wats. dend. brit. t. 21. Schmidt, arb. 3. t. 176. ex Rœm. et Schultes, syst. 6. p. 637. Flowers white. Fruit black. Serratures of leaves hooked a little, and somewhat cartilaginous. This species is more inclined to grow to a tree than any of the rest. The specific name is from *lento*, to make pliant, on account of the pliable propendent branches.

Lentago or Pliant-branched Viburnum. Fl. July. Clt. 1761. Shrub 10 feet.

19 V. NU'DUM (Lin. spec. 383.) leaves oval-oblong, angular at the base, bluntish, with revolute obsoletely crenulated margins, quite glabrous; petioles beset with scale-like scurf or down; corymbs pedunculate, exinvolucrate. ♄. H. Native from Canada to Georgia, in swamps, particularly on a sandy soil; about Quebec, and on the banks of the Saskatchawan; and of Newfoundland. Wats. dend. t. 20. Mill. fig. 274. V. squamàtum, Willd. enum. 1. p. 337. ex Torrey, fl. un. st. p. 319. Wats. dend. t. 24. Flowers whitish. Berries globose, black, or dark blue. In the southern states this shrub becomes evergreen; the young branches are ferruginous, and sometimes the under side of the leaves. According to Richard. in Boot's herb. this is the same as V. pyrifòlium, Poir.

Naked-cymed Viburnum. Fl. May, June. Clt. 1752. Shrub 6 to 10 feet.

20 V. OBOVA'TUM (Walt. car. p. 116.) glabrous; leaves obovate, crenately toothed, or quite entire, obtuse, but acute at the base, on short petioles; corymbs sessile; berries ovate-roundish. ♄. H. Native of Carolina and Georgia, in shady woods. Lodd. bot. cab. 1476. V. cassinoìdes. Michx. fl. bor. amer. 1. p. 179. but not of Lin. Flowers white. Fruit black, shining.

Var. β, punicifòlium (Desf. arb. 1. p. 345.) leaves oblong-obovate, obtuse, entire or loosely crenated at the apex. ♄. H. Growing along with the species.

Obovate-leaved Viburnum. Fl. May, June. Clt. 1812. Sh. 3 to 6 feet.

21 V. CASSINOÌDES (Lin. spec. p. 384.) leaves ovate-lanceolate, acute at both ends, crenated, glabrous above, with subrevolute edges; under side of leaves, as well as the petioles, which are keeled, and branches, which are tetragonal, covered with scurfy dots; corymbs sessile; fruit ovate. ♄. H. Native from New York to Carolina, in swamps. V. punctàtum, Rafin. in litt. Flowers white. Berries bluish-black.

Cassine-like Viburnum. Fl. June, July. Clt. 1761. Shrub 3 to 5 feet.

22 V. LÆVIGA'TUM (Willd. spec. 1. p. 1491.) leaves lanceolate or oblong-lanceolate, smooth, remotely and unequally serrated, cuneated at the base and quite entire, glabrous; branches tetragonally 2-edged, glabrous; corymbs sessile. ♄. H. Native of Virginia and Carolina, near the sea coast. Cassìne Parágua, Lin. mant. 220. Cassìne corymbòsa, Mill. icon. t. 83. f. 1. V. cassinoìdes, Duroi, harbk. 2. p. 486. V. lanceolàtum, Hill, hort. kew. t. 19. Flowers white. Berries black.

Smooth Viburnum. Fl. June, July. Clt. 1724. Shrub 10 to 14 feet.

23 V. NI'TIDUM (Ait. hort. kew. 1. p. 371.) quite glabrous; leaves linear-lanceolate, shining above, obsoletely serrated or entire; branches tetragonal. ♄. H. Native of Carolina and Georgia, in sandy barren woods. A low shrub, with small leaves. Flowers white.

Shining-leaved Viburnum. Fl. May, June. Clt. 1758. Shrub 2 to 4 feet.

24 V. ODORATI'SSIMUM (Ker, bot. reg. t. 456.) evergreen, glabrous; leaves coriaceous, elliptic-oblong, almost entire, with revolute margins; branches of thyrse opposite, having the peduncles of the branches trichotomously pedicellate; style simple, short; berries oblong. ♄. G. Native of China. V. Sinénse, Zeyh. in Coll. hort. ripul. 145. app. 2. p. 330. t. 16. V. Chinénse, Zeyh. ex Steud. nom. p. 880. Cóffea monospérma, Hook. et Arn. Berries red, but at length becoming blackish, shining, 1-seeded, crowned by the lobes of the calyx, which are erect. Flowers white, with the scent of those of *O'lea fràgrans*, or sweet olive. This shrub has scarcely at all the appearance of a *Vibúrnum*, from which genus the presence of a style essentially distinguishes it. (f. 76.)

FIG. 76.

Sweet-scented-flowered Viburnum. Fl. Feb. Clt. 1818. Shrub 4 to 8 feet.

25 V. LANTA'NA (Lin. spec. p. 384.) leaves cordate, rounded, finely serrated, veiny, clothed beneath, but more sparingly on the upper side, with starry mealy pubescence, like that on the branches, petioles, and peduncles; cymes pedunculate, broad, flat, of numerous crowded white flowers; bracteas several, small, acute. ♄. H. Native throughout Europe, even to Caucasus, in hedges. In Britain in woods and hedges, especially on

a chalky or limestone soil. Smith, engl. bot. t. 331. Jacq. austr. t. 341.—V. tomentòsum, Lam. fl. fr. 3. p. 363.—Cam. epit. 122. with a figure.—Duham. arb. 2. t. 103.—Lob. icon. 2. t. 106. A small tree, with copious, opposite, round, pliant, mealy branches. Under side of leaves and branches white from mealy down. Berries compressed in an early state, red on the outer side, yellow on the inner, finally black, with a little mealy astringent pulp. Seed large, flat, and furrowed. The leaves turn of a dark red in autumn. This shrub is hardly worth cultivating for ornament, nor is it of any particular use, except that the bark serves to make bird-lime; but that of the holly is much better. It is supposed to be the viburnum of Virgil. The name *lantàna* is from *lento* to make pliant, on account of the pliant branches.

Way-faring Tree. Fl. May, June. Britain. Shrub 6 to 15 feet.

26 V. LANTANOÌDES (Michx. fl. bor. amer. 1. p. 179.) leaves roundish-cordate, abruptly acuminated, unequally serrated: serratures awnless; branchlets, petioles, and nerves of leaves clothed with powdery tomentum; corymbs terminal, almost sessile; fruit ovate. ♄. H. Native of North America, from Canada to Carolina, principally in the forests called Beech-woods; about Quebec and Lake Huron. V. Lantàna β, grandifòlium, Ait. hort. kew. ed. 1. vol. 1. p. 392. V. grandifòlium, Smith, in Rees' cycl. no. 14. V. Lantàna β, Canadénse, Pers. ench. 1. p. 327. The outer flowers of the corymbs are abortive and radiant, a circumstance noticed by few botanists. Berries at first red, but at length becoming black. In North America it is known by the name of *hobble-bush*. Very like *V. Lantàna*, but of more humble growth, and the leaves larger and tomentose.

Lantana-like Viburnum or American Wayfaring Tree. Fl. June, July. Shrub.

27 V. DENTA'TUM (Lin. spec. p. 384.) partly glabrous; leaves ovate, and nearly orbicular, plicate, coarsely and dentately serrated, with the nerves thick and feathered, glabrous on both surfaces; cymes or corymbs pedunculate; fruit nearly globose. ♄. H. Native of North America, from New York to Carolina, in mountain woods, and of Mexico. Jacq. hort. vind. 1. t. 36. Wats. dend. t. 25. V. dentàtum lùcidum, Ait. hort. kew. 1. p. 372. V. dentàtum glabéllum, Michx. fl. bor. amer. 1. p. 179. Flowers white. Berries small, dark blue, crowned by the calyx. In North America the shrub is known by the name of *arrow-wood*.

Toothed-leaved Viburnum. Fl. June, July. Clt. 1763. Shrub 4 to 6 feet.

28 V. PUBE'SCENS (Pursh, fl. amer. sept. 1. p. 202.) pubescent; leaves ovate, acuminated, on short petioles, coarsely serrate-toothed, villous beneath, with the nerves feathered and prominent; corymbs pedunculate; fruit small, ovate. ♄. H. Native of North America, in the lower parts of Virginia and Carolina, and New York; and of Canada about Lake Winnepeg. V. dentàtum β, pubéscens, Ait. hort. kew. 1. p. 168. V. dentàtum semi-tomentòsum, Michx. fl. bor. amer. 1. p. 179. V. tomentòsum, Rafin. med. rep. 11. p. 360. V. villòsum, Rafin. in Desv. journ. 1. p. 228. V. Rafinesquiànum, Schultes, syst. 6. p. 630. Flowers white. The shrub is smaller in every part than *V. dentàtum*.

Downy Viburnum. Fl. June, July. Clt. 1736. Shrub 3 feet.

29 V. ELLI'PTICUM (Hook. fl. bor. amer. 1. p. 280.) leaves elliptic, obtuse, on short petioles, coarsely serrated at the top, very hairy beneath, but most so on the veins, which are parallel; corymbs dense, pedunculate; ovaries very hairy; berries oval-globose, deep black. ♄. H. Native of North America, common on the branches of the Columbia, near its confluence with the Pacific. Bark of branches pale brown. Leaves about 2 inches long.

Var. β; ovaries glabrous. ♄. H. Growing along with the species.

Elliptic-leaved Viburnum. Shrub 2 to 4 feet.

30 V. VILLÒSUM (Swartz, prod. p. 54. fl. ind. occ. 1. p. 564.) leaves ovate, acuminated, quite entire, glabrous above in the adult state, but tomentose beneath from stellate down, as well as the petioles and branchlets; corymbs terminal, pedunculate; fruit ovate-oblong. ♄. S. Native of the south of Jamaica, on the mountains. Peduncles and calyxes rather villous. Corollas white. This species agrees with *V. Tinus* in the leaves being entire, and from the tomentum with *V. Lantàna*. Petioles quadrangular and channelled.

Villous Viburnum. Clt. 1824. Shrub 5 to 6 feet.

31 V. COTINIFÒLIUM (D. Don, prod. fl. nep. p. 141.) leaves roundish-oval, quite entire, clothed with stellate tomentum on both surfaces, grey beneath, as well as the branches; corymbs terminal, woolly. ♄. H. Native of Nipaul, at Sirinagur. Flowers white.

Cotinus-leaved Viburnum. Shrub.

32 V. NERVÒSUM (D. Don, prod. fl. nep. p. 141.) leaves cordate, acuminated, nerved, serrated, clothed with deciduous stellate tomentum beneath, as well as on the branches; peduncles terminal, tern, cymose, few-flowered. ♄. H. Native of Nipaul, at Sirinagur, where it is called *Pheelaroo* by the natives. V. Lantàna, Wall. mss.

Nerved-leaved Viburnum. Shrub 4 to 6 feet.

33 V. CORDIFÒLIUM (Wall. cat. no. 462. D. C. prod. 4. p. 327.) leaves heart-shaped, acuminated, dentately serrated, membranous, glabrous above, clothed with stellate down on the petioles and nerves, which is at first dense, but at length scattered; corymbs terminal, sessile, with 5-7 long main branches or rays; berries elliptic. ♄. H. Native of Nipaul, in Kamaon and Gosaingsthan. Leaves 4 inches long, and 2½ broad. Petioles 12-15 lines long. There are 4-6 nerves at the base of the limb of the leaf on each side, rising from the midrib.

Heart-leaved Viburnum. Shrub 5 to 6 feet.

34 V. MULLA'HA (Hamilt. in D. Don, prod. fl. nep. p. 141.) leaves ovate, acuminated, distantly serrated, rounded at the base, densely clothed with tomentum beneath, as well as on the branches; corymbs terminal, compound, spreading, tomentose; teeth of calyx short. ♄. H. Native of Nipaul, at Suembu. Nearly allied to *V. tomentòsum*. Flowers white.

Mullaha Viburnum. Shrub.

35 V. STELLULA'TUM (Wall. cat. no. 463. D. C. prod. 4. p. 327.) leaves ovate, cordate, acuminated, glabrous above, except on the middle nerve, densely clothed with stellate down beneath, as well as the branchlets and peduncles; the margin serrated: serratures distant, small, callous; corymbs terminal, with 5-7 main branches, exinvolucrate. ♄. H. Native of Nipaul, in the valley, and at Kamaon. Wall. pl. rar. asiat. 2. p. 54. t. 169. Flowers white. Leaves roundish-cordate. Berries scarlet.

Starry-haired Viburnum. Shrub 12 to 20 feet.

36 V. INVOLUCRA'TUM (Wall. cat. no. 458. D. C. prod. 4. p. 327.) leaves ovate, acuminated, somewhat cordate at the base, villous from simple hairs while young, as well as the branchlets; corymbs terminal, decompound; bracteas and bracteoles foliaceous, oval, attenuated at the base, acuminated, nearly entire, exceeding the flowers. ♄. H. Native of Nipaul. Branches of corymb and calyxes villous. Flowers white.

Involucrated Viburnum. Shrub 4 to 6 feet.

§ 2. Leaves serrated and denticulated. Flowers monogynous from the style being a little elongated, and the stigmas being concrete.

37 V. ERÒSUM (Thunb. fl. jap. p. 124.) leaves broad-ovate, acuminated, erosely serrated, rather villous on both surfaces;

petioles tomentose; umbels decompound, pilose; style simple. ♄. H. Native of Japan. Branches grey, glabrous.

Erose-toothed Viburnum. Shrub 4 to 6 feet.

38 V. MONO'GYNUM (Blum. bijdr. p. 655.) leaves elliptic-oblong, attenuated at both ends, glandularly denticulated above the base, paler beneath; corymbs divaricate, terminal, downy; flowers monogynous. ♄. G. Native of Java, in woods on the mountains. Said to be nearly allied to *V. eròsum*.

Monogynous Viburnum. Shrub.

§ 3. *Leaves 3-lobed.*

39 V. ACERIFÒLIUM (Lin. spec. 383.) branchlets and petioles pilose; leaves ovate-cordate, usually 3-lobed, acuminated, sharply and loosely serrated, downy beneath; petioles glandless, when young stipulaceous at the base, and rather tomentose; corymbs terminal, pedunculate, not radiant. ♄. H. Native of North America, from New England to Carolina, and of Newfoundland, in rocky mountainous situations. Throughout Canada from Lake Huron to the Saskatchawan; and about Fort Vancouver on the Columbia. Vent. hort. cels. t. 72. Wats. dend. brit. t. 118. Flowers white. Berries black, oval, compressed.

Maple-leaved Guelder-rose. Fl. May, June. Clt. 1736. Shrub 4 to 6 feet.

40 V. ORIENTA'LE (Pall. fl. ross. t. 58. f. H.) leaves 3-lobed, acuminated, coarsely and bluntly toothed; petioles glandless, glabrous; corymbs terminal, not radiant; fruit oblong, compressed. ♄. H. Native of Iberia, in woods, on the mountains, &c. Bieb. fl. taur. 1. p. 245. O'pulus orientàlis folio amplissimo tridentato, Tourn. cor. p. 42. Flowers white. Seed oval, furnished with 2 channels on both sides, as in *V. Lantàna*. Very like the preceding species.

Oriental Guelder-rose. Fl. July. Shrub 6 to 10 feet.

SECT. II. O'PULUS (a name altered from *populus*, the poplar: the leaves resembling those of the poplar). Tourn. inst. t. 376. Mœnch, meth. p. 605. Outer flowers of the corymbs radiant and sterile, much larger than the rest, which are fertile. Seed obcordate.

41 V. O'PULUS (Lin. spec. 384.) quite glabrous in every part; leaves broad, 3-lobed, acuminated, unequally serrated, veiny; petioles beset with glands towards the top, and several oblong leafy appendages lower down; cymes pedunculate, white, with linear bracteas: with several of the marginal flowers dilated flat, radiant, and without stamens or pistils; berries elliptical, bright red, very juicy, but bitter and nauseous; seed compressed. ♄. H. Native throughout Europe to Caucasus, in watery hedges and swampy thickets. In Britain in like situations. Smith, engl. bot. t. 332. Fl. dan. 661. Hayn, term. t. 32. f. 4. V. lobàtum, Lam. fl. fr. 3. p. 363. O'pulus glandulòsus, Mœnch, meth. p. 505. O'pulus, Raii, syn. 460. Duham. arb. 2. t. 16. Sambùcus aquática, Bauh. pin. 456. Trag. hist. 1002. with a figure. Math. valgr. 2. p. 607. with a figure. Branches smooth, green. Leaves bright green in summer, but in autumn assuming a beautiful pink or crimson hue, like other European species of the genera, that are principally American, as *Córnus*, *Rhús*, &c. Flowers white. Berry crowned by the limb of the calyx. There is to be found in the gardens a variegated leaved variety.

Var. β, stérilis (D. C. prod. 4. p. 328) ♄. H. Cultivated in gardens. This variety is called *snow-ball-tree* or *guelder-rose*. It is commonly planted in shrubberies along with the lilac and liburnum, grouping elegantly with the various purple hues of the former, and the golden chain of the latter, but they are all mere summer beauties; nor does any thing profitable or ornamental follow. The several marginal flowers of the corymb in the species are dilated, flat, and radiant, without stamens or pistils. In this variety the whole cyme nearly consists of radiant sterile flowers, and becomes globular. V. O'pulus ròseum, Rœm. et Schultes, syst. 6. p. 635.—Knor. del. 2. t. 5 and 6. The snow-ball has been raised from seed by accident, and has been multiplied by cuttings.

Guelder-rose. Fl. May, June. Britain. Shrub 6 to 14 feet.

42 V. EDU'LE (Pursh, fl. bor. amer. 1. p. 203.) leaves 3-lobed, bluntish behind, and 3-nerved: lobes very short, denticulately serrated: serratures acuminated; petioles glandular; outer flowers of corymbs radiant. ♄. H. Native of North America, from Canada to New York, on the banks of rivers. In Canada from the Saskatchawan to Slave Lake, in lat. 66°. V. O'pulus edùle, Michx. fl. bor. amer. 1. p. 180. A smaller and more upright shrub than the preceding species. The berries of the same colour and size, but when completely ripe more agreeable to eat, and sometimes employed as a substitute for cranberries. It does not seem to differ much from *V. oxycóccos* except in the broader base of the leaf.

Edible-fruited Guelder-rose. Fl. July. Clt. 1812. Shrub 5 to 10 feet.

43 V. OXYCO'CCOS (Pursh, fl. amer. sept. 1. p. 203.) leaves 3-lobed, acute behind, 3-nerved; lobes divaricate, acuminated, coarsely and distantly serrated; petioles glandular; cymes radiant. ♄. H. Native of North America; on the mountains of New York and New Jersey; and throughout Canada to the Arctic circle, and from Hudson's Bay to the Rocky Mountains, in swamps and shady woods. V. opuloìdes, Muhl. cat. 32. V. trílobum, Marsh. arb. p. 162. V. O'pulus Pimìna, Michx. fl. 1. p. 180. V. O'pulus Americàna, Ait. hort. kew. 1. p. 373. Flowers white. Berries subglobose, red, of an agreeable acid, resembling that of cranberries, for which they are a very good substitute. Very like the *V. O'pulus* of Europe.

Var. β, subintegrifòlia (Hook. fl. bor. amer. 1. p. 281.) leaves but little cut, very pubescent beneath. ♄. H. Native on the banks of the Columbia.

Cranberry Guelder-rose. Fl. July. Shrub 6 to 12 feet.

44 V. MÓLLE (Michx. fl. bor. amer. 1. p. 180.) leaves nearly orbicular, cordate, plicate, toothed, rather tomentose beneath from very soft down; petioles rather glandular; corymbs radiant; fruit oblong-ovate. ♄. H. Native of North America, in Kentucky, near Danville; Tennessee and Upper Carolina, in hedges. V. alnifòlium, Marsh. arb. p. 162. Flowers white. Berries red. Bark deciduous. Very like *V. oxycóccos*, and perhaps only a variety of it.

Soft Guelder-rose. Fl. June, July. Shrub 6 to 12 feet.

45 V. MICROCA'RPUM (Cham. et Schlecht. in Linnæa. 5. p. 170.) leaves subcordate, orbicular, or obovate, short-acuminated, remotely and sinuately toothed, pubescent above, and clothed with hoary tomentum beneath; petioles short, without glands; rays of cyme almost sessile. ♄. H. Native of Mexico, near Jalapa and San Meguel del Soldado. Leaves like those of the filbert. Fruit black.

Small-fruited Guelder-rose. Shrub 6 to 8 feet.

SECT. III. SOLENOTI'NUS (from *σωλην, solen*, a tube, and *tinus*, the laurestine; in reference to the corollas being tubular). D. C. prod. 4. p. 328. Corymbs not radiant. Corolla obconical or cylindrical. Seeds oval-oblong. This section agrees with the tribe *Lonicèreæ* in the corollas being tubular.

46 V. DAHU'RICUM (Pall. fl. ross. ed. 8vo. p. 52.) leaves ovate, somewhat cordate at the base, crenately serrated, beset with stellate down, as well as the branchlets; corymbs dichotomous, few-flowered; corollas tubular, somewhat funnel-shaped, bluntly 5-toothed. ♄. H. Native of Dahuria. Lonicèra Mongólica, Pall. fl. ross. 1. t. 38. and t. 58. f. F. G. Gmel. sib. 3. t. 25. Córnus Daúrica, Laxm. Berry 5-7 seeded, ex Pall.

ed. 1., 1-seeded, at first red, but at length becoming black and sweet, ex Pall. ed. 2. Allied to *V. Lantàna*. Flowers yellowish white.

Dahurian Viburnum. Shrub 6 to 8 feet.

47 V. POLYCA'RPUM (Wall. cat. no. 455.) leaves cordate, ovate, somewhat acuminated, glabrous above, and tomentose from dense stellate white down beneath, but at length rather naked; corymbs terminal, 5-rayed, on short peduncles; corollas obconically tubular; berry elliptic, glabrous. ♄. H. Native of Nipaul, at Kamaon and Sirmore. Leaves 4-5 inches long, and 3 inches broad; petioles 4 lines long.

Many-fruited Viburnum. Shrub 6 to 8 feet.

48 V. CYLI'NDRICUM (Ham. in D. Don, prod. fl. nep. p. 142.) leaves oval-oblong, acuminated, coriaceous, quite entire, pubescent beneath, and on the branches; corymbs compound, erect, tomentose; corolla oblong, tubular, with a short 5-toothed limb. ♄. H. Native of Nipaul, at Narainhetty. This species has the habit of *V. nùdum*. Flowers white, tubular, very like those of *V. Dahùricum*.

Cylindrical-flowered Viburnum. Shrub.

49 V. GRANDIFLÒRUM (Wall. cat. no. 464. D. C. prod. 4. p. 329.) leaves elliptic, acuminated, dentately serrated, pubescent along the nerves beneath, when young ornamented with pencilled hairs in the axils of the serratures above; corymbs terminal, bracteate; corollas cylindrical. ♄. H. Native of Nipaul, at Kamaon. Very nearly allied to *V. erubéscens*, but differs in the singular hairs on the leaves. Bracteas villous, foliaceous, 4-5 lines long. Flowers white.

Great-flowered Viburnum. Shrub 5 to 8 feet.

50 V. ERUBE'SCENS (Wall. pl. rar. asiat. 2. t. 134. D. C. prod. 4. p. 329.) leaves elliptic, acuminated, serrated, glabrous; branchlets, petioles, and peduncles rather hairy; corymbs terminal; bracteas linear-subulate, small; corollas cylindrical. ♄. H. Native of Nipaul, at Kamaon. Leaves while young downy and ciliated. Flowers white. Berries oblong, red, 1-seeded, crowned.

Erubescent Viburnum. Shrub 10 to 12 feet.

51 V. CORIA'CEUM (Blum. bijdr. p. 656.) leaves ovate or oval-oblong, acuminated, denticulated, coriaceous, glabrous: corymbs terminal, fastigiate; tube of corolla cylindrical. ♄. H. Native of Java, in woods on the higher mountains.

Coriaceous-leaved Viburnum. Shrub 6 to 7 feet.

† *Species natives of Japan, but are not sufficiently known.*

52 V.? CUSPIDA'TUM (Thunb. fl. jap. p. 125.) leaves ovate, cuspidate, serrated, villous; umbels supra-decompound, terminal, radiant. ♄. H. Native of Japan. Flowers white.

Cuspidate-leaved Viburnum. Shrub.

53 V.? DILATA'TUM (Thunb. fl. jap. p. 124.) leaves ovate, acuminated, unequal, toothed; petioles and peduncles villous; panicle axillary, decompound, but not radiant; style simple, very short. ♄. H. Native of Japan.

Dilated Viburnum. Shrub.

54 V.? TOMENTÒSUM (Thunb. fl. jap. 123.) leaves ovate, acuminated, serrated, veiny, tomentose beneath and on the petioles; umbels lateral, radiant. ♄. H. Native of Japan, in woods. Sijo vulgo Adsai, Kœmpf. amœn. ex p. 854. Branches glabrous, reddish. Flowers blue, disposed on a dense large round head like the Snow-ball Guelder-rose; some are radiant and sterile, and others are small and pentandrous.

Tomentose Viburnum. Shrub 5 to 6 feet.

Cult. The species of *Vibúrnum* are all beautiful shrubs, and the hardy species are well adapted for ornamental shrubberies. They are either increased by laying in the shoots, or by cuttings under a hand-glass in a shady situation. The greenhouse and hardy kinds are early flowerers, which render them very desirable.

Tribe II.

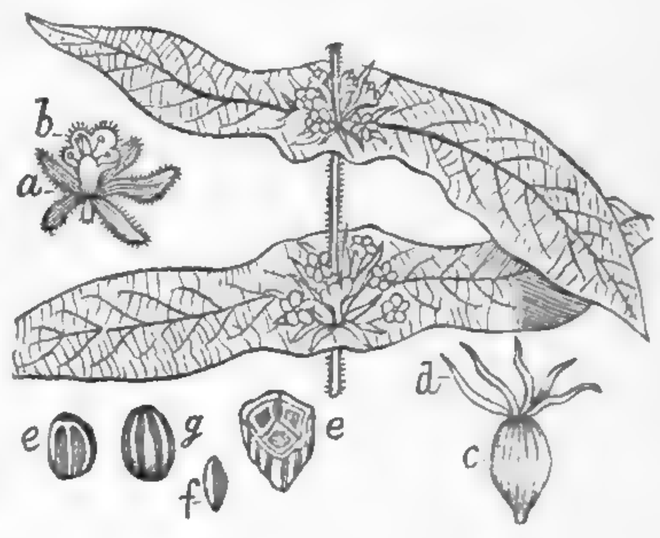
LONICE'REÆ (plants agreeing with *Lonicèra* in important characters). R. Br. char. et descr. (1818) p. 4. D. C. prod. 4. p. 329.—Caprifolièæ A. Rich. dict. class. 3. p. 173.—Caprifòlia, Batsch, tabl. aff. p. 239. Corolla gamopetalous, more or less tubular, often irregular. Style filiform; stigmas 3, free, or combined in one.

III. TRIO'STEUM (from τρεις, *treis*, three, and οστεον, *osteon*, a bone; in reference to the three bony seeds in each berry). Lin. gen. no. 234. Gærtn. fr. 1. t. 26. Lam. ill. t. 150. D. C. prod. 4. p. 329.

LIN. SYST. *Pentándria, Monogýnia.* Tube of calyx ovate; limb 5-parted (f. 77. *a.*): lobes linear-lanceolate, permanent. Corolla tubular (f. 77. *b.*), almost equally 5-lobed, gibbous at the base, a little longer than the calyx. Stamens 5, inclosed. Stigma thick, oblong. Berry coriaceous (f. 77. *c.*), obovately triquetrous, crowned by the calyx (f. 77. *d.*), 3-celled (f. 77. *e.*), but sometimes only 1-celled at maturity. Seeds 3 in each capsule, rarely 5, bony, elliptic.—Perennial herbs, rarely suffruticose. Leaves tapering into the petioles, and somewhat connate at the base. Flowers axillary, sessile, or on very short pedicels.

1 T. PERFOLIA'TUM (Lin. spec. 250.) leaves oval, acuminated, abruptly narrowed at the base, and connate; flowers sessile, appearing verticillate. ♃. H. Native of North America, in the states of New Jersey, New England, Upper Carolina, and Virginia, in rich rocky grounds, principally in a lime stone soil. Schkuhr, handb. 1. t. 41. Bigel. med. bot. 90. t. 9. T. màjus, Michx. fl. bor. amer. 1. p. 107.—Dill. elth. p. 394. t. 293. f. 378. Flowers and berries deep purple. Leaves sometimes subsinuated. There are glabrous and pubescent varieties of this species. The roots of this species, as well as those of the following, are used in North America as an emetic for ipecacuanha. It was first brought into notice by Dr. Tinkar, and hence it has been called Tinkar's root.

FIG. 77.



Perfoliate-leaved Fever-wort. Fl. June, Aug. Clt. 1730. Pl. 2 to 3 feet.

2 T. ANGUSTIFÒLIUM (Vahl. symb. 3. p. 37.) leaves oval-lanceolate, rather connate at the base; pedicels axillary, solitary, 1-flowered; stem hispid. ♃. H. Native of Virginia and Carolina, on the borders of woods in sandy soil. T. mìnus, Michx. fl. bor. amer. 1. p. 107.—Pluk. alm. t. 104. f. 2. Stem hairy, rather quadrangular. Leaves quite entire. Flowers yellow. Berries yellow.

Narrow-leaved Fever-wort. Fl. June, July. Clt. 1699. Pl. 1 to 2 feet.

3 T. HIMALAYA'NUM (Wall. in Roxb. fl. ind. 2. p. 180.) plant covered with long hairs; leaves obovate, acute, connate at the base: lowermost ones free; racemes terminal, bearing the flowers in whorls. ♃. H. Native of Nipaul, on the Himalaya at Gosaingsthan, where it grows on very high and exposed rocks. Stems terete. Leaves membranous, rounded at the end, with a short acumen, 6-8 inches long, about 4 fingers broad, somewhat narrow towards the base. Berries oval, about the size of a small gooseberry, 3-furrowed, 1-celled, 3-seeded, hairy, yellow.

Himalaya Fever-wort. Pl. 2 to 3 feet.

4 T. HIRSU'TUM (Roxb. fl. ind. 2. p. 180.) plant suffruticose, hairy; leaves on short petioles, lanceolate, entire, acuminated; flowers axillary, sessile, much shorter than their numerous lanceolate bracteas; berries 5-seeded. ♃. H. Native of Chittagong, where it flowers during the hot season.

Hairy Fever-wort. Pl. 2 to 3 feet?

Cult. These species of *Triósteum* will grow in almost any kind of soil, although they prefer a peat or vegetable mould; and they are easily increased by dividing at the root, or by seed, which generally ripen in abundance.

IV. DIERVI'LLA (named by Tournefort in compliment to M. Dierville, a French surgeon, who was the first to introduce *D. Canadénsis* into Europe). Tourn. act. ac. par. 1706. t. 7. f. 1. Lin. hort. cliff. p. 63. t. 7. Juss. gen. 211. D. C. prod. 4. p. 330.—Lonicèra species, Lin. gen.—Weigèla, Thunb. fl. jap. p. 6. Lam. ill. 105. and Weigèlia, Pers. ench. 1. p. 176. ex R. Br. in Wall. pl. asiat. 1. p. 15.

Lin. syst. *Pentándria, Monogýnia.* Tube of calyx oblong, bibracteate at the base: limb 5-cleft. Corolla funnel-shaped, 3-cleft, spreading twice the length of the calyx. Stamens 5, somewhat exserted. Stigma capitate. Capsule oblong, acute, 1-celled, not crowned by the limb of the calyx, as in most of the other genera of the present order. Seeds numerous, minute.—Erect shrubs. Leaves ovate, acuminated, serrated. Peduncles axillary, bibracteate, usually dichotomous, 2-3 or 4-flowered.

1 D. Canade'nsis (Willd. enum. 1. p. 222.) leaves on short petioles, ovate, acuminated, serrated, and are, as well as the petioles, glabrous. ♄. H. Native of Carolina, New England, Newfoundland, on rocks and the highest mountains; throughout Canada to the Saskatchawan; and from Hudson's Bay to the Rocky Mountains. Lonicèra Diervílla, Lin. mat. med. p. 62. Sims, bot. mag. 1796. D. Tournefórtii, Michx. fl. bor. amer. 1. p. 107. D. hùmilis, Pers. ench. 1. p. 214. D. lùtea, Pursh, fl. amer. sept. 1. p. 162. D. trífida, Mœnch, meth. 492. D. Arcadiénsis, Duham. arb. 1. t. 87.—Smidth, arb. t. 116. Flowers yellow. Fruit a brown dry capsule. There are a number of varieties of this plant in respect to size of flowers, and leaves. Root creeping, throwing up suckers.

Canadian Diervilla. Fl. June, July. Clt. 1739. Shrub 3 to 4 feet.

2 D. Japo'nica (D. C. prod. 4. p. 330.) leaves on short petioles, ovate, acuminated, having the veins and petioles hairy above. ♄. H. Native of Japan, near Jedo; and of Faconia. Weigèla Japónica, Thunb. fl. jap. p. 90. t. 16. and in Lin. trans. 2. p. 331. nov. gen. 1. p. 5. act. holm. 1780. p. 137. t. 5.—Sìma Utsùgi, Kœmpf. amœn. 5. p. 855. Corolla purple.

Japan Diervilla. Shrub.

3 D. Coræe'nsis (D. C. prod. 4. p. 330.) leaves petiolate, obovate, serrated, acuminated, glabrous; petioles stem-clasping, ciliated. ♄. H. Native of Japan. Weigèla Coræénsis, Thunb. in Lin. trans. 2. p. 331. Weigèla Coræénsis, Pers. ench. 1. p. 176.—Sòrei Utsùgi, Kœmpf. icon. sel. ed. Banks, t. 45. Flowers large, campanulate. Perhaps a congener of the preceding.

Coræa Diervilla. Shrub.

Cult. The species of *Diervílla* are well fitted for the front of shrubberies; and they are easily increased by cuttings put into the ground in autumn and spring; or by suckers, which rise from the roots in plenty.

V. LONICE'RA (named after Adam Lonicer, a German who was born in 1528, and died in 1586. There was another Lonicer, John, who wrote comments on Dioscorides). Desf. fl. atl. 1. p. 183. Lam. ill. t. 150. D. C. prod. 4. p. 330.—Lonicèra species, Lin. and many other authors.—Caprifòlium and Xylósteum, Juss. gen. p. 212.—Xylósteum, Caprifòlium, Chamæcérasus, and Periclýmenum, Tourn. inst. t. 378 and 379.—Caprifòlium and Lonicèra, Rœm. et Schultes, syst.—Lonicèra and Xylósteum, Torrey, fl. un. st.

Lin. syst. *Pentándria, Monogýnia.* Tube of calyx 5-toothed (f. 78. *a.*). Corolla tubular (f. 78. *b.* f. 79. *b.*), campanulate, or funnel-shaped: with a 5-cleft, usually irregular limb (f. 78. *b.* f. 79. *b.*). Stamens 5. Style filiform; stigma capitate (f. 78. *c.*). Berry 3-celled; cells few-seeded. Seeds crustaceous. —Erect or climbing shrubs. Leaves opposite, sometimes connate, entire, but sometimes somewhat runcinate (f. 79. *e.*) in the same species. Flowers axillary, variously disposed.

Sect. I. Caprifòlium (*caper*, a goat, and *folium* a leaf; in reference to the climbing habit of the species). D. C. fl. fr. 4. p. 270. D. C. prod. 4. p. 331.—Caprifòlium, Juss. gen. 212. Rœm. et Schultes, syst. 5. p. 19. Lonicèra, Torr. fl. un. st. 1. p. 242. but not of Schultes. Berries solitary, while young 3-celled, but when mature usually 1-celled, crowned by the tube of the calyx, which is permanent. Flowers disposed in capitate whorls.—Climbing shrubs.

* *Flowers ringent.—Caprifòlium, Tourn. inst. p.* 608.

1 L. Caprifo'lium (Lin. spec. p. 246.) branches twining; leaves deciduous, obovate, acutish, glaucous: uppermost ones broader and connate; flowers ringent, terminal, disposed in capitate whorls. ♄. ◠. H. Native of middle and south Eurupe, even to the Terek, in woods, hedges, and thickets. In England in like situations; in a wood near Elsfield, Oxfordshire, plentiful; in Chalkpit Close, Hinton, Cambridgeshire, certainly wild; also in another coppice in the same parish. In several woods in the south of Scotland. Smith, engl. bot. t. 799. Jacq. austr. t. 357. Engl. gard. cat. 14. t. 5.—Dodon. pempt. 411. with a figure.—Math. valgr. vol. 2. p. 321. with a figure. Cam. epit. 713. with a figure.—Rivin. irr. t. 123. Periclýmenum perfoliàtum, Ger. emac. p. 891. with a figure. Stem twining from left to right. Buds acute, glaucous. The lower leaves are distinct and somewhat stalked; 2 or 3 of the upper pairs united: the uppermost of all forming a concave cup. Flowers in one or more axillary whorls: the uppermost whorl terminal: with a central bud, 6 in each whorl, highly fragrant, 2 inches long, yellowish, with a bluish-coloured tube. Berries elliptical, of a tawny orange colour, each crowned by an almost entire calyx.

Goat's-leaf or Pale-perfoliate Honeysuckle. Fl. May, June. Britain. Shrub tw.

2 L. Etru'sca (Santi, viagg. 1. p. 113. t. 1.) branches twining; leaves deciduous, obovate, obtuse, pubescent: lower ones on short petioles: upper ones connately perfoliate, acute, glabrous; flowers disposed in verticillate heads: with usually about 3 heads on the top of each branch. ♄. ◠. H. Native of the south of France, Sicily, Vallais, Carniola, Dalmatia, on hills. Savi, fl. pis. 8. p. 236. D. C. fl. fr. suppl. 500. L. Etrúsca, Host, fl. aust. 1. p. 298. Caprifòlium Etrúscum, Rœm. et Schultes, syst. 5. p. 261. L. Periclýmenum, Gouan, hort. p. 101. Caprifòlium Itálicum perfoliàtum præ'cox, Tourn. inst. p. 608. Flowers glabrous, sweet-scented, purplish on the outside, and yellow inside.

Etruscan Honeysuckle. Fl. May, June. Clt.? Shrub tw.

3 L. imple'xa (Ait. hort. kew. 1. p. 231.) quite glabrous; branches twining; leaves permanent, evergreen, glaucescent: lower ones oblong, distinct: middle ones perfoliate: uppermost ones connate, forming a hollow roundish cup; flowers disposed in capitate whorls, ringent. ♄. ◠. H. Native of the Balearic Islands and Sicily. Sims, bot. mag. t. 640. Viv. fl. cors. p. 4. exclusive of the Guss. syn. Camb. bal. p. 84. et Guss.

sic. 1. p. 257. Caprifòlium impléxum, Rœm. et Schultes, syst. 5. p. 261. Flowers purplish before expansion, becoming paler on the outside as they expand; white on the inside; but finally changing to yellow, as in the common woodbine. The leaves in Curtis's figure appear to be ovate and acute.

Var. β, *Baleárica* (Viv. Camb. et Guss. l. c.) lower leaves somewhat cordate: upper ones connate, obovate, glaucous beneath. ♄. ⌒. H. Native of Corsica, South of France, Italy, Sicily, and Mauritania, &c. Caprifòlium Baleáricum, Dum. Cours. bot. cult. ed. 2. vol. 4. p. 358. Rœm. et Schultes, syst. 5. p. 261. L. Baleárica, D. C. fl. fr. suppl. 499. L. Caprifòlium, Desf. fl. atl. 1. p. 183. Evergreen. Bark of branches violaceous, clothed with glaucous bloom. Flowers 4-6 in a head, large, cream-coloured, 15-18 inches long.

Interwoven or Minorca Honeysuckle. Fl. June, Sept. Clt. 1772. Shrub tw.

4 L. Cyrena'ica (Viv. fl. lib. spec. 12. t. 8. f. 1.) quite glabrous; branches twining; leaves elliptic, glaucous beneath: lower ones sessile, distinct: upper ones truncate at the base, and confluent; flowers disposed in whorled heads. ♄. ⌒. H. Native of Lybia, in the vicinity of Cyren, on hills. Said to be allied to *L. Caprifòlium*, but differs in the upper leaves being much smaller, almost as in *L. Periclýmenum*.

Cyren Honeysuckle. Shrub tw.

5 L. Pericly'menum (Lin. spec. p. 247.) branches climbing; leaves all separate, deciduous, sometimes downy, glaucous beneath, ovate, obtuse, attenuated at the base: upper ones the smallest; heads of flowers all terminal, ovate, imbricated; flowers ringent. ♄. ⌒. H. Native of middle Europe, in hedges, groves, and thickets, common; plentiful in Britain, in like situations. Smith, engl. bot. t. 800. Curt. fl. lond. fasc. 1. t. 15. Oed. fl. dan. t. 908. Schmidt. arb. t. 107. Svensk, bot. t. 140. Caprifòlium Germánicum, Raii, syn. p. 458. engl. gard. cat. t. 5. Periclýmenum, Ger. emac. p. 891. with a figure. Periclýmenum Germánicum, Riv. mon. irr. t. 122. P. horténse, Gesn. icon. pict. fasc. 1. 38. t. 7. f. 49. Caprifòlium Periclýmenum, Rœm. et Schultes, syst. 5. p. 262. Caprifòlium sylváticum, Lam. fl. fr. 3. p. 365. There are varieties of this species with either smooth, pubescent, or variegated leaves; and when the plant grows by the sea-side they are occasionally more glaucous and rather succulent. Corollas externally deep red, or in the earlier flowering varieties all over buff coloured; in the maritime plant smaller and greenish. Berries nearly globular, deep red, bitter and nauseous, accompanied by permanent bracteas. The early writers attribute virtues to this shrub which are now quite given up, but the beauty and exquisite fragrance of the flowers make it a favourite plant in gardens and shrubberies. This is the true woodbine of poets, though likewise the "twisted eglantine" of Milton. Notwithstanding Curtis's imperfect quotation, Shakspeare is guiltless of this blunder. He says,

> "So doth the woodbine, the sweet honeysuckle,
> Gently entwist the maple."

Var. β, *serótinum* (Ait. hort. kew. 1. p. 378.) branches glabrous; flowers late, reddish. ♄. ⌒. H. Hort. angl. 14. no. 4. t. 7. Mill. fig. t. 79. Riv. mon. irr. t. 122. Periclýmenum Germánicum, Mill. dict. no. 4. This, the late red honeysuckle, produces a greater number of flowers together than either the Italian or Dutch honeysuckle, so that it makes a finer appearance than either of them, during the time of flowering. It has not been such a long inhabitant of our gardens as the Dutch honeysuckle, for about the year 1715 it was considered a great curiosity, when it was called the Flemish honeysuckle, and was probably brought over by the Flemish florists.

Var. γ, *Bélgica;* branches smooth, purplish; leaves oblong-oval, of a lucid green above, but pale beneath, on long petioles; flowers in terminal, verticillate heads, each flower arising out of a scaly cover, reddish on the outside, and yellowish within, of a very agreeable odour. ♄. ⌒. H. Periclýmenum Germánicum, Mill. dict. no. 4.—Hort. angl. 15. no. 5. t. 6. This, the Dutch honeysuckle, may be trained with stems, and formed into heads, which the wild sort cannot, the branches being too weak and trailing for that purpose.

Var. δ, *quercifòlium* (Ait. hort. kew. 1. p. 378.) leaves sinuated like those of an oak. ♄. ⌒. H. This variety is to be found in England in a wood near Kimberly, Norfolk; and near Oxford. There is also a kind of this with variegated leaves. The flowers are like those of the species. This is called the *Oak-leaved honeysuckle.*

Woodbine or Common Honeysuckle. Fl. June, July, Oct. Britain. Shrub tw.

6 L. fla'va (Sims, bot. mag. t. 1318.) quite glabrous; branches twining a little; leaves ovate, sometimes glaucous beneath, with cartilaginous margins; upper leaves connately perfoliate; flowers in terminal verticillate heads; corollas rather ringent: with oblong, obtuse lobes. ♄. ⌒. H. Native of the Paris Mountains, South Carolina; on the Catskill Mountains, New York. Torrey, fl. un. st. 1. p. 243. Caprifòlium flàvum, Ell. sketch. 1. p. 271. Caprifòlium Frasèri, Pursh, fl. amer. sept. 1. p. 160. Flowers bright yellow, but as they fade becoming orange-coloured, very fragrant.

Yellow-flowered Honeysuckle. Fl. June, July. Clt. 1810. Shrub tw.

7 L. pube'scens (Sweet, hort. brit. p. 194.) branches twining; leaves broad-ovate-elliptic, on short petioles, pubescent and ciliated, glaucous beneath: upper ones connately perfoliate; spikes or racemes composed of verticillate heads of flowers; corollas beset with glandular pubescence. ♄. ⌒. H. Native of North America, in Massachuset, Vermont, New York, and Canada, in many places. Caprifòlium pubéscens, Goldie, in edinb. phil. journ. 1822. april, p. 323. Hook, exot. fl. t. 27. L. hirsùta, Eaton, man. bot. ed. 3. p. 341. ex Torrey, fl. un. st. 1. p. 242. L. Góldii, Spreng. syst. 1. p. 758. Flowers yellow. This appears to hold the place in the more northern parts which *L. flàva* does in the south; of which indeed Dr. Torrey suspects it to be a variety.

Pubescent Honeysuckle. Fl. June, Jul. Clt. 1822. Sh. tw.

8 L. parviflòra (Lam. dict. 1. p. 728.) quite glabrous; branches twining; leaves elliptic, sessile: lower ones somewhat connate: upper ones connately perfoliate, glabrous, very glaucous beneath; flowers disposed in verticillate heads; corollas glabrous; with the tube gibbous at the base on one side; filaments hairy. ♄. ⌒. H. Native of North America, from New England to Carolina, in rocky shady situations; frequent in Canada, and as far north as the Saskatchawan; and from Hudson's Bay to the Rocky Mountains. Caprifòlium parviflòrum, Pursh, fl. amer. sept. 1. p. 161. Lonicèra dioíca, Lin. syst. veg. ed. 13. p. 181. L. mèdia, Murr. nov. comm. gœtt. 1776. p. 28. t. 3. Caprifòlium bracteòsum, Michx. fl. bor. amer. 1. p. 105. Caprifòlium dioícum, Rœm. et Schultes, syst. 5. p. 260. Caprifòlium glaúcum, Mœnch. Flowers yellow, smaller than in any of the foregoing species; but it varies exceedingly in the colour of the flowers, for there is a variety mentioned by Michaux having purplish flowers.

Var. β; leaves pubescent or tomentose beneath. ♄. H. Native of Canada, along with the species.

Small-flowered Honeysuckle. Fl. June, July. Shrub tw.

9 L. Dougla'sii (D. C. prod. 4. p. 332.) branches twining; leaves oval, acute at both ends, petiolate, glabrous, ciliated, tomentose on the outside: upper ones connate; flowers disposed in capitate whorls; stigma exserted; stamens inclosed. ♄. ⌒. H.

Native of the western coast of North America, on the banks of the Saskatchawan. Caprifòlium Douglàsii, Lindl. hort. trans. 7. p. 244. Corollas pubescent, bilabiate, deep orange red. Leaves 4-6 inches long, deep green. Hooker in his fl. amer. bor. 1. p. 282. considers this nothing but a variety of *L. parviflòra*.

Douglas's Honeysuckle. Fl. Jul. Sept. Clt. 1824. Sh. tw.

10 L.? MICROPHY'LLA (Hook. fl. bor. amer. 1. p. 283.) branches twining; leaves small, on short petioles, cordate, obtuse, stiff, hispid from pili as well as the branches, pale and glaucous beneath. ♄. ⌒. H. Native of north-west America, on the subalpine range of Mount Hood, in rocky, partially shady places, abundant; sparingly at the Grand Rapids, and on steep rocks near Oak Point, on the Columbia. The specimens examined have no flowers, but judging from the habit of the plant it may perhaps safely be referred to this genus, and to the present division of it. The leaves are hardly 6 lines long, uniform, exactly cordate, very villous as well as the stems with brown hairs.

Small-leaved Honeysuckle. Shrub tw.

11 L. GRA'TA (Ait. hort. kew. 1. p. 231.) branches twining; leaves permanent, obovate, rather mucronate, glaucous beneath and reticulately veined, glabrous: upper ones connately perfoliate; spikes composed of approximate whorles of flowers; corollas ringent. ♄. ⌒. H. Native of North America, from Carolina to New York, on the mountains, rambling among rocks in shady moist situations, but rare. Hort. angl. p. 15. no. 10. t. 8. Caprifòlium grà̀tum, Pursh, fl. amer. sept. 1. p. 161. Rœm. et Schultes, syst. 5. p. 262. L. Virginiàna, Marsh, arb. 136.? Periclýmenum Americànum, Mill. dict. no. 7. Branches reddish brown. Flowers inclining to scarlet on the outside, according to Pursh. Corolla ringent, reddish on the outside, and yellow inside. Berries red.

Pleasant Honeysuckle. Fl. Ju. Sept. Clt. 1730. Sh. tw.

* * *Limb of corolla nearly equal.—Periclýmenum, Tourn.*

12 L. SEMPERVÌRENS (Ait. hort. kew. 1. p. 230.) quite glabrous; leaves permanent, evergreen, obovate or ovate, glaucous beneath, glabrous: upper ones connately perfoliate; spikes nearly naked, composed of whorls of flowers; tube of corolla ventricose on the upper side; limb nearly regular, with 5 roundish lobes. ♄. ⌒. H. Native of North America, from New York to Carolina, in stony dry woods. Hort. angl. t. 7. Knor, del. 1. t. 53. Caprifòlium sempervìrens, Michx. fl. bor. amer. 1. p. 105. Periclýmenum sempervìrens, Mill. dict. no. 1. Alatérnus sempervìrens, Rœhl. ex Steud. Periclýmenum Virginiàcum, Riv. mon. 116. Branches brown. Leaves deep green above, 2 inches long and an inch broad. Whorls of flowers usually 3, at the top of each branch. Flowers of a beautiful scarlet outside and yellow inside, about 1 inch long, inodorous. There are several varieties of this species, particularly one with an almost upright stem.

Var. α, màjor (Ait. l. c.) leaves roundish. ♄. ⌒. H. Curt. bot. mag. 781. Schmidt, arb. t. 104. Great Trumpet Honeysuckle.

Var. β, mìnor (Ait. l. c.) leaves oblong, acute at both ends: upper ones obtuse, perfoliate. ♄. ⌒. H. Sims, bot. mag. 1753. Ker. bot. reg. t. 556. L. connàta, Meerb. icon. t. 11.? Small Trumpet Honeysuckle. According to the figure in bot. mag. the flowers are scarlet both outside and inside.

Evergreen or Trumpet Honeysuckle. Fl. May, June. Clt. 1656. Shrub tw.

13 L. CILIÒSA (Poir. suppl. 5. p. 612.) plant twining; upper part of the branches hairy on one side; leaves coriaceous, reticulated, ovate, on short petioles, glaucous beneath, and ciliated on the margins: upper ones connately perfoliate; spikes composed of approximate verticillate heads of nearly sessile flowers; tube of corolla hairy, ventricose in the middle: limb nearly equal. ♄. ⌒. H. Native of North America, on the banks of the Kooskoosky. Caprifòlium ciliòsum, Pursh, fl. amer. sept. 1. p. 160. L. ciliàta, Dietr. lex. suppl. 4. p. 263. Flowers deep yellow. Peduncles beset with glandular hairs.

Ciliated-leaved Honeysuckle. Fl. Ju. Clt. 1825. Sh. tw.

14 L. OCCIDENTA'LIS (Hook, fl. bor. amer. 1. p. 282.) twining; leaves oval, almost sessile, glabrous, ciliated, glaucous beneath: upper ones connately perfoliate; flowers disposed in verticillate heads; corolla glabrous, with an elongated tube, which is gibbous above the base: the limb nearly equal; stamens almost inclosed. ♄. ⌒. H. Native about Fort Vancouver, on the Columbia. Caprifòlium occidentàle, Lindl. bot. reg. t. 1457. Caprifòlium ciliòsum, Dougl. mss. The flowers are longer than any other British North American species, and of a full orange red. Branches and peduncles glabrous.

Western Honeysuckle. Fl. Ju. Jul. Clt. 1824. Shrub tw.

15 L. PILÒSA (Willd. mss. ex Kunth, D. C. prod. 4. p. 333.) leaves ovate-oblong, ending in an acute, cuspidate point, ciliated, pilose on the nerves beneath: upper ones connately perfoliate; flowers disposed in a verticillate terminal head; heads sessile: tube of corolla long: limb nearly equal. ♄. ⌒. H. Native of New Spain, in frigid places. Caprifòlium pilòsum, H. B. et Kunth, nov. gen. amer. 3. p. 427. t. 298. Flowers purple.

Pilose Honeysuckle. Shrub tw.

SECT. II. XYLÓSTEUM (ξυλον, *xylon*, wood, and οστεον, *osteon*, a bone; the wood of *L. xylósteum* is as hard as bone). D. C. fl. fr. ed. 3. vol. 4. p. 271. D. C. prod. 4. p. 333.—Xylósteon, Juss. gen. 212.—Lonicèra, Rœm. et Schultes, syst. 5. p. 19. —Xylósteon and Chamæcérasus, Tourn. inst. p. 609.—Xylósteum and Isìka, Adans, fam. 2. p. 501.—Cobæ'a, Neck. elem. no. 219. Pedicels axillary, 2-flowered, bibracteate at the apex. Berries twin, distinct, or joined together more or less, 3-celled in the young state, rarely 2-celled in the adult state; the limb of the calyx is generally deciduous, therefore the fruit is usually not crowned.—Climbing or erect shrubs. Leaves never connate.

§ 1. *Nintòoa* (*Nin-too* or *Sin-too* is the name of *L. Japónica* in China). *D. C. prod. 4. p. 333. Ovaria and berries altogether distinct. Stems scandent. Flowers irregular.*

16 L. MACRA'NTHA (D. C. prod. 4. p. 333.) branches twining, hispid; leaves ovate or oblong, rather cordate at the base, and acuminated at the apex, of an ash-grey colour and villous beneath, glabrous above, except along the nerves; peduncles axillary and terminal, 2-flowered, longer than the petioles, the whole forming an ample leafy raceme; calycine segments subulate, hispid; corolla very long. ♄. ⌒. H. Native of Nipaul, at Suembu, and of Silhet. Caprifòlium macránthum, D. Don, fl. nep. p. 140. Xylósteon scándens, Ham. mss. Lon. Japónica, Wall. in litt. and in Roxb. fl. ind. 2. p. 174. Leaves 3-5 inches long, shining above, and villous along the nerves and margins: beautifully reticulated, glaucous, villous, and hairy beneath. The flowers are at first snow-white and gradually changing into a beautiful yellow, acquiring thereby a peculiarly varied appearance. Berries nearly globular, smooth, deep purple, covered slightly with a pale bloom, crowned by the permanent villous calyx, 3-celled; cells 4-seeded. In Nipaul this species embellishes most of the forests, both in the valley and on the surrounding hills.

Large-flowered Honeysuckle. Fl. April, June. Shrub tw.

17 L. CONFU'SA (D. C. prod. 4. p. 333.) branches twining, pubescent; leaves ovate, acute, rounded at the base, downy on both surfaces as well as on the peduncles; peduncles axillary, longer than the petioles, 2-flowered, opposite, disposed in some-

hing like a thyrse at the tops of the branches; calycine segments ovate, and are as well as the corollas pubescent. ♄. ⌒. H. Native of Japan and China. Nintoòa confùsa, Sweet, hort. brit. ed. 2. Lonicèra Japónica, Andr. bot. rep. t. 583. Ker. bot. reg. t. 70. Delaun. herb. amat. t. 132. but not of Thunb. Nin-too Sin-too, Kæmpf. amœn. 5. p. 785. The flowers are snow-white at first, but gradually change to a golden yellow colour, hence it is called Sui-Kadsura and Kinginqua, i. e. gold and silver flowers, by the Japanese. Corolla about an inch long, bilabiate.

Confused Honeysuckle. Fl. July. Clt. 1805. Shrub tw.

18 L. LONGIFLÒRA (D. C. prod. 4. p. 333.) glabrous in every part; branches twining; leaves petiolate, oblong-lanceolate, shining above and pale beneath; peduncles short, 2-flowered, about the length of the petioles; tube of corolla very long and filiform: limb bilabiate. ♄. ⌒. H. Native of China and Nipaul. Caprifòlium longiflòrum, Sabine, ex Lindl. bot. reg. 1232. Nintòoa longiflòra, Sweet, hort. brit. ed. 2. Caprifòlium Japónicum, D. Don, prod. fl. nep. 140. Caprifòlium Nepalénse, G. Don, in Loud. hort. brit. 79. Flowers several inches long, at first snow white, but finally changing to a golden yellow colour.

FIG. 78.

Long-flowered Honeysuckle. Fl. July, Sept. Clt. 1826. Sh. tw.

19 L. JAPÓNICA (Thunb. fl. jap. p. 89.) stems twining, flexuous, hairy; branchlets opposite, very hairy, bearing 2 leaves and 2 sessile flowers at the top of each; leaves petiolate, ovate, acutish, villous, pale beneath: uppermost ones the smallest; corolla tubular, irregular, villous. ♄. ⌒. H. Native of China and Japan. Nintoòa Japónica, Sweet, hort. brit. ed. 2. L. Chinénsis, Wats. dend. brit. t. 117. L. flexuòsa, Lodd. bot. cab. 1037. Ker. bot. reg. 712. but not of Thunb. Leaves about an inch long. Corolla about an inch long, red, and villous on the outside and white inside, sweet-scented, equal in length to the stamens.

FIG. 79.

Japan Honeysuckle. Fl. July, Sept. Clt. 1806. Sh. tw.

20 L. JAVA'NICA (D. C. prod. 4. p. 334.) stem twining; leaves ovate or oval-oblong, acuminated, rounded at the base, ciliated, glabrous above, glaucous and tomentose beneath; peduncles 2-flowered, axillary, solitary, but so much crowded at the tops of the branches as to appear somewhat corymbose. ♄. ⌒. G. Native of Java, in woods on Mount Tjerimai. Caprifòlium Javánicum, Blum. bijdr. p. 653.

Java Honeysuckle. Shrub tw.

21 L. LOUREÌRI (D. C. prod. 4. p. 334.) climbing or twining; leaves ovate-oblong, acuminated, subcordate at the base, rather pilose on both surfaces; peduncles 2-flowered, axillary, solitary: those at the tops of the branches disposed in dense heads. ♄. ⌒. G. Native of Java, on the tops of Mounts Gede and Tjerimai. Caprifòlium Loureìri, Blum. bijdr. p. 653. Flowers white?

Loureiro's Honeysuckle. Shrub tw.

22 L. COCHINCHINE'NSIS; climbing or twining, much branched; leaves ovate, pubescent, small; peduncles 2-flowered, axillary; berries distinct, roundish. ♄. ⌒. H. Native of Cochin-china, among bushes and in hedges. L. Xylósteum, Lour. coch. p. 150. Tube of corolla very long; limb bilabiate: one of the lips 4-cleft and the other entire. Berry red. Flowers white.

Cochin-china Honeysuckle. Shrub tw.

23 L. TELFAI'RII (Hook. et Arn. in Beech. voy. pt. bot. p. 190.) branches twining, pubescent; leaves petiolate, oblong, acute, obtuse at the base or cordate, glabrous above in the adult state, and densely clothed with velvety pubescence beneath; peduncles bibracteate at the apex, 2-flowered, axillary, solitary, one half shorter than the petioles: the terminal ones forming a kind of head; calyx villous: with minute, ovate, acute teeth; tube of corolla elongated, equal, villous. ♄. ⌒. H. Native of China. Lonicèra Periclýmenum, Lour. coch. p. 150. Closely allied on the one hand to *L. confùsum*, D. C. from which it differs in the leaves being smooth above, and in the shorter peduncles, and on the other to *L. Leschenaúltii*, Wall. which, however, is said to have ovate-subcordate ciliated leaves; and villous branches.

Telfair's Honeysuckle. Shrub tw.

24 L. LESCHENAU'LTII (Wall. in Roxb. fl. ind. 2. p. 178.) branches twining; leaves ovate, subcordate, acute, quite entire, smooth above, hoary and villous beneath: with the margins ciliated; peduncles 2-flowered, axillary, solitary, or in terminal fascicles. ♄. ⌒. H. Native of the East Indies, on the Nelligherry Mountains, where it is called *Moulle Gueda* by the natives. Leaves 1-2 inches long; petioles villous. At the apex of each peduncle there is an involucrum, consisting of six unequal villous bracteas, which support the two flowers. Calycine teeth linear, villous. Corolla large, probably yellow; with a villous slender tube, about an inch in length; and a bilabiate limb, which is nearly as long as the tube; the upper lip consisting of 4 ovate, obtuse lobes; under lip deeply divided; throat villous. Ovarium ovate, villous. Stamens long.

Leschenault's Honeysuckle. Shrub tw.

25 L. GLABRA'TA (Wall. in Roxb. fl. ind. 2. p. 175.) glabrous in every part; branches twining; leaves ovate, acuminated, glaucous beneath, glabrous except on the nerves beneath, which are pubescent; peduncles axillary and terminal, short, villous, bearing towards the apex several opposite, approximate, very short, 2-flowered pedicels; tube of corolla rather short, cylindrical, widening at the apex; bracteas ovate. ♄. ⌒. H. Native of Nipaul, on the top of Sheopore, and from Kabelas in the valley. L. nìgra, Thunb. jap. p. 89. and in Lin. trans. 11. p. 330.? Bark of branches shining, brownish. Leaves 3-5 inches long, seldom obtuse at the base; the upper surfaces polished; petioles about half an inch long, surrounding the stem and branches with an elevated margin, as in *L. acuminàta*. Flowers yellow, smooth, with a purplish bloom on the outside, supported by a common involucrum, consisting of 6 very small, ovate, ciliated bracteas. Calycine segments subulate, ciliated. Tube of corolla about an inch long, widening at the apex into a bilabiate limb, which as well as the filaments and style are rather hairy: upper lip trifid, obtuse, the intermediate lobe retuse: the under lip oblong. Berries distinct, almost black, 3-celled; cells 4-seeded.

Smooth Honeysuckle. Shrub tw.

26 L. ACUMINA'TA (Wall. in Roxb. fl. ind. 2. p. 177.) branches twining, villous; leaves ovate to oblong, cordate, acuminated, slightly hairy, membranous; peduncles axillary, longer than the petioles, villous, 2-flowered; bracteas linear, acuminated, ciliated, longer than the ovaries; corolla not gibbous, funnel-shaped. ♄. ⌒. H. Native of the Himalaya, at Gosaingsthan.

Leaves 3-5 inches long: petioles half an inch long. At the apex of the peduncles there is usually an involucrum of 6 small bracteas, which are hairy. Flowers like those of *L. Xylósteum*, and about the same size; they are yellow, tinged with pale purple, slightly hairy on the outside. Calycine segments lanceolate, ciliated, bluntish. Style and filaments hairy.

Acuminate-leaved Honeysuckle. Shrub tw.

27 L. DIVERSIFÒLIA (Wall. in Roxb. fl. ind. 2. p. 178.) branches twining; leaves ovate, cuspidate, acute, or acuminated, rounded or subcordate at the base, pubescent above, villous beneath; peduncles axillary, shorter than the petioles, 2-flowered; calyx cup-shaped, acutely 5-lobed; corolla gibbous, funnel-shaped, villous; ovaries villous. ♄. ⌒. H. Native of the East Indies, on Mount Gurval. Branches villous. Leaves 3 inches long, on very short petioles. Peduncles smooth. Bracteas ciliated with long hairs. Flowers resembling those of *L. Xylósteum* both in size and colour.

Var. β, Royleàna (Wall. cat. no. 487. D. C. prod. 4. p. 334.) leaves oval; peduncles length of petioles. ♄. ⌒. H. Native of Nipaul, on Sirmore and Kamaon.

Diverse-leaved Honeysuckle. Shrub tw.

28 L. LIGUSTRÌNA (Wall. in Roxb. fl. ind. 2. p. 179.) branches slender, twining, covered with ash-grey, shining, smooth bark; young shoots villous; leaves ovate-lanceolate, hardly petiolate, shining, ciliated, obtuse at the base, acute at the apex; peduncles villous, axillary, very short, 2-flowered; limb of calyx truncate; berries distinct, and are as well as the ovaries covered by a common membrane. ♄. ⌒. H. Native of Nipaul, on the mountains, in woods. Xylósteum ligustrìnum, D. Don, prod. fl. nep. p. 140. X. Naisòca, Hamilt. mss. ex D. Don, l. c. Young shoots surrounded at the base with some lanceolate, acute, quadrifariously imbricated bud-scales. Leaves dark green above, pale and reticulated beneath; petioles villous. Bracteas 2 at the apex of each peduncle. Corollas yellowish-white, funnel-shaped, half an inch long; tube gibbous and pubescent at the base, villous within: limb nearly equal, spreading, divided into 5 ovate, obtuse, ciliated segments. Filaments smooth, about the length of the limb of the corolla. Ovaries distinct, 3 celled; cells 3-seeded.

Privet-leaved Honeysuckle. Shrub tw.

29 L. LANCEOLA'TA (Wall. in Roxb. fl. ind. 2. p. 177.) stems almost erect, bushy? leaves lanceolate, acuminated, hairy, acute at the base and glaucous beneath; peduncles axillary, longer than the petioles, and like them villous; berries distinct, globose, smooth; bracteas 2 linear and 4 ovate. ♄. H. Native of Nipaul, at Gosaingsthan. Stem covered with fibrous epidermis, probably erect. Branches slender, pubescent. Leaves pubescent above and shining, glaucous and hairy beneath, with somewhat repand margins. Petioles short. Berries the size and colour of black currants, smooth, crowned, 3-celled, supported by 2 linear and 4 ovate bracteas, the latter recurved and shorter.

Lanceolate-leaved Honeysuckle. Shrub erect?

30 L. CANE'SCENS (Schousb. mar. 1. p. 88.) branches twining, and are as well as the leaves canescent from down; leaves petiolate, ovate, cordate, bluntish; peduncles 2-flowered, longer than the petioles; bracteas and lobes of calyx oblong. ♄. ⌒. H. Native of hedges about Mogodor, and on Mount Trara in Mauritania; and of Sicily at Palermo. ex Guss. fl. sic. 1. p. 250. L. biflòra, Desf. fl. atl. 1. p. 184. t. 52. Corolla bilabiate, attenuated at the base, velvety on the outside. Berries nearly distinct.

Canescent Honeysuckle. Shrub tw.

§ 2. *Chamæcérasi* (The name signifies a kind of false cherry; the fruit of some of the species resemble cherries). *D. C. prod. 4. p. 335. Berries distinct, but usually connected together at the base, and diverging at the apex. Corolla hardly gibbous at the base or equal. Erect bushy shrubs.*

31 L. TATA'RICA (Lin. spec. 1. p. 247.) quite glabrous, erect; leaves cordate-ovate, hardly acute; peduncles shorter than the leaves; berries distinct while young, and nearly globose, but at length connate at the base. ♄. H. Native of Tartary. Pall. fl. ross. t. 36. Jacq. icon. rar. t. 37. Ker. bot. reg. t. 31. Guimp. abb. holz. t. 87. Xylósteum cordàtum, Mœnch, meth. p. 502. X. Tatáricum, Dum. Cours. Flowers rose-coloured, short, somewhat gibbous at the base. Fruit black, with one of the berries usually abortive. Bracteas 2, linear-setaceous. Peduncles 2-flowered.

Var. β, albiflòra (D. C. prod. 4. p. 335.) flowers white. L. Pyrenàica, Willd. baumz. p. 181.

Var. γ, rubiflòra (D. C. l. c.) flowers red. L. Sibírica, Hortul. ex Pers. ench.

Tartarian Honeysuckle. Fl. April, May. Clt. 1752. Sh. 4 to 6 feet.

32 L. CILIA'TA (Muhl. cat. p. 22.) erect; leaves ovate or oblong, cordate, thin, ciliated, villous beneath in the young state; peduncles elongated; bracteas 2, ovate, 3 times shorter than the ovaries, which are distinct; corolla bluntly spurred at the base: with short, nearly equal lobes; berries distinct, red, divaricate. ♄. H. Native of North America, on mountains among rocks, in rich soil; from Canada to Virginia, and throughout Canada to the Saskatchawan, frequent. Xylósteum ciliàtum, Pursh, fl. sept. amer. 1. p. 161. L. Tatárica, Michx. fl. amer. 1. p. 166. but not of Lin. L. Canadénsis, Rœm. et Schultes 5. p. 260. Flowers white, with a tinge of red or yellow; tube ventricose above; limb with short, acute segments. Style exserted. The variety β of Pursh is *Vaccínium álbum*.

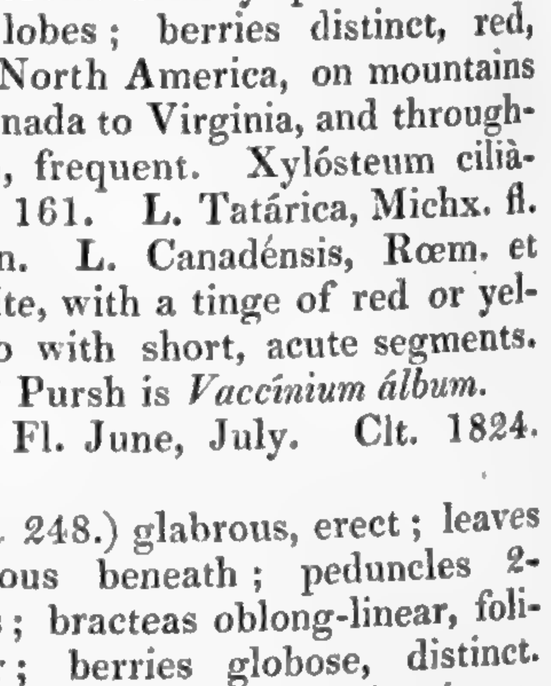
Ciliated-leaved Honeysuckle. Fl. June, July. Clt. 1824. Shrub 4 to 6 feet.

33 L. PYRENA'ICA (Lin. spec. p. 248.) glabrous, erect; leaves obovate-lanceolate, acute, glaucous beneath; peduncles 2-flowered, shorter than the leaves; bracteas oblong-linear, foliaceous; flowers almost regular; berries globose, distinct. ♄. H. Native of the Pyrenees, on calcareous rocks, in exposed situations. Duham. arb. 2. t. 110. ed. 2. vol. 1. t. 15. Magn. hort. p. 209. with a figure.—Caprifòlium Pyrenàicum, Lam. fl. fr. 3. p. 366.—Xylósteum, Tourn. inst. 609. Corolla white, twice the size of those of *L. Xylósteum*, funnel-shaped; limb 5-cleft, flat: with equal, ovate, obtuse segments.

Pyrenean Honeysuckle. Fl. May. Clt. 1739. Sh. 4 to 5 ft.

34 L. PUNI'CEA (Sims, bot. mag. t. 2469.) erect; leaves ovate, subcordate at the base, of the same colour on both surfaces: peduncles axillary and almost terminal, 2-flowered, shorter than the leaves; tube of corolla rather gibbous at the base; segments of corolla nearly equal, irregularly arranged, 3 one way and 2 another; berries distinct? ♄. H. Native country unknown. Symphoricárpos puníceus, Sweet. Flowers deep red or crimson. Leaves sometimes 3 in a whorl on the young shoots.

FIG. 80.



Crimson-flowered Honeysuckle. Fl. April, May. Clt. 1821. Shrub 2 to 4 feet.

35 L. XYLÓSTEUM (Lin. spec. 248.) erect, downy; leaves

ovate, acute, petiolate, soft; peduncles 2-flowered, shorter than the leaves; bracteas hairy, double: the 2 outer ones lanceolate, spreading: inner a small concave scale under each germ; berries oval, distinct, 1-celled, 6-seeded. ♄. H. Native nearly throughout the whole of Europe, even to Caucasus, in thickets, hedges, and rocky places, and by the sides of woods. In Britain in like situations; in the fissures of rocks under the Roman wall near Shewing-Reels, or rather Sewen-Rele, in Northumberland, plentiful; and certainly wild, in a coppice called the Hacketts, to the east of Houghton Bridge, 4 miles from Arundel, Sussex. Smith, engl. bot. t. 916. fl. græc. t. 223. Oed. fl. dan. t. 808. —Duh. arb. 1. p. 153. t. 59.—Riv. mon. irr. t. 120.—Mill. fig. 167. f. 1. Caprifòlium dumetòrum, Lam. fl. fr. 3. p. 367. Xylósteum dumetòrum, Mœnch. meth. p. 502. Flowers small, cream-coloured, downy. Calyx of 5 obtuse lobes. Berries scarlet. A shrub of little beauty and no known utility, though common in plantations. Stamens and styles villous. The wood is extremely hard.

Var. β, leucocárpa (D. C. prod. 4. p. 335.) berries white.—Duh. arb. ed. 2. vol. 1. p. 52.

Var. γ, xanthocárpa (D. C. l. c.) berries yellow.—Duham. l. c.

Var. δ, melanocárpa (D. C. l. c.) berries black.—Bauh. pin. 451.

Bony-wooded or Upright Fly Honeysuckle. Fl. July. Brit. Sh. 4 to 5 ft.

36 L. NÌGRA (Lin. spec. 247.) erect; leaves oval-oblong or elliptic, on short petioles, rather villous while young, but nearly glabrous in the adult state; peduncles 2-flowered, elongated, shorter than the leaves. ♄. H. Native of middle Europe, in subalpine woods, as in France, Switzerland, Austria, Silesia, Piedmont, &c. Jacq. aust. t. 314. Schmidt, arb. t. 110. Caprifòlium ròseum, Lam. fl. fr. 3. p. 368. Chamæcérasus nìgra, Delarb. fl. auv. ed. 2. p. 130.—Gesn. fasc. 37. t. 8. f. 48. Corolla reddish and pubescent on the outside, but whitish on the inside. Bracteas 4 under the ovaries: the 2 outer ones lanceolate: and the inner quadrifid. Berries black, globose, joined together at the side.

Black-fruited Honeysuckle. Fl. March, May. Clt. 1597. Shrub 3 to 4 feet.

37 L. HI'SPIDA (Pall. ex Willd. mss. Led. fl. ross. alt. ill. t. 212.) branches hispid; leaves ovate, ciliated, petiolate, glabrous on both surfaces; peduncles 2-flowered; bracteas ovate-elliptic, exceeding the berries. ♄. H. Native of Siberia, on the Altaian mountains. Branches opposite, glabrous or bristly, brownish. Leaves 2 inches or $1\frac{1}{2}$ inch long, and an inch broad, glabrous on both surfaces, cordate at the base. Flowers greenish white, pendulous. Berries distinct, purple.

Hispid Honeysuckle. Shrub 2 to 3 feet.

38 L. FLEXUO'SA (Thunb. in Lin. trans. 2. p. 330. but not of Lodd. nor Ker.) erect, branched; branches very villous at the apex; leaves ovate-oblong, acute, on short petioles, glabrous; petioles villous; nerves of leaves puberulous; flowers axillary, few, almost sessile; berries globose, glabrous. ♄. H. Native of Japan, L. nìgra, Thunb. fl. jap. p. 89. but not of Lin. L. brachýpoda, D. C. prod. 4. p. 335. Stems flexuous. Leaves about an inch long: upper ones the smallest. Peduncles hardly a line long. Berries distinct, ovate, acuminated, black.

Flexuous-stemmed Honeysuckle. Fl. June, July. Clt. 1806. Shrub 4 to 5 feet.

§ 3. *Cuphánthæ* (from *κυφος, kuphos*, a curve, and *ανθος, anthos*, a flower; in reference to the flowers being gibbous on one side at the base). *D. C. prod.* 4. *p.* 336. *Berries either distinct or joined together. Corollas very gibbous on one side at the base. Erect bushy shrubs.*

39 L. GIBBO'SA (Willd. mss. in Schultes, syst. 5. p. 257.) erect; leaves on very short petioles, ovate-oblong, acuminated, rounded at the base, pubescent beneath; peduncles 2-flowered, shorter than the leaves; bracteas linear, shorter than the ovaria; tube of corolla gibbous on the outer side at the base; berries almost globose, joined at the side. ♄. F. Native of Mexico, at Real del Monte, in woods. Xylósteum Mexicànum, H. B. et Kunth, nov. gen. amer. 3. p. 426. t. 297. Corolla scarlet; with the limb oblique and bluntly 5-lobed.

Gibbous-flowered Honeysuckle. Shrub 3 feet.

40 L. MOCINIA'NA (D. C. prod. 4. p. 336.) erect; leaves petiolate, elliptic-oblong, acuminated, obtuse at the base, pubescent beneath; peduncles 2-flowered, shorter than the leaves; bracteas oblong, acuminated, longer than the ovaria; tube of corolla gibbous above at the base; berries globose, joined together a little on the inner side. ♄. H. Native of Mexico. L. gibbòsa, Moc. et Sesse, fl. mex. icon. ined. Very nearly allied to *L. gibbòsa*, but differs in the corolla being yellowish: but when decayed of a blood colour, permanent, and jagged, with the bracteas spreading. Berries globose, dark purple.

Mocino's Honeysuckle. Shrub.

41 L. INVOLUCRA'TA (Banks, herb. ex Spreng. syst. 1. p. 759.) erect; branches acutely tetragonal; leaves ovate or oval, petiolate, membranous, beset with adpressed hairs beneath; peduncles axillary, 2-3-flowered; bracteas 4: 2 outer ones ovate: 2 inner broad, obcordate, at length widening, clothed with glandular pubescence; corollas pubescent, gibbous at the base on the outside; style exserted. ♄. H. Native of North-west America, between lat. 54° and 64° (but probably confined to the vicinity of the Saskatchawan), thence to the Rocky Mountains. Lindl. bot. reg. 1179. Xylósteum involucràtum, Richards. in Frankl. 1. journ. ed. 2. append. p. 6. Corolla yellowish, tinged with red.

Involucrated Honeysuckle. Fl. May. Clt. 1824. Sh. 2 to 3 ft.

42 L. LEDEBOU'RII (Eschsch. mem. act. soc. petersb. 10. p. 284. Hook. et Arn. in Beech. voy. pt. p. 145.) erect; branches elongated, acutely tetragonal; leaves ovate or oblong, somewhat acuminated, stiff, pubescent, tomentose on the nerves; peduncles axillary, 2-3-flowered; bracteas 4: 2 outer ones ovate: 2 inner broad-obcordate, pubescent, at length increasing in size; corollas gibbous at the base on the outside; berries distinct. ♄. H. Native of California. Cham. et Schlecht. in Linnæa. 4. p. 138. Very nearly allied to *L. involucràta* and hardly to be distinguished from it. Flowers yellow, tinged with red.

Ledebour's Honeysuckle. Shrub 2 to 3 feet.

§ 4. *Isìkæ* (a name employed by Adanson for this tribe of the genus *Lonicèra*, and is probably without a meaning). *D. C. prod.* 4. *p.* 336. *Berries 2 on each peduncle, joined together in one, which is biumbilicate at the apex.—Erect bushy shrubs.—Isìka, Adans. fam.* 2. *p.* 501.—*Isìca, Mœnch. meth. p.* 504.

43 L. ALPI'GENA (Lin. spec. 248.) erect; leaves oval-lanceolate or elliptic, acute, glabrous, or pubescent, on very short petioles, rather ciliated; peduncles 2-flowered, shorter than the leaves; corollas gibbous at the base. ♄. H. Native of middle and south Europe, in subalpine places of mountains. Jacq. fl. aust. t. 274.—Duh. arb. ed. 2. vol. 1. t. 16.—Mill. fig. t. 167. f. 2. Caprifòlium alpìnum, Lam. fl. fr. Caprifòlium Alpígenum, Gærtn. fr. 1. p. 136. Isìka Alpígena, Börck, Isìca lùcida, Mœnch. Chamæcérasus Alpígena, Delarb.—Lob. icon. 173. Corolla greenish yellow, tinged with red or purple. Berries red, size and appearance of those of a cherry; hence it is called *Cherry woodbine* by Jonstone. Leaves large.

Var. β, Sibírica (D. C. prod. 4. p. 336.) lower leaves rather

cordate; peduncles thickened a little under the flowers. ♄. H. Native of Siberia. L. Sibírica, Vest. in Rœm. et Schultes, syst. 5. p. 259.

Alpine Honeysuckle. Fl. April, May. Clt. 1596. Shrub 3 to 5 feet.

44 L. microphy'lla (Willd. rel. in Rœm. et Schultes, syst. 5. p. 258.) leaves elliptic, acute at both ends, glaucous beneath; peduncles 2-flowered. ♄. H. Native of Eastern Siberia. Led. fl. ross. alt. ill. t. 213. L. Alpígena, Sievers. The epidermis falls from the branches. Leaves rather villous on both surfaces, sometimes rounded at the base. Peduncles shorter than the leaves. Corollas greenish, yellow. Berries joined, of a reddish orange colour.

Small-leaved Honeysuckle. Clt. 1818. Shrub 3 to 4 feet.

45 L. Webbia'na (Wall. cat. no. 476. D. C. prod. 4. p. 336.) erect; leaves ovate-oblong, acuminated, obtuse at the base, on very short petioles, pilose along the nerves, and ciliated on the margins; peduncles 2-flowered, 3 times shorter than the leaves; berries semi-concrete. ♄. H. Native of the East Indies, in Sirinagur. Habit almost of *L. Alpígena*, but differs in the leaves being pilose and ciliated, in the peduncles being equal in length to the internodes, not longer than them, &c. Corolla unknown.

Webb's Honeysuckle. Shrub 3 to 4 feet.

46 L. Govania'na (Wall. cat. no. 481. D. C. prod. 4. p. 337.) erect; leaves elliptic or lanceolate, acute at both ends, membranous, glabrous; peduncles 2-flowered, 3 times longer than the petioles, but 4 times shorter than the leaves; bracteas linear, length of ovarium; corollas gibbous at the base; berries joined. ♄. H. Native of the East Indies, in Sirmore, where it was collected by Mr. Govan. Allied to *L. Alpígena*, but the leaves are much thinner, the petioles longer, the flowers smaller and sometimes solitary by abortion.

Govan's Honeysuckle. Shrub 3 to 4 feet.

47 L. angustifo'lia (Wall. cat. no. 480. D. C. prod. 4. p. 337.) erect; leaves oblong-lanceolate, acuminated, glabrous; peduncles 2-flowered, a little shorter than the leaves; bracteas linear, twice the length of the ovaria; berries joined together completely; corollas nearly equal, pubescent on the outside. ♄. H. Native of Nipaul, in Kamaon, and of Sirmore. Branches numerous, smooth. Leaves 15 lines long and 4 lines broad, pale and glaucous beneath; petioles 2-3 lines long. Corolla pale, 4 lines long.

Narrow-leaved Honeysuckle. Shrub 3 to 4 feet.

48 L. oblongifo'lia (Hook. fl. bor. amer. 1. p. 284. t. 100.) erect; leaves oblong or oval, clothed with velvety pubescence beneath; peduncles elongated, erect; bracteas obsolete; tube of corolla hairy, gibbous at the base on one side; limb unequal, deeply bilabiate: the upper lip 4-toothed, and the lower one nearly entire; berries joined in one, which is biumbilicate at the top, bluish black in the dried state. ♄. H. Native of North America, in the island of Montreal, in the St. Lawrence; about Montreal, Lake Winnipeg, and of the western parts of the state of New York. Xylósteum oblongifòlium, Goldie, in edinb. phil. journ. 6. p. 323. Corolla hairy, yellow? Berries bluish black, size of a pea.

Oblong-leaved Honeysuckle. Fl. April, May. Clt. 1823. Shrub 4 feet.

49 L. cæru'lea (Lin. spec. 249.) erect; leaves oval-oblong, ciliated, stiffish, densely clothed with pubescence while young; peduncles short, 2-flowered, reflexed in the fructiferous state; bracteas 2, subulate, longer than the ovaria; tube of corolla glabrous, short, gibbous on one side at the base: lobes of limb short, nearly equal; berries closely joined in one which is biumbilicate at the apex. ♄. H. Native of Europe, in France, Switzerland, and Austria, &c. on the mountains. Throughout the woody country of British North America, and as far as lat. 66° to the mountains in the west, Labrador and Newfoundland, Hudson's Bay; in the states of New York, Massachusets, New Hampshire; and of Siberia, and Kamtschatka. Jacq. fl. aust. 5. append. t. 17. Sims, bot. mag. t. 1965. L. villòsa, Muhl. cat. p. 22. Hook. et Arn. in Beech. voy. pt. bot. 1. p. 115. Xylósteon villòsum, Michx. fl. bor. amer. 1. p. 106. Richards, in Frankl. 1st journ. ed. 2. append. p. 6. X. Solònis, Eaton. man. bot. p. 518. L. velutìna, D. C. prod. 4. p. 337. L. Altàica, Pall. fl. ross. t. 37. Xylósteum cærùleum Canadénse, Lam. dict. 1. p. 731. X. Canadénse, Duham. arb. 2. p. 373. Caprifòlium cærùleum, Lam. fl. fr. Chamæcérasus cærùlea, Delarb. fl. auv. L. Pyrenàica, Pall. fl. ross. p. 58. L. Pallàsii, Led. fl. ross. alt. ill. t. 131. Flowers greenish yellow, tubular. Berries elliptic or globose, dark blue, and covered with a kind of bloom. Bark of young branches purplish. There is no difference between the American and European plants of this species.

Blue-berried Honeysuckle. Fl. Mar. April. Clt. 1629. Shrub 3 to 5 feet.

50 L. orienta'lis (Lam. dict. 1. p. 731.) erect; leaves on very short petioles, ovate-lanceolate, acute, quite entire, smoothish; peduncles 2-flowered, shorter than the leaves; bracteas 2, setaceous; berries joined in one, somewhat didymous and biumbilicate at the apex, 10-seeded. ♄. H. Native of Iberia and Asia Minor, in woods. Bieb. fl. taur. et suppl. no. 396. L. Caucásica, Pall. fl. ross. 1. p. 57. L. cærùlea, Güld. itin. 1. p. 423. ex Pall. Chamæcérasus orientàlis laurifòlio, Tourn. cor. p. 42. Berries black (Lam. Bieb.), dark blue (Pall.). Leaves stiffish, veiny, larger than in *L. cærùlea*. Flowers greenish yellow. This is perhaps nothing more than *L. cærùlea*.

Oriental Honeysuckle. Fl. April, June. Clt. 1825. Shrub 3 to 5 feet.

51 L. Ibe'rica (Bieb. fl. taur. and suppl. 395.) erect; leaves petiolate, cordate, roundish, tomentose or pubescent; peduncles 2-flowered, shorter than the leaves; bracteas oblong, ciliated; berries joined together to the middle, globose. ♄. H. Native of Iberia, about Tiflis and at the Derwent. Stev. mem. soc. mosc. 3. p. 257. Xylósteon Ibéricum, Bieb. cent. pl. rar. 1. t. 13. ex suppl. Corollas lurid, form of those of *L. Alpígena*, Ovarium tomentose. Berries blood-coloured. Leaves like those of *Cotoneáster vulgàris*.

Iberian Honeysuckle. Fl. April, May. Clt. 1824. Shrub 3 to 4 feet.

† *Species not sufficiently known.*

52 L. quinquelocula'ris (Hardw. asiat. res. 6. p. 351. ex fl. ind. 2. p. 174.) shrub bushy; leaves petiolate, elliptic, acute, quite entire; peduncles short, 2-flowered; berries 5-celled. ♄. H. Native of the East Indies, in valleys about Shreenagur. Very like *L. ligustrìna*, Wall. but differs in the 5-celled fruit, and is therefore probably a species of *Leycestèria*.

Five-celled-fruited Honeysuckle. Shrub.

53 L. corymbo'sa (Lin. spec. p. 249.) leaves ovate, acute; corymbs terminal. ♄. F. Native of Chili, near Conception, where it is called *Ytiu*. Itiu. Feuill. obs. 2. p. 760. t. 45. Loránthus Utùi, Molina, sagg. chil. p. 139. ex Schultes, syst. 7. p. 161. Frœlíchia violàcea, Spreng. syst. 1. p. 406. but the plant does not belong to *Rubiàceæ*, according to Bertero, in merc. chil. 1829. may. p. 611. nor *Loranthàceæ*, in consequence of the fruit being many-seeded. But from the flowers being 4-cleft, it is probably a genus of the present order. Leaves an inch broad, fine green. Corolla blood-coloured; and calyx 4-cleft to the middle. Stamens 4. Style yellow. Fruit form and colour of an olive; with sweetish flesh.

Corymbose-flowered Honeysuckle. Shrub 12 feet.

54 L. quadrifo'lia (Willd. spec. 1. p. 986.) stem unknown;

leaves 4 in a whorl, ovate-lanceolate, glabrous, bluntish; peduncles twin, 2-flowered, length of leaves; bracteas 2, linear; berries distinct. ♄. H. Native country unknown. Corollas like those of *L. Xylósteum*, but having the tube narrower.

Four-leaved Honeysuckle. Shrub.

Cult. All the species of honeysuckle are truly ornamental, particularly the climbing and twining species, which are well adapted for training on trellis work or arbours, or against walls. The greenhouse twining kinds have a fine appearance, trained on the rafters. The upright hardy species are well fitted for decorating shrubberies. They all grow well in any common garden soil, and are easily increased by cuttings taken off in autumn, and planted in a sheltered situation: those of the tenderer kinds under a hand-glass.

VI. LEYCESTE'RIA (named by Dr. Wallich after his friend William Leycester, formerly Chief Judge of the principal native court under the Bengal Presidency, who during a long series of years and in various distant parts of Hindoostan, has pursued every branch of horticulture with a munificence and zeal and success, which abundantly entitle him to that distinction). Wall. in Roxb. fl. ind. 2. p. 181. pl. rar. asiat. 2. p. 21. t. 120.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an ovate tube and an unequally 5-parted, permanent limb; segments unequal, small, linear, glandularly ciliated. Corolla funnel-shaped, having the tube gibbous above the base, and the limb campanulate, and divided into 5 ovate, nearly equal lobes. Stamens 5; filaments exserted. Stigma capitate. Berry roundish, crowned by the calyx, 5-celled; cells many-seeded. Seeds smooth, shining, ovate. Albumen fleshy. Embryo minute, terete, centripetal.—A beautiful large rambling shrub, with elongated fistular branches, which rise from scaly buds. Leaves opposite, ovate-lanceolate, acuminated, petiolate, smooth, entire, membranous, glaucous, with an obtuse, subcordate base; petioles pilose. Flowers white, with a tinge of purple, middle-sized and sessile, in fascicles, disposed in approximate whorls of fives and sixes, the whole forming short leafy drooping racemes, which terminate the branches and branchlets. Bracteas large, foliaceous, purplish, pubescent, and ciliated, lanceolate, acuminated, surrounding the rachis with their concave bases; there are generally 6 under each whorl of flowers, of which the 2 outer ones are 2 or 3 inches long, rounded, and generally connate at the base: the inner ones much smaller; those at the base of the racemes considerably larger than the rest. Berries deep purple, approaching to black, as large as a common-sized gooseberry; pulp very soft; cells 8-10-seeded.—This genus appears to be intermediate between the present order and *Rubiàceæ*, but from the last it is distinguished in the want of stipulas.

1 L. formo'sa (Wall. in Roxb. fl. ind. 2. p. 182.). ♄. H. Native on the highest mountains, surrounding the valley of Nipaul; and of the much more northerly situations towards Gosaingsthan. It is also found at an elevation of seldom less than 8000 feet above the plains, among the pine and oak forests of Bishupur, as at Huttoo and Desoo in the Thakooraee of Kioonthul, blossoming from June to August, and called by the natives *Nulkuroo.* Hamèlia connàta, Puerari, mss. Dr. Govan remarks, with great propriety, that this is a most beautiful shrub when in blossom, from the contrast of the deep green hue of its stem and leaves with the purple colour of the large bracteas and the berries.

Showy Leycesteria. Fl. June, Aug. Clt. 1824. Sh. rambl.

Cult. This elegant shrub grows best in a light soil; and it is easily increased by cuttings planted in autumn or spring, or by seeds which ripen in abundance. It is well fitted for decorating the front of shrubberies; but being rather tender, should be protected in winter by a mat, or the haulm of herbaceous plants.

VII. SYMPHORICA'RPOS (from *συμφορεω, symphoreo*, to accumulate, and *καρπος, karpos*, a fruit; the shrubs bear clusters of united fruit). Dill. elth. p. 371. Juss. gen. 211. Mœnch, meth. 502. D. C. prod. 4. p. 338.—Symphoricárpa, Neck. elem. p. 220.—Symphòria, Pers. ench. 1. p. 214.—Anisánthus, Willd. rel.—Lonicèra species Linnæus.

Lin. syst. *Pentándria, Monogy'nia.* Tube of calyx globose (f. 81. *c.*); limb small, 4-5-toothed. Corolla funnel-shaped (f. 81. *e.*), almost equally 4-5-lobed. Stamens 5, hardly exserted. Stigma semi-globose. Ovarium adnate, 4-celled; fertile cells containing only one ovulum each; and the sterile ones few ovula. Berry 4-celled, crowned by the calyx (f. 81. *c.*), having 2 of the cells empty, and the other 2 containing one seed each. —Erect elegant bushy oppositely branched shrubs. Leaves oval, quite entire. Peduncles short, axillary, one or many flowered. Flowers bibracteate, small, white or rose-coloured, on short pedicels.

1 S. vulga'ris (Michx. fl. bor. amer. 1. p. 100.) flowers disposed in axillary capitate clusters, composed of nearly sessile racemules. ♄. H. Native of Virginia, Carolina, and Pennsylvania, in sandy dry fields. Lonicèra symphoricárpos, Lin. spec. 249. S. parviflòra, Desf. cat. Symphòria conglomeràta, Pers. ench. 1. p. 214. Symphòria glomeràta, Pursh, fl. amer. sept. 1. p. 162.—Schmidt. arb. t. 115.—Dill. elth. t. 278. f. 360.—Hort. ang. 85. t. 20. Corolla white. Berries red, size of hemp seed; but according to Pursh the flowers are small, red, and yellow; and the berries purple. Branches brown, smooth. Leaves elliptic, ovate, obtuse, glaucous, and pubescent beneath. The berries are cup-shaped, and ripen in winter.

Common St. Peter's-wort. Fl. Aug. Sept. Clt. 1730. Shrub 3 to 6 feet.

2 S. racemòsus (Mich. fl. bor. amer. 1. p. 107.) flowers disposed in nearly terminal loose interrupted racemes, which are often leafy; corolla densely bearded inside; style and stamens inclosed. ♄. H. Native of North America; on mountains near Lake Mistassins; on the banks of the Missouri; of Upper Canada; abundant about the Saskatchawan; on the banks of the Columbia, and at Puget's Sound, and Nootka Sound, north-west coast. Symphòria racemòsa, Pursh, fl. amer. sept. 1. p. 162. Sims, bot. mag. 2211. Lodd. bot. cab. t. 230. S. leucocárpa, Hort. Leaves glaucous beneath. Corolla rose-coloured. Berries large, white. This is a fine shrub, very common in our gardens, easily known by its large white berries, and small red flowers. The S. elongàta and S. heterophýlla, Presl, in herb. Hænke, which were collected about Nootka Sound, do not differ from this species, in which the lower leaves are sometimes deeply sinuated.

FIG. 81.

Racemose-flowered St. Peter's-wort or Snow-berry. Fl. July, Sept. Clt. 1817. Shrub 4 to 8 feet.

3 S. occidenta'lis (Richards, in Frankl. 1st journ. ed. 2. append. p. 6.) spikes dense, terminal, and axillary, drooping; corolla and segments densely bearded inside; style and stamens a little exserted. ♄. H. Native of British North America, in the woody country, between lat. 54° and 64°, and known under the name of *wolf-berry;* abundant about the Saskatchawan and Red River; and about Fort Vancouver, on the Columbia. According to Dr. Richardson this species comes very near *S. racemòsus*, but is distinguished by the larger, less glaucous,

more rigid, and denser foliage, and by the flowers being arranged in dense drooping spikes, larger than in *S. racemòsus*, and by the prominent style and stamens.

Western St. Peter's-wort. Shrub 4 to 6 feet.

4 S. microphy'llus (H. B. et Kunth, nov. gen. amer. 3. p. 424.) flowers axillary, solitary; leaves roundish-ovate, bluntish, pubescent. ♄. F. Native of Mexico, in the temperate parts near Moran, at the altitude of 4000 feet. Symphòria microphýlla, Willd. in Schultes, syst. 1. p. 757. Anisánthus microphýllus, Willd. in Schultes, syst. 5. p. 223. Corolla white.

Small-leaved St. Peter's-wort. Shrub 4 to 6 feet.

5 S. glauce'scens (H. B. et Kunth, l. c. p. 424. t. 295.) flowers axillary, solitary; leaves elliptic, acute, somewhat mucronate, smoothish. ♄. F. Native of Mexico, on the mountains near Santa Rosa, at the elevation of 4000 feet. Symphòria montàna, Spreng. syst. 1. p. 757. Leaves glaucescent beneath.

Glaucescent St. Peter's-wort. Shrub 3 to 4 feet.

Cult. *Symphoricárpos* is a genus of very beautiful and delicate shrubs, well adapted for shrubberies or borders. They grow in any common garden soil; and are easily increased by cuttings, which should be planted either in autumn or spring.

VIII. ABE'LIA (named by Mr. Brown after Clarke Abel, M. D. physician to the embassy to China under Lord Amherst; he collected and brought home many interesting plants). R. Br. car. and descript. pl. Abel, 1818. in 4to. p. 5. with a figure. D. C. prod. 4. p. 339.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with an oblong tube, and a 2 or 5-parted foliaceous limb: the segments oblong. Corolla tubular, funnel-shaped, 5-lobed: lobes ovate, nearly equal. Stamens 4, didynamous or nearly equal. Stigma capitate. Ovarium 3-celled; 2 of the cells contain many ovula, but all become abortive, and the third contains only one ovulum, which comes to perfection. Pericarp 1-seeded, indehiscent, crowned by the foliaceous limb of the calyx.—Decumbent or weak glabrous shrubs. Leaves petiolate, dentately crenated. Peduncles axillary, trichotomous or trifid, or terminal and undivided. Involucrum 2 or many flowered, composed of 6 or more leaves.

1 A. Chine'nsis (R. Br. l. c.) involucrum 2-flowered; peduncles trichotomous; stamens exserted. ♄. G. Native of China, in the province of Kiang-si at the Lake Po-Yang, where it was collected by Dr. Clarke Abel. Tube of corolla 5-nerved: 4 of the nerves approximate, and the fifth remote. Ovarium having one nerve on one side, and 4 on the other. Leaves ovate, finely pubescent.

China Abelia. Shrub 2 to 3 feet?

2 A. triflòra (R. Br. in Wall. pl. asiat. rar. 1. p. 14. t. 15.) flowers by threes, forming terminal corymbs: lateral flowers furnished with 3 bracteas: middle one sessile, naked; calyx 5-parted: the segments foliaceous, linear, and ciliated; leaves ovate-lanceolate, acuminated, quite entire, ciliated with hyaline hairs. ♄. G. Native of the East Indies, on the highest mountains of Northern and Western Kamaon towards the Himalaya, where it is called *Kumki*. Flowers pale red, delightfully fragrant.

Three-flowered Abelia. Tree small.

3 A. uniflòra (R. Br. in Wall. pl. asiat. rar. p. 15.) peduncles 1-flowered, tribracteate. ♄. G. Native of China.

One-flowered Abelia. Shrub.

Cult. A mixture of loam, peat, and sand will be a good soil for the species of *Abèlia;* and they may be easily increased by cuttings planted in any light soil, with a hand-glass placed over them.

IX. LINNÆ'A (this little northern plant, long overlooked, depressed, abject, flowering early, Linnæus selected to transmit his own name to posterity). Gron. in Lin. gen. no. 774. Juss. gen. 211. D. C. prod. 4. p. 340.—Obolària, Sieg. prim. p. 79. —Campánula spec. C. Bauh. Tourn. &c.

Lin. syst. *Didynàmia, Angiospérma.* Calyx double, superior one of one leaf; in 5 deep, erect, lanceolate, acute, equal segments (f. 82. *b.*). Corolla bell-shaped (f. 82. *d.*); tube cylindrical, gradually dilated upwards, about twice the length of the superior calyx; limb divided into 5 deep, nearly equal, slightly spreading segments (f. 82. *d.*). Stamens 4, inclosed, didynamous (f. 82. *f.*); the 2 uppermost ones the shortest. Ovarium globular, of 3 cells. Style cylindrical, gently swelling upwards, declining longer than the corolla (f. 82. *e.*); stigma obtuse. Berry dry, ovate-oblong, of 1-cell, membranous, closely invested with the inferior calyx, and crowned with the superior one. Seed solitary, filling the cavity.—A trailing, somewhat shrubby plant, of an elegant aspect, and rendered most interesting to a botanist on account of the name given, with the concurrence of Linnæus, by his friend Dr. J. F. Gronovius.

FIG. 82.

1 L. borea'lis (Lin. spec. 880.) ♄. H. Native of Lapland, Sweden, Norway, Russia, Germany, Switzerland, Savoy, Siberia, &c., in dry, stony, shady, mossy, fir woods, on the mountains. In Scotland the plant was first found in an old fir wood at Inglismaldie, on the borders of Mearnshire in 1795; it has since been found in several similar situations in the highlands of Scotland. In North America in several parts, as in the states of New England, New Hampshire, Vermont, but more particularly in Canada throughout the woody country from Lake Huron to the Arctic circle; and from Newfoundland and Labrador on the east to the Columbia, Unalaschka, and Kotzebue's Sound on the west. Lin. fl. suec. p. 219. t. 1. fl. lapp. ed. 2. p. 214. t. 12. f. 4. Smith, engl. bot. t. 433. Wahl. fl. lapp. 170. t. 9. f. 3. Oed. fl. dan. t. 3.—A trailing, subshrubby, creeping, and evergreen plant, forming broad leafy patches; the young shoots hairy and leafy. Leaves roundish or ovate, firm, crenate in the fore part, slightly hairy, and of a full green above, paler beneath. Peduncles axillary, about a finger in length, bearing each 2 elegant, pendulous, flesh-coloured flowers at the apex, which are said to be very fragrant at night. A pair of very small leaves stand at the origin of the partial flower-stalks, or pedicels, and there is often a larger pair or two at the lower part of each peduncle. Corolla variegated internally with rose colour and yellow. The American plants are generally stronger than the European ones.

Northern Linnæa. Fl. May, June. Scotland. Pl. trailing.

Cult. This elegant little trailing evergreen shrub will not grow in cultivation unless in a peat border, where it will thrive and flower freely; and most so if the border is in a shady situation. It is sometimes grown in large pots or pans, filled with peat earth, and grows luxuriantly. It is easily increased by separating the creeping stems when rooted.

† *Genera allied to Caprifoliàceæ, but are not sufficiently known.*

X. AI'DIA (from *αιδιος, aidios*, perpetual; in reference to the durability of the wood of this tree). Lour. coch. p. 143. D. C. prod. 4. p. 340.

Lin. syst. *Pentándria, Monogýnia.* Tube of calyx adnate

to the ovarium; limb 5-toothed, erect. Corolla superior, salver-shaped, with a woolly throat and a 5-parted limb: the segments lanceolate. Anthers 5, linear, inserted in the recesses between the segments of the corolla. Style equal in length to the stamens; stigma ovate-oblong. Berry ovate, umbilicate, 1-seeded.—A large tree, with very durable wood and spreading branches. Leaves opposite, lanceolate, quite entire, glabrous. Racemes axillary, short, loose. Flowers white.

1 A. COCHINCHINE'NSIS (Lour. l. c.) ♄. G. Native of Cochinchina. The wood of this tree is white and heavy, composed of thick fibres; and is used for the purpose of forming the foundation of bridges, being imperishable either by being under water or under ground.

Cochinchina Aidia. Tree large.

Cult. Any common soil will suit this tree; and cuttings will be easily rooted if planted under a hand-glass.

XI. VALENTIA'NA (meaning unknown to us). Rafin. speech. 1. p. 87. D. C. prod. 4. p. 340.

LIN. SYST. *Tetrándria, Monogýnia.* Tube of calyx adnate to the ovarium; limb 8-cleft. Corolla tubular: with a 5-cleft nearly equal limb. Stamens 4, epipetalous, nearly equal. Style filiform: stigma 2-lobed. Fruit 2-celled?—A twining shrub. Leaves opposite, petiolate, somewhat sagittate, a little serrated, acute. Flowers axillary, solitary, bibracteate; bracteas cordate, winged on the outside.—This genus is said by Rafinesque to be allied to *Linnæ'a*, but the plant is wholly unknown to other botanists.

1 V. VOLU'BILIS (Rafin. l. c.) ♄. ◠. G. Native of Abyssinia.

Twining Valentiana. Shrub tw.

Cult. See *Aìdia*, p. 452. for culture and propagation. The plant is well fitted for training up the rafter in a green-house.

XII. KARPA'TON (meaning unknown to us). Rafin. fl. lud. p. 78. D. C. prod. 4. p. 340.

LIN. SYST. *Diándria, Monogýnia.* Tube of calyx adhering to the ovarium; limb 4-toothed. Corolla tubular, 4-cleft, bilabiate. Stamens 2; anthers 2-lobed: lobes remote. Style under the upper lip of the corolla; stigma simple. Capsule crowned by the calyx, 1-celled? 4-seeded. Stem herbaceous? angular; branches fastigiate. Leaves opposite, sessile, oblong, hastate, unequally toothed at the base, acuminated, glabrous. Flowers small, sessile, disposed in whorls. According to the author it is allied to *Diervílla*, but the genus is entirely unknown to any other author.

1 K. HASTA'TUM (Rafin. l. c.) ♃. H. Native of Louisiana. Anónyma, Rob. voy. p. 457.

Hastate-leaved Karpaton. Pl.?

Cult. This plant will grow best in a border of peat earth, and may probably be increased by dividing at the root.

ORDER CXXX. RUBIA'CEÆ (this order contains plants agreeing with *Rùbia* in important characters). Juss. gen. p. 196. D. C. ann. mus. 9. p. 216. prod. 4. p. 341. prop. med. ed. 2. p. 168. Juss. mem. mus. 6. p. 365. Cham. et Schlecht. in 3. p. 220. and 310. and vol. 4. p. 1. 30. and 179.—Aparìnes, Adans. fam. 2. p. 140.—Stellàtæ and Contórtæ genera of Lin.

Tube of calyx adhering to the ovarium (f. 94. *e.* f. 97. *g.*); limb variable, truncate (f. 93. *a.*), or of many lobes, usually regular; the sepals or lobes equal in number to the petals (f. 84. *c.*), very rarely intermixed with accessory teeth. Corolla gamopetalous, inserted in the upper part of the tube of the calyx, usually with a 4-5 lobed limb (f. 93. *b.* f. 84. *c.*), rarely with a 3 or 9-parted limb (f. 101. *b.*); the tube either short (f. 84. *b.*) or long (f. 92. *c.*); the lobes or segments twisted or valvate in æstivation. Stamens equal in number to the segments of the corolla, alternating with them, and more or less adnate to its tube (f. 83. *g.* f. 91. *b.*). Anthers oval, 2-celled (f. 111. *c.*), bursting inwardly. Ovarium situated within the calyx, and adhering to it (f. 94. *e.* f. 103. *g. f.*), usually 2 (f. 94. *c.*) or many celled (f. 103. *g.*), rarely 1-celled by abortion: always crowned by a fleshy urceolus, or the limb of the calyx (f. 103. *f.*). Style one, rising from the urceolus (f. 83. *d.*); stigmas usually 2, distinct (f. 105. *c.*), or more or less combined (f. 83. *e.*), rarely more than 2. Fruit baccate (f. 107. *h.*), capsular (f. 95. *k.*), or drupaceous (f. 103. *g.*), 2 (f. 94. *c.*) or many celled (f. 103. *g.*); cells 1-2 or many seeded. The seeds, where they are solitary in the cells, are sometimes fixed by the apex, but usually by the base; but where they are numerous in the cells, they are fixed to a central placenta, and are usually horizontal. Albumen large, horny or fleshy. Embryo straight, or a little curved, inclosed in the middle of the albumen; with a terete radicle turned towards the hilum; and foliaceous cotyledons.—Trees, shrubs, and herbs, with terete or tetragonal branches. Leaves simple, girded by a marginal nerve, and therefore quite entire, opposite or verticillate, always bistipulate. Stipulas variable in cohesion and form, interpetiolar or intrafoliaceous. Flowers arranged in various ways, but usually in panicles or corymbs, rarely unisexual by abortion.

This well marked order is nearly allied to *Compósitæ*, from which its distinct stamens, bilocular, and plurilocular ovarium and inflorescence, distinguish it, and consequently it participates in all the relation of that extensive order. From *Apocýneæ* in the æstivation of the corolla, the presence of stipulas, and the inferior ovarium distinguish it, yet, according to Mr. R. Brown, there exists a genus in equinoxial Africa which has the interpetiolar stipulas and seeds of *Rubiàceæ* and the superior ovarium of *Apocýneæ*, thus connecting these two orders, Congo, p. 448. There is a striking affinity between *Rubiàceæ* and *Caprifoliàceæ* in the monopetalous tubular corolla, definite stamens, inferior ovarium, and opposite leaves, which is confirmed by the corolla of the latter being occasionally regular or irregular. The tribe *Operculariècæ*, referred to this order by Mr. R. Brown (Congo, p. 447.) and others (A. Rich. elem. ed. 4. p. 483.), is remarkable for having but 1-seed, and the number of stamens unequal to the lobes of the corolla, and therefore occupies an intermediate station between the *Rubiàceæ* and *Dipsàceæ*. The tribe *Stellàtæ* is distinguished from the rest of the order in the stipulas being as large as the leaves, and of the same form and consistence, having from 1-3 between each leaf on both sides, forming with them a kind of star or whorl, from which circumstance the name stellate is applied. The leaves in this tribe can only be distinguished from the stipulas by the axillary buds.

Powerful febrifugal or emetic qualities are the grand features of this order, the most efficient products of which in these two respects are *Quinquina* and *Ipecacuanha*. The febrifugal properties depend upon the presence of a bitter tonic astringent

principle, which exists in great abundance in the bark; those of *Cinchòna* are known to depend upon the presence of two alkalies, called cinchonine and quinine, both of which are combined with kinic acid; two principles which, though very analogous, are distinctly different, standing in the same relation to each other as potass and soda. Turner, p. 648. Dr. Sertürner has obtained some other vegato-alkalies from *Cinchòna*, one of which he calls chinioidia. Brande, journ. 12. p. 417. new series. The existence of this is denied by M. M. Neury and Delondre, ibid, July, 1830, p. 442. A detailed account of the qualities, synonymes, and commercial names of the species of *Cinchòna* is given in Mr. Lambert's work on the genus Cinchòna, 4to. London, 1821. In the same work is the translation of Baron Humboldt's account of the Cinchòna forests of South America. Three species of *Cinchòna*, *the C. ferrugínea*, *C. Vellòsii*, and *C. Remijiàna*, are found in Brazil, where they are used for the same purposes as the Peruvian bark, to which, however, they are altogether inferior. St. Hil. pl. usuel. bras. no. 2. The French Guiana bark possesses properties analogous to those of *Cinchòna*, and is obtained from *Portlándia hexándra* the *Coutàrea speciòsa*, Aublet. Humb. cinch. forest. p. 43. The Quinquina Pitou and Quinquina des Antilles are produced by species of the genus *Exostémma*, and are remarkable for possessing properties similar to those of the true Quinquina, but without any trace of either cinchonine or quinine. St. Hil. pl. usuel. bras. no. 3. A kind of fever-bark is obtained at Sierra Leone from *Rondelètia febrífuga*. Besides, there are a great number of other species possess barks more or less valuable. *Pincknèya pùbens* is the fever-bark of Carolina; *Condamínea corymbòsa*, *Isértia coccínea*, *Antirhœ'a*, and *Morinda Ròyoc*, are all of the same description. A lightish brown, bitter, and powerfully astringent extract, called Gambier, is obtained at Malacca by boiling the leaves of *Naúclea Gámbir;* it is sometimes substituted for gum-kino, Ainslie, 2. p. 106. A decoction of the leaves, as well as the root, of *Cánthium parviflòrum*, is prescribed in India in certain kinds of flux, and the last is supposed to have anthelmintic properties, though neither has much sensible taste or smell. The bark and young shoots are also used in dysentery. Ainslie, 2. p. 63. Among the emetics, Ipecacuanha holds the first rank; it is the root of *Cephæ'lis Ipecacuànha*, a little creeping-rooted half-herbaceous plant, found in damp shady forests of Brazil. Similar properties are found in the roots of other *Rubiàceous* plants of the same country, as in *Richardsònia ròsea* and *R. scàbra*, *Borrèria ferrugínea* and *B. Poàya*, &c. A peculiar alkaline principle, called emetia, is found in Ipecacuanha, which contains 16 per cent. of it. Turner, p. 653. The Raiz Preta, which is celebrated for its power in curing dropsy, and in destroying the dangerous consequences of bites of serpents, is said to be related to Ipecacuanha. Edinb. phil. journ. 1. p. 218. Several species of *Psychótria*, as *P. emética*, &c. and *Geóphila renifórmis*, are substitutes for Ipecacuanha. The spurious barks called Quinquina Pitou, are capable of exciting vomiting. The powdered fruit of *Rándia dumetòrum*, is a powerful emetic. An infusion of the bark of the root is administered to nauseate in bowel complaints. Ainslie, 2. p. 186. According to Roxburg, the root bruised and thrown into ponds where there are fish, intoxicates them, as *Cócculus Indicus*. Ainslie, 2. p. 186. *Psychótria Nóxa* and *Palicoùrea Marcgràvii*, both called *Erva de rata*, are accounted poisonous in Brazil; but nothing very certain seems to be known of their properties. Edinb. phil. journ. 14. p. 267. The root of *Morínda umbellàta* in the Moluccas, and that of *M. citrifòlia* in India, is used for dyeing red and brown; and the bark of *M. Róyoc* for ink. The leaves of *Oldenlándia umbellàta* are considered by the native doctors of India as expectorant; and the root is employed in India for staining nankeens. Ainslie, 2. p. 101. Coffee is the roasted seeds of a plant of this order, *Coffèa Arábica*, and is supposed to owe its characters to a peculiar chemical principle called coffein. Turner, p. 699. The part roasted is the albumen, which is of a hard horny consistence; and it is probable that the seeds of most of the plants of the present order, whose albumen is of the same texture, would serve as a substitute. This would not be the case with those with fleshy albumen. The fruit of some *Gardènias Génipa* and of *Vanquèria*, the *Voa Vanga* of Madagascar, and *Sarcocéphalus esculéntus*, are succulent and eatable. The root of *Rùbia tinctòria*, the madder, is one of the most important dyes with which we are acquainted; a quality in which the roots of many other plants belonging to the tribe *Stellàtæ* participate in a greater or less degree. The roots of *Rùbia Munjísta* yield the madder of Bengal. Ainslie, 1. p. 203. The torrefied grains of *Gàlium* are said to be a good substitute for coffee. The flowers of *Gàlium vèrum* are used to curdle milk. An infusion of *Aspérula cynánchica* has a little astringency, and has been used as a gargle. *Aspérula odoràta*, or *Woodruff*, is remarkable for its fragrance when dried; it passes for a diuretic. *Rùbia Nóxa* is said to be poisonous.

Opposite leaves, with intervening stipulas, a monopetalous corolla, with a definite number of stamens, are the great characteristics of *Rubiàceæ;* an order of such extent, that it embraces a very large proportion of the whole phenogamous plants, including within its limits humble weeds and lofty trees. Among them the plants of beauty or value are innumerable; of the former description the genera *Ixòra*, *Bouvárdia*, *Catesbæ'a*, *Portlándia*, *Cardènia*, *Hamèlia*, *Cephæ'lis*, *Augústea*, and many others, are notable examples.

Synopsis of the genera.

A. *Cells of fruit many-seeded.*

Tribe I.

Cinchona'ceæ. *Fruit capsular, 2-celled; cells many seeded. Seeds winged.—Trees or shrubs. Stipulas interpetiolar.*

Subtribe I. Naucle'eæ. *Flowers capitate, sessile, upon a globose receptacle* (f. 83. *e.* f. 84. *k.*).

1 Nau'clea. Tube of calyx oblong; limb truncate or 5-toothed (f. 83. *b.*), with linear lobes. Corolla funnel-shaped (f. 83. *c.*), with a slender tube and naked throat. Stigma tumid, undivided (f. 83. *d.*). Capsules sessile, not attenuated at the base.

2 Unca'ria. All as in *Naúclea*, but differs in the flowers being scattered on the receptacle. Calyx urceolately 5-cleft. Capsules pedicellate, clavate, attenuated at the base.

3 Adi'na. Tube of calyx oblong; limb campanulate, 5-parted (f. 84. *a.*), permanent. Corolla funnel-shaped, 5-lobed (f. (f. 84. *b. c.*), with a naked throat and valvate lobes. Anthers almost sessile (f. 84. *e.*), inclosed. Stigma capitate (f. 84. *b.*). Capsules membranous, 4-valved (f. 84. *g.*), pyramidal. Seeds 2-4 in each cell.

4 Breo'nia. Limb of calyx 5-parted. Corolla with a terete tube, and a flat, 5-lobed, spreading limb. Stamens inserted in the throat, half-exserted. Style very long: stigma bipartite. Ovarium 2-celled; cells 7-8-ovulate: ovula fixed to membranous placentas, and hanging from the axis.

5 Lecana'nthus. Limb of calyx campanulate, coloured, irregularly divided. Corolla with a short tube, and a 5-lobed limb. Anthers large, inserted in the tube. Style bifid; stigmas linear. Ovarium 2-celled; cells many seeded. Placentas semicylindrical.

Subtribe II. Cincho'neæ. *Flowers more or less pedicellate, never seated on a globose receptacle.*

6 Steve'nsia. Calyx girded by a 4-lobed involucel; limb bipartite, deciduous. Corolla salver-shaped, with a short tube, and a bluntly 6-7-parted limb. Anthers 6-7, sessile in the throat. Capsule globose, areolate at the apex. Seeds a little winged, pubescent at the top.

7 Couta'rea. Limb of calyx 6-parted. Corolla funnel-shaped, with a short tube, and a bluntly 6-lobed limb. Stamens inserted in the bottom of the throat; anthers linear, exserted. Capsule obovate, compressed; valves bifid at the apex. Wings of seeds membranous.

8 Hi'llia. Calyx girded by a 4-leaved involucel; limb 2-4-parted, permanent. Corolla with a long tube (f. 85. *b.*), and a 4-6-parted limb (f. 85. *b.*). Stamens 4-6, inclosed, sessile beneath the throat (f. 85. *c.*). Capsule elongated, crowned. Seed ending in a pencil-formed tail (f. 85. *e.*).

9 Hymenópogon. Limb of calyx 5-parted, permanent. Corolla salver-shaped, with a very long tube, and a 5-parted limb. Stamens 5, inclosed, inserted in the top of the tube, which is inflated. Capsule oblong, clavate, 10-nerved, crowned. Seeds appendiculated at both ends.

10 Cincho'na. Calyx 5-toothed (f. 86. *a.*). Corolla with a terete tube, and a 5-parted limb (f. 86. *b.*), which is valvate in æstivation. Anthers linear, inserted in the middle of the tube (f. 86. *a.*), a little exserted. Capsules dehiscing at the valves, crowned. Seeds girded by a membranous lacerated wing.

11 Cosmibue'na. Calyx 5-toothed. Corolla with a long tube, and a 5-lobed limb, which is valvate in æstivation. Anthers oblong, exserted. Stigma bipartite. Capsule somewhat 4-valved, dehiscing from the apex. Seeds girded by a lacerated wing.

12 Lasione'ma. Calyx 5-toothed. Corolla tubular, with a 5-lobed limb, which is imbricate in æstivation. Stamens exserted; filaments bearded in the middle. Anthers roundish, peltate. Stigma 2-lobed. Capsule 2-celled, dehiscing in the middle of the cells, many-seeded. Seeds small, sameroid.

13 Lucu'lia. Calyx 5-toothed (f. 87. *c.*), deciduous: lobes foliaceous. Corolla with a longish tube, and a 5-lobed expanded limb, which is imbricate in æstivation. Stamens almost inclosed (f. 87. *a.*); anthers linear. Stigma 2-parted (f. 87. *b.*). Capsule dehiscing at the dissepiment from the apex. Wings of seed jagged.

14 Hymenody'ction. Calyx 5-toothed. Corolla tubular, with a 5-cleft limb, which is valvate in æstivation. Stamens exserted; anthers peltate. Capsule not crowned, dehiscing at the dissepiment. Wing of seeds bifid at the base.

15 Exoste'mma. Calyx 5-toothed. Corolla with a terete tube, and a 5-parted limb, which is plicate in æstivation. Anthers linear, exserted. Capsules crowned, dehiscing at the cells. Seeds girded by a membranous entire border.

16 Dana'is. Flowers dioecious from abortion. Limb of calyx 5-toothed. Corolla funnel-shaped, with a slender tube, a villous throat, and a spreading 5-parted limb. Stamens exserted in the male flowers, and in the female inclosed and abortive. Style bifid at the apex. Capsule globose. Seed girded by a membranous border.

17 Mane'ttia. Limb of calyx 4-5-lobed (f. 88. *d.*). Corolla funnel-shaped (f. 88. *b.*), with a terete tube, a hairy throat, and a 4 (f. 88. *b.*) -5-lobed limb. Anthers sessile in the throat. Capsule ovate, compressed (f. 88. *d.*), crowned. Seeds peltate, girded by a usually toothed border.

18 Bouva'rdia. Limb of calyx 4-parted (f. 89. *a. b.*). Corolla funnel-shaped, tubular (f. 89. *e.*), with a 4-parted (f. 89. *a.*) spreading short limb. Stamens adnate at the base to the tube, but free above the middle. Anthers linear, inclosed. Capsule membranous, globose, compressed. Seeds girded (f. 89. *a.*) by a membranous border.

19 Pinckne'ya. Calyx 5-parted; the fifth lobe expanded into a coloured leaf. Corolla with a cylindrical tube, and a 5-cleft limb, which is valvate in æstivation. Stamens inserted at the base of the tube, exserted; anthers peltate. Capsule compressed, 2-celled, dehiscing at the dissepiment. Seeds surrounded by a wing, which is emarginate at the base.

20 Calycophy'llum. Limb of calyx truncate or bluntly toothed; one of the teeth expanded into a membranous stalked coloured leaf. Corolla campanulate or funnel-shaped; limb 5-parted. Stamens rising from the throat; anthers oval, exserted. Style ending in 2 reflexed stigmas. Capsule oblong. Seed fixed to the linear placentas, girded by a narrow wing.

Tribe II.

Gardenia'ceæ. *Fruit indehiscent* (f. 94. *b.*), *fleshy, usually 2-celled, rarely 1-celled by abortion. Seeds not winged. Albumen fleshy.—Trees or shrubs, with opposite leaves, and interpetiolar stipulas.*

Subtribe I. Sarcocepha'leæ. *Flowers sessile, collected into a head* (f. 90. *a. b.*) *upon the receptacle. The fruit combined together into one* (f. 90. *b. c.*).

21 Sarcoce'phalus. The calyxes are closely joined together into a globose fleshy head (f. 90. *b.*); limb of calyx with a very short margin. Corolla funnel-shaped, 5-cleft. Anthers

sessile in the throat. Stigma undivided. Berries many seeded. Seed small, somewhat reniform.

22 Zuccari'nia. Limb of calyx 5-toothed. Corolla tubular: limb 5-lobed, erect. Anthers 5, linear, inclosed, adnate between the lobes of the corolla. Stigma bifid. Berries oval, stipitate, crowned by the calyx. Seed compressed, 2 rows in each cell.

23 Lucinæ'a. Flowers combined into a dense head. Margin of calyx entire. Corolla funnel-shaped, 4-parted, densely villous inside. Stamens shorter than the corolla; anthers linear. Stigma bifid. Berries joined together, many seeded. Seeds angular.

24 Cane'phora. Limb of calyx 5-6 toothed. Corolla with a somewhat campanulate tube, and a 5-6-lobed limb. Anthers 5-6, oblong, almost sessile, inclosed. Stigma bifid. Fruit baccate? 2-celled, many seeded. Ovula imbricate, inserted in spongy axillary placentas; but according to Rich the fruit is pea-shaped, 2-seeded, and crowned by the calyx.

Subtribe II. Gardenie'æ. *Flowers distinct, not joined together into a head.*

25 Burche'llia. Limb of calyx drawn out beyond the ovarium, 5-cleft (f. 91. *a.*) beyond the middle. Corolla clavately funnel-shaped (f. 91. *b.*); throat naked: lobes imbricated, and twisted in æstivation. Filaments adnate to the tube (f. 91. *b.*) at the base; anthers inclosed. Stigma bearing 5 convex crests on the outside, and tufts of hairs. Berry crowned by the calyx, turbinately globose. Placentas adnate to the dissepiment. Seeds angular. Flowers capitate.

26 Amaiou'a. Limb of calyx 6-toothed. Corolla salver-shaped, with a terete tube, which is longer than the calyx, and a 6-parted spreading limb. Anthers 6, inclosed, linear. Stigma clavate. Berry obovate-oblong, 2-3-celled. Seeds disposed in 2 rows in each cell, nearly orbicular, separated by the horizontal dissepiments.

27 Mussæ'nda. Limb of calyx 5-parted, deciduous, one of the outer lobes usually drawn out into a large petiolate coloured leaf. Corolla funnel-shaped, with a 5-parted limb and a villous throat. Anthers 5, sessile, linear. Stigma bifid. Fruit ovoid, fleshy, indehiscent, many seeded. Seeds scabrous. Placentas rising from the middle of the dissepiment, pedunculate, bifid at the apex. Flowers corymbose.

28 Kutchubæ'a. Limb of calyx truncate. Corolla with a cylindrical tube, much longer than the calyx, a villous throat, and an 8-parted limb: lobes twisted in æstivation. Anthers 8, oblong-acute, almost sessile among the villi in the throat. Stigma clavate, hairy on the outside. Flowers subcorymbose.

29 Cassu'pa. Limb of calyx short, entire. Corolla tubular, rugged on the outside, with a villous throat, and a 6-parted limb. Anthers 6, oblong, nearly sessile, inserted among the hairs in the throat. Stigma bifid. Berry globose, crowned, many seeded. Placentas fixed to the middle of the dissepiment.

30 Gynopa'chys. Limb of calyx urceolate, entire, deciduous. Corolla with a short tube, a 5-parted spreading limb, and a bristly throat. Stamens 5, inserted in the mouth of the tube; anthers linear, exserted. Berry globose, umbonate, many seeded. Placentas stipitate, rather fleshy. Seeds compressed.

31 Tocoye'na. Limb of calyx very short, 5-toothed. Corolla with a very long tube, a naked dilated throat, and a spreading 5-parted limb. Anthers linear-sagittate, rising from the throat, exserted. Style fusiform at the apex. Berry rather fleshy, crowned. Seeds numerous, imbedded in soft pulp.

32 Posoque'ria. Limb of calyx short, 5-toothed. Corolla funnel-shaped, with a very long terete tube, a villous hardly dilated throat, and a 5-parted spreading limb. Stamens 5, rising from the throat, free, a little exserted. Style filiform, bifid at the apex. Berry ovate, crowned, succulent, many seeded.

33 Oxya'nthus. Limb of calyx acutely 5-toothed (f. 92. *a.*). Corolla with a very long slender tube (f. 92. *c.*), a glabrous throat, and a regular 5-parted limb (f. 92. *d.*). Stamens 5, exserted (f. 92. *f.*), free at the throat; anthers acute. Style clavate at the apex (f. 92. *e.*). Fruit baccate.

34 Stylocory'na. Limb of calyx 5-toothed Corolla salver-shaped or funnel-shaped, with a cylindrical tube, and a 5-parted limb. Stamens 5, inserted in the mouth of the corolla; anthers linear, very long. Stigma clavate (f. 92. *g.*). Berry globose, crowned by the calyx, almost dry. Placentas spongy, adnate to the middle of the dissepiment on both sides. Seeds angular.

35 Ge'nipa. Limb of calyx truncate or subdentate. Corolla salver-shaped, the tube not exceeding the calyx, and the limb large and 5-parted. Anthers linear, exserted, sessile in the throat. Stigma clavate. Berry corticate, somewhat 4-celled, attenuated at both ends, crowned by the tubular calyx. Seeds many, horizontal, imbedded in pulp.

36 Garde'nia. Limb of calyx truncate or toothed (f. 93. *a.*). Corolla funnel or salver-shaped (f. 93. *b.*), having the tube much longer than the calyx; limb twisted in æstivation (f. 93. *e.*), 5-9-parted, spreading. Anthers 5-9, linear, nearly sessile in the throat. Stigma clavate, bifid. Berry fleshy, crowned by the calyx, incompletely 2-5-celled. Seeds minute, immersed in the fleshy parietal placentas.

37 Ra'ndia. Limb of calyx 5-lobed. Corolla salver-shaped, with a short tube, and a 5-parted limb. Anthers inclosed, sessile, within the throat. Stigmas 2. Berry nearly dry, crowned by the calyx, many seeded. Seeds fixed to the central placenta, imbedded in the pulp.

38 Chapelie'ria. Limb of calyx 5-parted, permanent. Corolla with a slender tube, a 5-parted limb, and a villous throat. Stamens 5, nearly sessile, inclosed, inserted in the middle of the tube. Stigma bipartite. Fruit ovoid, rather fleshy, crowned by the erect, large, spreading limb of the calyx, many seeded. Seeds angular, and clothed with adpressed golden silky down.

39 Heínsia. Limb of calyx 5-parted, permanent. Corolla salver-shaped: tube terete, longer than the calycine lobes, very hairy in the upper part inside: limb 5-lobed: lobes undulated. Anthers 5, linear, sessile towards the top of the tube. Stigmas

2, linear. Fruit globose, crowned, dry, hard. Placentas 2, thick, adnate to the dissepiment. Seed nestling on the superfices of the placentas.

40 Menestòria. Limb of calyx 5-parted. Corolla with a long terete tube, an almost naked throat, and a 5-lobed limb. Anthers 5, oblong, sessile within the tube. Stigma bifid, inclosed. Fruit baccate, nearly dry, not crowned. Placentas adnate to the dissepiment, many seeded.

41 Helo'spora. Limb of calyx campanulate, 4-toothed. Corolla with a longish tube, a naked throat, and a 4-lobed spreading limb. Anthers 4, linear, inclosed. Style 4-cleft at the apex. Berry crowned, tetragonal, not divided into cells, but having the seeds immersed in the pulp, and disposed crosswise in a double series.

42 Hippo'tis. Limb of calyx sheath-formed, cleft on one side, and drawn out into a mucronate auricle on the other. Corolla funnel-shaped, with the tube a little incurved, and the limb blunt and 5-lobed. Stamens inserted in the middle of the tube; anthers ovate, inclosed. Ovarium girded by a 5-crenate urceolus. Stigma of 2 adpressed lobes. Berry ovate, crowned. Seeds numerous, minute.

43 Poma'tium. Limb of calyx bluntly 5-toothed: the teeth deciduous. Corolla small, with a terete tube and a 5-parted limb. Anthers ovate, sessile in the throat, inclosed. Stigma bifid. Berry nearly dry, globose, subdidymous, crowned by the remains of the calyx, many seeded. Placentas rather tumid. Seed angular.

44 Bertie'ra. Limb of calyx short, 5-toothed, permanent. Corolla funnel-shaped, with a terete tube and a 5-parted spreading limb. Anthers 5, sessile within the throat. Stigma bifid. Berry nearly dry, crowned, roundish, many seeded. Seeds fixed to the central placentas, angular, muricated.

45 Pouche'tia. Limb of calyx small, 5-toothed. Corolla with a short obconical tube and a 5-lobed limb, which is twisted in æstivation. Anthers 5, linear, sessile in the tube. Stigmas 2, exserted a little. Berry dry, obovate, crowned. Seeds 4-6 in each cell, deformed, clothed with silky down.

46 Cu'pia. Limb of calyx 5-parted, permanent. Corolla funnel-shaped, with a terete tube, which is a little longer than the calyx, and gradually widening to the throat; and a 5-parted recurved limb. Filaments very short; anthers oblong. Style 2-lobed at the apex, or 10-angled. Berry globose, crowned. Placentas spongy, central, few-seeded at maturity. Seed angular, wrinkled at the hilum.

47 Tare'nna. Limb of calyx 5-parted, permanent, reflexed. Corolla unknown. Berry globose, 8-striped, crowned. Placentas central, spongy. Seed 4-6 in each cell, horizontal, semilunate, rugged.

48 Pete'sia. Limb of calyx short, 4-5-toothed. Corolla funnel-shaped, with a 4-5-cleft equal limb. Stamens 4-5 within the tube. Berry nearly globose, naked at the apex, many seeded. Seeds rather angular.

49 Coccocy'pselum. Limb of calyx 4-parted (f. 94. *d. a.*), permanent. Corolla funnel-shaped, with a 4-parted limb and a glabrous throat. Stamens 4 (f. 94. *b.*), inserted in the tube; anthers oblong, heart-shaped, inclosed. Stigma bifid. Berry ovate, crowned (f. 94. *d.*), many seeded. Seeds angular.—Creeping herbs.

50 Ferne'lia. Limb of calyx 4-cleft. Corolla small, with a short tube and a 4-lobed spreading limb. Stamens 4, inserted in the tube, almost inclosed. Stigma bifid. Berry crowned, having the dissepiment incomplete. Seeds numerous, rather compressed.

51 Petu'nga. Limb of calyx 4-toothed, permanent. Corolla funnel-shaped, with a short obconical tube, a 4-parted limb, and a villous throat. Stamens 4, a little exserted. Style villous; stigma bidentate. Berry globose, umbilicate. Seeds 2-4 in each cell, fixed to the upper part of the dissepiment, ex Roxb.; but according to Blume scale-formed, and imbricated downwards.

52 Higgi'nsia. Limb of calyx 4-toothed, permanent. Corolla funnel-shaped, somewhat campanulate, with a short tube, a 4-parted spreading limb, and a naked throat. Stamens inserted in the middle of the tube; anthers ovate, inclosed. Stigmas 2, exserted. Berry oblong, somewhat tetragonal, crowned, many seeded. Placentas adnate to the dissepiment.

53 Hoffma'nnia. Limb of calyx 4-toothed: tube tetragonal. Corolla salver-shaped, with a very short tube and a 4-parted limb. Anthers 4, linear, acute, sessile on the upper part of the tube, conniving. Stigma obtuse, hardly emarginate. Capsule baccate, indehiscent, crowned. Placentas ovate, distinct in each cell. Seeds minute, numerous.

54 Catesbæ'a. Limb of calyx 4-toothed or 4-parted. Corolla funnel-shaped, with a very long tube, which is gradually dilated to the throat; and a 4-lobed limb. Stamens 4, inserted in the bottom of the corolla; anthers linear, exserted. Stigma bidentate. Berry globose or oblong, crowned. Placentas spongy, fixed to the top of the dissepiment. Seeds numerous, scale-formed, collected into two fascicles in each cell.

Tribe III.

Hedyoti'deæ. *Fruit capsular* (f. 95. *k.*), *2-celled, dehiscing at the cells; and rather membranous and indehiscent; cells many-seeded. Seeds not winged.—Shrubs or herbs, with opposite leaves. Stipulas interpetiolar.*

Subtribe I. Rondeletie'æ. *Stipulas twin on both sides, combined or distinct, but neither sheathed nor divided into many bristles.—Trees or shrubs.*

55 Condami'nea. Calyx campanulate (f. 95. *a.*), 5 crenate or 5-toothed; limb deciduous. Corolla funnel-shaped (f. 95. *b.*), with a somewhat curved tube, which is a little longer than the calyx, a dilated throat, and a 5-parted limb (f. 95. *b.*). Stamens inserted above the middle of the tube (f. 95. *e.*), or near the throat; anthers oblong-linear, bifid at the base (f. 95. *f.*), length of corolla. Stigma 2-lobed (f. 95. *e.*). Capsule turbinate, truncate, opening in the middle of the cells (f. 95. *k.*). Seeds wedge-shaped (f. 95. *l.*).

56 Alse'is. Limb of calyx superior, 5-parted. Corolla cup-

shaped, with a 5-lobed limb and a bearded throat. Stamens 5, free to the base of the corolla, exserted. Stigma divided. Ovarium 2-celled, many ovulate.

57 Macrocne'mum. Limb of calyx minute, 5-toothed, permanent. Corolla tubular, with a widened throat and a 5-lobed limb; tube pentagonal at first. Stamens 5, free from the corolla, except at the very base, hairy above the middle; anthers oblong, inclosed. Stigma obtuse, 2-lobed. Capsule 2-valved; valves dehiscing at the sides. Seeds acute, imbricated.

58 Chima'rrhis. Limb of calyx almost wanting, entire. Corolla with a short tube and a 5-cleft spreading limb: lobes hairy in the middle outside. Stamens 5, inserted at the top of the tube, hairy at the base; anthers oval. Capsule obovate or turbinate, crowned; valves semibifid. Seeds many.

59 Augu'stea. Limb of calyx 5-parted. Corolla funnel-shaped, much longer than the limb of the calyx; tube widened at the apex, a little incurved; limb 5-parted, spreading. Anthers 5, sessile in the sinuses of the corolla, and shorter than its lobes. Style hairy at the base; stigma bifid. Capsule oblong, separable from the calyx, and naked at maturity, but crowned. Seeds many, tetragonal.

60 Portla'ndia. Limb of calyx 5-parted; tube 5-nerved. Corolla large, funnel-shaped, with a short tube, a wide throat, and a bluntly 5-lobed limb. Stamens 5, inserted in the bottom of the throat; anthers long, a little exserted. Stigma undivided. Capsule obovate, crowned, and retuse at the apex; valves dehiscing at the apex. Placentas coriaceous, central. Seeds scabrous.

61 Bíkkia. Calyx with an 8-ribbed tube, and a 4-parted limb. Corolla clavate, tetragonal, with a 4-cleft limb. Anthers 4, linear, not exceeding the limb. Capsule ovate, at length separating from the calyx, 2-celled or nearly 4-celled; valves bifid at the apex. Placentas narrow. Seeds small, crested on the margins.

62 Isido'rea. Limb of calyx 5-parted. Corolla tubular, pentagonal, with a naked throat, and a 5-cleft limb. Stamens inserted in the very base of the corolla, and equal in length to it, monadelphous and hairy at the base; anthers oblong, obtuse. Stigma bilamellate. Capsule nearly globose, pentagonal, truncate at the apex, crowned. Coccula dehiscent, many seeded. Seeds angular, furnished with a cup-formed membrane at the base.

63 Spallanza'nia. Limb of calyx 5-parted, permanent, longer than the tube of the corolla. Corolla with a slender tube, a naked throat, and a 5-lobed limb. Stamens 5, free from the throat, exserted; anthers oblong. Stigmas 2, slender. Capsule ovate-globose, ribbed, crowned; valves semibifid. Placentas adnate to the dissepiment. Seeds tubercular.

64 Rondele'tia. Limb of calyx 4-5-parted, permanent. Corolla with a cylindrical tube and a 4-5-lobed spreading limb. Anthers 4-5, sessile on the top of the tube, inclosed. Stigma bifid. Capsule globose, crowned; valves cleft in the middle. Placentas central. Seed angular, few in the cells at maturity.

65 Wendla'ndia. Limb of calyx very short, permanent, 4-5-toothed. Corolla with a terete tube, which is longer than the calyx, and a 4-5-lobed spreading limb. Stamens 4-5, rising from the top of the tube; anthers oblong, exserted. Stigma bifid. Capsule ovate-globose, crowned; dehiscing at the cells at top, many seeded.

66 Xanthophy'tum. Limb of calyx 4-5-cleft. Corolla funnel-shaped, with a short tube, a villous throat, and a 4-5-cleft spreading limb. Stamens 4-5, exserted, inserted in the throat, connivent. Style perforating the disk of the ovarium. Stigma 2-lobed, gaping. Drupe didymous, crowned, divided into 2 many seeded cells. Placentas prominent, fixed by the middle on both sides. Seeds angular, minute.

67 Carpha'lea. Limb of calyx 4-parted, permanent. Corolla with a long filiform tube, a ventricose hairy throat, and a 4-parted limb. Anthers oblong, almost sessile, inclosed. Stigma bifid. Capsule crowned, dehiscing at the cells; valves semiseptiferous; cells many seeded.

68 Sipa'nea. Limb of calyx 5-parted, permanent. Corolla with a long terete tube, a bearded throat, and a 5-parted limb. Anthers 5, sessile, inclosed. Stigma bifid. Capsule subglobose, crowned, dehiscing at the cells. Placentas central, fleshy. Seeds numerous, minutely tubercular. Annual herbs.

69 Vire'cta. Limb of calyx divided into 5 setaceous lobes. Corolla funnel-shaped, with an obconical tube, a naked throat, and having the limb divided into 5 linear-oblong ciliated lobes. Stamens 5, much exserted; anthers linear, oscillatory, bifid at the base. Stigma undivided. Capsule globose, dehiscing at the cells, at first crowned. Seeds numerous, 4-5-sided, a little muricated. Hairy half herbaceous plants.

70 Ophiorhi'za. Limb of calyx 5-cleft, permanent. Corolla tubular, funnel-shaped, 3 times longer than the limb of the calyx, hairy inside: with a 5-lobed limb. Stamens 5, inclosed. Style girded by an urceolus at the base. Stigma 2-lobed. Capsule compressed, 2-lobed, crowned, dehiscing by a transverse chink at the apex. Placentas exserted from the dissepiment. Seeds numerous, hexagonal.—Herbs.

71 Argoste'mma. Limb of calyx 3-4-5-toothed. Corolla rotate, spreading, 3-5, rarely 3-4-parted. Stamens alternating with the lobes of the corolla. Anthers large, exserted, cohering at the apex. Style perforating the fleshy disk; stigma globose. Capsule crowned, dehiscing radiately at the apex. Placentas convex, adnate to the dissepiment. Seeds numerous, angular.—Herbs.

72 Spiradi'clis. Limb of calyx 5-toothed. Corolla with a short tube and a 5-parted spreading limb. Stamens 5, inclosed. Style girded by 4 glands. Stigma 2-lobed, gaping. Capsule oblong, crowned; valves bipartite. Seeds numerous, angular. An herb.

73 Tu'la. Limb of calyx 5-toothed. Corolla with an oblong tube, and a 5-cleft toothed curled limb. Anthers inclosed. Capsule many seeded.—A procumbent herb.

74 Dente'lla. Limb of calyx 5-cleft. Corolla funnel-shaped, 5-cleft, with a hairy throat; lobes furnished with one tooth on each side. Anthers 5, inclosed, nearly sessile. Stigmas 2. Capsule or berry dry, almost indehiscent, nearly globose, crowned. Placentas fleshy, prominent on both sides within the cells. Seeds small, ovate.—Creeping herbs.

75 De'ppea. Teeth of calyx 4, short, triangular. Corolla rotate, glabrous. Anthers 4, linear, exserted. Style exserted. Capsule membranous, ellipsoid, crowned, 2-celled, and dehiscing at the cells; cells 1-seeded.—A shrub. Stipulas triangular, deciduous. Flowers cymose.

Subtribe II. Hedyo'teæ. *Stipulas formed into a sheath on each side, adnate to the petioles, and ending in many bristles at the apex.—Herbaceous or suffrutescent plants.*

76 Hedyo'tis. Limb of calyx 4-toothed, permanent. Corolla tubular, with a bearded throat, and a 4-cleft limb. Stamens exserted a little; anthers ovate-roundish, small. Capsule ovate, crowned, dehiscing at the cells. Seed numerous, minute, angular.

77 Oldenla'ndia. Limb of calyx 4-toothed, permanent. Corolla with a short tube, a 4-cleft limb, and a villous or glabrous throat. Stamens a little exserted; anthers ovate or orbicular. Stigma undivided or bifid. Capsule nearly globose, crowned, dehiscing at the vertex by a loculocudal chink. Seeds numerous, small, half immersed in a globose placentas.

78 Gonothe'ca. Limb of calyx short, truncate, somewhat 4-toothed. Corolla having the tube inflated at the base, the throat villous, and the lobes keeled. Stamens inclosed. Stigmas 2, obtuse, sessile. Capsule compressed, furnished with a double wing on each side, which also runs down along the pedicel, crowned, dehiscing between the stigmas. Seeds numerous, small, serobiculate.

79 Kohau'tia. Limb of calyx 4-toothed. Corolla with a long terete tube, and a 4-lobed limb: lobes cuspidate. Anthers sessile within the tube, inclosed. Style bifid at the apex. Capsule globose, crowned, dehiscing at the cells. Seeds numerous, small, half immersed in pits on the globose pedicellate placentas.

80 Ka'dua. Limb of calyx 4-cleft or 4-toothed. Corolla salver-shaped, with a long tube and a 4-cleft limb. Anthers linear or oblong, nearly sessile within the throat. Style bifid at the apex. Capsule globose, crowned, dehiscing at the apex at the cells. Seeds numerous, small, angular, inserted on fungous placentas, which are fixed to the middle dissepiment.

81 Ano'tis. Limb of calyx 4-toothed (f. 96. *a.*), permanent. Corolla salver-shaped (f. 96. *b.*), with a 4-lobed limb, and an almost glabrous throat. Anthers inclosed or exserted (f. 96. *c.*). Stigma somewhat 2-lobed (f. 96. *e.*). Capsule ovate, crowned, dehiscing at the cells at the apex. Seeds 4-8 in each cell, rather angular.

82 Rachica'llis. Limb of calyx 4-lobed, furnished with 1-3 teeth between each of the lobes. Corolla with a long terete tube, a short spreading 4-lobed limb, and a beardless throat. Anthers at the throat inclosed. Stigma 2-lobed. Capsule subdidymous, dehiscing at the cells, crowned. Seeds angular, 8-20 in each cell.

83 Lu'cya. Limb of calyx divided into 4 bifid teeth, permanent. Corolla with a very short tube and a 4-lobed limb. Stamens shorter than the corolla. Style short, bifid. Capsule globose, didymous, dehiscing at the cells and near the dissepiment; hence it is somewhat 8-valved at the top. Seed 2 in each cell, ex Spreng., 5-6, ex Rich.

84 ? Polypre'mum. Limb of calyx 4-parted. Corolla with a very short tube, a bearded throat, and a 4-lobed limb. Stamens 4, inclosed. Style undivided. Capsule ovate, compressed, dehiscing at the cells. Placentas oblong, adnate to the bottom of the dissepiment. Seeds numerous, very minute, angular.

Tribe IV.

Isertie'æ. *Fruit drupaceous* (f. 97. *g.*), *composed of from 2 to 6 many seeded pyrenæ or coccula* (f. 97. *f.*). *Albumen fleshy.—Shrubs or herbs. Leaves opposite. Stipulas interpetiolar.*

85 Meta'bolos. Limb of calyx 4, rarely 5-cleft. Corolla funnel-shaped, with a 4, rarely 5-parted limb. Stamens 4-5, inserted in the throat of the corolla. Stigma bifid or quadrifid. Berry dry, crowned, divisible into 2-4 coccula. Seeds angular, fixed to the prominent placentas.—Suffrutescent herbs.

86 Gonza'lea. Limb of calyx 4-lobed. Corolla funnel-shaped or salver-shaped, villous outside; with a long cylindrical tube, and a hairy or downy throat. Stamens 4, inclosed. Stigmas usually 4, adpressed to each other. Berry of 3-4 pyrenæ. Seeds angular, dotted, minute.

87 Ise'rtia. Limb of calyx 4-6-toothed (f. 97. *a.*). Corolla with a long tube (f. 97. *b.*), 6-lobed at the apex (f. 97. *c.*), woolly inside, having the recesses between the lobes drawn out into crests. Stamens 6, inclosed (f. 97. *d.*). Stigmas stellate. Berry globose (f. 97. *g.*), crowned (f. 97. *h.*), composed of 6 triquetrous pyrenæ (f. 97. *f.*).

Tribe V.

Hamelie'æ. *Fruit baccate, many celled* (f. 98. *f. h.*); *cells many seeded. Albumen fleshy.—Shrubs or trees, with opposite or verticillate leaves, and interpetiolar stipulas.*

88 Tepe'sia. Limb of calyx 5-toothed: teeth unequal. Corolla unknown. Berry oblong, crowned, 4-celled. Seeds numerous, imbedded in the pulp.

89 Evo'smia. Limb of calyx very short, 4-toothed (f. 98. *a.*). Corolla subrotate (f. 98. *e.*), 4-cleft. Stamens 4, inserted in the throat (f. 98. *b.*); anthers ovate, inclosed, or nearly so. Stigma thick or 4-lobed. Fruit crowned (f. 98. *g.*), 4-celled (f. 98. *h.*)

90 Sabi'cea. Limb of calyx 4-5-parted. Corolla salver-shaped, with a long slender tube, a 4-5-parted limb, and a hairy throat. Stamens 4-5, inclosed, or nearly so. Style 4-5-lobed at the apex. Berry globose, crowned, 4-5-celled.

91 Olo'stYla. Limb of calyx very short, 5-toothed. Corolla subrotate, with a short tube, which is pilose inside, and 4 reflexed lobes. Stamens 5, inserted in the throat; anthers linear, exserted. Style undivided. Berry crowned, 4-celled.

92 Axa'nthes. Flowers usually dioecious. Calyx with a quite entire border. Corolla rotate, with a short cylindrical tube, having 5 fascicles of hairs in the throat; lobes spreading. Stamens 5, inserted in the throat, hardly exserted. Stigma 5-lobed. Berry globose, crowned, 5-celled. Placentas fleshy.

93 Urophy'llum. Limb of calyx 5-cleft. Corolla funnel-shaped, with a bearded throat and a 5-parted limb. Stamens 5, shorter than the limb; anthers linear. Stigma 5-lobed? Ovarium crowned by a glandular disk. Berry globose, 5-celled.

94 Hame'lia. Limb of calyx 5-lobed (f. 99. *a.*). Corolla with a somewhat pentagonal tube, and a small 5-lobed hardly spreading limb (f. 99. *c.*). Stamens 5, inserted in the tube (f. 99. *b.*); anthers oblong-linear (f. 99. *f.*), inclosed. Stigma pentagonal (f. 99. *e.*). Berry oval, 5-celled (f. 99. *d.*).

95 Alibe'rtia. Flowers unisexual. Calyx tubular, 5-toothed. Corolla tubular, with a 5-parted spreading limb. Stamens 5, nearly sessile, inserted in the tube; anthers linear, inclosed. Style undivided in the male flowers, but crowned by a 5-lobed stigma in the female flowers. Berry globose, depressed, crowned, 5-celled. Seeds wrapped in thin pulp.

96 Schrade'ra. Limb of calyx truncate or subdenticulated. Corolla funnel-shaped, with a terete tube, a dilated pilose throat, and a 5-8-lobed spreading limb, each lobe usually furnished on the inside with a retrograde callous tooth. Anthers 5-8, linear, nearly sessile, inserted in the throat, hardly exserted. Stigma bifid or quadrifid. Berry pea-formed, 3-4-sided, crowned, 2-4-celled. Seeds imbedded in the pulp.

97 Brigno'lia. Limb of calyx 4-toothed; teeth unequal. Corolla with a short tube, and a 6-lobed limb, which is very hairy inside as well as the throat. Stamens 6, inserted in the tube; anthers linear. Stigma capitate, undivided. Fruit globose, fleshy, crowned.

98 Pati'ma. Limb of calyx tubular, with a sinuated, very short, 5-toothed border. Corolla tubular, 5-parted, densely clothed with silky down inside. Stamens 5, inserted in the tube; anthers oblong-cordate, inclosed. Style undivided. Berry roundish, crowned, 4-6, but usually 5-celled. Seeds fixed to a fleshy, 2-lobed placenta.

99 Polyphra'gmon. Limb of calyx entire or 5-toothed. Corolla salver-shaped, bristly, with a terete tube, and a 10-parted limb. Stamens 10, inserted in the middle of the tube; anthers linear, inclosed. Stigmas numerous. Berry globose, 10-20-celled, with 1 series of seeds in each cell.

100 More'lia. Limb of calyx erect, nearly entire. Corolla short, tubular, with a 5-parted limb, which is imbricate in æstivation. Stamens 5, inserted in the throat, exserted; anthers linear. Style fusiform towards the apex; stigma bifid. Fruit fleshy, 4-5-celled; cells 2-3-seeded.

B. *Cells of fruit usually* 1-*seeded, rarely 2-seeded.*

Tribe VI.

Cordie'reæ. *Fruit baccate, of many cells; cells* 1-*seeded. Differs from the neighbouring tribes in the cells being* 1-*seeded. Shrubs with opposite leaves, and broad interpetiolar stipulas.*

101 Tricaly'sia. Flowers hermaphrodite.

102 Cordie'ra. Flowers unisexual.

Tribe VII.

Guettarda'ceæ. *Fruit drupaceous* (f. 101. *d.* f. 103. *f.*) *composed of* 2-5 1-*seeded pyrenæ or nuts* (f. 103. *g.*). *Seeds terete, elongated, usually erect. Albumen fleshy.—Shrubs or small trees. Leaves usually opposite, rarely* 3 *in a whorl, with interpetiolar stipulas.*

Subtribe I. Mori'ndeæ. *Flowers and fruit congregated, or joined together into a head.*

103 Mori'nda. Character the same as that of the subtribe.

Subtribe II. Guetta'rdeæ. *Flowers distinct, not concrete.*

104 Myrmeco'dia. Limb of calyx tubular: with an entire border. Corolla funnel-shaped, 4-cleft, the throat closed from arched scales or hairs. Stigma simple (Jack.), or quadrifid (Blum.). Drupe baccate, composed of 4 triquetrous pyrenæ.

105 Hydnophy'tum. Limb of calyx entire. Corolla with a short tube, hairy inside, and a flat, 4-lobed limb. Stamens 4, inserted in the throat. Stigma 2-lobed. Drupe succulent, containing 2-pyrenæ.

106 Hyposa'thrum. Limb of calyx 4-toothed. Corolla small, subcampanulate, with a villous throat, and a 4-cleft spreading limb. Stamens 4, inserted in the mouth of the tube. Stigma bifid. Drupe crowned, 2-celled; cells containing 2 pyrenæ.

107 Nerte'ra. Limb of calyx small, 4-toothed. Corolla funnel-shaped, sub-campanulate, 4-lobed (f. 100. *b.*) glabrous inside. Stamens rising from the bottom of the corolla (f. 100. *c.*), adnate to the tube; anthers roundish, hardly exserted. Stigmas 2 (f. 100 *d.*), hairy. Berry roundish, umbilicate, containing 2-4 pyrenæ. Herbs creeping.

108 Mitche'lla. Limb of calyx large, 4-toothed. Corolla funnel-shaped, with a terete tube: having the throat as well as the lobes hairy inside. Stamens adhering to the tube almost to the throat; anthers ovate, hardly exserted. Stigmas 4, inclosed. Berry nearly globose, crowned, containing 4 pyrenæ. Creeping herbs.

109 Mephiti'dia. Limb of calyx 3-6-parted or toothed. Corolla funnel-shaped, 4-6-cleft, usually hairy. Stamens 4-6, inserted towards the throat; anthers linear, exserted, or inclosed. Stigmas 4-9. Drupe baccate, crowned, containing 4-9 pyrenæ.

110 Vangue'ria. Limb of calyx spreading, 5-toothed, deciduous. Corolla campanulate, 5-cleft, hairy in the throat; lobes reflexed. Stamens 5; anthers oblong, hardly exserted. Stigma capitate. Berry apple-formed, containing 5 pyrenæ.

111 Guetta'rda. Limb of calyx permanent or deciduous, truncate or irregularly toothed (f. 101. *a.*). Corolla salver-shaped, with a cylindrical tube (f. 101. *c.*), and a 4-9-lobed limb (f. 101. *b.*). Anthers 4-9, inserted in the throat, sessile, inclosed. Stigma capitate, rarely 2-lobed. Drupe crowned (f. 101. *d.*), containing a 4-9-celled angular putamen (f. 101. *e.*); cells 1-seeded.

112 Mala'nea. Limb of calyx 4-toothed. Corolla small, nearly rotate, with a very short tube, and a 4-lobed spreading limb. Stamens exserted; anthers roundish. Drupe dry, crowned, containing a 2-celled putamen; cells 1-seeded.

113 Antirhœ'a. Limb of calyx campanulate, 4-toothed. Corolla tubular, 4-cleft. Anthers nearly sessile in the throat, not exserted. Stigma bifid. Drupe sub-baccate, crowned, containing a 2-celled putamen; cells 1-seeded.

114 Stenóstomum. Limb of calyx small, 5-toothed. Corolla funnel-shaped, having the tube widened at the throat, and a 5-lobed limb. Anthers 5, oblong, hardly exserted. Stigma 2-lobed. Drupe ovate-oblong, crowned, containing a 2-celled putamen; cells 1-seeded.

115 Chio'ne. Limb of calyx repandly 5-toothed. Corolla tubular, short, 5-lobed. Stamens inserted in the top of the tube. Stigma 2-lobed. Fruit olive-formed, rather fleshy, containing a 2-celled bony nut; cells 1-seeded.

116 Timo'nius. Limb of calyx tubular, truncate, 2-6-toothed. Corolla tubular, salver-shaped, with a 4-6-parted spreading limb, and a naked throat Stamens 4, almost sessile, inserted in the upper part of the tube; anthers 4, oblong-heart-shaped. Stigmas 2, digitately 5-cleft. Drupe globose, crowned, containing 7-25 bony 1-seeded nuts.

117 Hamiltònia. Limb of calyx 5-parted. Corolla funnel-shaped, with a long tube (f. 102. *b.*), and a 5-lobed limb (f. 102. *c.*). Stamens 5, inserted in the throat, inclosed. Stigma 5-cleft. Capsule crowned, dehiscing at the apex, containing 5 1-seeded pyrenæ.

118 Leptode'rmis. Calyx inclosed by a 2-leaved calyciform involucrum; limb 5-lobed. Corolla funnel-shaped, scabrous, with a terete tube, which is pilose inside, and a 5-lobed cuspidate limb. Stamens 5, very short, inclosed. Stigma 5-cleft. Fruit 5-celled, 5-seeded?

119 Psathu'ra. Limb of calyx campanulate, 5-6-toothed. Corolla bearded inside, with a short tube, and a 5-6-lobed spreading limb. Anthers 5-6, nearly sessile in the throat. Stigma 5-6-lobed. Berry globose, crowned, containing 6 pyrenæ.

120 Myonìma. Limb of calyx small, bluntly 8-toothed. Corolla with a short tube, and a 4-parted limb. Stamens 4; anthers oblong, exserted. Stigmas 4, approximate. Berry globose, not crowned, containing 4 pyrenæ.

121 Pyro'stria. Limb of calyx 4-5-toothed. Corolla subcampanulate, 4-5-cleft; throat tomentose. Stamens 4-5, hardly exserted. Stigma capitate, bifid. Fruit pear-shaped, not crowned, containing 4-8 bony nuts.

122 Octa'via. Limb of calyx hardly any, truncate. Corolla unknown. Ovarium crowned by a fleshy disk, which is perforated in the middle. Drupe fleshy, globose, not crowned, containing 8 pyrenæ.

123 Litosa'nthes. Limb of calyx small, 4-toothed. Corolla globose, with a villous throat, and a short, spreading 4-cleft limb. Stamens 4, inclosed; anthers linear. Stigma 4-toothed. Drupe succulent, obovate, umbonate, containing 4 nuts.

124 Eri'thalis. Limb of calyx short, with a 5-10-toothed border. Corolla rotate, without a tube, 5-10-parted. Stamens 5-10, hardly adnate to the corolla at the base; anthers linear. Stigma bilamellate. Drupe globose, crowned, containing 5-10 pyrenæ.

125 Retiniphy'llum. Limb of calyx 5-cleft. Corolla salver-shaped, with a terete tube and a 5-lobed spreading limb. Stamens 5, exserted; anthers oblong. Stigma undivided. Drupe globose, crowned, containing 5 nuts.

126 Nonate'lia. Limb of calyx 5-toothed. Corolla funnel-shaped, with a somewhat gibbous tube, and a 5-lobed limb. Stamens 5, almost inclosed. Stigmas 2. Drupe globose, crowned, containing 5 nuts.

127 Gynóchtodes. Limb of calyx short, quite entire. Corolla 4-5-parted, villous inside; lobes connivent below and spreading above, each furnished with an inflexed point at the apex. Stamens 4-5, inclosed, inserted in the base of the corolla. Stigma bifid, warted. Drupe globose, umbilicate, containing 4 pyrenæ.

128 Cœlospe'rmum. Limb of calyx quite entire, deciduous. Corolla with a short tube, and a 4-6-cleft, spreading limb. Stamens 4-5, exserted, inserted in the throat; anthers linear, incumbent. Stigma bifid. Drupe globose, umbilicate, containing 4 pyrenæ.

129 Ancyla'nthus. Limb of calyx 5-parted (f. 103. *a.*). Corolla tubular (f. 103. *b.*), incurved; limb regular, 5-cleft (f. 103. *c.*); lobes cuspidate. Anthers 5, sessile in the throat (f. 103. *e.*). Stigma 5-lobed (f. 103. *d.*). Fruit 5-celled (f. 103. *g.*); cells 1-seeded.

130 Phalla'ria. Calyx with a globose tube, and an acutely 5-toothed limb. Corolla tubular, 5-cleft; lobes spreading or reflexed. Anthers 5, ovate, at the throat. Style filiform, crowned by an elongated thick stigma. Ovarium 2-seeded.

131 Hyla'cium. Limb of calyx 5-toothed. Corolla funnel-shaped, with a long tube and 5 roundish reflexed lobes. Anthers 5, almost sessile in the throat. Style thick at the base, 5-furrowed. Stigma cylindrical, 5-furrowed. Drupe dry, containing a 2-celled rugged nut: one of the cells usually abortive.

132 Cuvie'ra. Limb of calyx 5-parted. Corolla campanulate, 5-cleft, spinescent at the apex. Anthers 5, at the throat, inclosed. Stigma dilated, with a reflexed margin. Fruit baccate, 5-celled; cells 1-seeded.

133 Donìdsia. Limb of calyx very short, hardly 5-toothed. Corolla with a short broad tube, beset with a row of stiff retrograde hairs inside, and a 5-lobed limb. Style tumid in the middle, and hispid. Ovarium 1-celled? many seeded.

134 Stigma'nthus. Limb of calyx 5-parted. Corolla with a long tube and a 5-lobed limb. Stamens 5; anthers reflexed. Stigma large. Berry dry, tubercular, compressed, 1-celled. Seeds numerous, bony.

135 Stru'mpfia. Limb of calyx campanulate, 5-cleft beyond the middle. Corolla somewhat campanulate, profoundly 5-cleft, with hardly any tube. Stamens 5, inserted in the base of the tube of the corolla, connate. Stigma bifid. Drupe pea-formed, umbilicate, containing a 2-celled globose nut, rarely 1-celled.

136 Billio'tia. Limb of calyx 5-7-parted. Corolla salver-shaped, with a 5-7-parted limb, and the throat bearded by bristles inside. Stamens 5-7, adnate to the tube. Ovarium covered by a nectariferous urceolus at the apex. Style 1, crowned by 4 stigmas. Drupe 1-seeded by abortion.

Tribe VIII.

Pæderie'æ. *Fruit 2-celled, indehiscent, hardly fleshy, the rind easily separated from the seeds or carpels. Carpels compressed,* 1-*seeded* (f. 104. *f.*), *hanging from a filiform axis. Albumen fleshy.—Climbing shrubs, with opposite leaves, and interpetiolar stipulas.*

137 Lygodyso'dea. Limb of calyx 5-toothed (f. 104. *a.*). Corolla having the tube much longer than the teeth of the calyx (f. 104. *b.*), with a hairy throat and a 5-lobed limb (f. 104. *c.*); lobes revolute. Anthers sessile within the tube (f. 104. *e.*). Stigmas 2, slender (f. 104. *d.*). Fruit indehiscent, crowned (f. 104. *g.*), containing 2 carpella.

138 Leco'ntea. Limb of calyx 5-parted. Corolla with a longish terete tube, a 5-parted limb, and a naked throat. Anthers almost sessile in the throat, exserted. Stigmas 2, linear. Fruit containing 2 winged carpella.

139 Pæde'ria. Limb of calyx small, 5-toothed. Corolla funnel-shaped, hairy inside, 5-lobed, plicate in æstivation. Anthers 5, almost sessile in the middle of the tube. Stigma bifid. Berry 2-celled, 2-seeded, with the bark at length brittle.

Tribe IX.

Coffea'ceæ. *Fruit 2-celled* (f. 105. *k.* f. 107. *c.*), *baccate, containing 2* 1-*seeded bony nuts* (f. 107. *d.*), *which are flat inside, and usually marked by a furrow on the outside; rarely only containing* 1 *nut from abortion. Albumen horny.—Trees or shrubs, with opposite leaves. Stipulas interpetiolar, 2 on each side, combined or distinct.*

Subtribe I. Coffee'æ. *Flowers distinct, not joined together.*

140 Amaraca'rpus. Limb of calyx 4-cleft, unequal. Corolla funnel-shaped, with a villous throat, and a deeply 4-cleft limb. Stamens 4, inserted in the throat. Stigma 2-lobed. Drupe crowned.

141 Damnaca'nthus. Limb of calyx 5-toothed. Corolla unknown. Berry globose, crowned.

142 Ca'nthium. Limb of calyx 4-5-toothed. Corolla with a short tube, a bearded throat, and a 4-5-lobed spreading limb. Stigma undivided, globose or mitre-formed. Berry globose or didymous, crowned.

143 Plectro'nia. Limb of calyx 5-toothed. Corolla short, funnel-shaped, with a 5-parted limb and a bearded throat: lobes reflexed. Stamens 5, inserted in the throat, a little exserted. Stigma bilamellate, subcapitate. Berry nearly dry, naked at the apex, emarginate, compressed, didymous.

144 Psy'drax. Limb of calyx 5-toothed, deciduous. Corolla with a short tube, a hairy throat, and a 5-lobed reflexed limb. Stamens inclosed. Style exserted; stigma bilamellate. Berry fleshy, obovate, areolate at the apex.

145 Marqui'sia. Limb of calyx short, acutely 5-parted. Corolla with a short tube, a glabrous throat, and a 5-lobed spreading limb. Anthers 5, ovate, sessile at the throat. Stigmas 4-6. Berry ovate, fleshy, crowned.

146 Nesci'dia. Limb of calyx hardly any, quite entire. Corolla with a short tube, a 5-cleft limb, and a naked throat. Stamens 5, inclosed, nearly sessile, inserted in the throat; anthers linear, acute. Stigmas 2, face to face. Ovarium 2-celled.

147 Diplo'spora. Limb of calyx subcampanulate, 4-toothed. Corolla with a broad tube, a pilose throat, and a 4-lobed spreading limb. Stigma bifid. Ovarium 2-celled. Fruit unknown.

148 Epithi'nia. Limb of calyx cylindrical, hardly 4-toothed. Corolla tubular, with a spreading 4-parted acute limb, and a villous throat. Stamens 4, exserted; anthers linear. Style exserted: stigma bifid. Berry 8-furrowed.

149 Siderode'ndron. Limb of calyx hardly any, somewhat 4-toothed. Corolla with a long terete tube, a 4-lobed obtuse limb, and a glabrous throat. Anthers 4, oblong, sessile at the throat. Style bifid at the apex. Berry dry, subglobose, not crowned.

150 Euma'chia. Limb of calyx 4-toothed, deciduous. Corolla funnel-shaped, with a short tube, a naked throat, and a 4-parted spreading limb. Stamens 4, inserted at the bottom of the tube; anthers oblong, inclosed. Stigma bifid. Berry globose, not crowned.

151 Declieu'xia. Limb of calyx 4-parted (f. 105. *b.*). Corolla funnel-shaped (f. 105. *g.*), with a terete tube (f. 105. *f.*), a bearded throat, and a 4-lobed reflexed limb. Stamens 4, inserted in the throat; anthers linear, incumbent, exserted (f. 105. *e.*). Stigma bifid (f. 105. *c.*). Berry nearly dry, somewhat didymous, compressed (f. 105. *k.*), crowned (f. 105. *b.*).

152 Tertre'a. Limb of calyx 4-parted. Corolla short, funnel-shaped, 4-cleft; lobes spreading; throat beset with long hairs. Stamens inserted in the upper part of the tube, exserted. Style inclosed: stigmas 2. Drupe oblong, compressed, crowned.

153 Chioco'cca. Limb of calyx 5-toothed. Corolla funnel-shaped, with an obconical tube or throat, and a 5-lobed acute limb. Stamens 5, downy, hardly adnate at the bottom of the corolla; anthers linear, inclosed. Style clavate or 2-lobed at the apex. Berry somewhat didymous, compressed, crowned.

154 Marga'ris. Limb of calyx somewhat turbinate, semiquinquifid. Corolla funnel-shaped, with an obconical tube, which is bluntly 5-toothed or 5-lobed at the apex. Stamens inserted into the middle of the tube, inclosed; anthers ovate. Stigma undivided or somewhat 2-lobed. Berry globose, crowned.

155 Saldi'nia. Limb of calyx somewhat campanulate, obsoletely repand. Corolla with a short tube, an acute 4-parted limb, and a hairy throat. Stamens 4, inserted in the throat, hardly exserted; anthers oblong, nearly sessile. Fruit ovoid, compressed, crowned, drupaceous, 1-celled and 1-seeded by abortion, small.

156 Scolosa'nthus. Lobes of calyx 4, linear-lanceolate. Corolla tubular, tetragonal before expansion. Stamens adnate to the lower part of the tube, downy, not exserted; anthers linear. Stigmas 2. Drupe nearly globose, crowned, containing a 2-celled 2-seeded nut.

157 Chome'lia. Limb of calyx 4-toothed. Corolla salver-shaped, with a long slender tube, a glabrous throat, and a 4-lobed limb. Anthers 4, almost sessile in the throat. Style bifid at the apex, situated among the anthers. Drupe ovate, crowned, containing a 2-celled 2-seeded nut.

158 Bacònia. Limb of calyx bluntly 4-cleft. Corolla fun-

nel-shaped, with a short terete tube, a bearded throat, and 4 oblong lobes, which are longer than the tube, and twisted in æstivation. Anthers 6, linear, almost sessile, exserted. Style exserted. Stigma undivided. Berry dry, 2-celled, 2-seeded.

159 Ixòra. Limb of calyx small, 4-toothed (f. 106. *a*.). Corolla salver-shaped (f. 106. *b*.), with a slender terete tube (f. 106. *d*.), and a 4-parted spreading limb (f. 106. *b*.). Anthers 4, almost sessile in the throat. Style bifid (f. 106. *e*.) at the apex, equal in length to the corolla or a little longer. Berry drupaceous, crowned, nearly globose.

160 Pave'tta. All as in *Ixòra*, but differs in the style being exserted beyond the corolla, and clavate, undivided, or hardly bifid at the apex.

161 Sapro'sma. Limb of calyx small, 4-toothed. Corolla 4-cleft, with a hairy throat. Stamens 4, inserted in the throat. Stigma bifid. Berry oval, smooth, umbilicate, crowned, 1-seeded.

162 Coussa'rea. Limb of calyx tubular, sinuately 4-toothed. Corolla with an elongated terete tube, which is hardly subtumid under the apex, and a glabrous throat. Stamens 4, inserted in the upper part of the tube, inclosed; anthers oblong-linear. Stigma bipartite, hardly exserted. Berry ovate-globose, hardly fleshy, crowned, 1-celled, 1-seeded.

163 Polyòzus. Limb of calyx obsoletely denticulated, deciduous. Corolla with a cylindrical tube, which is shorter than the 4-5 lobes of the limb, and a villous throat. Anthers hardly exserted. Style short; stigma bifid. Berry drupaceous, nearly globose, not crowned.

164 Grumílea. Limb of calyx 5-toothed. Corolla and stamens unknown. Berry crowned, ovate-globose, rather coriaceous, 2 rarely 3-celled.

165 Rutídea. Limb of calyx small, 5-parted. Corolla funnel-shaped, with a terete tube and a 5-lobed spreading limb. Anthers oblong, sessile in the throat, exserted. Style clavate at the apex; stigmas 2, adnate. Berry nearly dry, globose, crowned, 1-celled, 1-seeded by abortion.

166 Fara'mea. Limb of calyx very short, 4-toothed, or entire. Corolla with a short terete tube, a naked throat, and 4 spreading oblong or linear lobes. Anthers 4, sessile, inclosed. Style short, bifid at the apex. Berry dry, marked by 8 crenæ at the apex; 1-celled by abortion at maturity.

167 Strempe'lia. Limb of calyx campanulately tubular, 4-5-toothed. Corolla tubular, with a 4-5-parted spreading limb, and a naked throat. Stamens inserted in the middle of the tube, pilose in the free part; anthers linear, inclosed. Fruit ovoid, crowned.

168 Coffe'a. Limb of calyx small, 4-5-toothed (f. 107. *a*.). Corolla tubular, funnel-shaped, with a 4-5-parted spreading limb (f. 107. *b*.). Stamens 4-5, inserted in the middle of the upper part of the tube, exserted or inclosed. Style bifid at the apex. Berry umbilicate (f. 107. *h*.), not crowned.

169 Antheru'ra. All as in *Psychótria*, but differs in the corolla being rotate and 5-parted; in the anthers being sagittate at the base and caudate at the apex; in the style being subulate, and longer than the corolla, and in the stigma being simple.

170 Rona'bea. Limb of calyx small, 5-toothed. Corolla oblong, somewhat funnel-shaped, with 5 spreading acute lobes, and a naked throat. Anthers 5, oblong, inclosed. Stigma bilamellate. Berry ovate, umbilicate.

171 Psychótria. Limb of calyx 5-lobed or 5-toothed. Corolla funnel-shaped, short, 5-cleft; limb spreading or recurved; throat bearded or glabrous. Stamens 5: anthers exserted or inclosed. Stigma bifid. Berry drupaceous, crowned.

172 Antònia. Calyx having the tube clothed with imbricate scales and a 5-cleft limb. Corolla funnel-shaped, with a bearded throat and a 5-parted limb. Stigma ovate, bifid. Berry 2-celled.

173 Palicou'rea. All as in *Psychótria*, except the corolla, which is tubular and cylindrical, and a little gibbous at the base or curved, 5-cleft, bearded beneath the middle inside. The teeth of the calyx, and the lobes of the corolla, sometimes rather unequal.

174 Chasa'lia. Limb of calyx urceolate, rather tubular, entire or 5-toothed at the apex. Corolla with an elongated equal tube, and 5 short acutish erect or spreading lobes. Anthers 5, inserted in the mouth or top of the tube, inclosed or a little exserted. Stigmas 2. Berry ovate, crowned, hardly dry.

175 Ja'ckia. Limb of calyx unilateral, trifid at the apex. Corolla funnel-shaped, with a filiform tube and a campanulate 5-parted limb. Anthers a little exserted, filiform, sessile at the throat. Style exserted, pilose in the middle; stigma ovate, globose, longitudinally furrowed.

Subtribe II. Cephæli'deæ. *Flowers disposed in heads, involucrated by bracteas.*

176 Cephæ'lis. Limb of calyx very short, 5-toothed. Corolla funnel-shaped, with 5 small lobes. Anthers inclosed. Stigma bifid, usually exserted. Berry obovate-oblong, crowned, 2-celled, 2-seeded. Shrubs and herbs.

177 Carapi'chea. All as in *Cephæ'lis*, but the anthers and stigmas are a little exserted. Berry dry, salcate, divisible into two parts, crowned. The nuts are smooth on the outside, not as in *Cephæ'lis* striated on the outside.

178 Sute'ria. Limb of calyx tubular, angular, 5 times longer than the ovarium, with an unequally 5-toothed border. Corolla salver-shaped, with a terete tube and a naked throat. Anthers sessile, inclosed. Stigma bilamellate. Fruit 2-celled, 2-seeded.

179 Geo'phila. Limb of calyx 5-parted. Corolla tubular, with a pilose throat, and 5 rather recurved lobes. Anthers 5, inclosed. Stigma bifid. Berry ovoid, angular, crowned, 2-celled, 2-seeded.—Herbs.

180 Pata'bea. Limb of calyx very short, entire, or 4-toothed, rarely 5-6-toothed. Corolla with a short, nearly terete tube, and 4-6 spreading lobes. Anthers 4-6, sessile within the throat. Stigma bluntly bifid. Berry globose, crowned, smooth, 2-celled, 2-seeded.

181 Salzma'nnia. Limb of calyx bluntly 4-toothed or sinuated. Corolla with a short tube and a 4-lobed limb. Stamens with very short filaments, and very long linear anthers. Style undivided. Berry dry, crowned, compressed, 1-celled and 1-seeded from abortion.

Tribe X.

Spermacòceæ. *Stigma bilamellate* (f. 189. *b.*). *Fruit dry, and rather fleshy, usually composed of* 2 1-*seeded mericarps, rarely of* 3-4, *which are sometimes joined together and sometimes separating, indehiscent, but sometimes dehiscing in various ways. Albumen between fleshy and horny.—Shrubs or herbs. Leaves opposite. Stipulas membranous at the base, and usually divided into many bristles at the apex.*

Subtribe I. Cephala'ntheæ. *Flowers and fruit sessile, densely aggregate, seated on a globose receptacle. Fruit divisible into two parts. Shrubs.*

182 Cephala'nthus. Limb of calyx angular, 4-toothed. Corolla tubular, slender, with a 4-cleft limb. Stamens 4, short, inserted in the tube, hardly exserted. Style exserted; stigma capitate. Fruit crowned.

Subtribe II. Euspermacòceæ. *Flowers distinct. Fruit dry, usually divisible into* 2 *parts, and sometimes in* 3 *or* 4 *parts.—Usually herbs, rarely shrubs.*

183 Democrítea. Lobes of calyx 5, lanceolate, acute, stiff. Corolla, stamens, and style unknown. Fruit 2-celled, 2-seeded when young, but becoming 1-celled from the dissepiment having vanished at maturity. Seeds free within the pericarp.—A shrub.

184 O'ctodon. Limb of calyx with 8 very short teeth. Corolla campanulate, 4-cleft, beset with adpressed hairs inside, which are tipped with glands. Stamens inserted in the bottom of the tube. Stigma globular. Capsule turbinate, obsoletely tetragonal, 2-celled, 2-valved, dehiscing at the dissepiment.

185 Borre'ria. Limb of calyx 2-4-toothed. Corolla salver-shaped or funnel-shaped, 4-lobed. Stamens 4, exserted or inclosed. Stigma bifid or undivided. Capsule crowned, 2-celled, dehiscing at the dissepiment when mature; coccula bursting by a longitudinal chink inside.

186 Spermacòce. Limb of calyx 2-4-toothed (f. 108. *a.*), with sometimes accessory teeth. Corolla salver-shaped or funnel-shaped, 4-lobed (f. 108. *c.*). Stigma bifid or undivided (f. 108. *e.*). Capsule crowned (f. 108. *f.*), 2-celled: nuts divisible into two parts from the apex, one open and the other closed.

187 Hexase'palum. Limb of calyx 6-parted. Corolla campanulately funnel-shaped, with an obconical tube and 4 lanceolate lobes. Stamens 4, shorter than the lobes of the corolla. Fruit oblong, dry, divisible into two parts at the dissepiment; the dissepiment being double the nuts are both closed.

188 Diòdia. Calyx with a 2-4-toothed limb, rarely more. Corolla funnel-shaped, with a 4-lobed limb. Stamens 4, exserted or inclosed. Style bifid or undivided. Fruit crowned, divisible into two parts: the parts indehiscent.

189 Tríodon. Limb of calyx 2-4-toothed, with sometimes other accessory teeth. Corolla short, funnel-shaped, 4-cleft. Stigma bifid. Capsule papery, crowned, 2-celled: nuts 2, indehiscent, having the axis tridentate and remaining after the nuts have fallen.

190 Cru'sea. Limb of calyx constricted above the ovarium, profoundly cleft into 4 linear lobes, and 4 accessory small ones. Corolla salver-shaped, with a long tube, a glabrous throat, and 4-lobed limb. Stamens exserted. Style exserted, bifid at the apex. Fruit of 2 indehiscent nuts, adhering to a flat membranous permanent axis, but at length separating from it.

191 Richardsònia. Limb of calyx of 4-7 unequal teeth. Corolla funnel-shaped, with an obconical tube, and a 3-5-lobed spreading limb. Stamens 3-5, exserted. Style 3-4 cleft at the apex. Capsule crowned at first, containing 3-4 1-seeded membranous indehiscent nuts. Seeds peltate.

192 Kno'xia. Teeth of calyx 4, unequal. Corolla salver-shaped, with a terete tube, a usually bearded throat, and a 4-lobed limb. Anthers at the throat. Stigma 2-lobed. Fruit 2-celled: the 2 nuts usually separating from the base to the apex at the dissepiment. Seed ovate-triquetrous.

193 Psylloca'rpus. Limb of calyx 8-toothed, unequal. Corolla funnel-shaped, having the tube bearded at the throat, and an acutish 4-lobed limb. Anthers 4, inclosed. Stigma 2-lobed. Capsule crowned, compressed from the back of the carpels, 2-celled: dissepiment parallel with the valves.—Small shrubs.

194 Mitraca'rpum. Limb of calyx 4-toothed; teeth unequal. Corolla salver-shaped, with a terete tube, having a circular line of hairs near the base inside, a glabrous throat, and a 4-lobed limb. Anthers exserted or inclosed. Stigma bifid. Capsule membranous, crowned, 2-celled, circumcised about the middle.

195 Crucksha'nksia. Limb of calyx 4-toothed: teeth usually having an accessory tooth on each side, 1 or 2 of which are usually expanded into roundish wings. Corolla salver-shaped, with an elongated tube, a 5-cleft spreading limb, and a glabrous throat. Stamens 5, exserted, inserted in the mouth of the corolla. Anthers linear-oblong, fixed by the base. Stigma bifid, pilose. Capsule globose, subdidymous, crowned, 2-celled, 4-valved: cells 2-seeded. Seed obovate, tubercular.

196 Stæ'lia. Teeth of calyx 2, subulate. Corolla funnel-shaped, with a slender tube, and a 4-lobed acute limb. Stamens 4, exserted. Stigma 2-lobed. Capsule crowned, membranous, 2-celled, 2-valved: dissepiment entire, permanent.

197 Tessie'ra. Limb of calyx 4-lobed: lobes unequal. Corolla funnel-shaped, with a glabrous throat, and a 4-lobed limb. Stamens exserted a little. Stigma 2-lobed? Capsule crowned, 2-celled, 2-valved; dissepiment entire, deciduous.

198 Gaillònia. Limb of calyx 5-7-toothed; teeth unequal. Corolla funnel-shaped, with a terete tube, and a 5-7-lobed limb. Stamens 5-7, exserted from the throat. Style filiform; stigma 2-lobed. Fruit ovoid, containing 2 separable indehiscent nuts.

199 Machaònia. Limb of calyx small, 5-parted. Corolla funnel-shaped, 5-cleft, with a short tube, and a villous throat. Stamens 5, inserted in the throat; anthers subcordate, exserted. Stigma bipartite. Capsule somewhat tetragonal, crowned, containing 2 1-seeded indehiscent nuts, which are fixed to the top of a linear axis.—Shrubs or trees.

Subtribe III. Putorie'æ. *Fruit rather fleshy, not divisible. —Shrubs and herbs.*

200 Serissa. Limb of calyx 5, rarely 4-cleft, with sometimes accessory teeth. Corolla funnel-shaped, having the tube hairy inside, and the limb 5, rarely 4-parted; lobes induplicate in æstivation, hence somewhat trifid at the apex. Stamens 5, rarely 4; anthers linear, exserted. Style inclosed, bifid at the apex. Berry nearly globose, 2-celled, 2-seeded.

201 Ernòdea. Limb of calyx 4-6-parted, permanent. Corolla salver-shaped, with a terete subtetragonal tube, a naked throat, and 4-6 lanceolate revolute lobes. Stamens longer than the corolla; anthers acute. Style exserted; stigma emarginate. Berry roundish, crowned, 2-celled, 2-seeded.

202 Cu'ncea. Limb of calyx small, 4-toothed. Corolla with a short tube and a 4-cleft limb, having the throat closed with villi. Anthers 4, linear, sessile, inclosed. Stigma bifid, exserted. Berry 2-celled, 2-seeded, crowned.

203 Hydrophi'lax. Limb of calyx 4-parted (f. 109. *a.*), permanent. Corolla campanulately funnel-shaped, 4-lobed (f. 109. *f.*). Anthers 4, linear-oblong, sessile, inserted at the throat (f. 109. *f.*), exserted. Stigma roundish, 2-lobed (f. 109. *b.*). Berry dry, angular, lanceolate, crowned, 2-celled (f. 109. *c.*). Seed bisulcate inside.

204 Scyphi'phora. Limb of calyx tubular, truncate, nearly entire. Corolla funnel-shaped, with a spreading limb, having the tube hairy inside. Stamens 4, exserted; anthers incumbent, Stigma bifid. Drupe baccate, crowned, 8-furrowed, containing 2 1-seeded nuts.

205 Plo'cama. Limb of calyx hardly any, sinuately 5-cleft. Corolla campanulately funnel-shaped, 5-cleft, rarely 6-cleft. Anthers linear, inserted between the lobes of the corolla, sessile. Stigma thickish. Fruit subbaccate, areolate at the apex, crowned, 2-3-celled.

206 Putòria. Limb of calyx short, tubular, sinuately 5-toothed. Corolla salver-shaped, with a long terete tube, a glabrous throat, and 4 spreading acutish lobes. Stamens short, rising from the top of the tube, hardly exserted; anthers oblong-linear. Stigma bifid. Berry almost dry, umbilicate, 2-celled.

Tribe XI.

Anthospe'rmeæ. *Flowers sometimes dioecious. Corolla rotate* (f. 110. *b.*). *Styles 2, separate to the base, ending each in an elongated plumose stigma* (f. 110. *c.*). *Fruit constantly composed of 2 indehiscent* 1-*seeded mericarps at maturity* (f. 110. *g.f.*), *which are easily separated. Albumen fleshy.—Herbs or subshrubs. Leaves opposite or in whorles. Stipulas small,* 1-3-*toothed, rather adnate to both sides of the petioles.*

207 Caprósma. Limb of calyx 4-7-toothed, short. Corolla campanulately turbinate, with a short broad tube, a naked throat, and 4-7 acute lobes. Stamens 4-7. Style nearly bipartite to the base, pilose, exserted. Berry obovate, pulpy, containing 2-3 bony indehiscent nuts.

208 Phy'llis. Limb of calyx obsolete. Corolla tubular, with a 5-lobed spreading limb. Stamens 5. Style almost wanting; stigmas 2. Capsule obovate, compressed, naked at the apex, divisible into two parts; mericarps hanging from the central axis.

209 Galopìna. Flowers hermaphrodite. Limb of calyx very minute, hardly any. Corolla subrotate, 4-parted. Stamens inserted in the bottom of the corolla. Styles 2, ending in very long pilose stigmas. Fruit didymous; nuts separable, indehiscent, warted.

210 Anthospe'rmum. Flowers dioecious, rarely polygamous or hermaphrodite. Limb of calyx small, 4-5-toothed (f. 110. *a.*), deciduous. Corolla with a short tube, and a 4-5-parted limb (f. 110. *b.*), which is longer than the tube. Stamens 4-5, inserted at the base of the tube (f. 110. *d.*); anthers oblong, terete. Stigmas 2, very long (f. 110. *c.*), hairy. Fruit constantly of 2 easily separated nuts (f. 110. *f. g.*).

211 Ambra'ria. Flowers dioecious, with the same structure as *Anthospérmum*, but the fruit is falsely 3-4-celled; mericarps joined by a concave commissure, hence the central cell is empty, and the 2 lateral ones filled.

Tribe XII.

Stella'tæ. *Flowers hermaphrodite, rarely unisexual. Corolla rotate or funnel-shaped; lobes valvate in æstivation. Styles 2, distinct from the base, or joined together more or less; stigmas capitate. Fruit constantly of 2 indehiscent* 1-*seeded mericarps. Seed hardly distinct from the calyx and pericarp. Albumen horny.—Sometimes subshrubs, but usually herbs. Leaves opposite, bearing buds in the axils, having* 1-2 *or* 3 *leaf-formed stipulas, on each side, forming whorls along with them. The leaves are only to be distinguished from the stipulas by being furnished with axillary buds.*

212 Shera'rdia. Limb of calyx 4-6-toothed, permanent. Corolla funnel-shaped, with a terete tube, and a 4-lobed limb. Stamens 4. Style one, 2-lobed. Fruit crowned, dry, bipartite.

213 Aspe'rula. Limb very short, 4-toothed, deciduous, or obsolete. Corolla funnel-shaped, rarely campanulate, 4-cleft, rarely 3-cleft. Styles 2, joined at the base, and sometimes nearly to the apex. Fruit didymous, not crowned, almost dry.

214 Cruciane'lla. Limb of calyx none. Corolla tubular, elongated, funnel-shaped, 4-5-lobed: lobes usually drawn out into a bristle-like inflexed appendage. Stamens 4-5, inclosed. Style 2-lobed at the apex. Fruit bipartite, not crowned.

215 Ru'bia. Limb of calyx hardly any. Corolla rotate, 5-parted. Stamens 5, short. Styles 2, short. Fruit didymous, globose, baccate, juicy.

216 Ga'lium. Limb of calyx hardly any. Corolla 4-parted (f. 111. *b.*), rotate, rarely 3-parted. Stamens 4, short (f. 111. *c.*). Styles 2, short. Fruit didymous, roundish, dry.

217 Callipe'ltis. Limb of calyx not perspicuous. Corolla 4-parted, campanulate. Stamens 4, very short. Stigmas 2. Fruit oblong, somewhat incurved, 1-seeded from one of the mericarps being abortive.

218 Vailla'ntia. Flowers by threes: the middle one hermaphrodite and fertile, the 2 lateral ones male, and joined to the middle one. Limb of calyx denticulated, permanent:

teeth many, irregular, stiff. Corolla of the male flowers trifid, of the hermaphrodite one quadrifid. Stamens 3-4. Styles in the female flower 2. Fruit 3-horned.

Tribe XIII.

Opercularie'æ. *Fruit* 1-*celled*, 1-*seeded*, *joined together laterally into a head* (f. 112. *b.*), *and at length opening by* 2 *valves at the apex.—Herbs or subshrubs, with opposite leaves. Stipulas twin on each side, distinct or concrete.*

219 Pòmax. Limb of calyx wanting. Corolla 3-4-cleft. Stamens 1-4. Style short; stigmas 2, slender. Seeds wrinkled from tubercles.—Suffrutescent herbs.

220 Opercula'ria. Limb of calyx 3-4-lobed. Corolla 3-4 cleft. Stamens 1-5. Style short; stigmas 2, slender. Seeds nearly smooth.—Herbs suffruticose at the base (f. 112.).

221 Lipo'stoma. Limb of calyx 4-parted. Corolla with a tubular base, a ventricose throat, and a 4-lobed limb; tube hairy inside, bearded at the top. Stamens 4, inserted in the throat. Stigmas 2. Capsule globose, 2-celled, but usually only 1-celled from the rupturing of the dissepiment, many seeded, crowned by a deciduous operculum.

† *Rubiaceous genera not sufficiently known.*

222 Psilò'bium. Limb of calyx spreading, 5-parted. Corolla with a short tube and a 5-parted limb. Stamens 5, fixed to the base of the corolla. Stigma clavate, 10-winged, exserted. Fruit cylindrical, silique-formed, crowned, 2-celled, many-seeded. Seeds fixed to the central axis, 2 series in each cell.—Shrubs.

223 Platyme'rium. Limb of calyx rotate, 5-parted, rarely 4-parted. Corolla coriaceous, funnel-shaped, with a short tube, which is woolly inside, and a 5, rarely 4-parted limb, which is twisted in æstivation. Anthers sessile in the tube. Style clavate, spirally 10-ribbed. Ovarium 2-celled, crowned by an epigynous disk.—Shrub, very nearly allied to *Psilòbium*.

224 Stipula'ria. Calyx small, tubular, with a 5-toothed border. Corolla tubular, slender. Stamens 5? Heads of flowers axillary, nearly sessile, surrounded by a large calyciform 5-toothed villous involucrum.

225 Benzo'nia. Limb of calyx small, 5-toothed. Corolla tubular, coriaceous, 5-cleft. Anthers triquetrous, sessile in the throat. Stigma ovate-globose, furrowed longitudinally. Fruit unknown.—A shrub, with corymbose flowers.

226 Himata'nthus. Calyx with a turbinate tube, and a loose permanent 5-parted unequal limb. Corolla funnel-shaped, having the tube much longer than the calyx, and a 5-cleft limb. Stamens 5, capillary, very short, inserted in the tube. Style clavate: stigma subulate. Ovarium 2-celled, 2-seeded.—A tree. Flowers spicate, sessile, involucrated by a large deciduous bractea before expansion. Perhaps belonging to *Rubiàceæ*.

227 Sicki'ngia. Calyx 5-toothed, permanent. Corolla campanulate, 5-toothed. Filaments inserted in the middle of the tube. Anthers exserted. Stigma 1. Capsule woody, 2-valved. Seeds winged.—A tree, with panicles of sweet-scented flowers. Perhaps belonging to *Rubiàceæ*.

Tribe I.

CINCHONA'CEÆ (this tribe contains plants agreeing with *Cinchòna* in important characters). D. C. prod. 4. p. 343. Cinchòneæ, Rich. diss. p. 108. Fruit capsular, 2-celled; cells many-seeded. Seeds winged. Albumen fleshy.—Trees or shrubs. Leaves opposite. Stipulas interpetiolar.

Subtribe I. Naucle'eæ (shrubs agreeing with the genus *Naúclea* in the globose flowers). D. C. prod. 4. p. 343. Flowers capitate, sessile upon a globose receptacle (f. 83. *e.* f. 84. *k.*)

I. NAU'CLEA (from *ναυς, naus*, a ship, and *κλειω, kleio*, to inclose; in reference to the hull-shaped half capsule). Lin. gen. no. 223. Gærtn. fruct. 1. p. 151. t. 30. Lam. ill. t. 153. Roxb. fl. ind. 2. p. 117. D. C. prod. 4. p. 343.—Naúclea species, Juss. Kunth, Blume.—Cephalánthus species. Lin. ed. 1. Lam. Reich.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an oblong tube (f. 83. *a.*), and a short, truncate, or 5-toothed limb (f. 83. *b.*); lobes linear. Corolla funnel-shaped (f. 83. *c.*), with a slender tube, a naked throat, and 5 spreading, oval-oblong lobes (f. 83. *c.*). Anthers inclosed (f. 83. *g.*), or exserted, always shorter than the lobes of the corolla. Style filiform (f. 83. *e.*), exserted; stigma oblong (f. 83. *d.*), or ovate, tumid, undivided. Capsules 2-celled (f. 83. *h. i.*), sessile upon the receptacle, not gradually attenuated to the base. Seeds numerous, imbricate, winged, fixed to oblong placentas, which are adnate to the dissepiment. Embryo inverted in a fleshy albumen.—Unarmed trees, rarely shrubs, natives of India and Africa. Leaves opposite, or 3-4 in a whorl, petiolate or sessile. Stipulas interpetiolar, deciduous. Peduncles terminal and axillary, each bearing a globose head of flowers. Bracteas wanting at the base of the head of flowers, but with linear paleæ among the flowers. Flowers crowded, sessile. This genus differs from *Cephalánthus* in the parts of the flowers being quinary, and in the cells of the capsules being many-seeded; and from *Sarcocéphalus* in the fruit being capsular, not baccate; and from *Uncària* in the capsules being sessile, not attenuated at the base.

Sect. I. Nauclea'ria (altered from *Naúclea*). Lobes of calyx short, acute, or wanting.

§ 1. *Capsules growing together in the head.*

1 N. undula'ta (Roxb. fl. ind. 2. p. 117.) arboreous; branches brachiate; leaves petiolate, ovate-oblong, obtuse, undulated, shining; stipulas elliptic, obtuse, almost the length of petioles; peduncles terminal, solitary; capsules united. ♄. S. Native of the Moluccas. Peduncles drooping, each bearing a large globular head of numerous, small, most beautiful yellow fragrant flowers. Anthers seated in the 5 fissures of the corolla, with hardly any filaments.

Undulated-leaved Nauclea. Fl. May, June. Clt. 1820. Tree 20 feet.

2 N. glabe'rrima (Bartl. in herb. Hænke ex D. C. prod. 4. p. 344.) branches tetragonal; leaves ovate, glabrous, flat; stipulas oval, length of petioles; peduncles solitary, terminal; capsules united. ♄. S. Native of the island of Luzon. This species differs from *N. undulàta* in the leaves not being undulated or shining, in the petioles being 1 inch long, not 2 inches. The heads are referrible to the fruit of *Plátanus*, but are smooth.

Quite-glabrous Nauclea. Tree 12 to 15 feet.

3 N. Wallichia'na (R. Br. in Wall. cat. 6098.) branches quadrangular; leaves broad, roundish-elliptic, obtuse at both ends, but sometimes cuneated at the base, glabrous: peduncles terminal, solitary; stipulas elliptic, obtuse; stamens exserted;

fruit combined. ♄. S. Native of the East Indies, on the banks of rivers.

Wallich's Nauclea. Shrub.

4 N. COADUNA'TA (Roxb. in Rees' cycl. vol. 24. no. 6.) arborescent; leaves petiolate, broad-ovate, cordate, obtuse, coriaceous, smooth; stipulas obovate; peduncles terminal, solitary; capsules united. ♄. S. Native of Ceylon. N. cordàta, Roxb. fl. ind. 2. p. 118. Peduncles drooping, each bearing a large beautiful globular head of very fragrant bright yellow flowers. Bractea a small irregularly 4-toothed withering ring, round the peduncles near the base, within the stipulas. Anthers cordate, on very short filaments, from the mouth of the tube just under the fissures of its border.

Coadunate-capsuled Nauclea. Fl. May, June. Clt. 1820. Tree 20 to 30 feet.

5 N. SERI'CEA (Wall. cat. no. 6095.) branches tetragonal; leaves elliptic, obtuse at both ends, almost sessile, smooth; heads terminal by threes: middle one on the shortest peduncle; corollas clothed with silky villi. ♄. S. Native of the Burman empire, on the banks of the Irrawaddi at Henzrava; and at Chittagong. Capsules combined.

Silky Nauclea. Shrub.

6 N. BRUNÒNIS (Wall. cat. no. 6097.) branches obscurely tetragonal; leaves broad, roundish, cordate at the base, smooth above and pubescent beneath, as well as on the petioles; peduncles terminal, trichotomously panicled: the middle ones shortest; stamens exserted; fruit combined; stipulas elliptic, obtuse, pubescent. ♄. S. Native of the East Indies, at Plavong.

Brown's Nauclea. Shrub.

7 N. BARTLI'NGII (D. C. prod. 4. p. 344.) branches from compressed to terete; leaves nearly sessile, cordate at the base, oblong, acute, shining above, at length glabrous, pubescent beneath as well as the branchlets; stipulas ovate, obtuse, pubescent on the outside, deciduous, longer than the petioles; peduncles terminal, solitary; fruit united, rather tomentose. ♄. S. Native of Luzon, near Sorzogon. N. móllis, Bartl. in herb. Hænke, but not of Blume. Heads size and form of the fruit of *Plátanus*.

Bartling's Nauclea. Tree 20 feet.

8 N. DIVERSIFÒLIA (Wall. cat. no 6096.) branchlets tetragonal; leaves of various sizes and shapes, but usually elliptic, obtuse at the apex, and somewhat cordate at the base, smooth, on longish petioles: peduncles terminal, trichotomously panicled: the middle one always short; heads globose; fruit combined; stamens exserted. ♄. S. Native of the East Indies, in various parts of the Burmese empire.

Diverse-leaved Nauclea. Shrub.

9 N. POLYCE'PHALA (Wall. cat. no. 6100.) leaves oblong-lanceolate, long-acuminated, glabrous; peduncles forming a terminal panicle; heads small; fruit combined. ♄. S. Native of the East Indies, on the mountains of Silhet.

Many-headed Nauclea. Shrub.

§ 2. *Capsules distinct in the heads.*

10 N. MACROPHY'LLA (Roxb. fl. ind. 2. p. 120.) arboreous; leaves stem-clasping, very broad, oval, obtuse, villous on the nerves beneath; stipulas linear-lanceolate; peduncles terminal, solitary, recurved; capsules distinct. ♄. S. Native of Amboyna. Trunk of tree straight, like that of a pine or fir. Branches decussate. Leaves 8-24 inches long, and 6-8 inches broad. Peduncles length of the stipulas; each supporting a head of numerous, short, beautiful pale yellow sweet-smelling flowers, which is 3 inches in diameter. Stigmas exserted, pure white. Placentas to which the seeds are attached linear.

Long-leaved Nauclea. Tree 30 to 40 feet.

11 N. SESSILIFÒLIA (Roxb. fl. ind. 2. p. 124.) arboreous; leaves oblong, sessile, rather cordate at the base and clasping the stem, rounded at the apex; heads terminal, solitary; capsules distinct, 4-valved. ♄. S. Native of the East Indies, in the forests of Chittagong. The rest unknown.

Sessile-leaved Nauclea. Tree.

12 N. OVALIFÒLIA (Roxb. fl. ind. 2. p. 124.) arboreous; leaves sessile, oval, or elliptic; heads of flowers terminal, solitary. ♄. S. Native of the East Indies, in the forests of Silhet, where it is called *Shal* by the natives. The rest unknown.

Oval-leaved Nauclea. Tree.

13 N. CADA'MBA (Roxb. fl. ind. 2. p. 121.) arboreous, glabrous; branches brachiate; leaves petiolate, coriaceous, ovate, obtuse at the base, and acuminated at the apex; stipulas triangular; peduncles terminal, solitary, usually shorter than the heads, which are globose; lobes of calyx linear; stamens exserted, shorter than the lobes of the corolla. ♄. S. Native of the East Indies, about Calcutta; and of Malabar. Katon-jaka, Rheed. mal. 3. t. 33. and therefore Cephalánthus orientàlis, Lin. spec. ed. 1. p. 95. N. citrifòlia, Poir. dict. 4. p. 435. Flowers orange-coloured, collected into heads about the size of a small apple (Roxb.). Style white, exserted; stigma thickish, oblong. Capsules distinct, 4-celled at top. Seeds not winged. Leaves 5-10 inches long. *Kudumba* is the native name of the tree. It is common about Calcutta, where it grows to be a large tree, and is not only highly ornamental, but very useful from the extensive close shade it yields.

Cadamba Nauclea. Clt.? Tree 30 to 40 feet.

14 N. PARVIFO'LIA (Roxb. cor. 1. p. 40. t. 52. fl. ind. 2. p. 122.) arboreous, glabrous; branches brachiate; leaves petiolate, obovate, obtuse, or short acuminated; stipulas oval; peduncles terminal, solitary, or by threes, when 3 the middle one is shortest; heads globose, bibracteate; limb of calyx truncate. ♄. S. Native of the East Indies, almost every where; and is a native of all the coast of Coromandel, but chiefly in the mountains and in the Philippines. Ham. in Lin. trans. 15. p. 94. N. parviflòra, Pers. ench. 1. p. 202. Wall. in litt. N. orientàlis, Gærtn. fruct. 1. p. 151. t. 30. exclusive of the synonymes, ex Ham. Branches numerous, spreading, forming a large oval shady head. Heads of flowers light yellow, globular, size of a plum. Anthers on short filaments. Style much exserted. The wood is of a light chestnut colour, firm and close grained; is used for various purposes, where it can be kept dry, but exposed to wet it soon rots. (f. 83.)

FIG. 83.

Small-leaved Nauclea. Tree 30 to 40 feet.

15 N. GLA'BRA (Roxb. fl. ind. 2. p. 121.) leaves elliptic, smooth; stipulas linear; peduncles terminal by threes; lobes of calyx triangular; stigma globose; cells of capsule 3-4-seeded. ♄. S. Native of the Moluccas. The leaves, according to Blum. bijdr. p. 1009. are oval, bluntish, attenuated at the base; and the peduncles are trifid from the falling of the leaves.

Glabrous Nauclea. Tree.

16 N. MISSIO'NIS (Wall. cat. no. 6099.) leaves lanceolate, glabrous; peduncles terminal, solitary, bracteate at the base; fruit distinct. ♄. S. Native of the East Indies. N. orientàlis, Herb. Madras. Stipulas lanceolate, acute.

Mission Nauclea. Shrub.

17 N. EXCE'LSA (Blum. bijdr. 1009.) leaves oval, acute, rounded at the base, coriaceous, glabrous; stipulas oblong, obtuse, pubescent; peduncles terminal by threes (or trifid from

the leaves having fallen). ♄. S. Native of Java, in the mountain woods of Seribu and Panang. Said to be allied to *N. glàbra*. Heads of flowers globose. Fruit sometimes sessile and sometimes pedicellate, but probably from abortion.

Tall Nauclea. Tree 30 to 40 feet.

18 N. OBTU'SA (Blum. bijdr. p. 1009.) leaves obovate-oblong, obtuse, coriaceous, glabrous, downy in the axils of the veins beneath; stipulas oblong, obtuse; peduncles solitary or by threes, terminal, length of petioles. ♄. S. Native of Java, in the woods on Mount Tjerimai.

Obtuse-leaved Nauclea. Tree.

19 N. STELLA'TA (Wall. cat. no. 6102.) branches terete, smooth; leaves lanceolate, glabrous; peduncles solitary, terminal, bearing each a globose crowded head of flowers. ♄. G. Native of Cochin-china. Cephalánthus stellàtus, Lour. coch. Flowers apparently red.

Stellate Nauclea. Shrub.

20 N. ROTUNDIFÒLIA (Roxb. fl. ind. 2. p. 124.) arboreous; leaves petiolate, roundish-oval, obtuse; stipulas oblong, obtuse, many-nerved; heads terminal, on short peduncles; capsules distinct. ♄. S. Native of the East Indies, in Chittagong; and of the Society Islands. The rest unknown.

Round-leaved Nauclea. Tree.

21 N. AFRICA'NA (Willd. spec. 1. p. 929.) shrubby, smoothish; leaves oval, acute, petiolate; stipulas oblong, acute; peduncles short, terminal, solitary, rarely by threes; bearing each a globose head of flowers; tube of calyx short, truncate; anthers exserted, reflexed. ♄. S. Native of Guinea, at Cape Coast, and Senegal, and all along the western coast of Africa. Uncària inérmis, Willd. in Ust. del. 2. p. 199. t. 3. N. Africàna, Schum. pl. guin. p. 104. Cephalánthus Africànus, Reichb. in Sieb. fl. exsic. seneg. no. 20. Flowers red.

Var. β, Luzoniénsis (D. C. prod. 4. p. 345.) pubescent; leaves pubescent beneath, but less so above; throat of corolla densely bearded. ♄. S. Native of the island of Luzon, one of the Philippines. N. Africāna, Cham. et Schlecht. in Linnæa. 4. p. 140. Perhaps a proper species.

African Nauclea. Shrub 6 to 10 feet.

22 N. CINCHO'NÆ (D. C. prod. 4. p. 345.) leaves ovate, obtuse at the base, and acutish at the apex, glabrous above, pale beneath and rather pilose on the nerves; panicle terminal, elongated: having the branchlets opposite, and each bearing a globose head of flowers, 3-5 in number; bracteas ovate-oblong, deflexed, under the branchlets of the panicle ♄. S. Native of South America, probably in Peru. Cínchona globífera, Pav. quinol. ined. N. polycéphala, A. Rich. mem. soc. hist. nat. par. 5. p. 289. Heads dense, many-flowered. Flowers velvety on the outside. Fruit unknown. Perhaps a species of *Cephalánthus*, but differs from that genus in the flowers being pentamerous.

Cinchona Nauclea. Shrub.

23 N. MICROCE'PHALA (Delile, in Caill. pl. afr. p. 67. no. 54.) shrubby, glabrous; leaves 4 in a whorl, lanceolate, tapering into the petioles; stipulas united into a 4-toothed ring; peduncles axillary, smooth, slender, longer than the petioles; heads of flowers globose; calyxes and corollas small, pubescent. ♄. S. Native of the north of Africa, at Singue.

Small-headed Nauclea. Shrub.

24 N. LANCEOLA'TA (Blum. bijdr, p. 1009.) leaves on short petioles, oblong-lanceolate, acuminated at both ends, coriaceous, glabrous; stipulas oblong, obtuse; peduncles terminal, solitary. ♄. S. Native of the west of Java, in mountain woods. Cephalánthus orientàlis, Blum. cat. hort. buitenz. p. 38. Flowers varying to tetrandrous.

Lanceolate-leaved Nauclea Shrub.

25 N. GRANDIFÒLIA (D. C. prod. 4. p. 345.) leaves rather large, obovate or ovate-oblong, obtuse, acute at the base, rather undulated, glabrous; stipulas oval, about equal in length to the petioles; peduncles terminal, solitary, length of petioles. ♄. S. Native of Java. N. macrophýlla, Blum. bijdr. p. 1010. but not of Roxb. There is a variety of this species in the province of Bantam, having the leaves all obovate and undulated, and another in the province of Rembang having larger and more undulated leaves.

Great-leaved Nauclea. Tree or shrub.

26 N. CORDA'TA (Blum. bijdr. p. 1011. but not of Roxb.) leaves roundish-cordate, retuse at the apex, glabrous; stipulas oblong-roundish, united at the base, length of petioles; peduncles terminal, solitary. ♄. S. Native of Java, on Mount Salak.

Cordate-leaved Nauclea. Shrub or tree.

27 N. ORIENTA'LIS (Lam. ill. 153. f. 1.) arboreous, glabrous; leaves oval-oblong, on short petioles, smooth; stipulas oblong; peduncles axillary, opposite: upper ones solitary, 3 times longer than the heads of flowers, which are globose. ♄. S. Native of the East Indies, Java, and China. Poir. dict. 4. p. 435. Blum. bijdr. p. 1006. Ham. in Lin. trans. 15. p. 94.—Bancàlus, Rumph. amb. 3. t. 55. f. 1. Anthers inclosed. Style much exserted; stigma ovate.

Eastern Nauclea. Tree 15 to 20 feet.

28 N. CANE'SCENS (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 346.) branches tetragonal, velvety; leaves on short petioles, elliptic, short-acuminated, glabrous above and canescent beneath; peduncles compressed: lower ones axillary, opposite: the upper ones from the falling of the leaves appear racemose, and are as well as the heads tomentose; lobes of calyx linear, obtuse. ♄. S. Native of the Island of Luzon. Stipulas deciduous, at the sides of the leaves, oblong-linear, twin, on both sides in the upper part of the racemes.

Canescent Nauclea. Shrub or tree.

29 N. ROTUNDIFÒLIA (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 340.) glabrous; branchlets tetragonal; leaves petiolate, roundish-cordate, short-acuminated, paler beneath; peduncles axillary, opposite, solitary, compressed, articulated in the middle; heads globose, tomentose; segments of the calyx ovate, obtuse. ♄. S. Native of the Island of Luzon. Corolla hoary from tomentum; with an elongated tube; and roundish lobes. The sterile peduncles become hardened and hooked, as in the genus *Uncària*.

Round-leaved Nauclea. Tree or shrub.

SECT. II. PENTACORY'NA (from πεντε, *pente*, five, and κορυνη, *coryne*, a club; in reference to the 5 club-shaped lobes of the calyx). D. C. prod. 4. p. 346. Segments of calyx (or bracteoles) elongated and club-shaped.

30 N. CORDIFÒLIA (Roxb. cor. 1. p. 40. t. 53. fl. ined. 2. p. 122.) arboreous; leaves petiolate, roundish-cordate, villous beneath; stipulas oval, peduncles 1-3 together, axillary; bearing each a globose head of flowers; lobes of calyx and stigmas clavate. ♄. S. Native of Coromandel and Cottala, on the mountains, in the southern peninsula of India. Petioles terete, rather villous, equal in length to the peduncles. Flowers yellowish. Seed 6 in each cell of the capsule, membranaceously winged, never imbricated, but bifid at the apex. Leaves 4-12 inches each way, on petioles from 2-3 inches long. Peduncles downy, from 1-4. The wood is exceedingly beautiful, its colour is like that of box-wood, but much lighter, and at the same time very close-grained. It is to be had of a large size, from 1-2 feet or more in diameter, and is used for almost every purpose, where it can be kept dry. For furniture it answers exceedingly well, being light and durable. This is probably the N. sterculiæfòlia, A. Rich. mem. soc. hist. nat. par. 5. p. 289.

Heart-leaved Nauclea. Tree 40 to 50 feet.

31 N. purpu'rea (Roxb. cor. 1. p. 41. t. 54. fl. ind. 2. p. 123.) sub-arboreous, glabrous; leaves petiolate, oval-oblong, acuminated, smooth; stipulas oval, obtuse, large, deciduous; peduncles terminal, solitary, or by threes, bracteate in the middle; lobes of calyx 5, clavate. ♄. S. Native of the East Indies, in the moist valleys up amongst the Circar mountains. Cephalánthus Chinénsis, Lam. dict. 1. p. 678. exclusive of the syn. of Rumph. Branches decussate. Leaves shining. Heads of flowers large, purple. Capsules turbinate, dehiscing from the base. Seeds imbricate, winged.

Purple-flowered Nauclea. Tree 20 feet.

32 N. Roxbu'rgii; shrub glabrous; leaves roundish, obtuse, cordate at the base, on long petioles; stipulas large, oblong, obtuse. ♄. S. Native of the East Indies. N. stipulàcea, Roxb. herb.

Roxburgh's Nauclea. Shrub.

33 N. pedunculà'ris (Wall. cat. no. 6091.) arborescent, smooth; leaves ovate-elliptic, coriaceous, acuminated, smooth; peduncles terminal by threes, not so long as the upper pair of leaves; heads of flowers globose. ♄. S. Native of Pulo Penang. N. purpùrea, Roxb. herb. Flowers purplish?

Peduncular Nauclea. Shrub.

34 N. calycìna (Bartl. in Hænke herb. ex D. C. prod. 4. p. 346.) glabrous; leaves petiolate, oblong, attenuated at both ends; stipulas deciduous; peduncles terminal, solitary, or by threes, bearing caducous bracteas under the apex; lobes of calyx 5, clavate; style not exserted. ♄. S. Native of the Island of Luzon, one of the Philippines. Very nearly allied to *N. purpùrea*, and is probably the same, but the calyx is pale, not purple, and the branches are tetragonally compressed, not terete.

Large-calyxed Nauclea. Tree 15 to 20 feet.

35 N. stipula'cea (D. C. prod. 4. p. 346.) arboreous; leaves broad-obovate, glabrous, downy on the nerves on the under surface, as well as on the petioles and branchlets; stipulas ovate, large, leafy; heads of flowers globose; corolla villous on the outside; calyx quite entire, truncate; bracteoles or lobes of calyx 5, club-shaped. ♄. S. Native of Africa, on the banks of the Gambia near Albreda. N. macrophýlla. Perr. et Leprieur. mss. but not of Roxb. nor Blum. The dehiscence of the capsule exhibits distinct carpella within the calycine tube, which is cleft lengthwise; the segments cohering at the apex, and propped by 5 claviform bracteoles on the outside.

Stipulaceous Nauclea. Tree 20 to 40 feet?

† *Species not sufficiently known.*

36 N. morindæfòlia (Blum. bijdr. p. 1011.) arboreous: leaves oval, acute, rounded at the base, ribbed, glabrous, bearing depressed glands in the axils of the ribs on the under surface; stipulas spatulate, coloured, viscid, one half shorter than the petioles. ♄. S. Native of Java, on Mount Salak. Flowers unknown.

Morinda-leaved Nauclea. Tree.

37 N. mo'llis (Blum. bijdr. p. 1010.) leaves rather large, oval, acute, rounded at the base, sometimes subcordate, glabrous above but rather villous beneath and on the branches; stipulas oval, obtuse, rather villous beneath. ♄. S. Native of Java, on Mount Salak. Flowers unknown. Allied to *N. macrophýlla*, Roxb.

Soft Nauclea. Tree.

Cult. All the species of this genus are of the most easy culture. A mixture of loam, sand, and peat is the best soil for them; and cuttings root readily in the same kind of earth under a hand-glass, in heat.

II. UNCA'RIA (from *uncus*, a hook; the old or inferior peduncles are converted into hooked axillary spines). Schreb. gen. no. 311. Roxb. and Wall. in fl. ind. 2. p. 125. but not of Burch. D. C. prod. 4. p. 347.—Naúclea, sect. ii. Blum. bijdr. p. 1011.—Ouroupària, Aubl. guian. 1. p. 177. Agylóphora, Neck, elem. no. 254.—Naúclea species, Lam. Willd. Juss. and Kunth.

Lin. syst. *Pentándria, Monogýnia.* All as in *Naúclea*, but differs in the flowers being less crowded on the receptacle. Calyx tubularly urceolate, 5-cleft. Capsules pedicellate, clavate, attenuated at the base.—Scandent shrubs, hanging to other trees by the old peduncles, which are hooked for the purpose. The greater portion are natives of India, but a few are natives of America. The old or lower peduncles are converted into compressed, hooked, axillary spines. Perhaps only a section of the genus *Naúclea*.

1 U. Ga'mbir (Roxb. fl. ind. 2. p. 126.) branches terete; leaves ovate-oblong, acute, on short petioles, smooth on both surfaces; stipulas ovate; peduncles axillary, solitary, opposite, bracteolate in the middle: the lower ones sterile, and converted into hooked spines. ♄. ☽. S. Native of Pulo-Penang, Sumatra, Malacca, &c. Naúclea Gámbir, Hunt. in Lin. trans. 9. p. 218. t. 22. Fleming in asiat. res. 11. p. 187. Smith, in Rees' cycl. vol. 24. no. 7. Hayn. getr. gew. 10. t. 3. U. jasminifòlia, Wall. herb. Fùnis uncàtus angustifòlius, Rumph. amb. 5. p. 63. t. 34. f. 2. and 3. The upper peduncles bear each a solitary, globular head of beautiful green and pink flowers. Bracteas forming a 3 or 4-cleft annular, perianth-like cup, about the middle of each peduncle. Calyx silky on the outside. Corollas villous on the outside, and hairy in the center of the inside. Capsules pedicellate, clavate, grooved longitudinally. Seeds imbricate, winged. *Gambier* is the Malay name of an extract prepared from the leaves of this plant, and one of the drugs, if not the only one, formerly called *Terra Japonica* in Europe. For the following account of the tree we are indebted to Dr. Charles Campbell of Bencoolen, who says, "This material is called by the Malays *gambier*. It is chewed by the natives, mingled with betel-leaf and areca, after the manner in which the cutch is used on the continent of India. With some sweetness it has a more highly concentrated astringent principle than *terra Japonica*. I am solicitous that a trial should also be made of its power in tanning. In regard to the natural history of the *gambier*, it is procured from a climber. It is the *Fùnis uncàtus*, or *Daun gatta gambier* of Rumph. amb. 5. t. 34. The variety from which it is chiefly made is that denominated by Rumphius the *Fùnis uncàtus angustifòlius*. The preparation is simple; the young shoot and leaves are shred, and bruised in water for some hours, until a feculum is deposited; this, inspissated in the sun to the consistence of paste, is thrown into moulds of a circular form, and in this state the gambier is brought to market. Rumphius has fallen into error in asserting that gambier is not made from this plant; for in my journey to Cochin-china I had an opportunity of inspecting the whole process, having resided some days at a small village near the foot of the mountains, where the Sultan of Moco has established a colony for the purpose of carrying on the manufacture to a considerable extent. The price at which it can be procured from the northern parts of this coast I have ascertained to be nearly 10 dollars per hundred weight; it can be supplied in any quantity desired, for the plant abounds in these districts, and the mode of eliciting the astringent matter is such as requires neither much attention nor labour." But Dr. Wallich has learned that in other parts to the eastward of the Bay of Bengal, the process is carried on by boiling the leaves and young shoots, evaporating the decoction by fire, and the heat of the sun. When sufficiently inspissated, it is spread out thin, and cut into little square cakes and dried. The same substance is mentioned by Marsden in his history of Sumatra at pp. 242 and 243, who

refers for a particular detail of the cultivation of the plant and manufacture of gambier to the 2d volume of the Transactions of the Batavian Society. Mr. Hunter (Lin. trans. 9. p. 220.) says, that in Prince of Wales's Island the substance is prepared by boiling the leaves for an hour and a half, adding more water as the first wastes, till towards the end of the process, when it is inspissated to the consistence of thin syrup, and when taken off the fire and allowed to cool it becomes solid. It is then cut into little square pieces, which are dried in the sun, turning them frequently. The gambier, prepared according to this process, is of a brown colour; but prepared in the way described by Dr. Campbell above, it is perfectly white. In medicine it is found beneficial in anguina and aphthæ, as well as diarrhœa and dysentery. The drug is infused in water, to which it gives the colour of black tea. By the Malays it is mixed with lime, and applied externally to cuts, burns, boils, &c. The finest is alone selected to chew along with leaves of betel, in the same manner as cutch or kut, the catechu in other parts of India. The brown being strong tasted and rank is exported to China and Batavia, to be used in dyeing and tanning.

For the cultivation of the shrub a rich soil is preferred. It gives the most luxuriant crop when the rains are frequent, but does not thrive in grounds that are apt to be flooded. On this account the side of a hill is esteemed better than any other situation. The plants are propagated from seed; and when they are about 9 inches high they may be finally removed to the field, and planted at distances of 8 or 9 feet. At the end of one year from the time when they are planted in the field, a small crop of leaves is obtained. A larger is got in eighteen months, and the third at the end of two years, when the plants are at their full growth. They continue in their prime, and admit of being cut twice a-year, for the space of 20 or 30 years, provided care be taken to keep the ground clean, and the roots free from weeds. Their tops must be cut to prevent them growing to a greater height than 5 or 6 feet. It is said that the young leaves produce the whitest substance. In Prince of Wales's Island, gambier, if good, is sold for 8½ dollars per pecul, while in the same island sago is sold for 3 dollars per pecul; hence the manufacturer is tempted to adulterate the gambier with this article, which mixes intimately, but may be easily detected by solution with water.

Gambier. Clt. 1825. Shrub cl.

2 U. a'cida (Roxb. fl. ind. 2. p. 129.) branches tetragonal, smooth; leaves ovate, acuminated, smooth on both surfaces; stipulas acuminated, twin on both sides; peduncles axillary, solitary, bearing each a single head of flowers, bracteolate in the middle, but after flowering becoming recurved and spinescent. ♄. ◡. S. Native of the Island of Pulo-Penang, at Soongey Clooan, ex Hunter; of Java, ex Blum. bijdr. 1011.; also of the Moluccas, ex Rumph. Naúclea ácida, Hunter, in Lin. trans. 9. p. 223. Fùnis uncàtus latifòlius, Rumph. amb. 5. p. 63. t. 34. f. 1. Naúclea longiflòra, Poir. suppl. p. 63.—Cinchòna Kattu-Kambar, Kœn. in Retz. obs. 4. p. 6. to which it is nearly allied. The leaves have an acid taste.

Acid Uncaria. Shrub cl.

3 U. sclerophy'lla (Roxb. fl. ind. 2. p. 130.) branches tetragonal, pubescent; leaves elliptic, short-pointed, stiff, rugged beneath; stipulas lateral, lunate, 2-lobed; peduncles axillary, solitary, simple, jointed, bracteolate above the middle, bearing each one head of flowers, after flowering becoming recurved and spinescent. ♄. ◡. S. Native of Pulo-Penang, on the top of the mountain called Soongey Clooan. Naúclea sclerophýlla, Hunter, in Lin. trans. 9. p. 223. Leaves pubescent beneath. Bracteas 6 in a whorl, at the joint of the peduncle. Calyx pubescent outside. Corolla villous on the outside. Flowers on long pedicels.

Hard-leaved Uncaria. Shrub cl.

4 U. ovalifo'lia (Roxb. fl. ind. 2. p. 128.) leaves oval, petiolate, acute, smooth on both surfaces; peduncles axillary and terminal, compound; receptacle of flowers as well as the capsules villous. ♄. ◡. S. Native of Pulo-Penang. Leaves sometimes obovate, from 3-6 inches long. Peduncles bearing from 1-3 heads of flowers, on pedicels which are as long as the common peduncle, and furnished with a sheathing 4-6-cleft bractea in the middle of each. Petioles short, recurved, channelled.

Oval-leaved Uncaria. Shrub cl.

5 U. pilòsa (Roxb. et Wall. in fl. ind. 2. p. 130.) branches villous, obscurely tetragonal; leaves oval, acuminated, sometimes subcordate, hairy on both surfaces, on very short petioles; stipulas bipartite or twin: segments lanceolate, acute, longer than the petioles; peduncles axillary, opposite, villous, divaricate, at length recurved and spinescent. ♄. ◡. S. Native of Nipaul, in the valley in the forest of Sankoo, and at Bheempedi; and of Chittagong and Java. Wall. pl. rar. asiat. 2. p. 55. t. 170. Naúclea scándens, Smith, in Rees's cycl. vol. 24. no. 9. Naúclea pilòsa, Blum. bijdr. p. 1013.? Branches clothed with rusty hairs; young shoots silky. Leaves from 5-7 inches long. Peduncles jointed, and bear a whorl of about 6 small linear-lanceolate bracteas, which are hairy without and smooth within. Flowers hairy, whitish, forming round dense heads of 2 inches in diameter. In the Java plant there are 4-6 ovate-lanceolate, acuminated, pilose, rather membranous bracteas in a whorl at the top of each peduncle, under the head of flowers. Perhaps distinct from the plant of Roxburgh.

Pilose Uncaria. Shrub cl.

6 U. lanòsa (Wall. in Roxb. fl. ind. 2. p. 131.) every part of the plant is clothed with long rust-coloured hairs; leaves ovate-lanceolate, acuminated, smooth above, on short petioles; stipulas twin, on both sides, ovate, membranous, recurved; peduncles axillary, opposite, short, at length converted into spinose hooks; corollas almost smooth; capsules on long pedicels. ♄. ◡. S. Native of Pulo-Penang and Sumatra, and other East Indian islands. Naúclea lanòsa, Poir suppl. 4. p. 54. Naúclea setígera, Blum. bijdr. 1013.. Branches rather quadrangular. Leaves 3-4 inches long. Stipulas hairy without, permanent. Peduncles about an inch long, surrounded by a whorl of 4 lanceolate bracteas. Capsules smooth, ash-coloured. In the Java plant, the branches are almost smooth, hardly hispid; and the upper surfaces of the leaves are glabrous, or scarcely hispid, but villous beneath from long adpressed hairs; fruit oblong, glabrous, shorter than the pedicels; lobes of calyx oblong, ciliated.

Woolly Uncaria. Shrub cl.

7 U. læviga'ta (Wall. cat. no. 6111.) branches quadrangular, smooth; leaves ovate-elliptic, acuminated, smooth; peduncles axillary, solitary, opposite, divaricate, bracteolate above the middle, some of which are converted into hooked spines. ♄. ◡. S. Native of the Burman empire at Amherst. Fruit sessile.

Smooth Uncaria. Shrub cl.

8 U. macrophy'lla (Wall. in Roxb. fl. ind. 2. p. 132.) branches tetragonal, pubescent, with 2 opposite furrows; leaves petiolate, broad-ovate, acuminated, smooth and shining above, villous beneath, coarsely nerved and reticulated; stipulas caducous; heads of flowers axillary, solitary, opposite, tomentose. ♄. ◡. S. Native of the East Indies, from Silhet. Leaves from 6-7 inches long. Peduncles opposite, axillary, and terminal, 2 inches long, covered with rusty hairs, about 5 lines under the apex they are jointed and surrounded by a ring of 5-6 lanceolate, spreading, villous bracteas. Flowers covered with ash-coloured dense pubescence.

Long-leaved Uncaria. Shrub cl.

9 U. insi'gnis (D. C. prod. 4. p. 348.) branches acutely tetragonal; leaves on short petioles, having a narrow cordate recess at the base, roundish-elliptic, short-acuminated, shining above, reticulately veined beneath, and canescent from down between the veins; peduncles axillary, solitary, recurved, compressed; flowers on long pedicels. ♄. ◡. S. Native of the island of Luzon, one of the Philippines. Calyx tubular, 5-cleft. Corolla large, clothed with silky tomentum inside. Style exserted. Ovarium containing 2 bodies, perhaps seeds or placentas.

Famous Uncaria. Shrub cl.

10 U. elli'ptica (R. Br. in Wall. cat. no. 6104.) branches rather tetragonal; leaves elliptic, acuminated, tapering at the base, on longish petioles, glabrous except on the nerves beneath while young; peduncles axillary, solitary, opposite, shorter than the leaves, usually not longer than the petioles: the lowermost ones converted into sterile hooked spines. ♄. ◡. S. Native of Pulo-Penang. Naúclea ovalifòlia, Roxb. herb. Corolla downy outside.

Elliptic-leaved Uncaria. Shrub cl.

11 U. cirrhiflòra (Roxb. fl. ind. 2. p. 120.) leaves ovate-oblong, smooth; stipulas bifid; peduncles recurved, floriferous at the apex. ♄. ◡. S. Native of the Malay Islands. The rest unknown.

Tendril-flowered Uncaria. Shrub cl.

12 U. glabra'ta (D. C. prod. 4. p. 348.) leaves oblong-lanceolate, acuminated, glabrous as well as the branches, which are tetragonal; stipulas bifid; peduncles solitary, spreading, articulated above the middle, at length hooked. ♄. ◡. S. Native of Java, on the mountains of Seribu. Naúclea glabràta, Blum. bijdr. p. 1012. Allied to *U. cirrhiflòra*, Roxb. ex Blume.

Glabrous Uncaria. Shrub cl.

13 U. pedicella'ta (Roxb. fl. ind. 2. p. 119.) leaves oval, acutish, rounded or subcordate at the base, shining above, reticulated beneath and clothed with rusty tomentum, as well as the branches, which are tetragonal; stipulas bifid; peduncles axillary, solitary, bearing each a single head of flowers, spreading, articulated above the middle; flowers on long pedicels. ♄. ◡. S. Native of the Molucca islands, and probably of Pulo-Penang and Java. Naúclea pedicellàta, Blum. bijdr. p. 1012. Flowers forming round heads of about an inch and a half in diameter, covered with rusty tomentum.

Pedicellate-flowered Uncaria. Shrub cl.

14 U. speciòsa (Wall. cat. no. 6106.) branches tetragonal, clothed with brown villi, as well as the under side of the leaves and nerves on the upper side, petioles, peduncles, and calyxes; leaves pilose on both surfaces, ovate-elliptic, cordate at the base, and short-acuminated at the apex, on very short petioles; peduncles axillary, solitary, opposite. ♄. ◡. S. Native of Pulo-Penang and Singapore. Naúclea cordifòlia, herb. Findl. Heads of flowers large. Calyx and fruit clothed with brown villi, and the corolla with white. Flowers pedicellate. Lower peduncles converted into spinose recurved hooks.

Showy Uncaria. Shrub cl.

15 U. ferrugi'nea (D. C. prod. 4. p. 348.) leaves ovate. acuminated, rounded at the base, shining above, reticulated beneath and clothed with rusty tomentum as well as the branches, which are tetragonal; stipulas bipartite; peduncles solitary, spreading, articulated in the middle. ♄. ◡. S. Native of Java, on the mountains. Naúclea ferrugínea, Blum. bijdr. p. 1013. Very like *U. pedicellàta*, but differs in the flowers and the capsules being 3 times smaller.

Rusty Uncaria. Shrub cl.

16 U. fe'rrea (D. C. l. c.) leaves on very short petioles, ovate-oblong, acuminated, rounded and subcordate at the base, pubescent above, densely tomentose beneath, as well as on the branches, which are obscurely tetragonal; stipulas bifid; peduncles solitary, spreading, articulated in the middle. ♄. ◡. S. Native of Java, on the mountains of Seribu. Naúclea férrea, Blum. bijdr. p. 1014.

Iron Uncaria. Shrub cl.

17 U. sessilifru'ctus (Roxb. fl. ind. 2. p. 130.) leaves elliptic, smooth, acuminated; peduncles axillary, bearing from 1-3 heads of flowers: also terminal, bearing many heads of flowers; capsules sessile. ♄. ◡. G. Native of the East Indies, in the forests of Chittagong. The shrub supports itself by strong spiral axillary hooks. The terminal peduncles form themselves into a kind of racemose panicle.

Sessile-fruited Uncaria. Clt. 1829. Shrub cl.

18 U. Africa'na; leaves ovate-lanceolate, acuminated, on short petioles; flowers disposed in a loose globular head; heads terminal; calyx and corolla villous on the outside; hooks axillary, twisted, or reflexed. ♄. ◡. S. Native of Sierra Leone, on the banks of rivulets. Corolla greenish yellow.

African Uncaria. Shrub 4 to 6 feet, cl.

19 U. Guiane'nsis (Gmel. syst. 1. p. 370.) branchlets tetragonal; leaves petiolate, ovate, acute, glabrous; stipulas solitary, on both sides, triangular; peduncles solitary, bracteolate in the middle, axillary, opposite, and terminal: lower ones sterile and converted into flat, hooked spines. ♄. ◡. S. Native of Guiana, on the banks of rivers and rivulets. Ouroupària Guianénsis, Aubl. guian. 1. p. 177. t. 68. Naúclea aculeàta, Lam. ill. t. 153. f. 2. Poir. dict. 4. p. 436. Hayn. term. bot. t. 29. f. 5. U. aculeàta, Willd. in Ust. del. opusc. 2. p. 200. The flowers in the same head are variable in colour, yellow, white, green, red, rufous, and blackish: they are very fragrant.

Guiana Uncaria. Shrub cl.

20 U. tomentòsa (D. C. prod. 4. p. 349.) arboreous; branches somewhat quadrangular, downy; leaves ovate-elliptic, acute, clothed with fine pubescent tomentum beneath, and shining above with the nerves downy; stipulas broad ovate; peduncles villous, disposed in a terminal panicle: and the lowermost ones converted into axillary hooks. ♄. ◡. S. Native of New Granada, on the banks of the river Magdalena, near Naers. Naúclea tomentòsa, Willd. in Rœm. et Schultes, syst. 5. p. 221. N. aculeàta, H. B. et Kunth, nov. gen. amer. 3. p. 282. Corolla clothed with silky pubescence on the outside. Peduncles also axillary, bearing 1-3 stalked heads.

Tomentose Uncaria. Tree.

Cult. See *Naúclea*, p. 469. for culture and propagation.

III. ADI'NA (from *αδινος*, *adinos*, crowded; in reference to the flowers being disposed in heads). Salisb. par. lond. t. 115. Juss. mem. mus. 6. p. 403. D. C. prod. 4. p. 349.—Naúclea species of some.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx with an oblong tube, and a campanulate 5-parted, permanent limb (f. 84. *a.*). Corolla funnel-shaped, 5-lobed (f. 84. *b. c.*); throat glabrous; lobes valvate in æstivation. Anthers almost sessile (f. 84. *e.*), at the recesses between the lobes, inclosed. Style exserted (f. 84. *d.*); stigma capitate-ovate. Capsule membranous, ob-pyramidal, 2-celled; valves 4 (f. 84. *g.*), dehiscing from the apex; central axis permanent, bearing the calyx at the apex. Seeds 2-4 in each cell, oblong, marginate (f. 84. *h.*), inserted near the top of the cell, hanging by spongy funicles.—Glabrous shrubs, natives of China. Branches terete, opposite. Stipulas twin, on both sides, joined at the base, yellowish, lanceolate. Leaves lanceolate, glabrous. Peduncles axillary, rarely terminal, solitary. Heads of flowers globose, without any involucra, yellowish. Flowers sessile, crowded, intermixed with paleæ. Receptacle pilose.—This genus is intermediate between *Naúclea* and *Cephalánthus*, and probably not distinct from the first.

1 A. globiflòra (Salisb. par. lond. t. 115.) leaves lanceolate; peduncles shorter than the leaves. ♄. G. Native of China. Naúclea Adìna, Smith, in Rees's cycl. vol. 24. Lindl. bot. reg. t. 895. Sims, bot. mag. 2613. Lodd. bot. cab. 1284. (f. 84.)

Globe-flowered Adina. Fl. July, Aug. Clt. 1804. Shrub 3 to 4 feet.

FIG. 84.

2 A. pedunculà'ris (D. C. prod. 4. p. 349.) leaves obovate-lanceolate; peduncles twice the length of the leaves. ♄. G. Native of China. Naúclea adinoìdes, Lindl. bot. reg. p. 895.

Peduncular Adina. Fl. July, Aug. Clt.? Shrub.

Cult. The culture and propagation of the species of *Adìna* are the same as those of *Naúclea*, p. 469, but do not require so much heat.

IV. BREO'NIA (this name is not explained, but is perhaps so called after some botanist of the name of Breon). A. Rich. mem. soc. hist. nat. par. 5. p. 290. D. C. prod. 4. p. 620.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx with a 5-parted limb, and truncate sub-cuneated lobes. Corolla with a terete tube, and a flat, spreading, 5-lobed limb: having the lobes oval-lanceolate. Stamens half exserted, inserted in the throat of the corolla. Style very long, exserted; stigma bipartite, with the lobes approximate. Ovarium 2-celled; cells 7-8-ovulate; ovulas fixed to the membranous placentas, which hang from the axis. Fruit somewhat crustaceous, indehiscent.—A tree. Leaves opposite, very large. Stipulas connate. Flowers disposed in axillary, solitary, globose heads, which stand on long peduncles; each peduncle girded by a beaked involucrum, which at length bursts on one side and falls off.—This genus is nearly allied to *Naúclea*, but probably referrible to *Sarcocephàleæ*, by the fruit being indehiscent.

1 B. Madagascarie'nsis (A. Rich. l. c.). ♄. S. Native of Madagascar.

Madagascar Breonia. Tree.

Cult. See *Naúclea*, p. 469. for culture and propagation.

V. LECANA'NTHUS (from λεκανη, *lecane*, a bowl, and ανθος, *anthos*, a flower; in reference to the cup-like involucrum under the head of flowers). Jack, mal. misc. vol. 2. ex Wall. in Roxb. fl. ind. 2. p. 319. A. Rich. mem. soc. hist. nat. par. 5. p. 293. D. C. prod. 4. p. 620.

Lin. syst. *Pentándria*, *Monogýnia*. Limb of calyx campanulate, dilated, coloured, divided irregularly. Corolla with a short tube, and a 5-lobed limb, which is valvate in æstivation. Anthers large, inserted in the tube of the corolla. Style bifid; stigmas linear, thick. Ovarium 2-celled; cells many-seeded; placentas semi-cylindrical or convex, central. The rest unknown.—A radicant shrub, with tetragonal stems, with 2 of the angles more prominent than the other 2. Leaves opposite, on short petioles. Stipulas ligulate. Flowers pale red, disposed in terminal, dense, globular heads; each head involucrated by a salver-shaped involucrum.—This genus is nearly allied to *Naúclea*.

1 L. erube'scens (Jack, l. c.). ♄. S. Native of Singapore. Leaves on short petioles, ovate-lanceolate, acute at both ends, about 8 inches long. The involucrum which surrounds each head of flowers is entire and cup-shaped. Flowers sessile. Ovarium crowned by a prominent nectareal ring.

Reddish-flowered Lecananthus. Shrub.

Cult. See *Naúclea*, p. 469. for culture and propagation.

Subtribe II. CINCHO'NEÆ (shrubs and trees agreeing with *Cinchòna* in important characters). D. C. prod. 4. p. 349.—Cinchòneæ and Manettièæ, Cham. et Schlecht. in Linnæa. 4. p. 178. Flowers on longer or shorter pedicels, not seated on a globose receptacle, as in those of the first subtribe. (f. 86. f. 88. f. 89.)

VI. STEVE'NSIA (in honour of Edward Stevens, who rendered important services to St. Domingo, while he was consul of the United States there). Poit. ann. mus. 4. p. 235. t. 60. Gærtn. fruct. 3. p. 99. t. 197. Juss. mem. mus. 6. p. 389. but not of Neck.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx with a subglobose tube, girded at the base by an unequally 4-lobed involucel; limb biparted, deciduous: having acute lobes. Corolla salver-shaped, with a short tube and a spreading bluntly 6-7-parted limb. Anthers 6-7, sessile in the throat of the tube. Stigma bilamellate. Capsule globose, areolate at the apex, and pubescent in the areolæ, 2-celled, containing 2 cocculi, which are separable from the calyx: one of them only dehiscent. Placentas central, connecting the margins of the valves. Seeds minute, numerous, oval, winged a little, rather pubescent at the apex. Embryo straight in the fleshy albumen: having the radicle turned towards the hylum.—A much branched shrub, native of St. Domingo; having the branches clothed with resin. Leaves oval, white beneath, finely reticulated. Stipulas joined into a short sheath. Flowers axillary, solitary, white, on short pedicels, girded by 4 concrete bracteas, forming a kind of involucel to each flower.

1 S. buxifo'lia (Poit. l. c.). ♄. S. Native of St. Domingo, near La Vigie du Cap Francais.

Box-leaved Stevensia. Shrub 10 to 12 feet.

Cult. See *Naúclea*, p. 469. for culture and propagation.

VII. COUTA'REA (this name is not explained by Aublet). Aubl. guian. 1. p. 314. t. 122. Juss. gen. 202. mem. mus. 6. p. 388. Gærtn. fr. 3. p. 79. t. 194. D. C. prod. 4. p. 350.—Portlándia species, Schreb.

Lin. syst. *Hexándria*, *Monogýnia*. Calyx with a turbinately oblong tube, and a 6-parted limb: having the segments subulate. Corolla large, funnel-shaped, with a short tube, an obconical ventricose throat, and a bluntly 6-lobed limb. Stamens inserted at the bottom of the throat; anthers linear, much exserted. Stigma furrowed. Capsule coriaceously chartaceous, obovate, compressed, 2-celled; valves bifid at the apex. Placentas spongy, at length nearly free. Seeds compressed, erect, girded by a membranous margin. Embryo long, in fleshy albumen: having a centripetal radicle, and flat cotyledons.—South American trees. Leaves ovate, acuminated, on short petioles; stipulas broad, short, acute. Peduncles usually trifid, axillary, and terminal. Flowers white, sometimes septamerous. This genus comes very near to *Portlándia*.

1 C. speciòsa (Aubl. guian. 1. p. 304. t. 122.) leaves glabrous on both surfaces; peduncles trifid, 3-flowered; corolla broad, funnel-shaped. ♄. S. Native of Guiana, Cayenne, Island of Trinidad, and Carthagena, and between Caraccas and La Guayra, among bushes. Lam. ill. t. 157. Portlándia hexándra, Jacq. amer. 63. t. 182. f. 20. Swartz, fl. ind. occid. 1. p. 385. The tree is much branched at the top. Corolla large, purple. ex Aubl.

Showy Coutaria. Clt. 1803. Tree 25 feet.

2 C. campani'lla (D. C. prod. 4. p. 350.) leaves glabrous above, but villous beneath as well as the calyxes and peduncles; peduncles trifid, 3-flowered. ♄. S. Native of South America, about the Caraccas, where it was collected by Vargas, who says it is called *Campanilla* by the natives. Flowers and fruit one half smaller than those of *C. speciòsa*, and the capsule is less compressed, and ribless.

Campanilla Coutarea. Shrub 3 to 4 feet.

3 C. Mexica'na (Zucc. et Mart. in litt. 1829. ex D. C. prod. 4. p. 350.) leaves glabrous on both surfaces; peduncles 1-flowered, bibracteolate at the base; corolla funnel-shaped, with very blunt lobes. ♄. S. Native of Mexico.

Mexican Coutarea. Shrub or tree.

† *Species hardly known.*

4 C. latiflo'ra (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 4. p. 350.) pedicels 1-flowered, bractless; the diameter of the flower equal to its length. ♄. S. Native of Mexico, where it is called *Copalchi* by the natives. Leaves oval, attenuated at the base. Pedicels axillary, usually twin. Corolla white. Stigma bilamellate. Capsule less compressed, ornamented with 6 ribs and scattered tubercles.

Broad-flowered Coutarea. Shrub or tree.

5 C. flave'scens (Moc. et Sesse, l. c. ex D. C. l. c.) pedicels numerous, bractless; the diameter of the flower almost one half smaller than its length. ♄. S. Native of Mexico. Superior leaves sometimes by threes, oval, attenuated at the base. Peduncles 3 in a whorl, twice bifid, only bracteate under the ramifications. Flowers yellowish, smaller and narrower than in the preceding species.

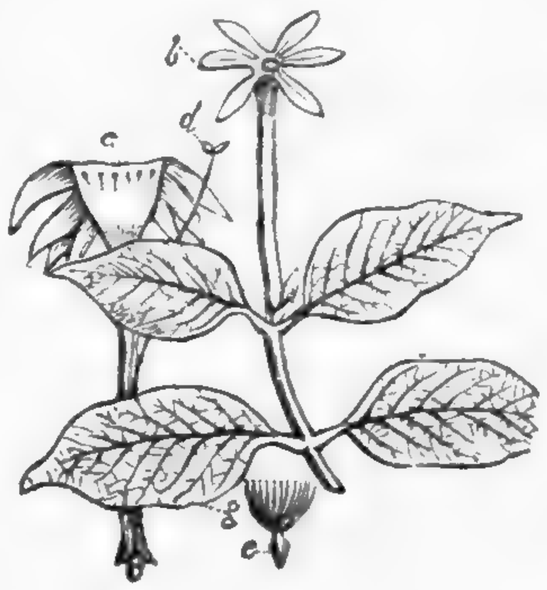
Yellowish-flowered Coutarea. Shrub or tree.

Cult. For culture and propagation see *Naúclea*, p. 469.

VIII. HI'LLIA (named after Sir John Hill, a voluminous botanical author). Jacq. amer. p. 96. t. 66. Lin. gen. no. 444. Lam. ill. t. 257. Gærtn. fruct. 3. p. 97. t. 197. Juss. mem. mus. 6. p. 388. D. C. prod. 4. p. 350.—Fereìria, Vand. in Rœm. script. p. 98. t. 6. ex icon.

Lin. syst. *Tetra-Hexándria, Monogýnia.* Calyx with an obovate tube, girded by a 2-4-leaved involucel at the base; limb 2-4-parted: segments narrow, acute, permanent. Corolla with a long terete tube, a short ventricose throat, and a 4-6-parted limb (f. 85. *b.*), with spreading flat oval lobes. Stamens 4-6, sessile beneath the mouth of the tube, inclosed (f. 85. *c.*). Stigma thick, bifid (f. 85. *d.*). Capsule elongated, 2-celled, crowned by the limb of the calyx; cells dehiscing from the top inside. Placentas 2, central. Seeds imbricated downwards, rather compressed, ending each in a pencil-formed tail (f. 85. *e.*). Embryo straight, in sparing fleshy albumen; having the radicle turned towards the hylum.—Small glabrous shrubs or subshrubs. Leaves obovate, green, rather fleshy. Stipulas oval, membranous, foliaceous, deciduous, the 2 upper ones constituting an involucel. Flowers terminal, solitary, elongated, white. Fruit follicle-formed.

FIG. 85.



1 H. longiflòra (Swartz, obs. p. 135. t. 5. f. 1.) flowers hexandrous; corollas 6-cleft, with linear-lanceolate, rather revolute segments. ♄. S. Native of Jamaica, Guadaloupe, Martinico, Cuba, the hotter parts of Mexico, on the decayed parts of old trees, and among moss. H. parasítica, Jacq. amer. p. 96. t. 66. Perhaps there are two species confused under this name. Lobes of calyx, ex Jacq. 6, but according to Swartz 2-4, and in the specimens examined only 2. The involucel, according to Swartz, is 6-leaved, but according to Jacquin and the specimen examined only 2-leaved, constantly composed of the 2 superior stipulas. The branches, according to Swartz and Jacquin, are terete, but according to the figure in the fl. mex. and the specimen examined tetragonal. In the figure of bot. mag. t. 721. the branches are round, the leaves ovate, smooth; the involucel of 2 leaves, limb of the corolla of 6 twisted segments, and the limb of the calyx apparently 6-cleft. The flowers are white and very fragrant.

Long-flowered Hillia. Fl. Feb. March. Clt. 1789. Shrub 2 feet.

2 H. Brasilie'nsis (Cham. et Schlecht. in Linnæa. 4. p. 201.) corollas 6-cleft, hexandrous: segments ovate-lanceolate, obtuse. ♄. S. Native of Brasil. Leaves oval, acuminated. Tube of corolla 3 inches long.

Brasilian Hillia. Shrub.

3 H. tetra'ndra (Swartz, fl. ind. occ. 1. p. 630. icon. t. 11.) flowers 4-cleft, tetrandrous: segments ovate. ♄. S. Native of Jamaica, on the high mountains among the roots of bushes. Leaves obovate, pale green. Roots creeping, tuberous. Lobes of calyx 4, cuneate-oblong, 2 of which are deciduous. Leaves of involucel 4, 2 of them smaller than the other two. Flowers yellowish-white, having the tube nearly an inch long and tetragonal. Seeds pappose at the apex.—Perhaps *H. Tuxtlénsis*, Moc. et Sesse, fl. mex. ined., which was collected about Tuxtla in Mexico, is distinct from this species, in consequence of the calyx being 2-lobed, and the involucel 2-leaved.

Tetrandrous Hillia. Fl. June, July. Clt. 1793. Shrub 3 to 4 feet.

Cult. The species of this genus delight in a mixture of turfy loam, peat, and sand; and cuttings will soon strike root in the same kind of soil, or in sand under a hand-glass, in heat.

IX. HYMENO'POGON (from ὑμην, *hymen*, a membrane, and πωγων, *pogon*, a beard; the seeds are furnished with a membranous appendage at each end). Wall. in Roxb. fl. ind. 2. p. 156. D. C. prod. 4. p. 351. but not of Beauv.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an obovate tube, and a 5-parted permanent limb. Corolla salver-shaped, with a very long tube, and a 5-parted limb. Stamens 5, inserted in the inflated apex of the tube, inclosed. Stigma oblong, 2-lobed: lobes linear. Capsule oblong-clavate, 10-nerved, crowned, 2-celled; carpels dehiscing at the apex, cleft in the middle, hence the capsule appears 4-valved. Placentas very narrow. Seeds imbricated, linear, furnished with a membranous appendage at both ends.—A small crooked shrub, with compressed branchlets. Leaves approximate, acuminated, membranous, pubescent above, and villous beneath. Stipulas permanent, membranous, ovate, acute, ciliated. Corymbs nearly terminal, trichotomous, bracteate. Flowers very long, white, inodorous, pubescent.

1 H. parasi'ticus (Wall. l. c.) ♄. S. Native of the East Indies, growing on trees, and sometimes on rocks, on Sheopore, Chandagiri, near Hetounra, and between that place and Chitlong. Stems rooting, as well as the branches, covered with pale ash-coloured bark. Leaves 5-7 inches long. Seeds linear, smooth, terminated by a long linear membranous, sometimes bifid appendage, measuring altogether 3 lines in length.

Parasitic Hymenopogon. Shrub.

Cult. See *Hillia* above for culture and propagation.

X. CINCHO'NA (said to be named in honour of the Countess de Chinchon, vice queen of Peru, who was cured of a fever

in 1638 by this remedy). Lamb. cinch. D. Don, in Lin. trans. vol. 17. D. C. 1806. bibl. univ. 1829. scienc. 2. p. 144. Humb. et Bonpl. pl. equin. 2. t. 10. Rœm. et Schultes, syst. no. 861. —Cinchòna, sect. 1. Pers. ench. 1. p. 196.—Cinchòna species, Lin. Gærtn. Lam. Vahl. Juss.—Kinkìna, Adans. fam. 2. p. 147.

LIN. SYST. *Pentándria, Monogýnia.* Calyx 5-toothed (f. 86. *a.*). Corolla tubular: with a 5-lobed limb (f. 86. *b.*), which is valvate in æstivation. Anthers linear, semi-exserted (f. 86. *c.*). Stigma 2-lobed (f. 86. *d.*). Capsule 2-celled, dehiscing at the dissepiment (f. 86. *g.*), many seeded. Seeds samaroid, girded by a membranous lacerated margin (f. 86. *h.*).—Trees, natives of South America, from which the various kinds of Peruvian bark are obtained. Leaves on short petioles, with flat margins. Stipulas ovate or oblong, foliaceous, free, deciduous. Inflorescence panicled. Flowers white or reddish. For the properties of *Cinchòna* see La Condamine in act. acad. sc. par. 1738. Vahl. in act. soc. hist. nat. hafn. vol. 1. Lamb. cinch. in 4to. Lond. 1797. Rhod. mon. cinch. Ruiz et Pav. fl. per. vol. 2. et 3. Ruiz, quin. in 4to. Madr. 1792. et def. quin. 1802. Humb. diss. in magaz. fr. nat. berl. 1807. Humb. et Bonpl. pl. equin. vol. 1. Alibert, trait. fievr. pern. 8vo. 1799. ed. 2. 1800. ed. 3. 1801. Fee, hist. nat. pharm. 2. p. 240.

§ 1. *Capsule dehiscing at the base.—Normal species.*

FIG. 86.

1 C. LANCEOLA'TA (Ruiz et Pav. fl. per. 3. p. 1. t. 223.) leaves oval-lanceolate, acute, naked on both surfaces, as well as the branches, shining; panicle brachiate, much branched, smooth; calycine teeth ovate, acuminated; segments of corolla linear-lanceolate; stigma emarginate; capsule ovate, ribbed. ♄. S. Native of Peru, in the mountains of Loxa, and other cold mountainous regions; as well as of New Granada, between Guaduas and Santa Fe de Bogota, where it was collected by Mutis. C. lancifòlia, Mutis, period. de Santa Fé, p. 465. Humb. in mag. der. gisell. nat. fr. berl. 1807. p. 116. Alib. tract. des fievers, p. 374. C. nítida, Ruiz et Pav. fl. per. 2. p. 50. t. 191. C. angustifòlia, Ruiz et Pav. quin. suppl. p. 14. with a figure. C. glàbra, Ruiz, quin. 2. p. 64. C. Cucumæfòlia, Pavon, mss. Quinquina orange, Mutis, quin. Cascarílla officinal. Ruiz, quin. p. 56. Cascarílla Lampìno, Ruiz, quin. 2. p. 64. Cinchòna Condamínea, Humb. et Bonpl. pl. equin. 1. p. 33. t. 10. Humb. in mag. der. gesell. nat. fr. berl. 1807. p. 112. nov. gen. amer. 3. p. 400. C. officinàlis, Lin. syst. veg. ed. 10. p. 929. Condamine in mem. de l'Academie de Paris, 1738. p. 114. Lam. ill. t. 164. f. 1. Vahl. skrivt. af. natur. selfkab 1. t. 1. Lamb. mon. t. 1. C. stùpea, Pav. mss. *Cascarilla fina de Uritusinga* of the Spaniards. This species varies extremely in the form of the leaves. The celebrated Mutis has, with great propriety, considered his C. lancifòlia the quina Naranganda or Quinquina orange of Santa Fé, as identical with the Quina fina de Uritucinga of Humb. et Bonpl. C. Condamínea. Although it is probable that several species of this important genus afford the Peruvian bark of the shops, of these three only are admitted into our national pharmacopœias, to which the names of *C. lancifòlia, C. oblongifòlia,* and *C. cordifòlia* have been applied, designating respectively the pale, the red, and the yellow bark. The present species was first described and figured by the astronomer Condamine in 1738, in the mem. de l'Acadamie. It is described by Humboldt as a handsome tree of from 30 to 40 feet in height, and exuding whenever it is wounded a yellow astringent juice. The stipulas are acute and silky. The flowers are of a very pale rose-colour, supported on pedicels, which are powdered and silky, as well as the calyx. The tube of the corolla is silky, and the border white and woolly above. This is the pale bark of the shops.

Lanceolate-leaved Cinchona or Pale Peruvian-bark. Tree 30 to 40 feet.

2 C. CORDIFÒLIA (Mutis, mss. Humb. in mag. &c. p. 117. nov. gen. amer. 3. p. 401.) leaves roundish-ovate, cordate at the base or attenuated, rather pilose beneath and on the branchlets, naked and shining above; panicle brachiate, diffuse, pubescent; teeth of calyx roundish-mucronulate; corolla silky on the outside: limb bearded; stigma 2-lobed; capsule oblong-ovate, cylindrical, ribless. ♄. S. Native of Peru, on the mountains of Loxa, in the kingdom of Quito; and of New Granada. Rhode, mon. p. 58. Steph. and Church. med. bot. 3. t. 175. Quina amarilla. Genitals inclosed. Flowers pale red. This species is totally distinct from Cinchòna purpùrea, hirsùta, and ovàta of Fl. peruv., which Humboldt and Bonpl. in their beforementioned work have given as synonymes of Mutis's plant. It differs from C. ovàta, Ruiz et Pav. the C. pubéscens of Vahl, with which it has the greatest affinity in the shorter petioles, by the broader round teeth of the calyx, by the filaments being twice longer, and, lastly, by its capsules being smooth, and without ribs. The bark of this tree is known to the natives by the name of *Quina amarilla, Cascarilla de Loxa,* and *Cascarilla amarilla,* and is the yellow or orange bark of the shops. It is described as a middle-sized tree, with a trunk of moderate thickness, and covered with smooth brownish bark; the younger branches are quadrangular. All the species of *Cinchòna* vary very much in the shape and smoothness of their leaves, according to the altitude in which they grow, to the severity or mildness of the climate, to the trees standing single, or being closely surrounded by other plants, to the luxuriance of growth, and the greater and less humidity of the soil. Cordate leaves occur but seldom in the present species; however, almost every branch exhibits some of them.

Cinchona bark appears to have been long known as a medicine in Peru; but we have not a satisfactory account at what period, nor by what means, the febrifugal virtues of this valuable remedy were first discovered. Some say a patient had been cured of an intermittent fever by having drank the water of a lake, which had acquired a bitter taste from Cinchona trees which had lain in it; others that a lion had cured himself of the ague by instinctively chewing Cinchona bark, and had directed the attention of the Indians to this tree. "That animals," observes Humboldt in his Dissertation on the Cinchona forests of South America, "have taught men is a very common form of the traditions of nations. The valuable antidote Bijuco del Guaco, a plant described by Mutis, which is probably a species of *Mikània,* and has been erroneously confounded with *Ayapàna* of Brasil, is also said to have attracted the notice of the Indians, as is affirmed of the Falco serpentarius, by the Falco Guaco of New Granada fighting with serpents. However, that the great American lion without mane (*Fèlis cóncolor*) should be subject to the ague is just as bold an hypothesis as the assertion of the inhabitants of the pestilential valley, Gualla Bamba, near the town of Quito, that even the vultures (*Véltur aúra*) in their neighbourhood were subject to that disorder. Indeed in the regions of the Cinchòna forests there is not a Fèlis cóncolor, so fond of warmth, to be found; but at the most the cat Puma, not yet properly described, and which we have met with in heights of 2,500 toises. The story so often copied

respecting the Countess Chinchon, vice-queen of Peru, is probably still more doubtful than it is generally supposed to be. There certainly was a Count Chinchon, Don Geronimo Fernandez de Cabrera Bobadella y Mendoza, who was Viceroy of Lima from 1629 to 1639. It is very probable that his wife, after her return to Spain in 1640, was the first to introduce the Cinchòna bark to Europe. The name of *Pulvis Committissa* appears even more ancient than that of *Pulvis Jesuiticus* or *Pulvis patrum*. But I do not believe that the Corregidor of Loxa, Don Juan Lopez de Cannizares, who is said to have cured the Countess of ague, received this remedy from the Indians. In Loxa there is no tradition whatever of this kind, nor is it probable that the discovery of the medicinal power of the Cinchona belongs to the primitive natives of America; if it is also considered that these natives (like the Hindoos) adhere with unalterable pertinacity to their customs, to their food, and to their nostrums; and that notwithstanding all this the use of the Cinchona bark is entirely unknown to them in Loxa, Guamcabamba, and far around. In the deep and hot valleys of the mountains of Catamango, Rio Calvas, and Macara, agues are extremely common. But the natives there, as well as in Loxa, of whatever cast, would die rather than have recourse to Cinchona bark, which, together with opiates, they place in the class of poisons, exciting mortification. The Indians cure themselves by lemonades, by the oleaginous aromatic peel of the small green wild lemon, by infusions of *Scopària dúlcis*, and by strong coffee. In Malacatis only, where many bark-peelers live, they begin to put confidence in the Cinchona bark. In Loxa, there is no document to be found which can elucidate the history of the discovery of the Cinchona; an old tradition, however, is current there, that the Jesuits, at the felling of the wood, had distinguished, according to the custom of the country, the different kind of trees by chewing their barks; and that on such occasions they had taken notice of the considerable bitterness of that of the Cinchona. There being always medical practitioners among the missionaries, it is said they had tried an infusion of the Cinchona in the tertian ague, a complaint which is very common in that part of the country. This tradition is less improbable than the assertion of European authors, and among them the late writers Ruiz and Pavor, who ascribe the discovery to the Indians. The medicinal powers of the Cinchona was likewise entirely unknown to the inhabitants of the kingdom of New Granada."

Cinchona bark is stripped from the trunk and branches in the dry season, from September to November; it is dried by exposure to the sun, and after being imported into Europe is sorted for sale. It is brought to this country in chests, each of which contains from 100 to 200 pounds weight of bark, mixed with dust and other impurities. According to Humboldt, the quantity of this drug annually exported from America is from 12,000 to 14,000 quintals. The kingdom of Santa Fe furnishes 2000 of these, which are sent from Carthagena; 110 are furnished by Loxa, and the provinces of Huamanga, Cuenca, and Jean de Bracamoros, and the thick forests of Guamcabamba and Ayavaca, furnish the rest, which is shipped from Lima, Guayaquil, Payta, and other ports on the South Sea.

The *pale bark* of the shops, the *Quina Naranjada*, and *Cascarilla fina de Uritusinga* of the Spaniards, which is obtained from *C. lanceolàta*, is preferred in South America to all the other kinds of bark. It is in pieces, 5 or 6 inches long, singly or doubly convoluted, externally of a greyish brown colour, to which crusts of lichens often adhere, and is internally when fresh broken of a bright cinnamon hue. There are often intermixed with this others of a coarser texture, thicker, and nearly flat, which appears to be obtained from the trunk and larger branches. The fracture is smooth and even; its powder is of a pale colour; its taste is bitter and astringent; its smell peculiar and aromatic.

The *yellow bark*, named *Quina amarilla*, *Cascarilla de Loxa*, and *Cascarilla amarilla*, is less rolled than the pale bark, and the pieces are larger and thicker. Externally it is of a greyish brown, and covered with lichens; internally of a much deeper orange than the pale bark. It has a more bitter taste, with a less aromatic odour, and with scarcely any sensible degree of astringency.

The *red bark* is sometimes rolled, but more commonly in flat thick pieces, covered with rough entire reddish brown epidermis. It has a smooth fracture. It is composed of three layers; the inner one being of a dark ferruginous colour, it is more bitter and astringent than the pale and yellow bark.

These three kinds of bark are only distinguished in Britain; but M. Von Bergen, a drug broker of Hamburgh, who has written a valuable monograph on the Cinchonas, enumerates eight kinds as distinguished in commerce; and the drug merchants of Spain enumerate about 50 different kinds of bark: these are probably obtained from as many species of *Cinchòna*, or several of them may be obtained from the same species—the difference depending upon the age, state, and habitats of the trees.

Qualities and chemical properties.—Few vegetable substances have undergone so many analyses, by the most eminent chemists, as the different varieties of Peruvian bark. The basis of all of them is woody fibre, combined with which are various principles capable of being abstracted by different solvents. The taste of all is more or less bitter and astringent. Boiling water extracts all their active principles, affording a solution of a pale brown colour; this infusion is transparent when hot, but on cooling becomes turbid, and a precipitate is deposited, which is soluble in alcohol. The decoction has a very astringent taste, and a deep brown colour. By long boiling the virtues are nearly destroyed, owing to the chemical change and precipitation of its active matter. Alcohol, in all its modifications, is a powerful solvent of the active principles of Cinchona. A saturated solution of ammonia is also a solvent of them, but acetate acid acts less imperfectly than even water. Vauquelin found that an infusion of the *pale bark* reddened litmus paper; was copiously precipitated by solution of galls, and in a smaller degree in yellowish flocculent flakes by solution of isinglass. A solution of tartar emetic was rendered turbid, and slowly precipitated by it; solution of superacetate of lead produces quickly a copious precipitate. The addition of a solution of the sulphate of iron to the infusion changed the colour to a bright olive green, but was scarcely precipitated. The powder macerated in sulphuric acid afforded a golden yellow tincture, which reddened litmus paper, and left a pellicle of bitter resin when evaporated on the surface of water, to which it gave the colour of the tincture. This coloured water did not precipitate the solution of galls and of tartar emetic, and occasioned no precipitate on the addition of the solution of sulphate of iron. With alcohol it produced a deep orange coloured tincture, which precipitated sulphate of iron, tartarized antimony, and tannin. The agency of the different menstrua on the red and yellow varieties of the *Cinchòna* produce nearly the same results as on the common or pale bark. The filtered solution of yellow bark has a pale golden hue, with a shade of red; it is bitter, reddens litmus paper, and precipitates solution of galls. On adding a solution of isinglass, a pinkish yellow precipitate is produced; superacetate throws down a precipitate; tartarised antimony gives a precipitate in pale yellowish flakes. A solution of the sulphate of iron changes its colour to a bluish green, and slowly lets fall a precipitate of the same colour. The alcoholic tincture appears to be in every respect the same as that afforded by the pale bark. The *red bark* has a more nauseous taste than the barks of the other species.

The aqueous infusion is of a pale ruby colour; its action on the solutions of galls and of isinglass is nearly the same as those of the two former species, but it is not altered by tartarised antimony, nor by the superacetate of lead; and the solution of iron occasions a dirty yellow colour only, little being precipitated. The alcoholic tincture is of a deep brownish red colour, and precipitates the solution of the sulphates of iron and of tartarised antimony; the former of a black colour, and the latter red. From the experiments of Vauquelin, Fabroni, and others, it appears that the active principles of Cinchonas consist chiefly of cinchonine, resin, extractive gluten, a very small portion of volatile oil, and tannin. Vauquelin has determined the presence of a peculiar acid, to which he gives the name of kinic acid, in some varieties of the bark. The following are the most important results that have been obtained by MM. Pelletier and Caventou, respecting the composition of the three officinal species.—1st, In pale bark they found acidulous kinate of cinchonine, a green fatty matter, which they term red cinchonine; tannin, a yellow colouring matter, kinate of lime, gum, starch, and woody fibre. 2nd, In yellow bark they found that the alkaline base differs from cinchonine in being uncrystallizable, very soluble in ether, and forming salts with the acids very different from those of cinchonine. The chemical constituents of the yellow bark are an acidulous kinate of this salt, which they have named quinine, a deep yellow fatty matter, red cinchonine, tannin, yellow colouring matter, kinate of lime, starch, and woody fibre. 3rd, Red bark contains acidulous kinate of cinchonine, kinate of quinine, reddish fatty matter, red cinchonine, tannin, kinate of lime, yellow colouring matter, starch, and woody fibre. The difference between the pale, the red, and the yellow barks, depends principally on the quantity of the two alkaline bodies, cinchonine and quinine, found in them. The pale bark contains cinchonine, but a very small portion of quinine; the alkali, again, which predominates in the yellow bark, is quinine; while in the red bark, and some spurious kinds, there is a combination of both these substances. The presence of cinchonine, as a distinct vegetable principle, was first discovered in Peruvian bark by Dr. Duncan, of Edinburgh.

The separation of cinchonine from the pale bark, and of quinine from the yellow bark, is a very simple operation. It consists in digesting the bark, coarsely powdered, in weak sulphuric acid, and then to repeat this digestion with about half the quantity of liquid, till all the soluble matter is extracted. To this decoction a small quantity of powdered slacked lime is added, somewhat greater than is necessary to saturate the acid; the precipitate that ensues (a mixture of cinchonine and the sulphate of lime,) is collected, dried, and boiled for a few minutes in alcohol, which takes up the cinchonine, but will not dissolve the sulphate of lime; the solution is decanted off while still hot, and fresh portions successively added for the repetition of the same operation, until it ceases to act on the residuum, which is then merely sulphate of lime. The different alcoholic solutions are then put into a retort, and considerably evaporated, during which and on cooling acicular crystals of cinchonine are deposited. By repeating the solution once or twice, in boiling alcohol, and again crystallizing, the cinchonine will be obtained in a perfectly pure state. Its crystals are semi-transparent, have a pearly lustre, and are usually obtained in the form of small needles. It has but little taste, and requires 700 parts of water for its solution, but boiling alcohol dissolves it much more abundantly; it is sparingly soluble in oils and sulphuric ether. At a moderate heat it is partly volatilized, and partly decomposed. It combines with different acids, forming neutral salts. Mr. Brande found that it contained no oxygen, 100 parts consisting of about 80 parts of carbon, 13 of nitrogen, and 7 hydrogen. It has an intensely bitter taste, and exerts the same action on the animal economy as the bark itself, but it is less generally used in medicine than the other active principle of the bark, quinine, because the yellow bark from which it is procured is more plentiful; the quinine, therefore, is cheaper than cinchonine, and equally efficacious. Quinine may be obtained from the yellow bark in the same manner as cinchonine is prepared from the pale bark, or by adding an alkali to the solution of the sulphate of quinine. Quinine is not crystallizable like cinchonine, but on the application of heat it melts into a kind of paste. It has a much more bitter taste than the other, and is very sparingly soluble in water. They differ also remarkably in their chemical composition, cinchonine containing no oxygen, while in quinine there is a notable proportion of this element. According to Mr. Brande, it consists of about 5.55 parts of oxygen, 7.65 hydrogen, 13 nitrogen, 73.80 carbon. By digesting quinine in a weak solution of sulphuric acid, the sulphate of quinine is obtained, which is the salt now generally used for medicinal purposes. The most approved process for preparing this salt was pointed out by Mr. Henry. A kilogramme of bark (2 lbs. 3 oz. 5 dr.) is reduced to a coarse powder, and boiled twice for about a quarter of an hour in 14 or 15 pints of water, 2 ounces of sulphuric acid being added to it each time. The decoctions containing the sulphate of quinine are of a reddish colour, which gradually acquire a yellow tint, and have a very strong bitter taste. They are to be filtered through a linen cloth, and about half a pound of powdered quicklime added to the solution. The sulphate of quinine is decomposed in this manner, the alkali being precipitated along with the sulphate of lime. This is digested repeatedly in alcohol, till it no longer imparts any bitter taste to this fluid; the alcoholic solutions are then evaporated till a very bitter viscid substance is obtained, which becomes brittle as it cools. This is the quinine separated from almost all the other ingredients of the bark, and by digesting it in dilute sulphuric acid a solution of sulphate of quinine is obtained, which crystallizes on evaporation. It is a white pulverulent substance; it crystallizes in small white 4-sided prisms, which are distinguished by their pearly lustre. It is not very soluble, therefore not affording a very bitter taste; but by adding a drop or two of acid to the solution, its solubility is increased, and then it becomes intensely bitter. It is decomposed by the alkalies and earths; it volatilizes at a moderate heat, and it can unite with an excess of acid, forming a bisulphate of quinine. The sulphate of quinine is frequently adulterated with starch, pipe-clay, and various other substances. To determine its purity, the simple process of heating it is sufficient; if it evaporate entirely without charring and melting, it is pure; but if it should turn black or smell sweetish, it is probable that sugar or starch is present. Pure quinine is seldom used in medicine, but the sulphate possesses in a very eminent degree the medicinal properties of Peruvian bark, one grain, or one grain and a half, being equivalent to a drachm of the bark in substance. In Paris it has superseded, in a great measure, the Peruvian bark, and is now extensively used in this country in all cases where that valuable medicine is indicated, in doses of from 2 to 5 grains.

Medical properties and uses.—Peruvian bark has been long known as one of the most powerful and valuable tonics we possess, and may be administered with great freedom in all cases where that class of remedies are indicated. The only effects of an overdose are headache and nausea. It also possesses antiseptic and astringent powers in a very eminent degree, and is universally employed as a febrifuge in the cure of intermittent and remittent fever, in diseases of debility, such as typhus, cynanche maligna, in passive hæmorrhages, confluent small pox, in dysentery, in some cutaneous diseases, as lichen agrius, and livida, in purpurea, in some varieties of erysipelas, in gangrene, in dyspepsia, and even in acute rheumatism and gout. The

decoction of yellow cinchona bark, given in large quantities, is the best antidote to the poison of tartar-emetic.

Cordate-leaved Cinchona or Yellow Peruvian-bark. Tr. 30 to 40 ft.

3 C. rotundifòlia (Pavon, mss. Lamb. cinch. p. 5.) leaves roundish, naked above and shining, pilose beneath and on the branchlets; panicle brachiate, pubescent; calycine teeth very short; corolla clothed by silky tomentum outside, with a bearded limb; style exserted; stigma bipartite; capsule linear, terete. ♄. S. Native of Peru, in the forests of Loxa, in the province of Quito. Segments of corolla ovate. Anthers shorter than the filaments. Lobes of stigma linear, flat, and obtuse. This is a very distinct species, being easily distinguished from all its congeners by its narrow cylindrical capsules, and by the narrow linear divisions of the stigma.

Round-leaved Cinchona. Tree 30 to 40 feet.

4 C. ovalifòlia (Humb. et Bonpl. pl. equin. 1. p. 65. t. 19. nov. gen. 3. p. 403.) leaves oval or obovate, naked above and shining, but pilose on the veins beneath; calycine teeth ovate, acute; corolla clothed by silky tomentum outside, with a bearded limb; anthers twice longer than the filaments; stigma bipartite; capsules oval, constricted at the apex. ♄. S. Native of Peru, in the forests of Loxa, in the kingdom of Quito; Pavon; and on the Andes of Peru, near Cuenca; Humboldt and Bonpland. Panicle brachiate, pubescent. Flowers white. Segments of corolla linear. Lobes of stigma linear, obtuse. This species must not be confounded with the C. ovalifòlia of Mutis, the C. macrocárpa of Vahl, or Quinquina blanc of New Granada, which are totally different.

Oval-leaved Cinchona. Tree 15 to 20 feet.

5 C. purpu'rea (Ruiz et Pav. fl. per. 2. p. 52. t. 193) leaves oval or ovate, acute at the apex, and attenuated at the base, at length naked on both surfaces and shining; panicle corymbose, pubescent; anthers shorter than the filaments, but exceeding the throat; corolla clothed by silky tomentum outside, with a bearded limb; stigma 2-lobed, inclosed; capsules narrow, ovate-oblong, attenuated at the apex. ♄. S. Native of the lower mountains of the Andes, in forests, at Chinchao, Pati, Muna, Casape, Casapillo, &c. (Pavon); and of the Andes of Peru, near the city of Jaen de Bracamoros. C. scrobiculàris, Humb. et Bonpl. pl. equin. 1. p. 165. t. 47. nov. gen. amer. 3. p. 402. Cascarilla fina Bracamorensium and Cascarilla morada, Ruiz, quinol. p. 67. Cascarilla bobo de hogamorada. Corolla rose coloured. Capsule bisulcate, pubescent when young, but glabrous in the adult state. This is distinguished from the preceding species by its more acute smoother leaves; by its corymbose panicles; by its filaments being longer than the anthers, and their surpassing the throat of the corolla; by the capsules, which are ovate-oblong, narrowed, and without ribs; and, lastly, by the shorter and broader lobes of the stigma.

Purple-flowered Cinchona. Tree 40 feet.

6 C. pube'scens (Vahl, in act. havn. 1. p. 19. t. 2. Lamb. mon. t. 2.) leaves broad-ovate, or roundish-ovate, acute, on long petioles, rounded at the base or acutish, naked and shining above, but clothed with pilose tomentum beneath, as well as the branchlets; panicle brachiate, diffuse, clothed with rusty tomentum; corolla clothed by silky down on the outside, with a bearded limb; anthers almost sessile; stigma 2-lobed; capsule oval-oblong, obsoletely ribbed, tomentose. ♄. S. Native of Peru, in forests on the lower mountains of the Andes, towards Puzuzo and Panao; and also of the forests of Huanuco, Ruiz et Pavon. C. ovàta, Ruiz et Pav. fl. per. 2. p. 52. t. 195. Cascarílla pállida, Ruiz, quinol. p. 74. Cascarillo de Pato de Gallareta. Petioles 2 inches long. Teeth of calyx very short, acute. Corolla purplish outside and white inside, with ovate obtuse segments. Genitals inclosed. Style exceeding the anthers. Lobes of stigma ovate.

Pubescent Cinchona. Tree 30 to 40 feet.

7 C. micra'ntha (Ruiz et Pav. fl. per. 2. p. 52. t. 194.) leaves broad, oval or obovate, naked and shining above, but pilose in the axils of the veins beneath; panicle crowded, pubescent; anthers shorter than the filaments, hardly exserted; style very short; stigma 2-lobed; capsule elliptic, attenuated at the apex. ♄. S. Native of the Andes of Peru, in cold elevated forests towards St. Antonio de Playa Grande, where it was first observed by John Tafalla. Corolla clothed with silky down on the outside, with a bearded limb, and ovate segments. Calycine teeth very short, acute. Lobes of stigma ovate. Capsule bisulcate, ribless. This species has some affinity with *C. Condamínea*, but its small flowers, and elliptical ribless capsules, together with its very short style, and other marks, readily distinguish it.

Small-flowered Cinchona. Tree 20 to 30 feet.

8 C. Humboldtia'na (Lamb. cinch. p. 7.) leaves lanceolate, acute at both ends, naked above, but villous beneath, as well as on the branchlets; panicle glomerate, villous; calycine teeth very short, acute; corolla clothed by silky down outside, with a bearded limb; anthers sessile, inclosed; stigma exserted, emarginate; capsules ovate, hairy, glomerate. ♄. S. Native of Peru, in the kingdom of Quito, in forests near the town of Jaen de Bracamoros. Pavon. This is a strongly marked and very distinct species; there is none with which it can be confounded; it is the C. villòsa, Pavon, mss.

Humboldt's Cinchona. Tree.

9 C. glanduli'fera (Ruiz et Pav. fl. per. 3. t. 224.) leaves oval, acutish at both ends, naked and shining above, very pilose beneath, as well as on the branchlets, with undulated rather revolute margins; panicle brachiate, very pilose; corolla pilose outside, with a bearded limb; calycine teeth very short, mucronulate; segments of corolla ovate; stigma emarginate; capsules ovate, drooping. ♄. S. Native of Peru, in the kingdom of Quito, at Loxa. Pavon. C. microphýlla, Mutis, mss. C. quercifòlia, Pavon, mss. C. Mutìsii, Lamb. cinch. p. 9. Anthers exserted, shorter than the filaments. Corolla white.

Var. β; leaves oval, obtuse, rounded at the base, and rather cordate. ♄. S. C. quercifòlia, var. crìspa, Pavon, mss.

Gland-bearing Cinchona. Tree 10 to 12 feet.

10 C. hirsu'ta (Ruiz et Pav. fl. per. 2. p. 51. t. 192.) leaves oval, acute at the base, beset with bristly hairs, as well as the branchlets, veiny above, and at length naked; flowers glomerate, beset with bristly hairs; calycine segments lanceolate, acuminated; corolla pilose outside, with a bearded limb; stigma 2-lobed; capsule ovate. ♄. S. Native of Peru, on the Andes, in forests in cold elevated places, towards Pillao and Acomayo. Ruiz et Pavon. Cascarílla delgado, Ruiz, quinol. p. 60. Flowers red. Humboldt and Bonpland have confounded this with the C. cordifòlia of Mutis, with which it has not the least resemblance.

Hairy Cinchona. Tree 20 to 30 feet.

11 C. stenoca'rpa (Lamb. cinch. p. 13.) leaves lanceolate, acute at both ends, naked above, but pilose on the veins beneath; teeth of calyx ovate, acute; corolla clothed by silky tomentum outside, with a glabrous limb; anthers sessile; style very short; stigma emarginate; capsule linear, terete. ♄. S. Native of Peru, in forests in the kingdom of Quito, near the city of Jaen de Bracamoros. Pavon. C. species nova, Pavon, mss. Panicle diffusely branched, pubescent. Segments of the corolla linear, obtuse. Very like *C. Condamínea*, but very distinct.

Narrow-fruited Cinchona. Tree.

12 C. caduciflòra (Bonpl. in pl. equin. 1. p. 167. H. B. et Kunth, nov. gen. amer. 3. p. 411.) leaves broad-obovate, acute at the base, naked and shining above, but pilose in the axils of the veins beneath; panicle brachiate, pubescent; calycine teeth ovate, obtuse; corolla clothed with silky down outside, having the limb glabrous above, and the segments linear-oblong; an-

thers a little exserted; style very short; stigma bipartite; capsules oval-oblong. ♄. S. Native of Peru, on the Andes, near the city of Jaen de Bracamoros. Humboldt and Bonpland. C. magnifòlia, Humb. et Bonpl. pl. equin. 1. p. 139. t. 39. exclusive of the synonyme of Flora Peruviana. Cascarilla bova of the Peruvians. Segments of corolla shorter than the tube. Lobes of stigma linear, flat.

Caducous-flowered Cinchona. Tree 100 feet.

§ 2. *Capsule dehiscing at the apex.—Aberrant species.*

13 C. macroca´rpa (Vahl, in act. havn. 1. p. 20. t. 3. exclusive of the synonymes. Lamb. mon. p. 22. t. 3.) leaves broad-elliptic, very blunt, densely clothed with rough tomentum beneath, as well as on the branches; calyx entire, with rather prominent teeth; corolla large, clothed by silky down outside, with a bearded limb, and lanceolate segments, which are recurved at the apex; genitals inclosed; stigma emarginate; capsule pear-shaped, tomentose. ♄. S. Native of Peru, in the forests of Loxa, Guayaquil, and Cuenca; and of New Granada. C. ovalifòlia, Mutis, mss. Humb. in mag. &c. p. 118. Cosmibuèna species nov. Pavon, mss. Called Quina blanca, and Quinquina blanc de Santa Fe. Corymbs few-flowered. Calyx urceolate, entire. Style furrowed. This species ought not to be confounded with the C. ovalifòlia of Humb., to which it has not the least resemblance.

Large-fruited Cinchona. Tree 30 to 40 feet.

14 C. oblongifòlia (Mutis, mss. Humb. in mag. &c. p. 118. Rhode, mon. p. 57. exclusive of the synonymes,) leaves oblong or cordate, densely clothed with scabrous hairs on both surfaces, as well as the branchlets; panicle brachiate, corymbose, scabrous from hairs; segments of corolla pilose outside, but glabrous inside, linear; genitals inclosed; anthers 3 times longer than the filaments; stigma bipartite; capsules ovate. ♄. S. Native of Peru, in forests in the mountains of Loxa; and of New Granada, near Maraquita. H. B. et Kunth, nov. gen. amer. 3. p. 401. exclusive of syn. of fl. per. and Ruiz, quinol. Called Quina roga and Cinchona vulgo Azahar. Flowers white. This is a very distinct plant from C. magnifòlia of Ruiz et Pav. It is distinguished from it by its leaves being rounded at the base, often cordate, covered on both sides with rough pilose tomentum, sometimes the older leaves, however, become nearly naked above; the corolla is covered on the outside with bristly pilose hairs, while that of C. magnifòlia has short down, and in the shape of the capsules.

Oblong-leaved Cinchona. Tree 12 to 20 feet.

15 C. magnifòlia (Ruiz et Pav. fl. per. 2. p. 52. t. 196. but not of Humb. et Bonpl.) leaves broad-roundish-oval, naked and shining above, and densely clothed with tomentum beneath; panicle brachiate, corymbose, tomentose; calycine teeth short, acute; corolla clothed with silky tomentum outside, but having the limb glabrous above, and the segments lanceolate; anthers inclosed; style exserted; stigma bipartite; capsules linear, terete. ♄. S. Native of Peru, on the Andes, in very hot places in forests, on the banks of mountain streams, at Chinchao, Cuchero, and Chacahuassi. Ruiz et Pavon. C. oblongifòlia, Steph. and Churchill, med. bot. 4. t. 184. Cascarilla amarilla, Ruiz, quinol. p. 71. This species of *Cinchòna* is regarded as yielding the red bark of the shops. Flowers white, sweet-scented.

Large-leaved Cinchona or Red Peruvian-bark. Tree 40 ft.

16 C. Pavònii (Lamb. cinch. p. 8.) leaves orbicular or cordate, naked above, but clothed with rusty tomentum beneath, as well as the branchlets; corymbs clothed with rusty tomentum; calyx urceolate, entire, obsoletely denticulated; tube of corolla very long, clothed by silky tomentum outside, with a bearded limb; anthers sessile; stigma deeply bipartite; capsules very long, terete. ♄. S. Native of Peru, in the kingdom of Quito, in groves at Loxa. C. càva, Pavon, mss. Called Canela. Corymbs crowded with flowers. Corollas large, with ovate-oblong obtuse segments; anthers hardly exserted above the throat. Style inclosed; lobes of stigma linear, obtuse, with revolute edges. Capsule length and thickness of a finger. This species has considerable affinity with *C. macrocárpa*. The form of its leaves, the deeply bipartite stigma, its very long cylindrical capsules, however, widely separate it.

Pavon's Cinchona. Tree.

17 C. acutifòlia (Ruiz et Pav. fl. per. 2. p. 51. t. 225.) leaves lanceolate, acuminated, naked and shining above, but pilose at the veins beneath; segments of the calyx linear-oblong, obtuse; corolla clothed with silky tomentum on the outside, having the limb glabrous above, and the segments linear, acute; genitals inclosed; stigma bipartite; capsule pear-shaped, hairy, attenuated at the base. ♄. S. Native of Peru, on the Andes in groves at the river Chilcoplaya. Cascarilla detropa aguda, Ruiz et Pav. suppl. quinol. p. 8. Panicle brachiate, densely clothed with pili. Lobes of stigma linear, obtuse.

Acute-leaved Cinchona. Tree 20 feet.

18 C. hexa´ndra; leaves large, oval, obtuse, clothed with ochraceous villi beneath, as well as on the branchlets and flowers; corollas 5-6-cleft; stamens 5-6. ♄. S. Native of Brazil, in mountain woods, in the provinces of Rio Janeiro and Minas Geraes. Buèna hexándra, Pohl. pl. bras. 1. p. 10. t. 8. China, Eschwege, journ. bras. 2. p. 86. Quino do Rio de Janeiro, mem. acad. Lisb. 3. pt. 2. p. 96. The bark is thin, of a bay colour on the outside, but blood-coloured within, very bitter, and is used by the Brazilians as a febrifuge, in place of Peruvian bark. Corolla purple.

Hexandrous Cinchona. Tree.

§ 3. *Flowers disposed in interrupted elongated axillary racemes. Corollas villous on the outside. Capsules dehiscing from the apex. Seeds peltate, girded by a membranous wing.—Remijia, D. C. bibl. univ.* 1829. *scienc. vol. 2. p.* 185. *prod. 4. p. 357. The species are called Quina de Serra or Quina de Remijo throughout Brazil.*

19 C. ferrugínea (St. Hil. append. voy. p. 8. pl. usuel. bras. 1. t. 3.) leaves oblong-lanceolate, rather narrow, coriaceous, clothed with rusty villi beneath, as well as the branches, with revolute margins; racemes interrupted, hardly branched; corolla tomentose outside. ♄. S. Native of Brazil, in the province of Minas Geraes, on arid mountains. Remijia ferrugínea, D. C. prod. 4. p. 357.—Macrocnèmum no. 1. Velloz. in Vand. fl. p. 14. Leaves usually 3 in a whorl. The fascicles of flowers on the raceme are opposite. The bark is bitter and astringent, and is used in place of Peruvian bark in Brazil, under the names of *Quina de Remijo* and *Quina de Serra*.

Rusty Cinchona. Shrub 4 to 5 feet.

20 C. Vello´zii (St. Hil. pl. usuel. bras. p. 1. no. 2.) leaves ovate, coriaceous, acuminated at both ends, clothed with rusty villi beneath as well as on the branchlets; racemes interrupted, hardly branched; corolla tomentose outside. ♄. S. Native along with the preceding. Remijia Vellòzii, D. C. prod. 4. p. 357.—Macrocnèmum, no. 2. Vell. in Vand. fl. p. 14. This differs from the preceding species in the flowers being on shorter pedicels, in the bracteas being less linear, and in the flowers being longer and more numerous. Fascicles of flowers on the racemes opposite. The bark of the species is used in Brazil in place of Peruvian bark, under the name of *Quina de Serra*.

Vellozi's Cinchona. Shrub 4 to 5 feet.

21 C. Remijia´na (St. Hil. pl. usuel. bras. p. 1. no. 2. in a note) leaves broad-elliptic, obtuse, cuspidate: the upper ones decurrent at the base, clothed with rusty villi beneath, as well as the branchlets; racemes interrupted, hardly branched; corolla

villous on the outside. ♄. S. Native of Brazil, along with the two preceding species. C. Remyàna, Spreng. syst. 1. p. 705. Remíjia Hilàrii, D. C. prod. 4. p. 357. Clusters of flowers opposite, on the raceme. The bark of this species is also used in place of Peruvian bark, under the name of *Quina de Remijo*.

Remijo's Cinchona. Shrub.

22 C. Candóllii; leaves oblong, acute, attenuated at the base, undulated, coriaceous; panicles axillary, verticillately branched: the branches interruptedly racemose; corolla villous on the outside. ♄. S. Native of Brazil. Remíjia paniculàta, D. C. prod. 4. p. 357. Branches trigonal. Branches and branchlets of panicle angular. Leaves clothed with rusty down beneath, as well as the branchlets and panicle. Fruit unknown.

De Candolle's Cinchona. Shrub.

† *Species not sufficiently known.*

23 C. Pela'lba (Pav. quinol. ined. D. C. bibl. univ. 1829. &c.) leaves roundish, hardly apiculated, membranous, beset with velvety hairs on the petioles and on the nerves beneath, and velvety between the nerves, but puberulous above; stipulas oval, obtuse, equal in length to the petioles; panicle glabrous, much branched; fruit oblong-terete, crowned by the calyx, glabrous. ♄. S. Native of South America, and probably of Peru. This is a very distinct species. Fruit 6-7 lines long. Stipulas an inch long.

Pelalba Cinchona. Tree.

24 C. Muzone'nsis (Goudot, in phil. mag. 1828. febr. p. 132.) leaves ovate-oblong, acute, attenuated at the base; stipulas revolute; panicle brachiate; corolla white, with a bearded limb. ♄. S. Native of Columbia, in the extensive forests about the town of Muzo.

Muzo Cinchona. Tree.

25 C. Lambertia'na (Mart. in bot. zeitung, no. 7. p. 119. 1831.) leaves petiolate, oval, rather cordate, bluntish, glabrous above and shining, soft and opaque beneath, and pilose on the nerves; cymes compound, terminal; fruit cylindrical, ribbed, glabrous, dehiscing on one side; seeds girded by a narrow jagged margin. ♄. S. Native of South America, on the banks of the Amazon.

Lambert's Cinchona. Tree.

26 C. Bergia'na (Mart. in bot. zeit. no. 7. p. 119. 1831.) branches and all the younger parts of the tree clothed with rusty hairs; leaves oblong-lanceolate, tapering into the short petioles, flat; thyrse axillary, interrupted, brachiate at the base; capsule oblong-cylindrical. ♄. S. Native of South America, on the banks of the Amazon.

Bergius's Cinchona. Tree.

Cult. All the species of this very interesting genus are grown with great difficulty in the stoves of our gardens. The best soil for them is a mixture of turfy loam and sandy peat. Cuttings should be taken off when ripe, and planted in a pot of sand, which should be plunged under a hand-glass in a moist heat.

XI. COSMIBUE'NA (named by Ruiz and Pavon after Cosimi Bueno, a Spanish physician, who has written on the natural history of Peru). Ruiz et Pav. fl. per. 3. p. 3. but not of their prod. D. Don, in Lin. trans. vol. 17. ined.—Buèna, Pohl. fl. bras. 1. p. 8. D. C. prod. 4. p. 356. but not of Cav.—Cinchòna species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-toothed. Corolla tubular, with a 5-lobed limb, which is imbricate in æstivation. Anthers oblong, exserted. Stigma bipartite. Capsule somewhat 4-celled, many-seeded, dehiscing from the apex. Dissepiment semiferous, double from the revolute margins of the valves. Seeds narrow, ramentaceous, fibrous at the extremities.—Smoothish trees, natives of South America, with ovate, coriaceous leaves, on short petioles; oval, large, obtuse stipulas, and cymose inflorescence. The bark of these trees is used like those of *Cinchòna*.

1 C. obtusifo'lia (Ruiz et Pav. fl. per. 3. p. 3. t. 198.) leaves obovate, very obtuse, naked, and shining on both surfaces; corymbs few-flowered, glabrous; calycine teeth ovate, acute; corolla glabrous, with a large tube; anthers sessile, inclosed; stigma 2-lobed; capsules elongated, terete. ♄. S. Native of Peru, in forests towards Pozozo, on the banks of streams; also at Pueblo Nuevo de St. Antonio de Chicoplaya. Cinchòna grandiflòra, Ruiz et Pav. fl. per. 2. p. 54. t. 198. Cinchòna Chìna, Lop. Ruiz, in fl. per. 3. p. 4. Buèna obtusifòlia, D. C. prod. 4. p. 356. Segments of corolla broad, ovate, flat, fleshy. Anthers linear. Style exserted. Lobes of stigma ovate, obtuse, thick. Capsule naked. The flowers are of a brilliant white, and large, which, together with its green shining leaves form a striking contrast in its native forests. It delights in the warmest regions of Peru.

Blunt-leaved Cosmibuena. Tree 20 feet.

2 C. acumina'ta (Ruiz et Pav. fl. per. 3. p. 4. t. 226.) leaves ovate, short-acuminated, naked and shining on both surfaces; flowers terminal, almost solitary, glabrous; calycine teeth oblong-ovate, bluntish; tube of corolla very long, and narrow; genitals hardly exserted; stigma 2-lobed; capsule oblong, cylindrical. ♄. S. Native of Peru, in forests on the lower Andes, at Chicoplaya, where it was gathered by John Tafalla. Buèna acuminàta, D. C. prod. 4. p. 356. Cinchòna acuminàta, Poir. and Spreng. Flowers large, white. Segments of corolla broad-ovate. Anthers linear, sessile. Lobes of stigma oblong, thick, and blunt.

Acuminated-leaved Cosmibuena. Tree 20 feet.

3 C. dichótoma: leaves elliptic, short-acuminated, at length naked on both surfaces, acute at the base, when young silky; peduncles terminal, dichotomous, few-flowered; calycine teeth very short; capsules linear, very long, terete. ♄. S. Native of Peru, in forests towards Pueblo-Nuevo, in the tract of the Chicoplaya, where it was first detected by John Tafalla. Cinchòna dichótoma, Ruiz et Pav. fl. per. 2. p. 53. t. 197. All the specimens collected by Tafalla, now in the collection of Mr. Lambert, are in a fruit-bearing state, so that the flowers still remain unknown; they are, however, probably white and glabrous, like the other species.

Dichotomous-peduncled Cosmibuena. Tree 20 feet.

Cult. See *Cinchòna* above, for culture and propagation.

XII. LASIONE'MA (from λασιος, *lasios*, woolly, and νημα, *nema*, a filament; in reference to the filaments, which are bearded in the middle). D. Don, in Lin. trans. vol. 17. ined.—Cinchòna species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-toothed. Corolla tubular, with a 5-lobed limb, which is imbricate in æstivation. Stamens exserted; filaments bearded in the middle; anthers roundish, peltate: cells loosened at the base. Stigma 2-lobed. Capsule 2-celled, dehiscing in the middle of the cells, many-seeded: having the dissepiment complete. Seeds small and narrow.—A tree, native of Peru, with panicled inflorescence.

1 L. ro'sea (D. Don, in Lin. trans. vol. 17. ined.). ♄. S. Native of Peru, on the Andes at Puzuzo, and in the tract of St. Antonio de Playa Grande. Cinchòna ròsea, Ruiz et Pav. fl. per. 2. p. 54. t. 199. Cinchòna Tarantàrum, Pavon. mss. Cascarílla Pardo, Ruiz, quinol. p. 77. Leaves lanceolate-ovate, acute at both ends, naked, and shining on both surfaces. Panicle crowded. Corolla tubular, rose-coloured: segments broad-

ovate. Capsules ovate, bisulcate, glabrous. Humboldt, on the authority of Zea, has joined this with *Cinchòna lancifòlia* of Mutis, with which it has not the least affinity. Called *Asmonich* in Peru.

Rose-coloured-flowered Lasionema. Tree.

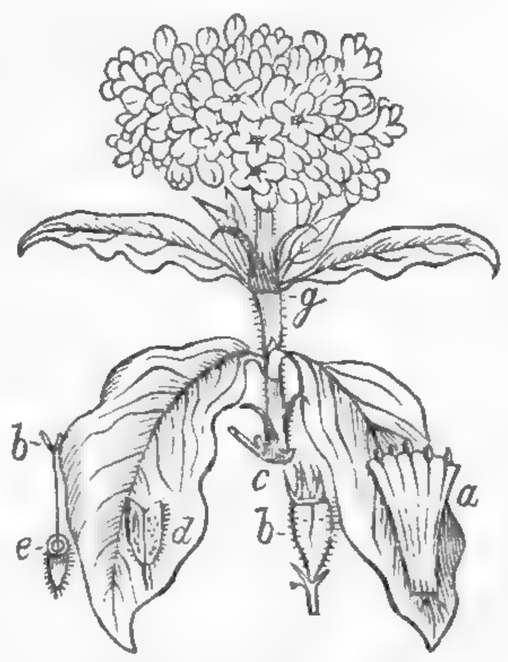
Cult. See *Cinchòna*, p. 479. for culture and propagation.

XIII. LUCU'LIA (*Luculi swa* is the name given to the tree by the Nipaulese). Sweet, brit. fl. gard. t. 145. D. C. prod. 4. p. 357. D. Don, in Lin. trans. vol. 17. ined.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx 5-parted (f. 87. *c.*); segments foliaceous. Corolla tubular, with a 5-lobed limb, which is imbricate in æstivation. Stamens almost inclosed (f. 87. *a.*). Anthers linear. Stigma bipartite (f. 87. *b.*) Capsule 2-celled (f. 87. *b.*), dehiscing at the dissepiment from the apex, many-seeded, crowned by the calyx. Seeds samaroid, surrounded by a jagged membranous margin.—A tree, native of Nipaul: having cymose bracteate inflorescence.

1 L. gratíssima (Sweet, l. c.). ♄. F. Native of Silhet and Nipaul, on the mountains. Cinchòna gratíssima, Wall. in Roxb. fl. ind. 2. p. 154. tent. fl. nep. 1. p. 30. t. 21. Mussæ'nda Lucùlia, Hamilt. in D. Don, prod. fl. nep. p. 139. A small branching tree, with terete pubescent branches; elliptic, acuminated leaves, which are glabrous above and villous on the veins beneath, on short petioles. Cymes terminal, many-flowered. Flowers rose-coloured, rather fleshy, sweet-scented. Stipulas solitary on each side, broad at the base and cuspidate at the apex, longer than the petioles. Segments of calyx deciduous. It is impossible to conceive any thing more beautiful than this tree, when covered with its numerous cymes of pink-coloured very fragrant flowers.

FIG. 87.



Very-grateful-scented Luculia. Fl. Aug. Sept. Clt. 1823. Tree 16 to 20 feet.

Cult. A very good rich light soil will suit this tree; and cuttings may be rooted in sand under a hand-glass, but with great difficulty.

XIV. HYMENODI'CTYON (from ὑμην, *hymen*, a membrane, and δικτυον, *dictyon*, a net; in reference to the seeds being girded by a reticulated membrane). Wall. in Roxb. fl. ind. 2. p. 148. tent. fl. nep. 1. p. 31. D. C. prod. 4. p. 385. D. Don, in Lin. trans. vol. 17. ined.—Cinchòna species of authors.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx 5-toothed. Corolla tubular, with a 5-cleft limb, which is plicate in æstivation. Anthers linear, exserted. Stigma 2-lobed. Capsule 2-celled, dehiscing at the cells, many-seeded; valves ventricose, membranous. Dissepiment complete. Seeds girded by a membranous, reticulated border, which is bifid at the base.—Trees, natives of the East Indies, with compressed branches: coriaceous, petiolate leaves; deciduous, glandularly ciliated stipulas; and small, inconspicuous, greenish, pubescent flowers, disposed in fascicles, the whole forming racemose panicles. Floral leaves one under each branch of the panicle, lanceolate, convex, veiny, on long petioles, similar to the large calycine teeth of *Musæ'nda*, but placed in a different situation.

1 H. exce'lsum (Wall. in Roxb. fl. ind. 2. p. 358.) leaves oblong, downy: floral ones coloured and blistered; stipulas cordate, serrated; panicles axillary and terminal; anthers almost sessile in the mouth of the tube; partition of capsule contrary. ♄. S. Native of the East Indies, in the mountainous parts of the Circars, and chiefly of the valleys, where it grows to be a large tree. It is called *Bundaroo* in the Telinga language. Cinchòna excélsa, Roxb. cor. 2. p. 3. t. 106. Tratt. tab. t. 170. The lower pair, or two of the ramifications of the panicle, are ornamented each with a pair of coloured floral leaves. Panicles terminal, large. Flowers fascicled, small, greenish white. The infusion of one fresh leaf in water all night had little taste, but struck quickly a deep purplish blue with a chalybeate. The two inner coats of the bark (the outer light spongy stratum is tasteless) possess both the bitterness and astringency of Peruvian bark, and when fresh in a stronger degree; the bitterness is not so quickly communicated to the taste on chewing the bark, as that of the former, but is much more durable, and chiefly about the upper part of the fauces. The wood is firm, close-grained, of a pale mahogany colour, and very useful for many purposes.

Tall Hymenodyction. Fl. July, Aug. Clt. 1820. Tree 30 to 50 feet.

2 H. thyrsiflo'rum (Wall. in Roxb. fl. ind. 2. p. 151.) leaves ovate, downy, pale beneath: the floral ones coloured and reticulated; thyrse terminal and axillary, drooping; stipulas oblong, fringed with coloured glands; limb of corolla urceolate; partition of capsule contrary. ♄. S. Native of the East Indies, in the interior parts of Bengal. Cinchòna thyrsiflòra, Roxb. Branches forming a large ovate head to the tree. Leaves from 2-8 or 10 inches long. Thyrse very dense. Flowers small, greenish yellow, fascicled. The floral pair or two of leaves are on longer petioles than the rest.

Thyrse-flowered Hymenodyction. Fl. June, July. Clt. 1819. Tree 20 to 30 feet.

3 H. fla'ccidum (Wall. in Roxb. fl. ind. 2. p. 152.) leaves ovate-elliptic, smooth, and shining above; stipulas oblong-spatulate, ciliated; racemes axillary, slender, pendulous; capsules oblong. ♄. S. Native of the East Indies, on the north side of Sheopore, towards the bottom; and in the valley of Noakote. Leaves from 6-10 inches long: having the margins slightly waved. Common peduncle pubescent, bearing a hardly coloured, lanceolate-oblong, pubescent, reticulated floral leaf, which is convex on the upper side, and concave on the under. It comes very near the preceding species, but differs, however, in having broader, elliptic, downy leaves, and much thicker both terminal and axillary subcompound racemes; its capsules too are much broader.

Flaccid Hymenodyction. Tree 20 to 30 feet.

4 H. obova'tum (Wall. in Roxb. fl. ind. 2. p. 153.) leaves obovate, acuminated, smooth: floral ones lanceolate, acuminated, reticulated, convex, glaucous; stipulas ovate, acute, glandularly ciliated; racemes axillary and terminal, a little branched, erect. ♄. S. Native of the East Indies, and perhaps of Wynaad. Young shoots green, much compressed. Rachis of peduncles villous. At the apex of each peduncle there is a floral pallid leaf, 2 inches long, convex and a little rugose above: glaucous and concave, beautifully veined, and rather pubescent beneath.

Obovate-leaved Hymenodyction. Tree.

Cult. See *Cinchòna*, p. 479. for culture and propagation.

XV. EXOSTE'MMA (from εξω, *exo*, without, and στεμμα, *stemma*, a crown; in reference to the exserted stamens). D. C. diss. 1806. Rœm. et Schultes, syst. 5. p. 111. Spreng. syst. 1. p. 705. D. C. prod. 4. p. 358. D. Don, Lin. trans. vol. 17. ined.—Exostèma, Rich. in Humb. et Bonpl. pl. æquin. 1. p. 151.—Cinchòna, section Exostèma, Pers. ench. 1. p. 196.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx 5-toothed. Corolla tubular, with a 5-parted limb: having linear, elongated

segments, which are induplicate in æstivation. Stamens exserted; anthers narrow-linear, having the cells adnate at the base. Stigma undivided. Capsule 2-celled, dehiscing at the dissepiment from the apex, many-seeded. Seeds girded by an entire membranous border.—Trees or shrubs, usually glabrous. Leaves oval or lanceolate, on short petioles. Stipulas solitary on each side. Peduncles axillary and terminal. Flowers white or reddish. The barks of all the species are destitute of quinine and cinchonine, according to St. Hilaire.

SECT. I. PITO'NIA (the bark of some of the species is called *Quinquina Piton* in the Antilles). D. C. prod. 4. p. 359. Limb of calyx parted almost to the base into teeth of various lengths. Corolla glabrous: having the tube longer than the segments. Stigma undivided.—Species all natives of the Caribbee Islands. The bark is febrifugal, somewhat emetic, and is sold in the shops under the name of *Quinquina Piton* of the Antilles.

1 E. CARIBÆ'UM (Rœm. et Schultes, syst. 5. p. 18.) leaves ovate-lanceolate, acuminated, glabrous; pedicels axillary, 1-flowered, rather shorter than the petioles; calyx bluntly 5-toothed; style and stamens about equal in length to the corolla. ♄. S. Native of the Caribbee Islands, Guadaloupe, St. Domingo, Jamaica, Santa Cruz, &c.; and of Mexico. Cinchòna Caribæ'a, Jacq. amer. t. 179. f. 65. obs. 2. t. 17. Lamb. mon. t. 4. Gærtn. fruct. 1. t. 33. f. 4. Cinchòna Jamaicénsis, Wright, in roy. soc. trans. lond. p. 67. p. 504. t. 10. Andr. bot. rep. t. 481. Flowers white, sweet-scented, about the length of the leaves; but according to Jacquin they are pale flesh-coloured. Stamens, according to Andrews's figure, shorter than the segments of the corolla. Dr. Wright says that the jesuits' bark of Jamaica rises only to 20 feet, with leaves of a rusty green colour; and the young buds of a bluish green hue. The bark is generally smooth and grey on the outside, though in some rough and scabrous, when well dried, and the inside of a dark brown colour. Its flavour is at first sweet, with a mixture of the taste of horse radish and of the aromatics of the East, but when swallowed of that very bitterness and astringency which characterises the Peruvian bark. It grows near the sea shore, and is called in Jamaica *Sea-side beech*.

Caribbæan Exostemma. Fl. Ju. Jul. Clt. 1780. Tr. 20 ft.

2 E. LONGIFLO'RUM (Rœm. et Schultes, syst. 5. p. 18.) leaves linear-lanceolate, attenuated at both ends, glabrous; pedicels axillary, very short; teeth of calyx long, linear-lanceolate, glabrous; corollas 3 or 4 times longer than the leaves. ♄. S. Native of St. Domingo. Cinchòna longiflòra, Lamb. mon. p. 38. t. 12. exclusive of the synonymes. Flowers white, 5 inches long before expansion; segments linear; tube very long.

Long-flowered Exostemma. Fl. June, July. Clt. 1820. Tree 20 feet?

3 E. CANE'SCENS (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 359.) leaves ovate-oblong, acuminated, canescent from villi on both surfaces as well as on the branchlets; peduncles axillary, 1-flowered. ♄. S. Native of Mexico. The canescent down on the leaves, branches, pedicels, and young fruit distinguishes it from all the other species. Flowers unknown. Capsule naked at the apex, not crowned by the calyx. Pedicels length of fruit.

Canescent Exostemma. Tree.

4 E. ANGUSTIFO'LIUM (Rœm. et Schultes, syst. 5. p. 19.) leaves linear-lanceolate, pubescent beneath, as well as on the calyxes; peduncles terminal, corymbose; calycine teeth linear-subulate. ♄. S. Native of St. Domingo, on the rocky banks of rivers. Cinchòna angustifòlia, Swartz, prod. p. 42. fl. ind. occid. p. 380. act. holm. 1787. p. 117. t. 3. Lamb. cinch. 29. t. 9. Capsule oblong, pentagonal. Branches and pedicels rather downy. Peduncles forming a terminal corymbose panicle. Corolla glabrous, white? about the size of those of *E. Caribæ'um*, sweet-scented.

Narrow-leaved Exostemma. Tree 10 to 15 feet.

5 E. CORIA'CEUM (Rœm. et Schultes, syst. 5. p. 20.) leaves ovate, scarcely acute, coriaceous, glabrous on both surfaces, shining; branches and flowers glabrous; peduncles axillary, 2-3-flowered; teeth of calyx short, acute; corollas about the length of the leaves; capsules ovate, smooth. ♄. S. Native of St. Domingo. Cinchòna coriàcea, Poir. dict. 6. p. 38. Peduncles 2 or 3 times shorter than the leaves. Seed girded by a membranous wing. Corolla glabrous, 2 inches long, with a terete tube and narrow reflexed segments. Branches of panicle dichotomous.

Coriaceous-leaved Exostemma. Tree.

6 E. LINEA'TUM (Rœm. et Schultes, syst. 5. p. 18.) leaves ovate, acuminated, and are as well as the branches and flowers glabrous; peduncles terminal, corymbose; calycine segments linear; capsule pentagonal. ♄. S. Native of St. Domingo. Cinchòna lineàta, Vahl. symb. 2. p. 27. act. soc. hist. nat. hafn. 1. p. 20. t. 4. Lamb. mon. p. 26. t. 6. Panicle corymbose, terminal, trichotomous. Leaves marked with lines on the upper surface. Flowers an inch long, white.

Lined-leaved Exostemma. Tree 20 to 30 feet.

7 E. PARVIFLO'RUM (Rich. in Humb. et Bonpl. pl. equin. 1. p. 132.) leaves oval, mutic, furnished with porose glands in the axils of the nerves; petioles, branches, and peduncles pubescent; fascicles of flowers axillary and terminal, crowded; teeth of calyx short. ♄. S. Native of the Caribbee Islands.

Small-flowered Exostemma. Tree.

8 E. BRACHYCA'RPUM (Rœm. et Schultes, syst. 5. p. 19.) leaves elliptic, obtuse, and are as well as the branches and flowers glabrous; peduncles terminal, corymbose; teeth of calyx short, acutish; capsules ovate or obovate, ribbed. ♄. S. Native of the eastern parts of Jamaica, in shady parts of mountains. Cinchòna brachycárpa, Swartz, prod. p. 42. fl. ind. occid. 378. Lindsay, roy. soc. trans. edinb. 1794. p. 214. t. 5. Vahl, act. soc. hist. nat. hafn. 1. p. 22. Lamb. cinch. p. 18. t. 8. Panicle terminal, corymbose, trichotomous. Corolla $3\frac{1}{2}$ inches long before expansion, pale red or flesh-coloured. Leaves 5-6 inches long, deep green. The bark, when wounded, emits a whitish juice; which becomes of a brownish purple colour on drying, and is easily reduced into a greyish purple powder, which is at first sweet, but afterwards very bitter and astringent.

Short-fruited Exostemma. Tree 20 feet.

9 E. TRIFLO'RUM; leaves lanceolate, obtuse, attenuated at the base, quite glabrous, and shining on both surfaces; branches glabrous; corymbs compound; peduncles 2-3-flowered; calycine teeth subulate; corolla with a very long filiform tube, and long, narrow, linear, dependent segments; capsule obovate. ♄. S. Native of Jamaica. Cinchòna triflòra, Wright, in edinb. med. journ. p. 240. Lamb. cinch. p. 15. It comes nearest to *E. floribúndum*, but differs from it in the leaves being ovate-elliptic, acuminated, not attenuated at the base; the corymbs of flowers are also much larger and closer; the teeth of the calyx are shorter and broader; the tube of the corolla is much shorter and wider; and the capsules oblong-cylindrical.

Three-flowered Exostemma. Tree 20 feet.

10 E. FLORIBU'NDA (Rœm. et Schultes, syst. 5. p. 19.) leaves elliptic, acuminated, and are as well as the branches and flowers glabrous; peduncles terminal, corymbose; teeth of calyx short, acute; capsules turbinate, smooth. ♄. S. Native of the Caribbee Islands, Jamaica, Guadaloupe, St. Domingo, St. Lucia, and Trinidad, in woods on the banks of mountain streams. Cinchòna floribúnda, Swartz, prod. p. 41. fl. ind. occid. p. 375. Lamb. mon. p. 17. t. 7. Cinchòna montàna, Badier. in journ. phys. 1789. febr. p. 129. t. 1. Cinchòna, St. Lùciæ, David, phil.

trans. vol. 74. Cinchòna Luciàna, Vittm. summ. suppl. 1. p. 264. Kinkìna Piton. Act. nat. cur. 1787. Rozier, journ. de phys. 1781. p. 169-179. and 1789. p. 129-132. t. 1. Murr. append. med. vol. 1. p. 941. Panicle large, corymbose, terminal. Leaves like those of *Coffèa Arábica*, 5-6 inches long. Corolla 2 inches long before expansion, of a whitish purple colour. The *Quinquina Piton* is of a cinnamon colour, and is used as a succedaneum for Peruvian bark, but is somewhat drastic.

Bundle-flowered Exostemma. Clt. 1794. Tree 20 to 80 ft.

11 E. CAPITA'TUM (Spreng. new. entd. 2. p. 143.) leaves ovate, coriaceous, glabrous; flowers capitate; calyx small, 5-toothed; corolla with a long tube, and revolute segments. ♄. S. Native of South America. Perhaps only a variety of *E. floribúndum*. Specimens of this tree were received under the name of St. Lucia bark.

Capitate-flowered Exostemma. Tree.

SECT. II. BRACHYA'NTHUM (from βραχυς, *brachys*, short, and ανθος, *anthos*, a flower; in reference to the tube of the flower being shorter than the segments). D. C. prod. 4. p. 360. Limb of calyx divided even to the base into teeth. Corolla having the tube shorter than the segments of the limb, or at the longest hardly equal in length to them. Stigma sometimes undivided, and sometimes somewhat 2-lobed. Corolla glabrous, or pubescent on the outside.

12 E. PHILÍPPICUM (Rœm. et Schultes, syst. 5. p. 366.) leaves oval, acute, crowded, and are as well as the branches and flowers glabrous; peduncles terminal, corymbose; teeth of calyx short, acute; tube of corolla rather shorter than the segments of the limb; filaments hairy. ♄. S. Native of the Philippine Islands, at Manilla: and in Santa Cruz de la Laguna. Cinchòna Philíppica, Cav. icon. 4. t. 329. Peduncles axillary, trichotomous, corymbose, bearing 2 leaves at the origin of the branches, about the length of the leaves. Corolla 9 lines long before expansion. Stigma clavate, marked by a furrow on each side, probably from the cohesion of the lobes. Capsule turbinate, 5 lines long, crowned by the calycine limb. Bark bitter and astringent.

Philippine Exostemma. Tree 10 to 15 feet.

13 E. CORYMBÍFERUM (Rœm. et Schultes, syst. 5. p. 20.) leaves oblong, acute, and are as well as the branches and flowers glabrous; peduncles axillary, corymbose, bearing 2 leaves just below the ramifications; teeth of calyx short, acute; segments of corolla hardly shorter than the tube. ♄. S. Native of the islands of Tongatabu and Eaove, in the Pacific Ocean, where it is cultivated for the elegance and odour of its flowers. Cinchòna corymbífera, Forst. act. nov. ups. 3. p. 176. Lin. fil. suppl. p. 144. Lamb. cinch. p. 25. t. 5. Leaves deep green, size of those of *Coffèa Arábica*: having the nerve purplish beneath. Corymbs trichotomous. The bark is very bitter and subastringent, and very like Jesuits' bark. Flowers white, but reddish on the outside.

Corymb-bearing Exostemma. Tree 10 to 15 feet.

14 E. PERUVIA'NUM (Humb. et Bonpl. pl. equin. 1. p. 133. t. 38.) leaves ovate or oblong, acute, rounded at the base: the superior ones sessile and cordate; corymbs terminal, sessile; peduncles and calyxes pubescent; corolla silky outside. ♄. S. Native of Peru, on the declivities of the Andes, in cold places by the sides of streams, at the altitude of 3000 feet. H. B. et Kunth, nov. gen. amer. 3. p. 404. Cinchòna Peruviàna, Poir. suppl. 4. p. 640. Flowers rose-coloured. Leaves smooth, deep green above. Segments of corolla hardly shorter than the tube. Filaments glabrous, adnate to the throat of the corolla. Stigma obsoletely 2-lobed. Teeth of calyx acute.

Peruvian Exostemma. Tree 10 to 12 feet.

15 E. CORYMBO'SUM (Spreng. syst. 1. p. 706.) leaves oblong-lanceolate, acute, and are as well as the branches and flowers glabrous; corymbs terminal, brachiate; teeth of calyx almost linear, acute, spreading; segments of corolla about equal in length to the tube. ♄. S. Native of Peru, in hot places between Chaclla and Muna. Portlándia corymbòsa, Ruiz et Pav. fl. per. 2. p. 49. t. 190. f. a. Leaves shining above, 2-3 inches long. Corolla white: having the limb reflexed. Capsule fuscous, turbinate. Seeds girded by a membranous wing, hence it is not a species of *Portlándia*.

Corymbose-flowered Exostemma. Tree 15 to 18 feet.

16 E. DISSIMILIFLO'RUM (Rœm. et Schultes, syst. 5. p. 17.) leaves cordate-oblong, quite glabrous; limb of corolla longer than the tube; capsules almost linear, very narrow. ♄. S. Native of South America, at the altitude of 6000 or 7000 feet. Cinchòna dissimiliflòrum, Mutis, in Humb. berl. mag. nat. 1. p. 120.

Dissimilar-flowered Exostemma. Tree.

SECT. III. PSEUDOSTE'MMA. Limb of calyx campanulate, sub-tubular, truncate, or somewhat 5-toothed. Corolla usually villous on the outside: having the tube shorter than the segments of the limb. Stigma usually 2-lobed. Fruit unknown. Flowers disposed in panicles. Species natives of Brazil. Perhaps a proper genus.

17 E. CUSPIDA'TUM (St. Hil. pl. usuel. bras. 1. t. 3. f. A.) leaves ovate-lanceolate, cuspidate, nerved, villous beneath; panicle terminal; limb of calyx campanulately tubular, obscurely 5-toothed, longer than the ovarium; corolla villous on the outside: with the segments longer than the tube; filaments villous in the middle; stigma bifid. ♄. S. Native of Brazil, in woods. Leaves 9-15 lines long. Corolla white, 2-4 lines long. Fruit unknown. It is called *Quino do mato*, and the bark is used as a substitute for Peruvian bark.

Cuspidate-leaved Exostemma. Tree 8 to 10 feet.

18 E. AUSTRA'LE (St. Hil. pl. usuel. bras. 1. t. 3. f. B.) leaves ovate, nerved, rather villous beneath; panicle terminal, sessile, tripartite; limb of calyx campanulate, shorter than the ovarium, bluntly 5-toothed; corolla rather pubescent on the outside: with the segments longer than the tube; filaments glabrous; stigma undivided. ♄. S. Native of Brazil, in woods. Leaves 12-15 inches long, and 7-8 broad. Style villous. The bark of this and the preceding species is employed by the Brazilians in the cure of intermittent fevers, from the want of more efficacious remedies. It is bitter and a little astringent.

Southern Exostemma. Tree 8 to 10 feet.

19 E. FORMO'SUM (Cham. et Schlecht. in Linnæa. 4. p. 179.) leaves obovate-elliptic, acute at both ends, rather granular when examined under a lens; panicle trichotomous, loosely pyramidal; limb of calyx quite entire; corolla glabrous on the outside, but the throat is villous, and the segments are rather pilose on the inside, and a little longer than the tube; stigma 2-lobed. ♄. S. Native of Brazil, within the tropics.

Var. α, *leprò̀sum* (D. C. prod. 4. p. 361.) leaves large; tube of corolla shorter than the segments of the limb.

Var. β, *læ̀ve* (D. C. l. c.) leaves lanceolate; tube of corolla longer than the segments of the limb.

Showy Exostemma. Tree.

20 E. SOUZA'NUM (Mart. reis. ex Linnæa. 5. p. 45.) leaves obovate or ovate, acute, glabrous; corymbs few-flowered, terminal; capsules hardly an inch long, obovate, compressed; valves usually 4-nerved; seeds transversely oblong, with a broad margin. ♄. S. Native of Brazil.

Souza's Exostemma. Tree.

21 E. MACROCNE'MIA; branches naked; leaves oblong-spatulate, acuminated, tapering into the short petioles, smooth on both

surfaces, shining; stipulas connate at the base, and running sound the petioles, and forming a callous semicircular margin to them; thyrse axillary, panicled, loose; flowers minute, tetramerous; fruit cylindrical; seeds furnished with a quite entire rounded membrane at both ends. ♄. S. Native of South America, on the banks of the Amazon. Cinchona macrocnèmia, Mart. in bot. zeit. no. 7. p. 119. 1831.

Long-stamened Exostemma. Tree.

Cult. See *Cinchòna*, p. 479., for culture and propagation. The species are of freer growth than those of *Cinchòna;* and the cuttings should not be too ripe when taken off.

XVI. DANA'IS (δαναη, *danae*, the laurel of Alexandria; similarity). Comm. herb. Vent. tabl. 2. p. 584. Pers. ench. 1. p. 198. Juss. mem. mus. 6. p. 385. D. C. prod. 4. p. 361. —Pædèria species, Juss. gen. p. 204. Lam. ill. t. 166. f. 2.—Danàis, spec. Poir. Cinchòna species, Pet. Th.

Lin. syst. *Pentándria, Monogýnia.* Flowers dioecious from abortion. Calyx with a short obovate tube, and a small limb, which is 5-toothed to the base. Corolla funnel-shaped, with a slender tube, a villous throat, and a 5-parted limb. Stamens exserted in the male flowers, but abortive and inclosed in the female flowers. Style exserted in the female flowers, and bifid at the apex, but abortive in the male flowers. Capsule globose, coriaceously chartaceous, marked by an areola at the apex from the fallen calyx, 2-celled, dehiscing at the cells, 2-valved. Seeds small, fixed to central placentas, imbricated downwards, girded by a membranous wing; albumen fleshy.—Smooth, climbing, or straggling shrubs, natives of the Mauritius. Roots exuding a yellow juice when bruised. Leaves oblong or roundish. Stipulas solitary on each side, broad, very short. Peduncles axillary, many-flowered, corymbose, with opposite branchlets. Flowers fragrant, orange-coloured, sometimes hexamerous.

1 D. fra'grans (Comm. ex Lam. ill. t. 166. f. 2.) leaves oblong; corymbs crowded; capsule not furrowed, crowned by the permanent, spreading, calycine teeth. ♄. ◡. S. Native of the Mauritius. Gærtn. fil. carp. 3. p. 83. t. 195. D. fràgrans β, coronàta, Pers. ench. 1. p. 198. Pædèria fràgrans, Lam. dict. 2. p. 260. Cinchona A'fro-I'nda, Willem. herb. maur. p. 16. Petioles 3-4 lines long. Corymbs crowded, many-flowered, twice longer than the petioles. Segments of corolla narrow, spreading. Flowers small, red, swelling like those of *Narcíssus*.

Fragrant Danais. Shrub cl.

2 D. laxiflo'ra (D. C. prod. 4. p. 361.) leaves obovate, obtuse, and cuspidate; corymbs loose, sub-panicled; capsule not furrowed, crowned by the erect permanent calycine teeth. ♄. ◡. S. Native of Madagascar and Bourbon. Petioles 4 lines long. Panicle of female flowers 2-3 inches long, but that of the males is unknown.

Loose-flowered Danais. Shrub cl.

3 D. rotundifo'lia (Poir. suppl. 2. p. 450.) leaves ovate-roundish, acutish at the apex; corymbs crowded; capsule not furrowed, crowned by the toothless truncate limb of the calyx. ♄. ◡. S. Native of the Mauritius, where it is called *Liane de bois jaune*. Cinchòna chlorrhìza, Bory, in litt. Malànea verticillàta, Sieb. fl. maur. exsic. 2. p. 264. exclusive of the synonymes. Petioles 7-8 lines long. Corymbs hardly an inch, much shorter than the leaves. Flowers small. Leaves 2-3 inches long.

Round-leaved Danais. Shrub cl.

4 D. sulca'ta (Pers. ench. 1. p. 198.) leaves ovate; capsule furrowed, crowned by the calycine segments, which are foliaceous. ♄. ◡. S. Native of the Mauritius, where it climbs over the highest trees.

Furrowed-fruited Danais. Shrub climbing.

Cult. A mixture of loam, peat, and sand will be a good soil for the species of *Danàis;* and cuttings will be easily rooted under a hand-glass, in heat. They are well fitted for training up the rafters in a stove.

XVII. MANE'TTIA (named after Xavier Manetti, prefect of the botanic Garden at Florence, and secretary of the botanic society there. Author of Viridarium Florentìnum 1751: and Regnum Vegetabile, 1756). Mutis, in Lin. Mant. (1771.) p. 556. gen. ed. vii. no. 171. Schreb. gen. 181. H. B. et Kunth, nov. gen. amer. 3. p. 387. D. C. prod. 4. p. 361. but not of Adans.—Nacíbea, Aubl. (1775.) guian. 1. p. 96. t. 37. Juss. mem. mus. 6. p. 384. exclusive of Forsk. syn. and the syn. in fl. per.

Lin. syst. *Tetra-Pentándria, Monogýnia.* Calyx with a turbinate tube, and the limb parted into as many lobes as there are corolline segments, or double that number (f. 88. *a.*), and often furnished with lobules in the recesses between the segments. Corolla funnel-shaped, with a terete tube, a hairy throat (f. 88. *c.*) and a 4 (f. 88. *b.*), rarely 5-parted limb. Anther sessile in the throat. Capsule ovate, compressed, crowned by the calycine lobes (f. 88. *d.*), dehiscing from the apex to the base at the dissepiment (f. 88. *d.*): the divisions boat-shaped. Placentas somewhat exserted from the dissepiment. Seeds imbricate, almost sessile, peltate, surrounded by a winged membranous border, which is usually toothed. Embryo erect, in fleshy albumen; cotyledons foliaceous, lanceolate.—Perennial, herbaceous, or suffruticose plants: having the stems and branches twining and slender. Leaves ovate-oblong, or subcordate. Stipulas broad, short, acute, usually adhering to the petioles at the base. Peduncles axillary, 1 or many-flowered.

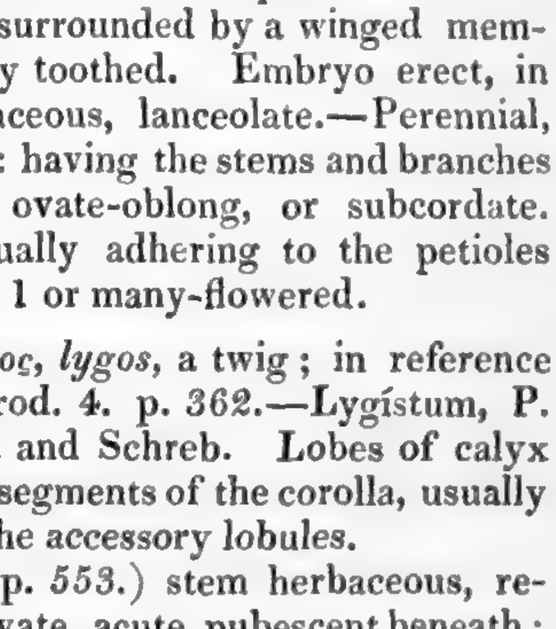
Sect. I. Lygístum (from λυγος, *lygos*, a twig; in reference to the twiggy stems). D. C. prod. 4. p. 362.—Lygístum, P. Browne.—Manéttia, Mutis, Lin. and Schreb. Lobes of calyx twice the number of those of the segments of the corolla, usually 8 (f. 88. *a.*), rarely 10; besides the accessory lobules.

1 M. reclina'ta (Lin. mant. p. 553.) stem herbaceous, reclinate, weak, branched; leaves ovate, acute, pubescent beneath; peduncles axillary, many-flowered, shorter than the leaves; pedicels opposite, hairy. ⊙. ◡. G. Native of Mexico. Corolla white. Calyx 8-lobed; lobes linear, concave, hairy. Nacíbea reclinàta, Poir. in Lam. dict. 4. p. 416.

Reclinate-branched Manettia. Pl. tw.

2 M. racemo'sa (Ruiz et Pav. fl. per. 1. p. 58. t. 89.) stems twining; branches tetragonal; leaves ovate or oblong, acuminated; stipulas semi-circular, acuminated, ciliated; racemes axillary, few-flowered, longer than the leaves; corollas hairy. ♄. ◠. S. Native of Peru, in groves at Cuchero and Chinchao. M. mutábilis, Pers. ench. 1. p. 134. Nacíbea mutábilis, Poir. suppl. 4. p. 55. Lobes of calyx 8, but in the ultimate flowers 10, according to the figure; and sometimes 4-5, according to the description. Corolla purplish.

FIG. 88.



Racemose-flowered Manettia. Shrub tw.

3 M. coccínea (Willd. spec. 1. p. 625.) stems twining; branches tetragonal; leaves ovate, acuminated, glabrous, shining; stipulas oblong, acute; peduncles axillary, racemose, few-flowered, shorter than the leaves. ♄. ◠. S. Native of French Guiana. Ker. bot. reg. 693. Nacíbea coccínea, Aubl.

guian. 1. p. 96. t. 37. f. 1. Calyx oblong, compressed: having 4 furrows on each side, and 8-lobed at the apex; lobes narrow, acute, fleshy. Corolla having a white tube, spotted with red, a throat closed by yellow hairs: and 4 oval, acute lobes, which are scarlet and villous above.

Scarlet-flowered Manettia. Fl. May, July. Clt. 1806. Shrub tw.

4 M. LYGÍSTUM (Swartz, prod. 4. p. 362. fl. ind. occ. p. 323.) stem suffruticose, flexuous, scandent; branches filiform; leaves ovate, acute, veiny, roughish on the nerves beneath; stipulas subulate, very short; peduncles axillary, longer than the leaves, many-flowered. ♄. ⌒. S. Native of the south of Jamaica, on the higher mountains. Spreng. syst. 1. p. 413. exclusive of the syn. of Kunth. Lygístum, Browne, jam. p. 142. t. 3. f. 2. but the calyx is said to be 4-lobed and the fruit baccate and 4-celled, and is therefore the Petèsia Lygístum, Lin. spec. 160. the Lygístum axillàre, Lam. ill. 1. p. 286. t. 67. f. 2., in which the calyx is also delineated with 4 lobes, and therefore also the Coccocýpsilum biflòrum, Willd. spec. 1. p. 618.; the Fernèlia biflòra, Rœm. et Schultes, syst. 3. p. 187. Perhaps 2 species are here confused, one with a 4-lobed calyx and the other with an 8-lobed calyx: having 4 of the lobes lanceolate, and 4 of them tooth-formed and smaller.

Twiggy Manettia. Fl. Feb. April. Clt. 1822. Sh. cl.

5 M. HAVANNE'NSIS (H. B. et Kunth, nov. gen. amer. 3. p. 388.) stems twining; branches angular; floriferous branchlets by threes; 1-3-flowered; leaves ovate-oblong, acuminated, glabrous. ♄. ⌒. S. Native of Cuba, in humid places near the Havannah. Leaves usually 3 in a whorl. Flowers unknown. Capsule roundish, crowned by the 8 linear lobes of the calyx. Seeds girded by a jagged wing.

Havannah Manettia. Shrub tw.

6 M. CUSPIDA'TA (Bert. in Spreng. syst. 1. p. 415.) plant glabrous; stems twining; branches filiform, rather tetragonal; leaves oval-oblong, acuminated; stipulas broad, very short; peduncles axillary, bipartite; pedicels elongated, 1-flowered. ♄. ⌒. S. Native of Jamaica, Trinidad, and Mexico. Calyx roughish, turbinate, with 8 linear elongated subulate lobes. Corolla smoothish. Capsule oval, compressed, glabrous, with 8 nerves, which remain after the seeds have fallen. Seeds girded by a toothed wing.

Cuspidate-leaved Manettia. Shrub tw.

7 M. UNIFLO'RA (H. B. et Kunth, nov. gen. amer. 3. p. 387.) stems suffrutescent, scandent; branches tetragonal, rather hispid; leaves ovate-oblong, ending in a narrow acumen, rather pilose above and glabrous beneath; peduncles terminal and lateral, 1-flowered. ♄. ⌣. S. Native of New Andalusia, in temperate places near Caripe. Stipulas short, ovate, ciliated. Corolla red. Lobes of calyx 8, linear. Capsule pear-shaped, 8-ribbed. Wings of seeds laciniately toothed. According to Kunth this is very nearly allied to *M. racemòsa*.

One-flowered Manettia. Shrub cl.

SECT. II. NACI'BEA (Aublet does not give the meaning of this word). D. C. prod. 4. p. 363. Lobes of calyx equal in number to the lobes of the corolla, usually 4, without any accessory lobules.

8 M. CORDIFO'LIA (Mart. spec. mat. med. bras. 1. p. 19. t. 7.) stems herbaceous, twining, terete, roughish; leaves ovate, cordate at the base, acute at the apex, finely pubescent on both surfaces; peduncles axillary, 1-flowered. ↿. ⌒. G. Native of Brazil, in the province of Minas Geraes, at Villa Ricca, in hedges and on the margins of woods. Roots woody, brown, and are an excellent remedy in dropsy and dysentery. Lobes of calyx 4, ovate-lanceolate, downy. Corolla scarlet, an inch long, glabrous outside, and villous inside.

Heart-leaved Manettia. Fl. Aug. Oct. Clt. 1832. Pl. tw.

9 M. GLA'BRA (Cham. et Schlecht. in Linnæa. 4. p. 159.) plant quite glabrous; stems twining; leaves cordate, acuminated; peduncles axillary, 1-flowered. ↿. ⌒. G. Native of the South of Brazil, among bushes, on the banks of rivers and rivulets, as on the Uraquay. Corolla scarlet, glabrous on the outside, but clothed with white villi above the base inside. Stigma club-shaped. Stipulas with a subulate point in the middle. Segments of calyx narrower than in *M. cordifòlia*, which plant is very similar, and which Hook. and Arnott consider identical.

Glabrous Manettia. Pl. tw.

10 M. GRA'CILIS (Cham. et Schlecht. in Linnæa. 4. p. 169.) plant puberulous, twining; leaves petiolate, ovate-lanceolate, acuminated; peduncles axillary, 1-flowered; calyx glabrous. ↿. ⌒. S. Native of the south of Brazil. Very like *M. glàbra*, but is distinguished by the characters given, in the flowers being smaller and slenderer, also scarlet; in the calycine lobes being narrower, and in the anthers being linear.

Slender Manettia. Pl. tw.

11 M. PUBE'SCENS (Cham. et Schlecht. l. c. p. 170.) plant cinereous from down; stems twining; leaves petiolate, ovate, obtuse at the base, and acuminated at the apex; stipulas furnished with a short acumen; peduncles axillary, 1-flowered; calycine segments longer than the tube, but at length equal with it. ↿. ⌒. S. Native of the south of Brazil. Very like the two preceding species. Corolla scarlet, 3 times longer than the limb of the calyx.

Pubescent Manettia. Pl. tw.

12 M. VILLO'SA (Cham. et Schlecht. l. c. p. 172.) plant twining; branches cinereously tomentose from roughish down; leaves petiolate, ovate, somewhat acuminated, acutish at the base; stipulas triangular; peduncles axillary, 1-flowered; segments of the calyx linear, one half shorter than the tube of the corolla; corolla pubescent on the outside; capsule ovate, rather villous. ↿. ⌒. S. Native of the south of Brazil.

Villous Manettia. Pl. tw.

13 M. ATTENUA'TA (Nees. et Mart. in nov. act. bonn. 12. p. 14.) stem scandent, almost terete, roughish; leaves ovate-lanceolate, attenuated at both ends, clothed with pubescent tomentum beneath; peduncles axillary, 1-flowered. ♄. ⌒. S. Native of Brazil, on the road to Felisbert, and in fields at the mountain called Grao-major, in the province of the Mines. Lobes of calyx 4, lanceolate, acuminated, erect, pubescent. Corolla glabrous, 2 inches long, crimson, with ovate acutish reflexed lobes. Upper leaves 3 in a whorl.

Attenuated-leaved Manettia. Shrub tw.

14 M. ACUTIFÒLIA (Ruiz et Pav. fl. per. 1. p. 58. t. 89. f. b.) plant glabrous; stems twining, terete; leaves lanceolate, very acute, petiolate; stipulas acuminated, adpressed, broad at the base; peduncles axillary, 1-3-flowered; tube of corolla hardly longer than the calyx. ↿. ⌒. S. Native of Peru, in groves, in the province of Panatahua. M. acutiflòra, Rœm. et Schultes, syst. 3. p. 203. Nacíbea acutiflòra, Poir. suppl. 4. p. 55. Lobes of calyx 4, lanceolate-linear, acute. Corolla purple, villous outside, as well as in the throat.

Acute-flowered Manettia. Shrub tw.

15 M. UMBELLA'TA (Ruiz et Pav. fl. per. 1. p. 58. t. 90. f. *a*.) plant glabrous; stems scandent, terete; leaves ovate and rather cordate, acute; stipulas broad at the base, acuminated, adpressed; peduncles axillary, many flowered, umbellate. ♄. ⌣. S. Native of Peru, in groves, at Muna. Nacíbea umbellàta, Poir. suppl. 4. p. 55. Bracteas 2-4, surrounding the flower in the manner of an involucrum. Lobes of calyx 4, lanceolate. Corolla blue, with a bearded throat.

Umbellate-flowered Manettia. Shrub cl.

16 M. rósea (Pohl, in litt. ex D. C. prod. 4. p. 364.) stems rather twining, compressedly angular, rather pubescent; leaves oblong, acuminated, glabrous; stipulas broad, short, acuminated; peduncles axillary, bifid, 2-flowered, shorter than the leaves. ♄. ◠. S. Native of Brazil. Lobes of calyx 4, lanceolate, longer than the tube of the calyx. Corollas rose-coloured, larger than in any other species of the genus, pubescent outside, with oblong ciliated segments.

Rose-coloured-flowered Manettia. Shrub tw.

17 M. pí'cta (Willd. spec. 1. p. 625.) stems suffruticose, twining; leaves ovate, acute, on short petioles; peduncles somewhat corymbose at the apex, longer than the leaves. ♄. ◠. S. Native of Cayenne. Nacíbea álba, Aubl. guian. 1. p. 96. t. 37. f. 1. Conotríchia álba, A. Rich. diss. with a figure. Coccocípsilum virgàtum, Lam. ill. no. 1457.? Spreng. syst. 1. p. 417. ex synonymes. Leaves variegated with yellow. Calyx 4-toothed. Corolla white, having the hairs in the throat erect, and forming an exserted truncate cone, ex A. Rich., with the lobes villous on the upper side. Flowers varying from 4 to 5-parted, according to Aublet's figure.

Painted-leaved Manettia. Shrub tw.

18 M. fimbria'ta (Cham. et Schlecht. in Linnæa. 4. p. 173.) plant twining and quite glabrous; leaves petiolate, elliptic, acuminated, acute at the base; peduncles lateral, 1-3-flowered; lobes of calyx ovate-lanceolate, a little shorter than the tube of the corolla; lobes of corolla fringed with long hairs; stigma 4-lobed. ↄ. ◠. S. Native of the south of Brazil.

Fringed-flowered Manettia. Pl. tw.

19 M. pseu'do-diòdia (Cham. et Schlecht. l. c. p. 174.) stems twining, obscurely tetragonal, glabrous, marked by a ciliated line at the apex; leaves petiolate, broad-oval, acuminated, acute at the base; stipulas triangular, ciliated; peduncles lateral, 1-3-flowered; segments of calyx lanceolate, acuminated, ciliated; corolla clothed with grumose tomentum outside; capsule tetragonal, pear-shaped. ↄ. ◠. S. Native of the south of Brazil. Diòdia pedunculàta, Spreng. syst. 1. p. 405.

False-Diodia Manettia. Pl. tw.

20 M. cilia'ta (Cham. et Schlecht. l. c. p. 176.) stems twining, tetragonal; angles winged, ciliated; leaves on short petioles, lanceolate, acuminated, ciliated, rather coriaceous; stipulas ciliated, ending each in a reflexed acumen; peduncles 1-3-flowered, pubescent; segments of calyx lanceolate, acuminated, ciliated; corolla clothed with rusty tomentum on the outside; capsule obconical. ↄ. ◠. S. Native of the south of Brazil.

Ciliated-stemmed Manettia. Pl. tw.

21 M. albiflòra (Schott, mss. ex Pohl, in litt. D. C. prod. 4. p. 364.) stems herbaceous; branches tetragonal, rather pilose; leaves oblong, acuminated at both ends, pubescent on both surfaces; stipulas broad, short, cuneated; pedicels numerous, 1-flowered, rising umbellately from the axils of the leaves. ↄ. ◠. S. Native of Brazil. Calyx with a turbinate, rather tetragonal tube, and 4 lanceolate lobes. Corolla white. Fruit unknown.

White-flowered Manettia. Pl. tw.

† *Species not sufficiently known.*

22 M. Gærtne'ri (D. C. prod. 4. p. 364.) stems and leaves unknown; capsule ovate, compressed a little, bisulcate, crowned by the 4-parted limb of the calyx.—The rest unknown. Nacíbea glàbra, Gærtn. fil. carp. 3. p. 102. t. 197. f. 5.

Gærtner's Manettia. Pl. tw.

23 M. secundiflòra (D. C. prod. 4. p. 364.) plant herbaceous, scandent; leaves ovate-lanceolate-linear; racemes axillary, subsecund, few-flowered; flowers on short pedicels, bracteate. ↄ.? ◠. S. Native of St. Domingo. Pædèria secundiflòra, Poir. suppl. 2. p. 450. Nacíbea species, ex A. Rich. Nacíbea angustifòlia, Vahl, ined. ex Rich.

Secund-flowered Manettia. Pl. cl.

Cult. All the species of *Manéttia* are worth cultivating for the beauty and elegance of their flowers. A mixture of loam peat and sand is the best soil for them. They are easily propagated by young cuttings in the same kind of soil under a hand-glass, in a moderate heat.

XVIII. BOUVA'RDIA (named after Dr. Charles Bouvard, formerly superintendent of the Jardin du Roi at Paris). Salisb. parad. lond. 2. no. 88. Ait. hort. kew. ed. 2. vol. 1. p. 245. Kunth, nov. gen. amer. 3. p. 383. Juss. mem. mus. 6. p. 383. exclusive of the tetrandrous species of Rondelètia.—Ægiphìla, Cav. icon. 6. p. 51. but not of Lin. nor Roxb.—Houstònia species, Andr.—Houstònia, section Christímia, Rafin. ann. gen. sc. phys. 5. p. 224.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with a subglobose tube (f. 89. *a.*), and a 4-parted limb (f. 89. *b.*); lobes linear-subulate (f. 89. *b.*), sometimes with a tooth between each lobe. Corolla funnel-shaped (f. 89. *e.*), tubular, elongated, beset with velvety papillæ outside, with a naked throat, and a 4-parted spreading short limb (f. 89. *d.*). Stamens having the filaments adnate to the tube at the base, and free from about the middle (f. 89. *e.*); anthers linear, inclosed. Stigma bilamellate (f. 89. *g.*), exserted. Superior part of the ovarium naked. Capsule membranaceous, globose, a little compressed, 2-celled, and dehiscing at the cells above; valves semi-septiferous. Placentas orbicular. Seeds many in each cell, compressed, imbricated downwards according to the figure of Salisbury, but upwards according to the figure in fl. mex., girded by a membranous wing.—Shrubs, natives of Mexico. Leaves opposite or in whorles. Stipulas narrow, acute, adnate to the petioles on both sides. Peduncles terminal, 3-flowered or trichotomous and corymbose.—This genus is very nearly allied to *Manéttia.*

§ 1. *Leaves disposed in whorles. Corollas flesh-coloured or pale red, having the tube bearded inside.*

1 B. linea'ris (H. B. et Kunth, nov. gen. amer. 3. p. 383.) branches terete, when young pubescent; leaves 3 in a whorl, linear, with revolute edges, scabrous above, but canescent from hairs beneath; corymbs trichotomous; lobes of calyx 5 times shorter than the tube of the corolla, which is hairy. ♄. G. Native of the temperate parts of Mexico, near St. Augustin de Las Cuevas, Moran, &c. Corolla 8 lines long, pale red.

Linear-leaved Bouvardia. Shrub 5 feet.

2 B. angustifòlia (H. B. et Kunth, l. c. p. 384.) branches terete, smoothish; leaves 3 in a whorl, lanceolate, with revolute edges, glabrous above, but beset with fine hairs beneath; corymbs somewhat trichotomous; lobes of calyx 2 or 3 times shorter than the tube of the corolla, which is hairy. ♄. G. Native of temperate parts of Mexico, along with the preceding. There is a variety of this species with 5-cleft flowers. Flowers pale red.

Narrow-leaved Bouvardia. Shrub.

3 B. hirte'lla (H. B. et Kunth, l. c.) branches terete; branchlets and leaves hairy on both surfaces, lanceolate, with revolute edges; flowers corymbose; lobes of calyx 5-6 times shorter than the tube of the corolla, which is hairy. ♄. G. Native about the city of Mexico. Flowers pale red or flesh-coloured.

Hairy Bouvardia. Shrub.

4 B. quaternifòlia (D. C. prod. 4. p. 365.) branches striated, rather downy; leaves 4 in a whorl, lanceolate, acuminated, rather scabrous above, and pubescent beneath; corymbs trichotomous; lobes of calyx 6 times shorter than the tube of the

corolla, which is pilose. ♄. G. Native about the city of Mexico. Carphàlea? pubiflòra, Moc. et Sesse, fl. mex. icon. ined. Flowers scarlet, 12-14 lines long. Perhaps only a variety of *B. hirtélla*.

Four-leaved Bouvardia. Shrub.

FIG. 89.

5 B. Jacqui'ni (H. B. et Kunth, l. c. p. 385.) branchlets trigonal, and are, as well as the under side of the leaves, hairy; leaves smoothish above, 3 in a whorl, oblong; corymbs somewhat trichotomous; lobes of calyx 5 times shorter than the tube of the corolla, which is hairy. ♄. G. Native near the city of Mexico. Ixòra Americàna, Jacq. hort. schœnbr. 3. p. 9. t. 257. Ixòra ternifòlia, Cav. icon. 4. p. 3. t. 305. exclusive of the description of the seeds. Houstònia coccínea, Andr. bot. rep. 106. Delaun. herb. amat. t. 116. Bouvárdia triphýlla, var. α, Salisb. parad. no. 88. Ker, bot. reg. 107. Ixòra Americàna and Hedyòtis fruticòsa, Moc. et Sesse, fl. mex. icon. ined. Tlacoxochilt jasminiflòra, Hern. mex. p. 231. with a figure. Corolla scarlet, with the tube about 9 lines long. There are varieties of this species with either pubescent or glabrous leaves.

Var. β, *exógyna* (D. C. prod. 4. p. 365.) leaves oblong-lanceolate, acuminated; style exserted. ♄. G. Cultivated in gardens.

Var. γ, *ovàta* (D. C. l. c.) leaves ovate, acute. ♄. G. Bouvárdia triphýlla, var. β, Salisb. parad. t. 88.

Jacquin's Bouvardia. Fl. April, Nov. Clt. 1794. Shrub 2 to 3 feet.

6 B.? obova'ta (H. B. et Kunth, l. c. p. 385.) branches tetragonal, striated, and are, as well as the leaves, smoothish; leaves 4 in a whorl, obovate; corymbs trichotomous. ♃. G. Native of Mexico, between Chapoltepec and Tezcuco. Herb 1-3 feet high, ex Bonpland. Perhaps this is a true species of Bouvárdia, ex Kunth.

Obovate-leaved Bouvardia. Pl. 1 to 3 feet.

§ 2. *Leaves opposite. Corolla with a beardless tube.*

7 B. versi'color (Ker, bot. reg. t. 254.) branches terete, glabrous, velvety while young; leaves opposite, lanceolate, ciliated; corymbs 3-flowered, trichotomous, drooping; lobes of calyx 8 times shorter than the tube of the corolla, which is glabrous both inside and outside. ♄. G. Native of South America, but in what place is unknown. Corolla with a scarlet tube, which is 9 lines long, but having the limb yellowish inside.

Party-coloured-flowered Bouvardia. Fl. July, Sept. Clt. 1814. Shrub 2 to 3 feet.

8 B. triflòra (H. B. et Kunth, nov. gen. amer. 3. p. 386. t. 288.) branches terete, glabrous; branchlets rather hairy; leaves opposite, lanceolate-oblong, acute, rounded at the base, beset with fine hairs; peduncles terminal, 3-flowered; lobes of calyx 3 or 4 times shorter than the tube of the corolla, which is glabrous. ♄. G. Native of the temperate parts of Mexico. Céstrum spermacocifòlium, Willd. rel. mss. in Rœm. et Schultes, syst. 4. p. 808. Corolla white, with the tube 5-6 lines long.

Three-flowered Bouvardia. Shrub.

9 B. longiflòra (H. B. et Kunth, l. c. p. 386.) branches compressedly tetragonal, glabrous; leaves opposite, oblong, acute, cuneated at the base, glabrous; flowers terminal, solitary, sessile; lobes of calyx 3 or 4 times shorter than the tube of the corolla, which is glabrous. ♄. G. Native of temperate parts of Mexico, near Santa Anita, where it is called by the natives *Flor de San Juan;* also near Queretaro and Huanajuato, ex Cav.; and at Pascuaro, ex Cervantes, in herb. Hænke. Æginètia longiflòra, Cav. icon. 6. p. 51. t. 572. f. 1. Corolla white, with the tube 2 or 3 inches long. Stipulas usually cleft into 2 awns at the apex.

Long-flowered Bouvardia. Clt. 1827. Shrub 2 to 3 feet.

10 B. Cavanille'sii (D. C. prod. 4. p. 366.) suffruticose; leaves opposite, ovate-lanceolate, acuminated, rather villous beneath; peduncles terminal, trifid, 3-flowered; capsule transversely ovate, somewhat didymous. ♄. G. Native of Mexico. Æginètia multiflòra, Cav. icon. 6. p. 52. t. 572. f. 2. without flowers.

Cavanilles's Bouvardia. Shrub.

11 B. cordifo'lia (D. C. prod. 4. p. 366.) suffruticose; leaves opposite, on very short petioles, cordate, acute; corymbs terminal, sessile, 8-10-flowered. ♄. G. Native of Mexico. Ixòra cordifòlia, Moc. et Sesse, fl. mex. icon. ined. Corolla from dirty yellow to scarlet, 6-7 lines long.

Heart-leaved Bouvardia. Shrub.

Cult. The species of this genus usually bear red or scarlet flowers, and are therefore worth cultivating in gardens. The readiest way of increasing them is by pieces of the roots, planted in a pot of good mould, and placed in a warm situation; or they may be increased by young cuttings, which root readily under a hand-glass, in a mixture of sand, peat, and loam, in heat.

XIX. PINCKNE'YA (named after an American gentleman of the name of Pinckney, who is now forgotten). Michx. fl. bor. amer. 1. p. 103. t. 13. Gærtn. fil. carp. 3. p. 80. t. 194. D. C. prod. 4. p. 366. D. Don, in Lin. trans. vol. 17. ined.—Pinknèa, Pers. ench. 1. p. 197.—Mussæ'nda species, Juss.—Cinchòna species, Poir.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted, having one of the segments large, coriaceous, and coloured. Corolla tubular, with a 5-cleft limb, which is valvate in æstivation. Stamens 5, exserted, inserted in the base of the tube; anthers peltate. Stigma emarginate. Capsule 2-celled, dehiscing at the dissepiment. Seeds compressed, surrounded by a winged membranous margin, which is emarginate at the base.—A tree, native of North America. Branches opposite. Leaves oval, acute at both ends, tomentose beneath, as well as the branches. Stipulas deciduous. Flowers rather large, pubescent, pale red, bracteolate, disposed in cymes; the cymes rising from the axils of the upper leaves. Large calycine leaves, white, tinged with red.

1 P. pu'bens (Mich. l. c.) ♄. F. Native of North America, in Georgia, on the banks of the river St. Maria, in muddy places; and on the banks of the New river in South Carolina. Pursh, fl. amer. sept. 1. p. 158. Ell. sketch. 1. p. 268. Cinchòna Caroliniàna, Poir. dict. 6. p. 40. Pinknèya pubéscens, Pers. ench. 1. p. 197. The bark of this tree is used in place of Peruvian bark in Georgia and Carolina, under the name of fever bark.

Downy Pinckneya. Fl. June, July. Clt. 1786. Tree 20 ft.

Cult. This tree is usually treated as a greenhouse plant in Britain; but thrives much better against a south wall, with the protection of a mat in severe weather. A mixture of sand and peat is the best soil for it; and cuttings planted in sand, with a hand-glass placed over them, will strike root.

XX. CALYCOPHY'LLUM (from καλυξ, *calyx*, a calyx, and φυλλον, *phyllon*, a leaf; in allusion to one of the teeth of the calyx being expanded into a large petiolate coloured leaf.) D. C. prod. 4. p. 367.—Macrocnèmum, Vahl, symb. 2. p. 38. but not of Browne.—Mussæ'nda species, Poir.

LIN. SYST. *Pentándria, Monogýnia.* Limb of calyx truncate, or bluntly 5-toothed; one of the teeth expanded into a petiolate coloured membranous leaf. Corolla campanulate or funnel-shaped, with a 5-parted limb. Stamens 5; filaments rising from the throat, free, length of corolla; anthers oval, exserted. Style ending in 2 reflexed stigmas. Capsule dehiscing at the apex, oblong, 2-celled, many seeded. Seeds fixed to the linear placentas, imbricate, oblong, girded by a very narrow membranous wing.—Small smoothish trees, natives of the West Indies. Leaves opposite, petiolate, membranous, glabrous above, but villous on the veins beneath. Stipulas short, broad, deciduous. Flowers disposed in axillary and terminal trichotomous corymbs; peduncles compressed. Habit of *Mussæ'nda*.

1 C. CANDIDI'SSIMUM (D. C. prod. 4. p. 367.) leaves ovate, bluntly acuminated; corymbs terminal; limb of calyx truncate, except the petiolate leaf; corolla campanulate, with a bearded throat. ♄. S. Native of St. Martha, Vahl, and near St. Fernando de Atabapo, on the banks of the Orinoco, H. B. et Kunth; and of Cuba, about the Havannah. Macrocnènum candidíssimum, Vahl, symb. 2. p. 38. t. 30. Mussæ'nda candidíssima, Rœm. et Schultes, syst. 5. p. 251. M. cándida, Poir. dict. 4. p. 395. The peduncles of the corymbs are 2-edged. Calyxes villous. Flowers 3 together, the middle one bearing a petiolate leaf, but the 2 lateral ones are naked. Leaves 2-3 inches long. Leaf of calyx hardly an inch long, white, sometimes ovate, and sometimes subcordate.

Very-white-leaved Calycophyllum. Tree 20 feet.

2 C. COCCI'NEUM (D. C. prod. 4. p. 367.) leaves elliptic-lanceolate; corymbs axillary, disposed in an elongated panicle; limb of calyx bluntly 5-toothed; corolla somewhat funnel-shaped, glabrous. ♄. S. Native of the island of Trinidad. Macrocnènum coccíneum, Vahl, symb. 2. p. 38. t. 29. Mussæ'nda coccínea, Poir. dict. 4. p. 395. Leaves a foot long and a hand broad. Flowers crowded, few, bearing each an oval-oblong, purple or scarlet calycine leaf, which is about 6 inches long.

Scarlet-leaved Calycophyllum. Clt. 1823. Tree 20 feet.

3 C. TUBULÒSUM (D. C. prod. 4. p. 367.) leaves oval, acute at the base, acuminated at the apex, clothed with fine velvety down on both surfaces; panicles terminal; limb of calyx bluntly 5-toothed; corolla tubular, pubescent on the outside; large lobe of calyx petiolate, orbicular and pubescent on the nerves and veins. ♄. S. Native of Brazil. Macrocnèmum tubulòsum, A. Richard, in herb. mus. par. Capsule ovate, truncate, dehiscing from the apex to the base at the dissepiment. Anthers exserted. Filaments joined together beyond the middle into a tube.

Tubular-stamened Calycophyllum. Tree.

Cult. Like *Mussæ'nda* this genus is remarkable for the large coloured segment of the calyx, which see for culture and propagation, p. 492.

Tribe II.

GARDENIA'CEÆ (this tribe agrees with the genus *Gardènia* in important characters). A. Rich. diss. p.108. D. C. prod. 4. p. 367.—Gardenièæ and Coccocysèleæ, Cham. et Schlecht. in Linnæa. 4. p. 138. and 197. Fruit baccate, 2-celled, or from abortion only 1-celled; cells many seeded. Albumen fleshy, Seeds not winged.—Trees or shrubs, with opposite leaves, and interpetiolar stipulas.

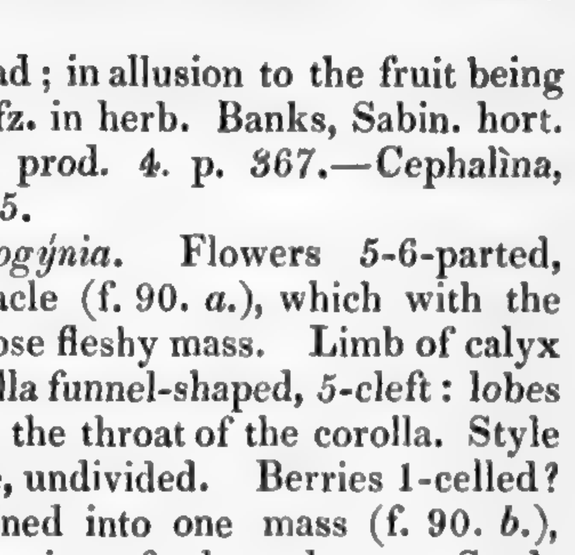
SUBTRIBE I. SARCOCEPHA'LEÆ (agreeing with *Sarcocéphalus* in the fruit being combined and fleshy). D. C. prod. 4. p. 367. Flowers collected into a bracteated head (f. 90. *a.*), sessile upon the receptacle. Fruit combined (f. 90. *b.*).

XXI. SARCOCE'PHALUS (from σαρξ σαρκος, *sarx sarkos*, fleshy, and κεφαλη, *kephale*, a head; in allusion to the fruit being combined into a fleshy head). Afz. in herb. Banks, Sabin. hort. trans. 5. p. 442. t. 18. D. C. prod. 4. p. 367.—Cephalìna, Thonn. in Schum. pl. guin. p. 105.

LIN. SYST. *Pentándria, Monogýnia.* Flowers 5-6-parted, sessile upon the globose receptacle (f. 90. *a.*), which with the calyxes are combined into a globose fleshy mass. Limb of calyx with a very short margin. Corolla funnel-shaped, 5-cleft: lobes erect, obtuse. Anthers sessile in the throat of the corolla. Style exserted; stigma oblong, capitate, undivided. Berries 1-celled? many seeded, the whole combined into one mass (f. 90. *b.*), which is areolate from the margins of the calyxes. Seeds small, somewhat kidney-shaped.—A spreading branchy shrub. Leaves opposite, on short petioles, roundish-oval, acute, shining above, and pubescent in the axils of the veins beneath. Stipulas solitary on each side, triangular, undivided, almost concrete at the base. Heads terminal, on short peduncles or sessile, about the size of a peach. Flowers rose coloured or yellowish.

1 S. ESCULE'NTUS (Sabin. in hort. trans. 5. t. 18.) Native of Guinea, in many parts, as of Sierra Leone and Gambia. Lindl. bot. reg. t. 1827. Cephalìna scándens, Thonn. in Schum. pl. guin. 105. Naúclea latifòlia, Smith in Rees' cycl. 24. no. 5. The heads of fruit are edible, and by the negroes of Sierra Leone called *peach;* they are brown when ripe. Cephalìna scándens of Schum. is probably a distinct species, as the Sierra Leone plant does not climb at all. (f. 90.)

FIG. 90.



Edible-fruited Sarcocephalus. Fl. July. Clt. 1822. Shrub 4 to 6 feet.

Cult. A mixture of loam and peat is the best soil for this plant; and cuttings are easily rooted in the same kind of soil under a hand-glass, in heat. The shrub requires to be kept in a strong heat, or it will neither flower nor fruit.

XXII. ZUCCARI'NIA (J. G. Zuccarini, a professor in the academy at Monach; author of some papers in the transactions of that academy). Blum. bijdr. (1826.) p. 1006. but not of Spreng. (1827.)

LIN. SYST. *Pentándria, Monogýnia.* Calyx with an oval tube and a 5-toothed limb. Corolla with a short tube, and an erect 5-lobed limb. Anthers 5, linear, inclosed, adnate to the tube between the segments. Stigma bifid, hardly exserted. Ovarium covered by a depressed disk. Berries oval, stipitate, crowned by the calyx, 2-celled. Seeds compressed, 2 rows in each cell. Embryo albuminous, centripetal.—A fine tree, having the ultimate branches compressed. Leaves elliptic-oblong, acuminated, undulated, glabrous. Stipulas twin, keeled, semi-concrete on both sides. Heads of flowers pedunculate, axillary, solitary. Receptacle hemispherical. Flowers aggregate, sessile, bracteate.

1 Z. MACROPHY'LLA (Blum. l. c.) ♄. S. Native of the west of Java, in woods on the mountains, where it is called *Kibara*. Leaves more than a foot long.

Long-leaved Zuccarinia. Tree.

Cult. See *Sarcocéphalus* above for culture and propagation.

XXIII. LUCINÆ'A (Lucina is one of the names of Juno or Diana). D. C. prod. 4. p. 368.

LIN. SYST. *Tetrándria, Monogýnia.* Flowers combined into a dense head. Margin of calyx entire. Corolla funnel-shaped,

4-parted, densely villous inside. Stamens 4, shorter than the corolla; filaments short; anthers linear. Stigma bifid. Berries combined, 2-celled, many-seeded. Seeds numerous, angular. —A glabrous somewhat dichotomous shrub. Leaves petiolate, ovate, acuminated, smooth, coriaceous. Stipulas short, interpetiolar. Axillary peduncles opposite, but the terminal ones are subumbellate. Heads few-flowered. This genus differs from *Morínda* in the fruit being many seeded, not 1-seeded.

1 L. Moríndæ (D. C. prod. 4. p. 368.) ♄. S. Native of the island of Singapore. Morínda polyspérma, Jacq. in mal. misc. 1. no. 2. p. 14. fl. ind. 2. p. 204. Leaves about 3 inches long.

Morinda-like Lucinæa. Shrub cl.

Cult. See *Sarcocéphalus*, p. 487. for culture and propagation.

XXIV. CANE'PHORA (from *κανης, kanes*, a basket, and *φερω, phero*, to bear; in reference to the involucrum under the head of the flowers). Juss. gen. mem. mus. 6. p. 401. Lam. ill. t. 151. f. 1. A. Rich. mem. soc. hist. nat. par. 5. p. 261. D. C. prod. 4. p. 617.

Lin. syst. *Penta-Hexándria, Monogýnia.* Calyx with an obovate tube, a 5-6-toothed limb: and triangular, lanceolate, bluntish, rather concave teeth. Corolla with a campanulate tube, and a 5-6-lobed spreading limb. Anthers 5-6, oblong, almost sessile, not exserted. Stigma bifid. Fruit baccate? 2-celled; cells many seeded. Seeds compressed, imbricated, inserted in an axillary spongy receptacle. The fruit, according to A. Rich. l. c., is pea-formed, crowned, and 2-seeded.—A glabrous shrub, native of Madagascar. Leaves elliptic, coriaceous. Stipulas solitary on both sides, triangular, acute. Flowers on the top of dilated peduncles, or sessile on the tops of the branches, intermixed with distinct scales, girded by a tubular toothed involucrum. This genus appears to be intermediate between the subtribes *Sarcocephàleæ* and *Gardenièæ*.

1 C. axilla'ris (Lam. ill. t. 151. f. 1.) leaves elliptic, acute, on short petioles; peduncles axillary, thickened from the base to the apex, ending in a 5-6-lobed cupula at the apex, which bears the flowers. ♄. S. Native of Madagascar, where it is called *Allou-gala-lay* by the natives. Poir. suppl. 2. p. 77. exclusive of the diagnosis.

Axillary-flowered Canephora. Shrub.

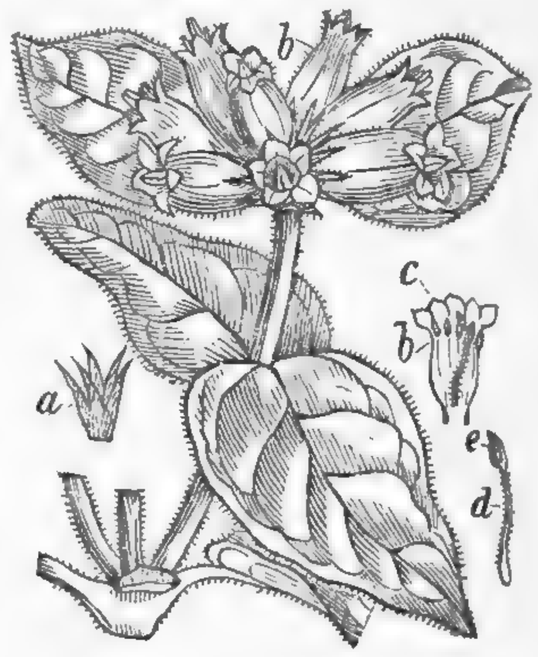
Cult. See *Sarcocéphalus*, p. 487. for culture and propagation.

Subtribe II. Gardenie'æ (containing shrubs agreeing with the genus *Gardènia* in having distinct flowers). D. C. prod. 4. p. 368. Flowers distinct, never combined into a head.

XXV. BURCHE'LLIA (named in honour of William Burchell, F.R.S. F.L.S., who collected many thousand plants in his travels at the Cape of Good Hope, and in Brazil). R. Brown, in bot. reg. no. 466. D. C. prod. 4. p. 368.—Bubalìna, Rafin. ann. gen. sc. phys. 6. p. 86.—Patàbea species, Juss. Lonicèra species, Lin.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an obovate tube, having the limb 5-cleft beyond the middle (f. 91. *a.*), and drawn out above the ovarium. Corolla of a clavate funnel-shape (f. 91. *b.*), with a naked throat, and 5 short lobes (f. 91. *c.*), which are imbricated and twisted in æstivation. Stamens 5; filaments adnate to the tube, but free above the middle; anthers almost sessile, inclosed (f. 91. *b.*). Stigma oblong-clavate (f. 91. *e.*), and appearing as if it were composed of 2 concrete ones, bearing five convex crests, and a series of tufts of hairs. Berry crowned by the calyx, 2-celled, turbinately globose. Placentas adnate to the dissepiment. Embryo slender.—Shrubs, native of the Cape of Good Hope. Leaves ovate, acute, a little cordate at the base, petiolate. Stipulas interpetiolar, broad, cuspidate at the apex, deciduous. Flowers scarlet, disposed in heads at the tops of the branches, sessile upon a villous receptacle, intermixed with small distinct bracteoles; and each head is propped by the ultimate pair of leaves.

FIG. 91.



1 B. Cape'nsis (R. Brown, in Ker, bot. reg. t. 466.) leaves ovate, acute, clothed with hispid pubescence; stipulas very broad, and very short, cuspidate at the apex; anthers adnate to the upper part of the tube of the corolla. ♄. G. Native of the Cape of Good Hope, where it is called from the hardness of the wood *buffel-horn*. Cham. et Schlecht. in Linnæa. 4. p. 146. Lonicèra Bubalìna, Lin. fil. suppl. p. 146. Thunb. fl. cap. 187. Cephæ'lis Bubalìna, Pers. ench. 1. p. 202. Flowers 9-10 lines long, of a deep scarlet colour. (f. 91.)

Cape Burchellia. Fl. March. Clt.? Shrub 3 to 5 feet.

2 B. parviflòra (Lindl. bot. reg. t. 891.) leaves oval-lanceolate, smoothish; stipulas ovate, each ending in a short point; anthers inserted in the middle of the tube of the corolla. ♄. G. Native of the Cape of Good Hope. Cinchòna Capénsis, Burm. herb. B. bubalìna, Sims, bot. mag. t. 2339.? Canéphora capitàta, Lam. ill. t. 151. f. 2.? Poir. suppl. 2. p. 77.? exclusive of the country. Flowers 7-8 lines long, orange coloured.

Small-flowered Burchellia. Fl. May, June. Clt. 1818. Shrub 3 to 4 feet.

Cult. The species of *Burchéllia* thrive well either in the warm part of a green-house, or the cold parts of a stove, and therefore may be termed hardy stove plants. Their heads, of beautiful scarlet and orange coloured flowers, make them desirable for collections. They grow well in a rich light soil, or a mixture of turfy loam, turfy peat, and sand; and cuttings taken off not too ripe strike root readily, if planted in sand and placed under a hand-glass, in a moderate heat.

XXVI. AMAIOU'A (Amaioua and Graine a Tatou are the Guiana names of the first species). Aubl. guian. suppl. 13. t. 375. D. C. ann. mus. 9. p. 218. Schultes, syst. 7. p. 90. D. C. prod. 4. p. 369.—Amaioùa, Desf. mem. mus. 6. p. 11. t. 4-6. Juss. mem. mus. 6. p. 391.—Amajoùa, Spreng. syst. 2. p. 126. exclusive of some species.—Hexactìna, Willd. rel.—Haméllia species, Lam.

Lin. syst. *Hexándria, Monogýnia.* Limb of calyx tubular, terete, 6-toothed, falling off very slowly. Corolla salver-shaped, with a terete tube, which is longer than the calyx, and a 6-parted spreading limb; lobes oblong. Anthers 6, inclosed, linear. Stigma clavate. Berry obovate-oblong, corticate, areolate at the apex, 2-3-celled. Seeds disposed in 2 rows in each cell, flat, depressed, nearly orbicular, separated from each other by small horizontal dissepiments.—Trees or shrubs, natives of South America. Leaves opposite or 3 in a whorl, on short petioles, nerved, glabrous. Stipulas oblong, deciduous. Flowers almost sessile, disposed in corymbs at the tops of the branches. —Perhaps the fruit is at length 1-celled, from the dissepiment having vanished, ex Aubl.

1 A. Guiane'nsis (Aubl. guian. suppl. p. 13. t. 375.) branchlets triquetrous, furrowed, clothed with adpressed pubescence; leaves usually 3 in a whorl, broad-elliptic, acuminated, nerved; flowers crowded, almost sessile; limb of calyx tubular, elongated. ♄. S. Native of Cayenne. The leaves in the specimens examined are all 3 in a whorl, but are sometimes op-

posite according to Desfontaines, mem. mus. 6. p. 12. t. 4. Hamèlia sessiliflòra, Willd. spec. 1. p. 981. Hamèlia glàbra, Lam. dict. 3. p. 65. Duhamèlia glàbra, Pers. ench. 1. p. 203. Berry obovate, areolate at the apex, from the calyx having fallen off, 2-3-celled; cells bearing each 2 rows of seeds, and distinct septa; hence the fruit appears 4-6-celled at first sight in the dry state.

Guiana Amaioua. Shrub 4 to 6 feet.

2 A. fagifòlia (Desf. mem. mus. 6. p. 14. t. 5.) branchlets nearly terete, smoothish; leaves opposite, obovate, acuminated, nerved; corymbs of flowers on short peduncles; flowers crowded, almost sessile; limb of calyx tubular, short. ♄. S. Native of Cayenne. Fruit unknown.

Beach-leaved Amaioua. Shrub 4 to 6 feet.

3 A. interme'dia (Mart. in Schultes, syst. 7. p. 90.) branches terete, glabrous; leaves opposite, oblong, attenuated at both ends, ciliated; flowers crowded, almost sessile, silky; upper 2 stipulas forming an involucrum to the head of flowers. ♄. S. Native of Brazil, in the province of Bahia, in woods.

Intermediate Amaioua. Shrub 4 to 6 feet.

4 A. corymbòsa (H. B. et Kunth, nov. gen. amer. 3. p. 419. t. 294.) branchlets almost terete, smoothish; leaves opposite, ovate-elliptic, nerved, acuminated; corymbs panicled, peduncu-late; limb of calyx tubular, short. ♄. S. Native of New Andalusia, near Cumanacoa, in bushy shady places. Desf. mem. mus. 6. p. 15. Hexáctina corymbòsa, Willd. rel. ex Schlecht. in Schultes, syst. l. c. Petioles 6-10 lines long. Fruit unknown. Flowers by threes.

Corymbose-flowered Amaioua. Shrub 8 to 9 feet.

5 A. Peruvia'na (Desf. mem. mus. 6. p. 16. t. 4. f. B.) leaves opposite, elliptic, nerved, acuminated, shining on the upper surface; flowers aggregate, corymbose. ♄. S. Native of Peru. Said to be nearly allied to the preceding.

Peruvian Amaioua. Shrub 4 to 6 feet.

6 A. ? sacci'fera (Mart. in Schultes, syst. 7. p. 91.) branches angular and bristly at the apex; leaves 3 in a whorl, obovate-lanceolate, attenuated at the base, saccately scrobiform, hairy, costately nerved; flowers terminal, crowded, on short peduncles; calyxes elongated. ♄. S. Native of Brazil, in woods, at Barra do Rio Negro, where it is called by the natives *Folho de Cominao* and *Coa-Jusara*.

Sack-bearing Amaioua. Shrub 4 to 6 feet.

7 A. Brasilia'na (A. Rich. diss. ex D. C. prod. 4. p. 370.) plant suffrutescent, creeping; branches assurgent; leaves elliptic, acuminated; flowers small, disposed in crowded corymbs; segments of corolla very short. ♄. S. Native of Brazil.

Brazilian Amaioua. Shrub creeping.

Cult. See *Mussæ'nda*, p. 492. for culture and propagation.

XXVII. MUSSÆ'NDA (the vernacular name of *M. frondòsa* in Ceylon). Lin. gen. no. 241. Gærtn. fruct. 1. p. 140. t. 28. Lam. ill. t. 157. Juss. mem. mus. 6. p. 386. Ham. in Lin. trans. 14. p. 198. and 203. D. C. prod. 4. p. 370.—Belílla, Rheed. and Adans.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an oblong-turbinate tube, a 5-parted limb, and deciduous erect acute lobes, one of which is usually drawn out into a large petiolate, reticulately nerved, coloured leaf. Corolla funnel-shaped, with a 5-parted limb, and a villous throat. Anthers 5, sessile within the tube, linear, inclosed, and sometimes a little exserted. Stigma bifid. Fruit ovoid, fleshy, naked at the apex from the limb of the calyx being deciduous, indehiscent, 2-celled; cells many seeded. Placentas pedunculate, bifid at the apex, rising from the dissepiment, and appearing like a Burgundian cross. Seeds very numerous, small, lenticularly compressed, scabrous. Embryo in fleshy albumen, with the radicle thick, and turned towards the hylum.—Small trees or shrubs. Leaves ovate, petiolate, villous or glabrous. Stipulas twin on both sides, free or combined at the base, acuminated. Flowers corymbose, terminal. Bracteas small under the pedicels or branches of the corymb, and ought to be cautiously distinguished from the large coloured calycine lobes.

Sect. I. Beli'lla (the name of one of the species in Malabar). Rheed. mal. and Adans. One of the calycine lobes is always drawn out into a large coloured reticulately veined bractea-formed leaf, which has been through want of proper caution taken for and called bracteas. Anthers sessile within the tube of the corolla, inclosed. Capsule ovate.

1 M. speciòsa (Poir. suppl. 4. p. 37.) leaves broad-oval, acute, rather villous at the nerves and veins above, pubescent beneath; teeth of calyx obtuse, one of which is usually petiolate, large, and coloured; corolla tubular, with obtuse lobes. ♄. S. Native of South America, in Caraccas. Macrocnèmum speciòsum, Jacq. hort. schœnbr. 1. p. 19. t. 43. The bractea-formed calycine leaves are rose coloured. Corymbs fastigiate, rather villous; bracteas subulate. Style exserted. Anthers inclosed. Corolla villous on the outside, an inch long, with a rose-coloured limb.

Showy Mussænda. Fl. Aug. Sept. Clt. 1820. Shrub 3 to 6 feet.

2 M. acutiflo'ra (Bartl. in Hænke, herb. ex D. C. prod. 4. p. 370.) leaves oval, acuminated, acute at the base, glabrous, except the nerves and veins, which are pubescent on the under surface; corymbs trichotomous pubescent; teeth of calyx acute, one of which is usually large, petiolate, ovate, and coloured; corolla tubular, with acute lobes. ♄. S. Native of Mexico. Stipulas villous on the outside, bifid, acuminate, and deciduous. The large calycine leaf is 5-nerved and acuminated. Perhaps only a variety of *M. speciòsa*.

Acute-flowered Mussænda. Shrub 5 to 6 feet.

3 M. frondo'sa (Lin. spec. 251.) leaves oblong, acuminated, villous; branchlets and corymbs downy; stipulas subulate; corymbs terminal, dichotomous, somewhat panicled; lobes of calyx elongated, subulate, one of which is petiolate, ovate, acuminated, membranous and puberulous. ♄. S. Native of the East Indies, Java, Malabar, &c. Belílla, Rheed. mal. 2. p. 27. t. 17. M. Zeylánica, Burm. zeyl. 165. t. 76. M. formòsa, Lin. mant. p. 338. M. frondòsa, Roxb. et Wall. in fl. ind. 2. p. 227. Lam. ill. t. 157. f. 1. Flowers of a deep golden colour. The bractea-formed leaf of the calyx is 2 inches long and white.

Frondose Mussænda. Fl. Ju. Sept. Clt. 1824. Sh. 5 to 6 ft.

4 M. gla'bra (Vahl. symb. 3. p. 38.) leaves oval, acuminated at both ends, glabrous on both surfaces, as well as the branches; corymbs terminal, smoothish; segments of calyx broad-lanceolate, acute, one of which is large, petiolate, glabrous, and acute. ♄. S. Native of the East Indies. Lodd. bot. cab. t. 1269. Fòlium Principíssæ, Rumph. amb. 4. t. 51. Flowers yellow. The bractea-formed leaf of the calyx is about 4-5 inches long, white.

Glabrous Mussænda. Fl. Ju. Sept. Clt. 1820. Sh. 5 to 6 ft.

5 M. calycìna (Wall. cat. no. 6253.) leaves ovate or oblong, acuminated, tapering to both ends, almost glabrous, except on the nerves; stipulas villous, cuspidate at the apex; calyxes downy: segments large, ovate, cuspidate; the large foliaceous segment petiolate, ovate, elliptic, acuminated, yellow; young branches and peduncles villous; peduncles terminal and axillary, corymbose, or trichotomous, bearing a single flower in each fork; fruit turbinate. ♄. S. Native of the East Indies, in the Burmese empire, on Mount Taong Dong, and at Prome. Flowers yellow.

Large-calyxed Mussænda. Shrub 5 to 6 feet.

6 M. villo'sa (Wall. cat. no. 6254.) leaves oblong, acumin-

ated, tapering at the base, on short petioles, hispid from villi on both surfaces; petioles, young branches, and peduncles very villous; stipulas linear-lanceolate, cuspidate, very villous; corymbs trichotomous, terminal: calyx villous: segments linear: the large, foliaceous segment petiolate, elliptic, yellow. ♄. S. Native of Penang. Flowers yellow.

Villous Mussænda. Shrub 4 to 6 feet.

7 M. Sumatre'nsis (Roth, nov. gen. et spec. p. 152.) leaves elliptic, tomentose on the under surface, as well as the petioles and branches; corymbs terminal; bractea-formed leaf of calyx roundish, pubescent, reticulately veined. ♄. S. Native of the East Indies.

Sumatra Mussænda. Shrub 5 to 6 feet.

8 M. acumina'ta (Blum. bijdr. p. 986.) leaves lanceolate, acuminated at both ends, pubescent on the mid-rib on both sides; corymbs terminal, trichotomous, pubescent; lobes of calyx linear, acuminated: one of which is drawn out into an elliptic-oblong leaf. ♄. S. Native of Java, at the head of the river Tjikundal, on Mount Gede.

Acuminated-leaved Mussænda. Shrub 5 to 6 feet.

9 M. híspida (D. Don, prod. fl. nep. p. 139.) leaves oval, acuminated, pilose; branchlets hispid; pedicels and calyxes very bristly; stipulas lanceolate; segments of calyx ovate, acute: one of which is petiolate, ovate, acuminated, hispid on the petiole and villous on the nerves. ♄. G. Native of Nipaul, at Narainhetty. The lobes of the corolla are rounded and mucronate. It comes near to *M. frondòsa*, but the leaves of that species are canescent from tomentum beneath, and the segments of the calyx are linear and elongated.

Hispid Mussænda. Shrub 5 to 6 feet.

10 M. erythrophy'lla (Schum. pl. guin. p. 116.) branches velvety from short soft down; leaves ovate, cuspidate, pubescent above, and villously tomentose beneath; stipulas villous, deciduous; corymbs terminal, trichotomous, villous; calycine segments subulate: one of which is large, petiolate, ovate-acuminated, and very villous; tube of calyx hispid. ♄. S. Native of Guinea, where it was collected by Thonning. The bractea-formed calycine segments are 4-5 inches long, and 2 inches broad, 5-nerved, and of a reddish colour. Corolla hardly twice the length of the calyx. Habit of *M. frondòsa*, under which name it was received from Puerari.

Red-leaved Mussænda. Shrub 5 to 6 feet.

11 M. lute'ola (Delil. in Caill. pl. afr. p. 65. t. 1. f. 1. Caill. voy. t. 62.) leaves almost sessile, ovate-lanceolate, acute, nerved, and tomentose beneath; stipulas twin on each side, lanceolate-subulate; corymbs terminal, trichotomous; calycine teeth subulate: one of which is often petiolate, oval, and acute. ♄. G. Native of Arabia, on the mountains of Hadie and elsewhere; and about Singue in Nubia. Ophiorhìza lanceolàta, Forsk. ægypt. arab. p. 42. Manéttia lanceolàta, Vahl, symb. 1. p. 12. Mussæ'nda lanceolàta, Spreng. syst. 1. p. 705. but not of Poir. The bractea-formed calycine leaf is yellowish, as well as the flowers. Corolla an inch long, slender.

Yellow-bractead Mussænda. Shrub 5 to 6 feet.

12 M. Isertia'na (D. C. prod. 4. p. 371.) leaves elliptic, on short petioles, and are as well as the branches glabrous; flowers disposed in corymbose panicles; peduncles and corollas clothed with canescent villi; bractea-formed calycine lobes large, roundish, and glabrous. ♄. S. Native of Guinea, where it was collected by Isert. M. macrophýlla, Schum. pl. guin. 118. but not of Wall.

Isert's Mussænda. Shrub 5 to 6 feet.

13 M. Afze'lii; every part of the shrub is villous; leaves ovate-lanceolate: having the veins clothed with rusty hairs beneath, as well as the petioles; corymbs panicled, crowded; bractea-formed calycine segment large, white, and villous; capsules villous. ♄. S. Native of Sierra Leone, by the sides of rivulets, among other bushes. Flowers yellow.

Afzelius's Mussænda. Shrub 4 to 6 feet.

14 M. pube'scens (Ait. hort. kew. ed. 2. vol. 1. p. 372.) leaves ovate-oblong, acuminated, pubescent on the nerves; stipulas twin on each side, subulate; corymbs terminal; calycine lobes subulate: one of which is petiolate, ovate, and acute; corolla with a slender tube, and acute lobes. ♄. G. Native of China, where it is called *Cum mun fa*. M. pubéscens, Sims, bot. mag. 2099. Lodd. bot. cab. t. 451. but not of Humb. et Bonpl. Corollas small, yellow, clothed with adpressed down on the outside. The branches are rather scandent, and the bractea-formed calycine segments are white.

Downy Mussænda. Fl. May, Sept. Clt. 1805. Sh. 3 to 4 ft.

15 M. variolòsa (Wall. cat. no. 6259.) branches and peduncles hispid and warted; leaves elliptic-lanceolate, hispid from stiff hairs on both surfaces, as well as on the petioles; corymbs trichotomous, terminal; the large foliaceous segments of the calyx roundish, mucronate, triple-nerved, somewhat cordate and somewhat cuneated at the base, white; fruit roundish, not crowned, warted; calycine teeth short. ♄. S. Native of the East Indies, at Amherst, Chappedong, and Tavoy.

Warted-fruited Mussænda. Shrub 5 to 6 feet.

16 M. corymbo'sa (Roxb. fl. ind. 2. p. 226.) leaves oblong, pointed, and are as well as the branches smooth; corymbs terminal, smooth; stipulas cordate at the base, and cuspidate at the apex; calycine segments setaceous: the bractea-formed one ovate-lanceolate; lobes of corolla ovate, acute. ♄. S. Native of Ceylon, Malabar, and other parts of the East Indies. The bractea-formed calycine segment is white, and the border of the corolla orange-coloured, but greenish underneath. In some parts of India the white floral leaves are brought to table as an esculent herb.

Corymbose-flowered Mussænda. Shrub 5 to 6 feet.

17 M. macrophy'lla (Wall. in Roxb. fl. ind. 2. p. 228.) branchlets beset with soft silky hairs; leaves ovate, acuminated, pubescent; stipulas broad-ovate, bifid, acuminated and recurved at the apex; corymbs terminal, trichotomous, very pilose, on short peduncles; calycine segments foliaceous, broad, oblong-lanceolate; bracteas large, very hairy. ♄. S. Native of Nipaul, on the mountains of Chundugiri and Nagarjoon. Branches tetragonal, brown. Leaves green above and pale villous beneath. Stipulas nearly twice as long as the petioles. Corymbs shorter than the uppermost pair of leaves. There are generally 3 floral leaves in each corymb, which are snow white, and 2-3 inches long. Bracteas large under each division of the inflorescence. Flowers large, orange-coloured, hairy outside. Berries dark purple, hairy, size of a marrowfat pea.

Long-leaved Mussænda. Shrub 5 to 6 feet.

18 M. Walli'chii; leaves long, elliptic, tapering much to both ends, acuminated, quite glabrous; corymbs glabrous, trichotomous, terminal; the large petiolate calycine leaflets glabrous, triple-nerved, white, acuminated; fruit roundish, crowned by the calycine segments, which are linear. ♄. S. Native of the East Indies, at Tavoy and Rangoon. M. longifòlia, Wall. cat. no. 6258. but not of Lam.

Wallich's Mussænda. Shrub 6 to 8 feet.

19 M. inca'na (Wall. in Roxb. fl. ind. 2. p. 229.) shrub hoary in every part from adpressed soft hairs; leaves ovate-oblong, almost sessile, white beneath; stipulas broad at the base, lanceolate at the apex, adpressed; corymbs terminal, sessile, faciculate, few-flowered; bracteas linear-subulate; bractea-formed segment of the calyx large, ovate, petiolate, and acuminated. ♄. G. Native of Nipaul, towards Gosaingsthan. Root simple, slender. Stem about the thickness of a goose quill, undivided, though seldom with 1 or 2 slender alternate

branches. Leaves rather longer than the interstices, which are pretty equal, about 5-6 inches long, villous above. Stipulas about the length of the petioles, furnished with a number of glands inside on the lower part. Corymbs very hairy. Floral leaves subcordate, milk white, downy. Tube of corolla very long, hairy.

Hoary Mussænda. Shrub 2 to 3 feet.

20 M. cuneifo'lia (D. Don, prod. fl. nep. p. 139.) leaves cuneate-oblong, acuminated, downy on both surfaces as well as on the branches; stipulas lanceolate, acuminated; corymbs terminal; bracteas lanceolate; calycine segments linear, acute, 5 times shorter than the corolla: one of which is bractea-formed, petiolate, oval, acuminated; tube of corolla villous. ♄. G. Native of Nipaul. The large calycine segment is probably white, and the flowers are probably yellow.

Wedge-leaved Mussænda. Shrub 4 to 6 feet.

Sect. II. La'ndia (M. De la Land, a correspondent of the Museum of Natural History at Paris). Comm. herb. D. C. prod. 4. p. 372. Lobes of calyx equal or nearly so: having none of the segments expanded into bractea-formed leaves. Capsule naked at the apex, not crowned by the calyx. Leaves opposite.

21 M. La'ndia (Lam. ill. t. 157. f. 2. Poir. dict. 4. p. 392.) leaves ovate, acuminated, clothed with villous pubescence on both surfaces; branches, petioles, corymbs and corollas villous; lobes of calyx equal, triangularly lanceolate, 12 times shorter than the tube of the corolla. ♄. S. Native of the Mauritius, where it is called *Quinquina indigène*, or Indigenous Peruvian bark, and is used in the cure of fevers. M. latifòlia, Poir. suppl. 4. p. 36. dict. scienc. nat. 33. p. 452. Rodelètia Lándia, Spreng. syst. 1. p. 707. M. holoserícea, Smith, in Rees' cycl. vol. 24. no. 6. Bracteas linear, acute. Corolla an inch long, hairy outside.

De La Land's Mussænda. Fl. Ju.Sept. Clt. 1824. Sh. 4 to 5 ft.

22 M. uniflo'ra (Wall. cat. no. 6264.) young branches, tube of corolla, calyxes, and fruit villous; leaves small, rather villous, roundish, acute, running down the petioles at the base; stipulas villous, narrow; calycine segments subulate; corolla with a long tube and a spreading limb; flowers solitary, terminal. ♄. S. Native of the East Indies, at Tavoy. Flowers as large as those of the common jasmine, probably white.

One-flowered Mussænda. Shrub 1 to 2 feet.

23 M. Stadma'nni (Michx. med. ex Bory in litt. D. C. prod. 4. p. 372.) leaves oval, ending in short cuspidate points, hardly pubescent, unless on the nerves; branchlets, corymbs, and corollas pubescent; lobes of calyx equal, elongated, lanceolate, 6 times shorter than the tube of the corolla. ♄. S. Native of the Mauritius. Oxyánthus cymòsus, Reichb. in Sieb. fl. maur. exsic. 2. no. 78. M. Lándia, Smith, in Rees' cycl. vol. 24. no. 5. Tube of corolla $1\frac{1}{2}$ inch long, as in *M. Lándia*. The lobes of the calyx are 3 lines long in the present plant, while in that of *M. Lándia* they are hardly a line and a half long.

Stadmann's Mussænda. Shrub 4 to 6 feet.

24 M. arcua'ta (Lam. dict. 4. p. 392.) leaves oval-oblong, acuminated, rather pilose on the nerves beneath; branchlets, corymbs, and corollas glabrous on the outside; lobes of calyx linear-subulate, a little unequal; tube of corolla very villous inside. ♄. S. Native of the Mauritius. Sieb. fl. maur. exsic. 2. no. 78. Lándia stellígera, and Lándia astrogràpha, Comm. ex herb. mus. Paris. The flowers are yellow, and when immersed in water tinge it with the same colour. Limb of corolla glabrous outside. Branches arched.

Arch-branched Mussænda. Clt. 1822. Shrub 4 to 5 feet.

25 M. tomento'sa (Wall. cat. no. 6265.) branches downy; leaves elliptic or ovate-elliptic, acute, clothed with white woolly down on both surfaces; calyx downy, with subulate segments; stipulas subulate, twin on both sides; tube of corolla long, slender, hairy, with a broad, spreading border; berries roundish, crowned by the calycine teeth; corymbs terminal, trichotomous. ♄. S. Native of the East Indies, on the Gingee mountains. Flowers apparently white, as large as those of jasmine.

Tomentose Mussænda. Shrub 4 to 6 feet.

26 M. e'legans (Schum. pl. guin. p. 117.) leaves oval, ending in short cuspidate points, and are as well as the branches glabrous; corymbs terminal, trichotomous, pubescent; segments of calyx linear, spreading a little; tube of corolla very hispid, but the lobes are glabrous. ♄. S. Native of Guinea, where it was collected by Thonning. M. díscolor, Thonn. in herb. Vahl, ex Puerari. Very distinct from *M. díscolor*, Willd.

Elegant Mussænda. Shrub 4 to 6 feet.

27 M. cordifo'lia (Wall. cat. no. 6260.) glabrous in every part; leaves ovate-oblong, acuminated at the apex and cordate at the base, glabrous, coriaceous, on short petioles; corymbs trichotomous, terminal; berries turbinate, not crowned. ♄. S. Native of Pulo Penang.

Heart-leaved Mussænda. Shrub 5 to 6 feet?

28 M. pa'rva (Wall. cat. no. 6261.) branches and leaves rather hispid from scattered hairs; leaves ovate-lanceolate, acuminated, tapering to both ends; stipulas subulate; corymbs terminal, crowded; tube of corolla very long, slender, rather swollen near the top; calycine segments linear. ♄. S. Native of the East Indies, at Tavoy. M. angustifòlia, Wall. mss. Apparently a rambling, small shrub.

Small Mussænda. Shrub rambling.

29 M. serícea (Blum. bijdr. p. 986.) leaves ovate-oblong, acuminated, attenuated at the base, glabrous, except on the veins underneath; branches silky; corymbs terminal, trichotomous, silky. ♄. S. Native of the Moluccas. Segments of calyx linear-lanceolate, silky, all equal. Tube of corolla elongated, densely tomentose.

Silky Mussænda. Shrub 4 to 6 feet.

30 M. re'pens (Wall. cat. no. 6263.) root creeping; leaves elliptic, acuminated, rather hispid; petioles, young branches, and corymbs clothed with brown villi; stipulas subulate, villous; corymbs terminal; calyx downy, with linear-subulate segments; corolla long, slender, swelling a little near the top. ♄. S. Native of Silhet. The leaves opposite each other are unequal in size.

Creeping Mussænda. Pl. $\frac{1}{2}$ to 2 feet.

Sect. III. Ca'anthe (from καιω, *kaio*, to burn or nip, and ανθος, *anthos*, a flower; the flowers of the species are deprived of the large calycine leaves). D. C. prod. 4. p. 372. Lobes of calyx equal, all linear or setaceous, permanent, therefore the fruit is crowned. Leaves 3 in a whorl. Stipulas broad at the base, acute at the apex, adpressed, coriaceous.—Species natives of Madagascar. Perhaps a proper genus.

31 M.? citrifo'lia (Lam. in Poir. dict. 4. p. 393.) leaves 3 in a whorl, ovate, almost sessile, coriaceous, and are as well as the branches glabrous; stipulas broad at the base, acute, short; corymbs terminal; lobes of calyx linear. ♄. S. Native of Madagascar. Habit of *Rauwólfia*. Corolla small, yellow.

Citron-leaved Mussænda. Shrub 5 to 6 feet.

32 M.? longifo'lia (Lam. in Poir. dict. 4. p. 393.) leaves 3 in a whorl, lanceolate-oblong, rather tomentose from short down; stipulas broad at the base, acute; corymbs terminal; lobes of calyx setaceous; capsule ribbed. ♄. S. Native of Madagascar. Very similar to the preceding species. Leaves green above and whitish beneath. Fruit pyriform, with 8 or 10 longitudinal ribs.

Long-leaved Mussænda. Shrub 5 to 6 feet.

† *Species not sufficiently known.*

33 M.? GLOMERULA'TA (Lam. in Poir. dict. 4. p. 393.) leaves ovate, acute, smoothish beneath, but clothed with fuscous velvety down above and on the petioles; branches rather villous; flowers terminal, glomerate; calyx campanulate, with a 5-6-toothed limb. ♄. S. Native of French Guiana. Rodelètia glomerulàta, Spreng. syst. 1. p. 707. Peduncles and calyxes beset with white silvery hairs. Corolla tubular, white, rather villous outside. Stamens 5-6.

Glomerate-flowered Mussænda. Shrub 5 to 6 feet.

34 M. DÍSCOLOR (Pet. Th. in Willd. rel. ex Schultes, syst. 5. p. 254.) hairy; leaves scabrous, strigose above, and clothed with canescent pili beneath; flowers corymbose, permanent. ♄. S. Native country unknown, as well as flowers.

Two-coloured-leaved Mussænda. Shrub.

35 M.? CHINE'NSIS (Lour. coch. p. 152.) leaves in fascicles, lanceolate, glabrous; flowers solitary, terminal; berries 4-celled, many-seeded. ♄. G. Native of China, in the suburbs of Canton. Calyx 5-parted, with lanceolate segments. Seeds bony, almost kidney-shaped. This is certainly not a species of *Mussæ'nda*.

China Mussænda. Shrub 5 to 6 feet.

36 M. ECHITOÌDES (Willd. rel. in Schultes, syst. 5. p. 254.) leaves oblong, acute, glabrous; flowers corymbose. ♄. ◡. S. Native country unknown. A climbing shrub.

Echitus-like Mussænda. Shrub cl.

37 M. TETRA'NDRA (Schultes, syst. 5. p. 254.) leaves smooth, glabrous, acute; corymbs tripartite; flowers tetrandrous. ♄. S. Native country unknown. Macrocnèmum tetrándrum, Cav. ann. sc. ex Schultes.

Tetrandrous-flowered Mussænda. Shrub.

Cult. Some of the species of this genus are very pretty, and worth cultivating in collections. A mixture of loam and peat is the best soil for them; and cuttings are easily rooted in the same kind of mould under a hand-glass, in heat.

XXVIII. KUTCHUBÆ'A (named after — Koutchouba, minister of the home department of Russia; a promoter of the sciences). Fisch. in litt. ex D. C. prod. 4. p. 373.

LIN. SYST. *Octándria, Monogýnia.* Calyx with a turbinate tube, and a tubular truncate limb, which is longer than the ovarium. Corolla with a cylindrical tube, much longer than the calyx, a villous throat, and an 8-parted limb, which is twisted in æstivation; segments of corolla lanceolate, acuminated. Anthers 8, almost sessile, oblong, acute, inserted in the throat of the corolla among the hairs. Style filiform; stigma large, clavate, with 2 lobes, which are applied to each other, hairy and convex on the outside, but flat and smooth on the inside. Fruit unknown.—A glabrous tree, native of Guiana. Branches terete. Leaves obovate, bluntish, on short petioles. Stipulas ovate, broad, short, combined, permanent, sometimes bifid. Flowers terminal, somewhat corymbose, pedicellate, large, bractless. Corolla purple at the base and pale at the apex.—This genus comes very near *Génipa* and *Cassùpa*; from the first it differs in the tube of the corolla being much longer than the calyx; and from the second in the calyx being tubular, and in the stigma being clavate; and from both in the greater number of the parts of the flower.

1 K. INSÍGNIS (Fisch. l. c. with a figure). ♄. S. Native of French Guiana, where it was collected by Martin. A tall elegant tree. Tube of corolla 3 inches long, coriaceous.

Famous Kutchubæa. Tree.

Cult. For culture and propagation see *Mussæ'nda* above.

XXIX. CASSU'PA (called *Cassupo* by the natives on the banks of the Rio Negro, in Brazil). Humb. et Bonpl. pl. equin. 1. p. 43. t. 12. Juss. mem. mus. 6. p. 389. D. C. prod. 4. p. 373.

LIN. SYST. *Hexándria, Monogýnia.* Calyx with a globose tube and a short entire hardly perspicuous limb. Corolla much longer than the calyx, tubular, wrinkled on the outside, with a villous throat, and a 6-parted short limb; lobes acutish and spreading a little. Anthers 6, almost sessile, inserted in the throat of the corolla among the villi. Stigma bifid, slender, inclosed. Berry almost globose, crowned, 2-celled, many-seeded; placentas fixed to the middle dissepiment. Seeds minute.—An American tree. Leaves obovate-oblong, on long petioles, coriaceous, rather tomentose, about a foot long. Thyrse panicled, terminal, with opposite flowers. Bracteoles 2-3 under each flower, sometimes adnate to the calyx. Corolla 1-2 inches long, pale red.

1 C. VERRUCO'SA (Humb. et Bonpl. l. c.). ♄. S. Native of South America, in shady places on the banks of the Rio Negro, near San Carlos. H. B. et Kunth, nov. gen. amer. 3. p. 412.

Warted Cassupa. Tree 30 to 40 feet.

Cult. See *Mussæ'nda* above for culture and propagation.

XXX. GYNOPA'CHYS (from γυνη, *gyne*, a female, and παχυς, *pachys*, thick; in reference to the thick 2-lobed stigma). Blum. in flora, 1825. p. 134. bijdr. p. 933. D. C. prod. 4. p. 374.

LIN. SYST. *Pentándria, Monogýnia.* Limb of calyx turbinate, urceolate, almost quite entire, deciduous. Corolla with a short tube, a 5-parted spreading limb, and a bristly throat. Stamens 5, seated in the mouth of the tube; filaments short; anthers linear, rather incumbent, exserted. Style short; stigma thick, 2-lobed, exserted. Berry globose, umbonate, crowned by the circular base of the calyx, 2-celled, many-seeded; placentas membranous, stipitate, rather fleshy, transversely lamellate. Seeds compressed.—Climbing shrubs, natives of Java. Leaves distich. Stipulas interpetiolar, undivided, or twin and rather concrete. Flowers rising from the axils of the leaves in dense corymbs, unilateral.—This genus comes near to *Cánthium* and *Bertièra*, but differs from them in the undivided limb of the calyx, and in the short tube of the corolla.

1 G. ACUMINA'TA (Blum. l. c.) leaves ovate or elliptic-oblong, acuminated, almost sessile, glabrous; cymes short, interfoliaceous; pedicels numerous, 1-flowered. ♄. ◡. S. Native of Java, on the west side, on the mountains. Leaves 7-8 inches long.

Acuminated-leaved Gynopachys. Shrub cl.

2 G. TOMENTO'SA (Blum. l. c.) leaves sessile, rather cordate-oblong, acuminated, shining above, but clothed with deciduous rufous tomentum on the veins beneath and on the corymbs, which are dichotomous and interfoliaceous. ♄. ◡. S. Native of Java, on Mount Burangrang, in woods.

Tomentose Gynopachys. Shrub cl.

3 G. CORYMBÒSA (Blum. l. c.) leaves almost sessile, elliptic-oblong, bluntish, glabrous; corymbs trichotomous, interfoliaceous, divaricate. ♄. ◡. S. Native of Java, on Mount Salak, in woods. Throat of corolla beset with yellowish rufous bristles. Fruit globose, size of a pea.

Corymbose-flowered Gynopachys. Shrub cl.

Cult. See *Mussæ'nda* above for culture and propagation.

XXXI. TOCOYE'NA (the name of the first species in Guiana). Aubl. guian. 1. p. 131. t. 53. Lam. ill. t. 163. Juss. mem. mus. 6. p. 390. H. B. et Kunth, nov. gen. amer. 3. p. 411. D. C. prod. 4. p. 374.—Ucriàna, Willd. spec. 1. p. 961.

LIN. SYST. *Pentándria, Monogýnia.* Calyx with a turbinate tube, and a very short 5-toothed limb. Corolla with a very

long tube, a naked dilated throat, and a 5-parted spreading limb; the lobes obtuse. Anthers rising from the throat of the corolla, exserted, linear-sagittate, furnished each with a blunt appendage at the base? Style filiform, fusiform at the apex; stigma clavate, bilamellate. Berry rather fleshy, 2-celled, crowned. Seeds numerous, roundish-ovate, imbedded in soft pulp.—Unarmed shrubs or undershrubs. Leaves opposite, on short petioles. Stipulas triangular or ovate. Flowers terminal, corymbose.

1 T. LONGIFLO'RA (Aubl. guian. 1. p. 131. t. 50.) stem tetragonal, quite simple; leaves lanceolate-oblong, acuminated at both ends, glabrous; flowers almost sessile, aggregate. ♄. S. Native of French Guiana, at Araura. Lam. ill. t. 163. f. 1. Ucriàna speciòsa, Willd. spec. 1. p. 961. Tocoyèna longifòlia, Poir. dict. 7. p. 602. but not of Kunth. Leaves a foot long, and 4-5 inches broad. Corolla 8-9 lines long, with the tube yellow, and the limb white. Stipulas triangular.

Long-flowered Tocoyena. Clt. 1826. Shrub 3 to 6 feet.

2 T. MACROPHY'LLA (H. B. et Kunth, nov. gen. amer. 3. p. 412.) branches tetragonal; leaves broad-ovate, short-acuminated, glabrous; stipulas roundish, coriaceous; flowers terminal, racemose. ♄. S. Native of South America, on the banks of the river Magdalena, between Monpox and El-Penon, and near Honda. Ucriàna insígnis, Willd. rel. Spreng. syst. 1. p. 761. exclusive of the synonyme of Lam. T. insígnis, Rœm. et Schultes, syst. 5. p. 229.

Large-leaved Tocoyena. Shrub.

3 T. LONGIFO'LIA (H. B. et Kunth, nov. gen. amer. 3. p. 411. but not of Poir.) branches terete; leaves ovate-oblong, acute, glabrous, shining, with revolute margins; stipulas ovate, acuminated; flowers racemose; teeth of calyx short, acute. ♄. S. Native of New Granada, in hot places. Ucriàna Humbóldtii, Spreng. syst. 1. p. 761.

Long-leaved Tocoyena. Shrub.

4 T. MUTÍSII (H. B. et Kunth, nov. gen. amer. 3. p. 411.) branches terete; leaves oblong, acutish, glabrous, shining, with somewhat revolute margins; stipulas ovate, acuminated; flowers terminal, corymbose; teeth of calyx short. ♄. S. Native of New Granada, in hot places. Ucriàna Mutísii, Spreng. syst. 1. p. 761.

Mutis's Tocoyena. Shrub.

5 T. HIRSU'TA (Moricand, herb. ex D. C. prod. 4. p. 375.) leaves elliptic, ending each in a short cuspidate point, clothed with villous down above, and with soft velvety hairs beneath. ♄. S. Native of Brazil. Tube of calyx 4 inches long.

Hairy Tocoyena. Shrub.

Cult. See *Oxyánthus*, p. 494., for culture and propagation.

XXXII. POSOQUE'RIA (Aymara-posoqueri is the name of the first species by the natives of Guiana). Aubl. guian. 1. p. 134. t. 51. Lam. ill. t. 163. Juss. mem. mus. 6. p. 369. D. C. prod. 4. p. 375. but not of Roxb. Blume, nor Gærtn.—Tocoyèna species, Rich.—Kyrtánthus, Gmel. syst. 1. p. 362.—Cyrtánthus, Schreb. gen. no. 302. but not of Ait.—Solèna, Willd. spec. 1. p. 961. but not of Lour. nor Hoffm. nor Agardh.—Posòria, Rafin, ann. gen. sc. ph. 6. p. 80.

LIN. SYST. *Pentándria*, *Monogýnia*. Calyx with an obovate tube, and a short 5-toothed limb. Corolla funnel-shaped, with a very long terete tube, a villous hardly dilated throat, and a 5-parted limb; the segments spreading, obtuse, and nearly equal; the alabastra gibbous on one side. Stamens 5, rising from the throat of the corolla, free, unequal, a little exserted. Style filiform, slender, and bifid at the apex: with the lobes unequal, rather papillose and acute. Berry ovate, crowned by the calyx, succulent, 2-celled, many-seeded. Seeds unknown.—Glabrous shrubs or small trees, natives of Guiana. Branches terete. Leaves opposite, on short petioles, coriaceous. Stipulas oblong-triangular, at length falling off. Flowers white, very long, disposed in terminal corymbs.

1 P. LONGIFLO'RA (Aubl. guian. 1. p. 134. t. 51.) leaves oblong, acuminated, acute at the base; stipulas oblong; calyx bluntly 5-toothed; tube of corolla very much incurved, and nutant at the apex. ♄. S. Native of French Guiana, on the banks of rivers. Lam. ill. 163. Solèna longiflòra, Willd. spec. 1. p. 961. Kyrtánthus longiflòrus, Gmel. syst. 1. p. 162. Corolla white, with the tube very long, and green at the base; and the hairs in the throat are very long. Berry yellow, about the size of a hen's egg. Seeds 12, imbedded in the red pulp, according to Aublet. The limb of the corolla is said to be regular. Corymbs composed of about 6 flowers; and the flowers are pedicellate and scaly at the base from bracteas.

Long flowered Posoqueria. Clt. 1820. Shrub 5 to 6 feet.

2 P. LATIFO'LIA (Rœm. et Schultes, syst. 5. p. 227.) leaves ovate, acuminated, obtuse at the base, or a little cordate; stipulas broad, triangular; calyx bluntly 5-toothed; tube of corolla straight: and the limb irregular; alabastra gibbous on one side. ♄. S. Native of French Guiana and Brazil. Solèna latifòlia, Rudge, guian. 1. p. 26. t. 40. Tocoyèna latifòlia, Lam. ill. t. 163. f. 2. Poir. dict. 7. p. 692. Corolla white, with the tube 4 inches long.

Broad-leaved Posoqueria. Clt.? Shrub 5 to 6 feet.

3 P. DECO'RA (D. C. prod. 4. p. 375.) leaves ovate, ending each in a short cuspidate point, obtuse and rather cordate at the base; stipulas oval, obtuse, large, foliaceous, and coriaceous; calyx bluntly 5-toothed; tube of corolla straight; alabastra rather gibbous on one side. ♄. S. Native of French Guiana. Allied to *P. latifòlia*, but differs from all the species in the form of the stipulas. Tube of corolla 3-4 inches long. Flowers terminal, corymbose.

Neat Posoqueria. Shrub.

4 P. TRINITA'TIS (D. C. prod. 4. p. 375.) leaves ovate, on short petioles, ending in short cuspidate points, obtuse at the base and subcordate; stipulas oblong, bluntish, membranous and foliaceous, and sheathing a little; calyx bluntly 5-toothed. ♄. S. Native of the Island of Trinidad. Sieb. fl. trin. exsic. no. 215. without a name. Tube of corolla slender, $4\frac{1}{2}$ inches long. Corollas white.

Trinidad Posoqueria. Shrub 5 to 6 feet.

5 P. HAVANE'NSIS (D. C. prod. 4. p. 375.) leaves oval, acute, membranous, bluntish at the base; stipulas lanceolate, acute; calyx bluntly 5-toothed; tube of corolla straight; alabastra gibbous on one side. ♄. S. Native of Cuba, about the Havannah. Tube of corolla slender, $4\frac{1}{2}$ inches long. Petioles 6 lines long.

Havannah Posoqueria. Shrub 5 to 6 feet.

6 P. GRA'CILIS (Rœm. et Schultes, syst. 5. p. 277.) leaves oval-lanceolate; stipulas oblong; calyx acutely 5-toothed; tube of corolla curved, and the limb irregular. ♄. S. Native of French Guiana, in remote woods, from the river Darapa to Kaw. Solèna grácilis, Rudge, pl. guian. p. 27. t. 41. It differs from *P. longiflòra* in the character given, and in the slender nerves of the leaves. Flowers white, 4-5 in a corymb.

Slender-flowered Posoqueria. Clt. 1825. Shrub 5 to 6 ft.

7 P. REVOLU'TA (Nees, in flora, 1821. p. 328. Schrad. gœtt. anz. 1821. p. 714.) leaves elliptic-ovate, each ending in a short cuspidate point, with revolute margins; stipulas deciduous; corymbs dense; tube of corolla straight: throat villous, and limb irregular. ♄. S. Native of Brazil. P. insígnis, Neuw. in flora. 1821. p. 301. in reis. bras. with a figure. Flowers white.

Revolute-leaved Posoqueria. Shrub 5 to 6 feet.

Cult. For culture and propagation see *Oxyánthus* below. All the species are very pretty when in flower.

XXXIII. OXYA'NTHUS (from *οξυς, oxys,* sharp, and *ανθος, anthos,* a flower; in reference to the acute teeth of the calyx and acuminated segments of the corolla). D. C. ann. mus. 9. p. 218. Juss. mem. mus. 6. p. 390. D. C. prod. 4. p. 376. Lindl. coll. p. 13.

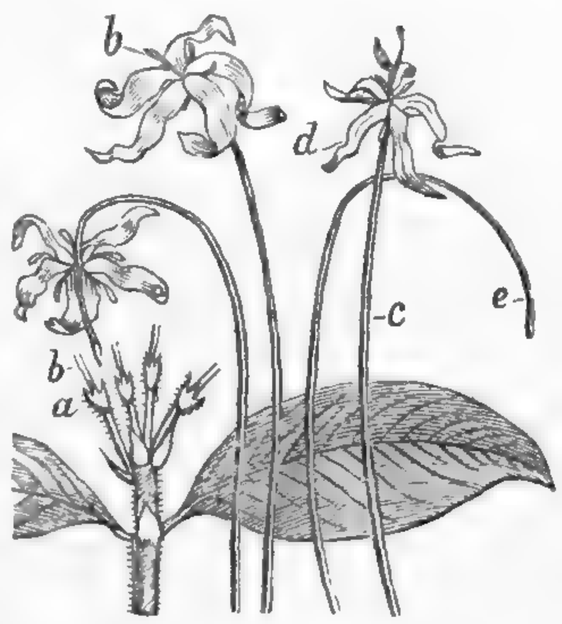
Lin. syst. *Pentándria, Monogýnia.* Calyx with an obovate tube (f. 92. *a.*), and a short, acutely 5-toothed limb (f. 92. *a.*). Corolla with a very long tube (f. 92. *c.*), a glabrous throat, and a 5-parted regular limb (f. 92. *d.*): having the segments oblong and acuminated. Stamens 5, rising from the throat of the corolla, free, exserted (f. 92. *b.*). Anthers very acute. Style filiform, clavate at the apex (f. 92. *e.*), protruding beyond the anthers. Fruit 2-celled, and probably baccate.—Shrubs, natives of Guinea. Leaves elliptic, acuminated, on short petioles. Stipulas oblong-triangular, falling off but slowly. Peduncles axillary, racemosely corymbose.—This genus comes very near *Posoquèria*, but differs from that genus in the limb of the corolla being regular, in the throat being glabrous, and its parts being acute, and in the clavate stigma.

1 O. speciòsus (D. C. l. c. and in diss. ined. with a figure) branchlets, leaves, and calyxes quite glabrous; calycine teeth very much acuminated; racemes many-flowered; tube of corolla one half shorter than the leaves. ♄. S. Native of Sierra Leone on the mountains, where it was collected by Smeathmann. Flowers about 20 in each raceme, apparently red, according to the dried specimens, but are probably white or milk-coloured in their recent state.

Showy Oxyanthus. Shrub 3 to 4 feet.

2 O. tubiflo'rus (D. C. prod. 4. p. 376.) branchlets, leaves, and calyxes glabrous; calycine teeth bluntish; racemes very short, 3-flowered; tube of corolla longer than the leaves. ♄. S. Native of Sierra Leone on the mountains. Gardènia tubiflòra, Andr. bot. rep. t. 183. O. speciòsus, Ait. hort. kew. ed. 2. vol. 1. p. 371. but not of D. C. Flowers by threes, white, 6 inches long, sweet scented.

FIG. 92.



Tube-flowered Oxyanthus. Fl. July. Clt. 1789. Sh. 3 to 4 ft.

3 O. hirsu'tus (D. C. prod. 4. p. 376.) branchlets, petioles, and nerves of leaves on the under side as well as the calyxes beset with hairy down; calycine teeth acute; racemes few-flowered; tube of corolla much longer than the leaves. ♄. S. Native of Sierra Leone, on the mountains. O. speciòsus, Sims. bot. mag. t. 1992. Lindl. coll. t. 13. but the synonymes given are extremely doubtful, and ought probably to be excluded. Ucriàna racemòsa, Schum. pl. guin. p. 107. Tube of corolla 6 inches long. Flowers white, sweet-scented. (fig. 92.)

Hairy Oxyanthus. Fl. July. Clt. 1789. Shrub 2 to 3 ft.

4 O. villo'sus; villous all over; leaves petiolate, obovate, acute; flowers subcapitate, terminal; tube of corolla very long; style much exserted; stigma clavate. ♄. S. Native of Sierra Leone. Flowers cream-coloured, very fragrant. Calyx 5-cleft.

Villous Oxyanthus. Shrub 2 to 3 feet.

Cult. This genus is easily distinguished by its very long, slender, sweet-scented flowers. All the species thrive well in a mixture of loam, sand, and peat; and cuttings are easily rooted by planting them in a pot of sand, and placing it under a hand-glass, in heat.

XXXIV. STYLOCORY'NA (from *στυλος, stylos,* a style, and *κορυνη, coryne,* a club; in allusion to the stigma, which is clavate). Cav. icon. 4. p. 45. t. 368. Gærtn. fil. carp. 3. p. 100. t. 197. Blum. bijdr. p. 982. D. C. prod. 4. p. 377.—Wahlenbérgia, Blum. cat. hort. buit. p. 14. but not of Schrad. nor Schum.—Ceríscus, Nees in flora, 1826, p. 116. and perhaps of Gærtn.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an ovate-globose tube, and a short, tubular, 5-toothed limb. Corolla salver-shaped, with a cylindrical tube, and a 5-parted limb. Stamens 5, inserted in the mouth of the tube of the corolla; anthers linear, very long. Style exserted; stigma clavate, undivided, or the lobes are closely conferruminated. Berry globose, crowned by the calyx, dry, 2-celled; placentas spongy, adnate to the middle dissepiment. Seeds numerous, wingless, angular. Albumen rather cartilaginous. Embryo long.—Trees or unarmed shrubs. Leaves opposite, oval, or oblong, petiolate. Stipulas solitary on both sides, 1-nerved in the middle, broad at the base and acuminated at the apex. Peduncles axillary, and almost terminal, bearing many flowers disposed in corymbs or cymes.

1 S. racemòsa (Cav. l. c. t. 368.) leaves elliptic-oblong, acute at the base, acuminated at the apex, glabrous; panicles axillary, dichotomous, loose, one-half shorter than the leaves; corolla salver-shaped, having the lobes longer than the tube. ♄. S. Native of the Philippines. Corolla whitish-yellow. Berry spherical, about the size of a pea. Seeds nestling in pulp, ex Cav. but not according to Gærtn., nor in the fruit examined. Cymes of fruit large, spreading. Segments of corolla ovate, obtuse.

Racemose-flowered Stylocoryna. Shrub 10 to 12 feet.

2 S. fra'grans (Blum. bijdr. p. 982.) leaves elliptic-oblong, acute at both ends, glabrous, beset with minute strigæ on the veins beneath; corymbs terminal, fastigiate, dense-flowered; corolla salver-shaped, with the segments shorter than the tube. ♄. S. Native of Java, in shady parts of woods. Wahlenbérgia fràgrans, Blum. cat. hort. buit. p. 13. Ceríscus fràgrans, Nees, in flora, 1825. p. 116. Style very long.

Fragrant Stylocoryna. Shrub 5 to 6 feet.

3 S. laxiflòra (Blum. bijdr. p. 983.) leaves oblong, acuminated at both ends, strigose on the veins beneath; corymbs terminal, trichotomous, divaricate, loose-flowered; corolla salver-shaped. ♄. S. Native of Java, on the mountains of Parang, in the province of Tjangor. The flowers are smaller, and the styles less elongated than those of the preceding species.

Loose-flowered Stylocoryna. Tree 10 to 15 feet.

4 S. tomentòsa (Blum. bijdr. 983.) branchlets, petioles, and peduncles densely clothed with tomentum; leaves oval, acute, pubescent on the veins beneath; cymes pedunculate, axillary, and terminal, dense-flowered; corolla funnel-shaped, 5-parted. ♄. S. Native of Java, in the province of Bantam, on the mountains.

Tomentose Stylocoryna. Tree 10 to 12 feet.

5 S. pube'scens (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 377.) leaves oblong, acuminated, downy on both surfaces, as well as on the branchlets; cymes terminal, pedunculate, of 5 rays. ♄. S. Native of the island of Luzon. Branches compressedly tetragonal, opposite. Stipulas triangular, acuminated. Calyx minutely 5-toothed. Lobes of corolla linear. Style filiform, undivided, exserted.

Pubescent Stylocoryna. Shrub.

6 S. macrophy'lla (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 377.) leaves elliptic-oblong, acuminated at both ends, and

are, as well as the branches, glabrous; panicle terminal, fastigiate; flowers and pedicels pubescent on the outside. ♄. S. Native of the island of Manilla, near Sorzogon.

Long-leaved Stylocoryna. Shrub or tree.

7 S.? Panda'ki (D. C. prod. 4. p. 377.) glabrous; spines scattered; leaves oblong, minutely apiculated at the apex; racemes axillary, short; pedicels in fascicles, 1-flowered; tube of corolla shorter than the lobes. ♄. S. Native of the East Indies. Gardènia Pandàki, Vahl, herb. ex Puer. Rándia Malabárica, Lam. Branches spinescent on one side. Leaves coriaceous, an inch long, and 4 lines broad. Peduncles axillary, very short, bearing the pedicels in an umbel. Stigma oblong, undivided. Fruit unknown. Perhaps sufficiently distinct from the following.

Pandaki Stylocoryna. Shrub.

8 S. Malaba'rica (D. C. prod. 4. p. 377.) spines opposite, 3 times shorter than the leaves; leaves oblong-obovate, obtuse, cuneated at the base, glabrous, beset with glandular pili in the axils of the veins beneath; umbels 8-10-flowered, almost terminating the branches; flowers on short pedicels; limb of calyx 5-toothed. ♄. S. Native of Coromandel and Malabar near Cochin, in arid places. Gardènia fràgrans, Roxb. corom. t. 197. Posoquèria fràgrans, Roxb. fl. ind. 2. p. 167. Flowers small, white, sweet-scented. Berry globose, size of a cherry, red, 2-celled. Seeds orange coloured. Perhaps G. fràgrans, Roth, nov. spec. 150. is the same. The Benkàra of Rheed. mal. cited by Lam. for this species, is a distinct plant, from the flowers being said to be purple. The shrub is well adapted for making hedges, being well armed with thorns.

Malabar Stylocoryna. Clt. 1820. Shrub 4 to 5 feet.

Cult. For culture and propagation see *Oxyánthus*, p. 494.

XXXV. GE'NIPA (*Genipapo* is the Guiana name of the first species). Plum. cat. no. 20. Tourn. inst. t. 437. Lin. gen. no. 240. Juss. gen. 201. mem. mus. 6. p. 391. Gærtn. fil. carp. 3. p. 55. t. 190. D. C. prod. 4. p. 378.—Gardènia species, Swartz, Lam.—Duròia, Lin. fil. suppl. p. 30.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an ovate tube, and a tubular truncate or subdentate limb. Corolla salver-shaped, not exceeding the tube of the calyx; limb large, 5-parted: segments ovate, acute. Anthers linear, sessile in the throat of the corolla, exserted. Stigma clavate, obtuse, undivided. Berry corticate, somewhat 4-celled, crowned by the tube of the calyx, attenuated at both ends. Seeds numerous, horizontal, nestling in the pulp. Albumen cartilaginous. Embryo with a common radicle, and foliaceous cotyledons.—Trees. Leaves opposite, oval or oblong. Stipulas interpetiolar, ovate, acuminated, deciduous. Flowers axillary or terminal, solitary or few, white, at length yellow. Fruit when young yielding a black juice. *Génipa* agrees with *Stylocorýna* in the undivided stigma, and with *Gardènia* in habit: but from both it is easily distinguished by the truncate limb of the calyx and fruit.

1 G. America'na (Lin. spec. 251.) leaves oblong-lanceolate, quite glabrous on both surfaces; peduncles axillary, dichotomous, corymbose. ♄. S. Native of the Caribbee islands, as in St. Domingo, &c., and now cultivated in many parts for the sake of the fruit, especially in Brazil and Guiana. Plum. ed. Burm. t. 136. Gærtn. fil. carp. t. 190. Gardènia Génipa, Swartz, obs. p. 84.—Janipàba, Marcgr. bras. p. 92. with a figure. Pis. bras. 159. with a figure. Flowers small, white. Fruit large, greenish-white, full of dark purple juice; pulp edible, rather acid.

American or Common Genipa. Clt. 1779. Tree 20 to 30 ft.

2 G. Caru'to (H. B. et Kunth, nov. gen. amer. 3. p. 407.) leaves obovate, obtuse, glabrous above, clothed with velvety tomentum beneath; peduncles terminal, 2-3-flowered; pedicels longer than the peduncle. ♄. S. Native on the banks of the Orinoco and Rio Negro, and near Caraccas and Carthagena, where it is called *Caruto* by the natives. Corolla white, having the tube silky both inside and outside.

Caruto Genipa. Tree 20 feet.

3 G. pube'scens (D. C. prod. 4. p. 378.) leaves obovate, obtuse, glabrous above, and clothed with velvety pubescence beneath; flowers by threes, almost terminal, on very short pedicels. ♄. S. Native of Cuba, about the Havannah. Flowers very like those of *G. Americàna*, but are on shorter pedicels, and fewer in number; and the leaves are broader and blunter.

Downy Genipa. Tree 20 feet.

4 G. oblongifo'lia (Ruiz et Pav. fl. per. 2. p. 67. t. 220. f. a.) leaves oblong-ovate, obtuse, shining above, and downy on the nerves beneath, with rather revolute margins; flowers crowded at the tops of the branches, on short pedicels, and disposed somewhat racemosely. ♄. S. Native of Peru, on the Andes, in groves in hot places, and at Guayaquil. The corolla is said to be yellow, but is probably white in the recent state as in the rest of the species. Fruit size of a peach. The seeds and pulp of the fruit are used by the Indians to dye their face and hands of a permanent black colour.

Oblong-leaved Genipa. Clt. 1821. Tree 20 feet.

5 G.? striiflòra (D. C. prod. 4. p. 378.) leaves elliptic, membranous, acuminated at both ends, glabrous, on short petioles; stipulas small, deciduous; pedicels axillary, short, 1-flowered; limb of calyx broadly truncate, ciliated, short; tube of corolla broad, conical, striated, horny on the inside at the base, and closed in the middle inside by a circle of hairs; stigma thick, 2-lobed. ♄. S. Native of Brazil. Perhaps a proper genus. Leaves somewhat sinuated from some cause.

Striped-flowered Genipa. Tree.

† *Species not sufficiently known.*

* *American.*

6 G. Meria'næ (Rich. act. soc. hist. nat. par. p. 107.) hairy; leaves oblong-obovate; flowers crowded at the tops of the branches; fruit globose, very villous, crowned by the tube of the calyx. ♄. S. Native of Cayenne and Surinam. Poir. suppl. 2. p. 708. Duròia eriópila, Lin. fil. suppl. p. 30. and p. 209.—Merian, sur. t. 43. The tree has the habit of *Isértia coccínea*. Flowers hexamerous and hexandrous, nearly sessile, very like those of *Jasmìnum Sámbac*. Berry hairy, about the size of the clenched fist, umbilicate. Seeds imbedded in the pulp, which is grateful and edible.

Merian's Genipa. Clt. 1800. Tree 20 feet.

** *Asiatic.*

7 G.? Buffali'na (Lour. coch. p. 149.) prickles long, straight, opposite; leaves ovate, glabrous, in fascicles; flowers solitary; calyx bluntly 5-cleft; berry almost dry, roundish. ♄. G. Native of Cochinchina. Flowers greenish-white. Berry brownish. Perhaps a species of *Rándia* or *Gardènia*, but the berry is said to be 2-celled. Corolla rotate, 5-cleft.

Buffalo's Genipa. Shrub 9 feet.

8 G.? escule'nta (Lour. l. c.) stem quite simple; spines long, straight, opposite; leaves opposite, hairy, in fascicles: flowers lateral, in fascicles; calyx acutely 5-cleft; berry fleshy, roundish, 1-celled. ♄. G. Native of Cochinchina. Flowers greenish-white. Segments of corolla oblong, acuminated. Berry size of a cherry, edible.

Esculent Genipa. Clt. 1823. Shrub 6 feet.

9 G.? fla'va (Lour. l. c.) prickles few, scattered, straight; leaves broad-lanceolate, glabrous; flowers solitary, terminal; corolla rather hairy. ♄. G. Native of China, about Canton. Corolla yellow, rotate. Fruit unknown.

Yellow-flowered Genipa. Shrub 5 feet.

Cult. For culture and propagation see *Gardènia*, p. 499.

XXXVI. GARDE'NIA (so named after Alexander Garden, M.D. of Charlestown, Carolina, one of the correspondents of Ellis and Linnæus). Ellis, in Lin. gen. no. 296. Gærtn. fruct. t. 23. 177. 193. and 194. Blum. bijdr. p. 1014. Roxb. fl. ind. 2. p. 549. D. C. prod. 4. p. 379.—Gardènia and Rothmánnia, Thunb.—Gardènia and Pirínga, Juss.—Gardènia and Sahlbérgia, Neck.

LIN. SYST. *Pentándria, Monogýnia* Calyx with an ovate, usually ribbed tube, and a tubular truncate, toothed (f. 93. *a.*), cleft, or parted limb. Corolla funnel-shaped (f. 93. *b.*), or salver-shaped, having the tube much longer than the calyx, and the limb twisted in æstivation (f. 93. *e.*), but afterwards spreading, from 5-9-parted. Anthers 5-9, linear, almost sessile in the throat of the corolla or exserted (f. 93. *c.*). Stigma clavate, bifid or bidentate: lobes thick, erect. Ovarium 1-celled, half divided by 2-5 incomplete dissepiments. Berry fleshy, crowned by the calyx, chartaceous or nucleate inside, incompletely 2-5-celled. Seeds minute, immersed in the fleshy parietal placentas. Embryo albuminous.—Unarmed or spinescent trees or shrubs. Leaves opposite, and sometimes, though rarely, in whorls, oval or ovate. Flowers axillary or terminal, usually solitary, white, and generally sweet-scented. The fruit of the greater number of the species not being sufficiently known, they cannot be divided into proper sections.

§ 1. *Shrubs without prickles. Tube of calyx or ovarium ribbed. Tube of corolla cylindrical.*

1 G. FLO'RIDA (Lin. spec. p. 305.) shrubby, unarmed, erect; leaves elliptic, acute at both ends; flowers solitary, almost terminal, sessile, salver-shaped; calycine segments vertical, lanceolate-subulate, equalling the tube of the corolla in length; berry elongated, turbinate, ribbed. ♄. G. Native of China, and cultivated in Japan, East Indies, the Cape of Good Hope, &c. Ker, bot. reg. t. 449. G. jasminoìdes, Sol. phil. trans. 52. t. 20.—Pluk. amalth. t. 448. f. 4. Jasmìnum Capénse, Mill. dict. no. 7. fig. t. 180. Ehret. pict. t. 15. Flowers white, sweet-scented, 5-9-parted. Berry 5-6-angled, 5-6-celled at the base, and 1-celled at the apex, orange coloured, size of a pigeon's egg, and the pulp is used for dyeing yellow in China and Japan.

Var. β, *flòre plèno;* flowers double white, when fully blown about the size of the middling rose. ♄. G. This variety is very frequent in gardens. G. jasminoìdes, Ellis in phil. trans. vol. 51. t. 23. Jasmìnum Capénse, Mill. fig. t. 180.—Rumph. amb. 7. t. 14. f. 2.

Flowering Gardenia or Cape Jasmine. Fl. July, Aug. Clt. 1754. Shrub 2 to 6 feet.

2 G. RADÌCANS (Thunb. diss. gard. no. 1. t. 1. f. 1.) shrubby, unarmed; stems radicant; leaves lanceolate; flowers solitary, almost terminal, and nearly sessile, salver-shaped; segments of the calyx vertical, linear-subulate, equal in length to the tube of the corolla. ♄. G. Native of Japan, and cultivated in the East Indies, and at the Cape of Good Hope. Thunb. fl. jap. t. 20. Ker, bot. reg. t. 73. Andr. bot. rep. t. 491. Flowers white, very fragrant.

Rooting Gardenia or Cape Jasmine. Fl. March, June. Clt. 1804. Pl. 1 to 2 feet.

3 G. ANGUSTIFO'LIA (Lodd. bot. cab. 512.) very like *G. flòrida*, from which it chiefly differs in being smaller, with narrower leaves. ♄. S. Native country unknown. Flowers white, sweet-scented.

Narrow-leaved Gardenia. Fl. July. Clt. 1823. Shrub 3 ft.

4 G. TOMENTÒSA (Blum. mss. ex D. C. prod. 4. p. 379.) unarmed; branchlets, leaves, and calyxes clothed with velvety tomentum; leaves obovate-cuneated; flowers terminal, sessile, solitary; tube of calyx angularly ribbed: calycine teeth 10, subulate, short. ♄. S. Native of the island of Java. Lobes of corolla 10, obovate-oblong; tube hardly longer than the calyx. Flowers white, sweet-scented. Fruit unknown.

Tomentose Gardenia. Shrub.

5 G. CALYCULA'TA (Roxb. fl. ind. 2. p. 550.) arboreous, unarmed; leaves ovate, petiolate, acuminated, smooth; flowers terminal, solitary, sessile, involucrated; calycine segments ensiform; anthers inclosed within the tube of the corolla. ♄. S. Native of the East Indies. Flowers large, white, fragrant, 5-parted.

Calyculate Gardenia. Tree.

6 G. COSTA'TA (Roxb. fl. ind. 2. p. 550.) arboreous, unarmed; leaves cuneiform-oblong, smooth, ribbed; flowers terminal, salver-shaped; calycine segments resiniferous, caducous; berry drupaceous, oval, 5-ribbed, 1-celled, containing a 2-valved shell; placentas 2, opposite. ♄. S. Native of the mountainous parts of India; from those of Chittagong it has been introduced to the botanic garden of Calcutta. G. coronària, Hamilt. in Symes. emb. to Ava, p. 474. with a figure. Flowers large, white, sweet-scented, the tube being above 3 inches long, and the border above 4 in diameter; limb 5-parted. Berry yellow, containing a soft and rather fetid pulp.

Ribbed-fruited Gardenia. Tree 20 feet.

7 G. CARINA'TA (Wall. in Roxb. fl. ind. 2. p. 560.) arboreous, unarmed, resinous on the younger parts; leaves elliptic-obovate, ribbed, villous beneath; flowers terminal, solitary; limb of calyx truncate, broad, obscurely 5-lobed, and 5-keeled; tube of corolla very long: limb 6-8-lobed. ♄. S. Native of Penang, where it grows on the hills. Flowers smaller than those of *G. costàta*, at first snow white, but afterwards yellow, becoming when dry of a beautiful orange colour. Fruit precisely as in *G. costàta*.

Keeled-calyxed Gardenia. Tree.

8 G. GRANDIFLÒRA (Lour. coch. p. 147.) arboreous, unarmed; leaves lanceolate, shining; flowers solitary, lateral, and terminal, hexamerous; segments of the calyx reflexedly-falcate; corolla salver-shaped, 6-parted; berry oblong, acute at both ends. ♄. G. Native of Cochinchina, on the banks of rivers. Blum. bijdr. p. 1013. Flowers large, white, sweet-scented. Berry hexagonal, 1-celled, glabrous, yellow. Seeds nestling in red pulp. Anthers 6, rarely 5-7.

Great-flowered Gardenia. Tree middle-sized.

9 G. TAITE'NSIS (D. C. prod. 4. p. 380.) unarmed, glabrous, resinous at the tops of the branches; leaves obovate, almost sessile; stipulas broad, connate, permanent, short-acuminated; flowers solitary, in the axils of the upper leaves, pedicellate; tube of calyx angular: limb 3-4-parted, with vertical-oblong foliaceous lobes; corolla with a long terete tube, and a 5-7-parted limb. ♄. G. Native of the island of Tahiti, where it was collected by D'Urville. Lobes of calyx fewer by abortion than the lobes of the corolla. Stigma bifid, the lobes long, and acute. Fruit unknown.

Tahiti Gardenia. Shrub.

10 G. MARU'BA (Siebold, in Blum. bijdr. p. 1013.) unarmed; leaves opposite, or 3 in a whorl, obovate, coriaceous, glabrous; calyx angular, 5-cleft: segments subulate, spreading. ♄. G. Native of Japan. The rest unknown.

Maruba Gardenia. Tree.

11 G. SULCA'TA (Gærtn. fil. carp. 3. p. 79. t. 194.) berry obovate or elliptic, attenuated at the base, angular from obtuse furrows, 1-celled; seeds imbedded in the pulp. ♄. G. Native country unknown. Perhaps allied to *G. flórida*.

Furrowed-fruited Gardenia. Shrub.

§ 2. *Unarmed shrubs or trees. Tube of calyx or ovarium not*

ribbed; having the limb equally toothed or parted, rarely truncate. Tube of corolla cylindrical.

12 G. MUTA'BILIS (Reinw. in Blum. bijdr. p. 1016.) unarmed? leaves oblong, acuminated, glabrous, but pubescent in the axils of the ribs on the under surface; flowers axillary, solitary; limb of calyx rather truncate; corolla with an elongated glabrous tube, and a 5-cleft limb. ♄. S. Native of the island of Celebes. Said to be allied to *G. carinàta* and *G. tubiflòra*.

Changeable-flowered Gardenia. Tree.

13 G. CALYCÌNA; leaves oblong-lanceolate, rather coriaceous, glabrous, on short petioles; flowers axillary, solitary, almost sessile; corolla with a long tube, and a 5-cleft equal border; calyx 5-cleft. ♄. S. Native of Sierra Leone, on the edges of woods. Flowers pale red, pentandrous.

Large-calyxed Gardenia. Shrub.

14 G. REINWARDTIA'NA (Blum. bijdr. p. 1913.) unarmed? leaves oblong, attenuated at both ends, bluntish at the apex, coriaceous, glabrous; corymbs axillary, trifid, shorter than the leaves; limb of calyx obsoletely 5-toothed, rather truncate; corolla with an elongated glabrous tube, and a 5-cleft limb. ♄. S. Native of the Moluccas. Ignàtia, Reinw. herb. ex Blum. Ovarium half 2-celled, many seeded.

Reinwardt's Gardenia. Shrub.

15 G. LATIFÒLIA (Ait. hort. kew. 1. p. 294.) arboreous, unarmed; leaves almost sessile, ovate or obovate: in the axils of the veins beneath are hollow glands with hairy margins; flowers terminal, 1-4-together, almost sessile, salver-shaped, 7-11-parted; limb of calyx short, subdentate; berry drupaceous, round, 1-celled, 5-valved. ♄. S. Native of the East Indies, on barren rocky hills, in the Circars and Carnatic. Roxb. cor. 2. p. 18. t. 134. fl. ind. 2. p. 552. G. enneándra, Kœn. mss. ex Roxb. Flowers very large and very fragrant, when they first open in the morning white, gradually growing yellow before night. Berry size of a pullet's egg, crowned by a small part only of the tube of the calyx. Leaves opposite or 3 in a whorl. —G. latifòlia, Gærtn. fr. 3. p. 78. t. 193. is a distinct species from the fruit being crowned by the whole of the calyx, not with part of it.

Broad-leaved Gardenia. Clt. 1787. Tree 10 feet.

16 G. LU'CIDA (Roxb. fl. ind. 2. p. 553.) subarboreous, unarmed, with resinous buds; leaves oblong, smooth, shining, with lateral simple parallel veins; flowers almost terminal, solitary, on short pedicels: lobes of calyx 5, subulate, 3 times shorter than the tube of the corolla; berry drupaceous, containing a 2-valved shell. ♄. S. Native of Chittagong, and various other parts of India; and of the island of Luzon. Leaves about 6 inches long and 3 broad. Peduncles clavate, 1 to 1½ inch long. Flowers large, pure white, fragrant, 5-parted.

Shining-leaved Gardenia. Clt. 1819. Shrub or tree.

17 G. ARBÒREA (Roxb. fl. ind. 2. p. 554.) arboreous, unarmed; leaves ovate-oblong; flowers terminal, almost sessile, usually by threes; corolla with a filiform tube, and a 5-parted limb; berry drupaceous, smooth, containing a 4-5-valved shell. ♄. S. Native of the East Indies, among the Circars. The leaves are deciduous during the cold season, and the shrub continues naked till the hot season is pretty far advanced. From the buds and wounds made in the bark there exudes a very beautiful yellow resin, like that from *G. gummífera*. The size, number, fragrance, mutability, and beauty of the flowers of this species render it more deserving of a place in the garden than any other species. The natives eat the fruit when ripe.

Arboreous Gardenia. Tree.

18 G. GUMMI'FERA (Lin. fil. suppl. 1. p. 164.) shrubby, unarmed, with resinous buds; leaves oblong, bluntly acuminated, (hairy, ex Lin.); flowers sessile, solitary, almost terminal; segments of the calyx ovate, acute, very short; tube of corolla equal in length to the limb. ♄. S. Native of Ceylon and Coromandel. Thunb. diss. gard. no. 4. t. 2. f. 3. Rottl. and Willd. in act. bonn. 4. (1803) p. 198. G. inérmis, Dietr. lex. 4. p. 285. Allied to *G. arbòrea*. Flowers white, sweet-scented. From the bark of this tree exudes a yellow resin, similar to gum elemi.

Gum-bearing Gardenia. Shrub 3 to 4 feet.

19 G. CLUSIÆFÒLIA (Jacq. coll. append. 37. t. 4. f. 3.) shrubby, unarmed, glabrous; leaves obovate, retuse, and somewhat emarginate, coriaceous, on short petioles; peduncles almost terminal, racemose; flowers on long pedicels; limb of calyx short, 5-toothed; corolla salver-shaped, with 5 linear acute segments, which are about the length of the tube. ♄. G. Native of the Bahama islands, where it is called by the inhabitants *seven years apple*, ex Catesb. car. 1. p. 59. t. 59. Flowers white, sweet-scented, with a greenish tube. Berry large, oval. Seeds imbedded in the pulp. The internal structure of the berry is unknown. It differs from *Gardènia* in the shape of the stigma and disposition of the flowers.

Clusia-leaved Gardenia. Shrub 5 feet.

20 G.? TETRASPE'RMA (Roxb. fl. ind. 2. p. 555.) shrubby, unarmed; leaves obovate-cuneated, smooth; flowers axillary, solitary, on short pedicels, pentandrous; calycine segments 5, subulate; limb of corolla 5-parted; berry round, 4-seeded. ♄. S. Native of the East Indies, on the mountains near Shreenugur. Gardènia, no. 3. Hardw. in asiat. res. 6. p. 354. Leaves on short petioles. Flowers greenish yellow, sweet-scented, with a long tube, which widens upwards, and partly closed about the middle by a ring of silky down.

Four-seeded Gardenia. Shrub 2 feet.

21 G. TUBI'FERA (Wall. in Roxb. fl. ind. 2. p. 562.) subarboreous, unarmed; leaves cuneate-oblong, petiolate, slightly scabrous above, and pubescent beneath; drupe round, uneven, crowned by the very long truncate calycine tube. ♄. S. Native of the East Indies, in Singapore. All the young parts of the tree are resinous. Leaves 5-6 inches long. Drupe containing a putamen, which is divisible into 8 valves. Flowers unknown.

Tube-bearing Gardenia. Tree or shrub.

22 G.? ANISOPHY'LLA (Jack, in Roxb. fl. ind. 2. p. 561.) arboreous, unarmed; leaves elliptic, those opposite each other unequal, densely clothed with villi; stipulas concrete at the base, bearded inside; corymbs axillary, villous; limb of calyx 5-toothed; tube of corolla short; drupe oval, villous. ♄. S. Native of the islands of Pulo-Penang and Singapore, on the hills. Leaves tapering to the base, 6-12 inches long. Flowers rather small, white, by threes, villous outside: limb 5-parted. Stigma clavate, 2-lobed. Drupe size of a walnut, containing a 2-valved putamen. Perhaps a species of *Génipa* or *Posoquèria*.

Unequal-leaved Gardenia. Tree.

23 G. FORMÒSA (Cham. et Schlecht. in Linnæa. 4. p. 200.) unarmed; leaves on short petioles, nearly orbicular, terminating in a very short acumen each, clothed with canescent tomentum along the veins on the upper surface, but clothed with hoary tomentum underneath, as well as the petioles, cymes, and flowers; calyx 5-toothed; stigma bilamellate. ♄. S. Native of Brazil. Corolla white, having the tube about 4 inches long, and the throat an inch in diameter; limb 5-parted. Fruit unknown.

Beautiful Gardenia. Shrub.

24 G. SELLOWIA'NA (Cham. et Schlecht. l. c. p. 198.) unarmed, glabrous; leaves broad-lanceolate, on short petioles, shining above; stipulas connate between the petioles; cymes 3-5-flowered; calyx 5-toothed; stigma bilamellate. ♄. S. Native of Equinoxial Brazil. Corolla white, hairy; the tube about 3 inches long and coriaceous, and the limb 5-parted. Fruit spherical, smooth.

Sello's Gardenia. Shrub.

25 G. HEXA'NDRA (Willd. rel. in Rœm. et Schultes, syst. 5. p. 243.) unarmed; leaves obovate, pubescent beneath; flowers usually hexandrous; corollas hairy both inside and outside, with the tube very short. ♄. S. Native of South America, where it was collected by Humboldt and Bonpland. The rest unknown.

Hexandrous-flowered Gardenia. Shrub.

§ 3. *Unarmed shrubs. Tube of calyx or ovarium not ribbed; but the limb is tubular and ribbed, 5-6-cleft, as well as being cleft laterally. Tube of corolla cylindrical.—Piringa, Juss.*

26 G. THUNBE'RGII (Lin. fil. suppl. p. 162.) shrubby, unarmed; leaves elliptic, acute, glabrous; flowers terminal, solitary, sessile, 8-parted; limb of calyx tubular, cleft laterally: with the segments dilated at the apex; berry ovate. ♄. G. Native of the Cape of Good Hope, and the island of Manilla. Thunb. diss. gard. no. 3. Sims, bot. mag. t. 1004. Thunbérgia Capénsis, Montin, in act. holm. 1773. t. 11. G. verticillàta, Lam. dict. 2. p. 607. G. crassicaúlis, Salisb. par. lond. t. 46. Bérgkias, Sonner. voy. nov. guin. t. 17-18. Journ. phys. 3. p. 299. t. 3. Caquepíria Bérgkia, Gmel. syst. 651. Piríngа, Juss. mem. mus. 6. p. 399. Flowers large, white, fragrant. Berry 1-celled; placentas parietal, 4, exserted. Leaves opposite, or 3-4 in a whorl.

Thunberg's Gardenia. Fl. Jan. March. Clt. 1774. Shrub 4 to 5 feet.

§ 4. *Unarmed shrubs. Tube of calyx ribbed or angular from the decurrent segments. Tube of corolla with a dilated obconical throat. Berry 2-celled.—Rothmánnia, Thunb.*

27 G. ROTHMA'NNIA (Lin. fil. suppl. p. 165.) arboreous, unarmed; leaves oblong, acute, glabrous, on very short petioles, having glandular hairs in the axils of the veins underneath; flowers axillary, and almost terminal, solitary, sessile, 5-parted, and pentandrous; calyx ribbed, having the segments subulate, terete, and erect; corolla with an obconical tube, a campanulate throat, and spreading acute segments. ♄. G. Native of the Cape of Good Hope. Thunb. diss. gard. no. 6. Sims, bot. mag. 690. Rothmánnia Capénsis, Thunb. act. holm. 1776. p. 65. f. 2. Flowers white, spotted with red, sweet-scented; tube of corolla glabrous. Young branches downy.

Rothmann's Gardenia. Fl. July. Clt. 1774. Shrub 5 to 10 feet.

§ 5. *Unarmed or spinose shrubs. Leaves 3 in a whorl.*

28 G. TERNIFÒLIA (Thonn. in Schum. pl. guin. p. 147.) unarmed, glabrous; leaves 3 in a whorl, obovate, cuneated at the base, almost sessile; flowers solitary, almost terminal, girded at the base by a short truncate involucel; calyx with a smooth tube, and a tubular short toothed limb; corolla with a long terete tube, and a 6-7-parted limb. ♄. S. Native of Guinea. Flowers 3 inches long, white; lobes of corolla oval-oblong, acutish.

Tern-leaved Gardenia. Shrub 4 to 5 feet.

29 G. TRIACA'NTHA (D. C. prod. 4. p. 382.) glabrous; branches 3 in a whorl, spinescent; leaves 3 in a whorl, obovate, cuneated at the base, almost sessile; flowers solitary, terminal, sessile; calyx with a smooth tube, and a tubular semi-5-cleft limb: lobes acute; corolla with a long almost terete tube, and a 5-parted limb: lobes thick, obovate. ♄. S. Native of the Gambia, in woods. Leaves hardly an inch long. Corolla 2 inches long. Berry ovate-globose. Fruit size of a walnut. Spines thick, short, conical, spreading.

Three-spined Gardenia. Shrub 4 to 5 feet.

30 G. MEDICINA'LIS (Vahl, in Schum. pl. guin. p. 148.) glabrous; spines tern, stiff, leafy at the apex; leaves elliptic, glabrous; flowers terminal, sessile, solitary; limb of calyx bifid, with roundish recesses, and trifid segments; corolla with the tube dilated upwards, and the lobes obovate. ♄. S. Native of Guinea.

Medicinal Gardenia. Shrub 4 to 5 feet.

§ 6. *Spiny shrubs.*

FIG. 93.

31 G. AMŒ'NA (Sims, bot. mag. t. 1904.) shrubby; spines axillary, short, straight; leaves oval, acute, glabrous, on short petioles; flowers almost terminal, solitary, sessile, 5-parted, and pentandrous; tube of calyx with short teeth; corolla salver-shaped, with a long terete tube. ♄. G. Native of China. Flowers white, having the lobes purple on the outside in that part, which is exposed to the air, while the corolla is in æstivation; the tube greenish.

Pleasing Gardenia. Fl. June, Aug. Shrub 3 to 5 feet.

32 G. TU'RGIDA (Roxb. fl. ind. 2. p. 557.) arboreous, with swollen mealy bark, and brachiate branches; spines opposite and terminal; leaves obovate, tapering into the petioles at the base, smooth; flowers lateral, usually solitary; limb of calyx tubular, 5-toothed; corolla smooth, salver-shaped; anthers almost inclosed. ♄. S. Native of the East Indies, at Botham. Leaves 1-4 inches long, and 1-3 broad. Stipulas broad at the base, and subulate at the apex. Flowers 5-6-parted. Berry oval, scabrous outside, containing a hard 5-valved putamen. Seeds imbedded in the pulp. Stigma clavate, 5-grooved.

Swollen-barked Gardenia. Tree.

33 G. MONTA'NA (Roxb. fl. ind. 2. p. 556.) arboreous; spines opposite, short, acute, stiff; leaves oblong, obtuse, almost sessile, downy beneath, with revolute edges; flowers rising 3-5 in a fascicle from the buds, on short pedicels; limb of calyx usually 5-toothed; corolla 5-7-cleft; stamens inclosed; berry drupaceous, roundish, containing a 5-6-valved putamen. ♄. S. Native of the East Indies, among the Circar mountains. Bark white, soft, and spongy. Leaves deciduous in December, 3 inches long, and 2 broad, smooth and shining above. Flowers pretty large, fragrant, when first open white, but soon becoming more or less yellow. Corolla with a somewhat gibbous tube, and a smooth throat. Nectary a moniliform fleshy ring, surrounding the insertion of the style. Berry the size of a pullet's egg, ash coloured, and yellow mixed. Seeds imbedded in the pulp.

Mountain Gardenia. Clt. 1819. Tree or shrub.

34 G. CAMPANULA'TA (Roxb. fl. ind. 2. p. 557.) shrubby; branches short, spiny at the apex; spines solitary; leaves lanceolate, smooth, acuminated at both ends; flowers on short pedicels, in terminal and lateral fascicles; limb of calyx campanulate, with a short acutely 5-toothed border; corolla subcampanulate, 5-lobed; berry roundish-ovate. ♄. S. Native of the East Indies, in the forests of Chittagong. Thorns generally terminating the little lateral opposite branchlets. Leaves 2-5 inches long. Stipulas triangular, acute. Flowers small, of a pale yellow colour, crowded at the extremities of short stiff lateral spinose branchlets. Stigma somewhat 5-grooved. Anthers inclosed. Berry round, the size of a golden pippin apple, smooth, 1-celled; placentas 5, parietal. Seeds imbedded in the yellow pulp.

Campanulate-calyxed Gardenia. Clt. 1815. Sh. 5 to 10 ft.

35 G. Blumea'na (D. C. prod. 4. p. 383.) shrubby, spinose; leaves lanceolate, glabrous; flowers axillary, and almost terminal, usually solitary; calycine segments ovate, bluntish; corolla somewhat campanulate. ♄. S. Native of Java, among bushes on the mountains. G. campanulàta, Blum. bijdr. p. 1017. This differs from G. campanulàta, Roxb. in the figure of the calyx.

Blume's Gardenia. Shrub 5 to 6 feet.

† *Species not sufficiently known.*

* *Unarmed shrubs.*

36 G.? volu'bilis (Lour. coch. p. 148.) shrubby, unarmed, twining; leaves lanceolate, acuminated, glabrous, on short petioles; peduncles long, axillary, many flowered; calycine segments 5, acute, erect; corolla funnel-shaped, with a dilated throat; berry roundish, 2-celled. ♄. G. Native of China beyond the suburbs of Canton. Flowers pale. Stigma thick, warted, subulate at the apex. Seeds round. This shrub should be excluded from *Gardènia*. Segments of corolla, long, repand.

Twining Gardenia. Shrub tw.

37 G.? pube'scens (Roth, nov. spec. 151.) unarmed; leaves roundish-oval, acuminated at both ends, clothed with brown tomentum beneath while young, as well as on the branchlets; corymbs axillary, dichotomous, divaricate; calyx minutely 5-toothed; corolla funnel-shaped, tomentose. ♄. S. Native of the East Indies. Flowers the size of those of *Rhámnus frángula*. Berry the size of a cherry, rugged from dots, glabrous.

Pubescent Gardenia. Clt. 1824. Shrub 4 to 6 feet.

38 G.? acumina'ta; shrubby, branched, unarmed; leaves broad-oval, lanceolate, long, sessile; flowers terminal and axillary, small; fruit oval, acuminated. ♄. S. Native of Sierra Leone, on the mountains in the woods. Perhaps a species of *Pomàtium*.

Acuminated-fruited Gardenia. Shrub 6 to 8 feet.

39 G.? Brasilie'nsis (Spreng. syst. 1. p. 763.) unarmed; leaves oblong, coriaceous, opaque; branchlets hairy; peduncles axillary, 3-4-flowered, shorter than the leaves; calycine segments subulate, shorter than the tube of the corolla. ♄. S. Native of Brazil.

Brazilian Gardenia. Shrub.

40 G.? longifòlia; shrubby, branched, unarmed; leaves long, broad-lanceolate, acuminated, entire, membranous, petiolate; flowers terminal, solitary, sessile; fruit large, roundish, smooth. ♄. S. Native of Sierra Leone, in the woods on the mountains.

Long-leaved Gardenia. Shrub 5 to 6 feet.

* * *Spinose shrubs.*

41 G.? de'nsa (Wall. in Roxb. fl. ind. 2. p. 559.) shrubby, stiff; branches numerous, decussate, spinose at the apex; leaves in fascicles, obovate, almost sessile, smooth; flowers solitary, sessile, terminal; limb of calyx tubular, 5-toothed: teeth subulate; corolla with a 5-parted limb, and lanceolate acuminated lobes. ♄. G. Native of Nipaul, on the southern face of Sheopore, above Thoka. Branches obscurely 4-cornered. While young the thorns are pubescent, and covered by a pair of approximate stipula-like scales. Flowers small, of a yellowish white colour, fragrant. Corolla pubescent within, and closed by a circle of silky hairs about the middle. Stigma obscurely 2-lobed. Very nearly allied to *G. tetraspérma*. Cells of ovarium 3-seeded.

Dense Gardenia. Shrub 4 to 5 feet.

42 G. sca'ndens (Thunb. diss. gard. no. 9. t. 2. f. 5.) shrubby, climbing; spines straight, very short, decussate; leaves ovate, glabrous; peduncles axillary, solitary, 1-flowered; corolla with a terete tube, and lanceolate segments; calyx 5-toothed. ♄. ◡. G. Native of China. G. jasminoìdes, Retz, obs. 2. p. 14. Perhaps a species of *Rándia*. Corolla white, glabrous. Stigma clavate.

Climbing Gardenia. Shrub cl.

43 G.? pa'tula (Horsf. ex Willd. in Rœm. et Schultes, syst. 5. p. 244.) spines hooked, shorter than the petioles; leaves ovate, acute; corymbs axillary. ♄. S. Native of Java. The rest unknown.

Spreading Gardenia. Shrub.

44 G.? stipula'ris (Rottl. et Willd. in act. bonn. 4. (1803.) p. 182.) shrubby; spines setaceous; leaves elliptic, acute at both ends, short; flowers sessile, solitary, terminal; calycine segments obtuse, and are as well as the tube glabrous. ♄. S. Native of the East Indies. Spines very short. Leaves like those of *G. spinòsa*. Corolla with a long slender tube. The spines, according to Rottler, are stipular; hence the name.

Stipular-spined Gardenia. Shrub.

45 G.? fagifòlia (Willd. rel. ex Rœm. et Schultes, syst. 5. p. 243.) branchlets terminated by 4 spines; flowers solitary; leaves roundish-ovate, downy beneath, stiff, plicately veined. ♄. S. Native of South America, where it was collected by Humboldt and Bonpland. Willdenow says the leaves are acute-angled, but this is probably a mistake.

Beach-leaved Gardenia. Shrub 5 to 6 feet.

46 G.? cornifòlia (D. C. prod. 4. p. 384.) shrubby, spinose; branches glabrous; leaves acuminated, ovate, rather coriaceous, and are, as well as the branches, downy; flowers 6-8-together at the tops of the branches, sessile, subcorymbose, each furnished with a bifid involucel; calyx 4-toothed; corolla villous on the outside, with a terete tube, and a spreading 4-parted limb. ♄. G. Native of the temperate parts of New Granada, near Guadua. Gardènia parviflòra, *H. B. et Kunth, nov. gen. amer. 3. p. 408. t. 293.* but not of Poir. Flowers white, sweet-scented. The ovarium and fruit being unknown, it is doubtful whether it belongs to the genus.

Dogwood-leaved Gardenia. Shrub 5 feet.

47 G.? micro ca'rpa (Bartl. in herb. Hænke ex D. C. prod. 4. p. 384.) spines few, short, straight; leaves oblong, coriaceous, shining above, quite glabrous on both surfaces, as well as the branchlets; stipulas subulately acuminated; flowers 1-3-together, terminal, pedicellate; limb of calyx short, tubular, with subulate teeth, which are much shorter than the corolla, which is glabrous; fruit ovate, crowned. ♄. S. Native of the Philippine islands, as in Luzon, &c. Perhaps a species of *Rándia*.

Small-fruited Gardenia. Shrub 5 to 6 feet.

Cult. All the species of *Gardènia* bear elegant sweet-scented flowers, which in most of the species are large. They are generally free flowerers. The soil best suited for them is a mixture of loam, peat, and sand. The stove species thrive best in a moist heat; and cuttings of all root readily if taken off while not too ripe, planted in a pot of sand, which should be plunged in a moist heat under a hand-glass. The double-flowered varieties of *G. flòrida* and *G. radìcans* are cultivated to a considerable extent, under the name of Cape jasmine, for the beauty and fragrance of their flowers; the best manner of getting these to bloom freely is to set them in a close frame, on a little bottom heat, in spring, but the pots should not be plunged; and in winter they may be set in the green-house.

XXXVII. RA'NDIA (named after Isaac Rand, M.D. once a demonstrator of botany at the Chelsea botanic garden). Houst. in Lin. hort. cliff. (1737.) p. 485. gen. no. 211. Juss. mem. mus. 6. p. 392. Lam. ill. t. 156. D. C. prod. 4. p. 384.—Oxý-

ceros, Lour. coch. p. 151.—Posoquèria and Rándia species, Roxb. fl. ind.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx with an obovate tube, and a 5-lobed limb. Corolla salver-shaped, with a short tube, which is hardly longer than the calycine lobes in the first section, but in the second section 2 or 3 times longer, always with a 5-parted limb, which is twisted in æstivation. Anthers sessile within the tube of the corolla, inclosed. Stigmas 2, thick. Berry nearly dry, crowned by the calyx, corticate, 2-celled. Seeds many in each cell, fixed to a central placenta, wingless, imbedded in the pulp, or imbricated downwards. Albumen cartilaginous. Embryo straight, with a terete radicle, and orbicular flat cotyledons.—Much branched small trees or shrubs, with axillary opposite or subverticillate thorns. Leaves sessile or on very short petioles. Stipulas solitary on each side, sometimes evidently formed from 2 being combined. Flowers almost sessile, usually solitary, rising from the axils of the leaves.—This genus is nearly allied to *Posoquèria*, but differs in the dry fruit, and in its being truly 2-celled.

Sect. I. Oxy'ceros (from *οξυς*, *oxys*, sharp, and *κερας*, *keras*, a horn; in reference to the shrubs being furnished with sharp thorns). D. C. prod. 4. p. 385. Thorny shrubs. Throat of corolla not dilated.

§ 1. *Flowers axillary, solitary, on short pedicels.*

1 R. latifòlia (Lam. dict. 3. p. 24. ill. t. 156. f. 1.) branchlets glabrous; leaves obovate, quite glabrous, almost sessile, cuneated at the base; flowers axillary, sessile, solitary, salver-shaped; tube of corolla twice the length of the calycine teeth, with a pilose throat. ♄. S. Native of the West India islands, in arid places among bushes; and probably of Mexico. Rándia aculeàta, Lin. spec. p. 214. Gardènia aculeàta, Ait. hort. kew. Gard. Rándia, Swartz, fl. ind. occ. p. 526.—Browne, jam. t. 8. f. 1. Sloan. hist. t. 2. f. 4. Spines axillary, opposite, spreading, forming a straight angle, 4-5 lines long. Corolla white, with the tube 4-5 lines long, and green. Berry the size of a small cherry, white or yellow. Seeds 6-8 in each cell, surrounded by pulp. Browne called this species Indigo berry, because the pulp of the fruit stains paper and linen of a fine fixed blue colour. The spines at the tops of the branchlets are usually solitary.

Var. β, mìtis (D. C. prod. 4. p. 385.) the larger leaves are nearly oval; the thorns are few or wanting altogether, and the flowers are fewer and larger than in the species. ♄. S. Native along with the species, but in more moist situations. Rándia mìtis, Lin. spec. 213. Gardènia Rándia β mìtis, Swartz, fl. ind. occ. p. 528. Gard. Rándia, Sims, bot. mag. t. 1841.—Sloane, hist. t. 161. f. 1. Flowers white. The juice of the fruit is deep blue.

Broad-leaved Randia. Fl. May, Sept. Clt. 1733. Shrub 5 to 10 feet.

2 R. obova'ta (H. B. et Kunth, nov. gen. amer. 3. p. 409. but not of Ruiz and Pav.) branchlets clothed with hairy tomentum; leaves obovate, glabrous; thorns straight, spreading; flowers solitary, sessile, almost terminal; tube of corolla twice the length of the calyx, with a silky throat? ♄. S. Native of New Granada, at the mouth of the river Sinu. Flowers small, white. Very like *R. latifòlia*, but differs in the branches being tomentose, and in the flowers being smaller.

Obovate-leaved Randia. Shrub 5 to 8 feet.

3 R. pube'scens (Ruiz et Pav. fl. per. 2. t. 120. f. b.) leaves obovate, acute, downy; thorns opposite, axillary, spreading, much shorter than the leaves; flowers solitary, sessile, girded at the base by numerous short adpressed bracteas; tube of corolla equal in length to the calycine lobes. ♄. S. Native of Peru, on the Andes, in hot places among broken rocks. R. obovàta, Ruiz et Pav. fl. per. syst. 2. p. 68. Rœm. et Schultes, syst. 5. p. 246. but not of Kunth. Gardènia obovàta, Dietr. Spreng. Floriferous branches spinose, the rest unarmed, spreading, and somewhat tetragonal; stipulas subulate. Leaves 4-5 inches long. Corolla white, twice the length of the calyx. Berry pubescent, of a greyish yellow colour, crowned by the lobes of the calyx, which are acuminated.

Downy Randia. Fl. June, Aug. Clt. 1820. Shrub 5 to 6 ft.

4 R. rotundifòlia (Ruiz et Pav. fl. per. 2. p. 68.) thorns and branches somewhat verticillate; leaves roundish and ovate, downy on both surfaces, wrinkled; flowers solitary, sessile; corolla twice as long as the calyx. ♄. S. Native of Peru, in groves about Huassa-Huassi. Gardènia rotundifòlia, Dietr. ex Rœm. et Schultes, syst. 5. p. 246. Stipulas ovate, acute. Flowers solitary in the centre of the leaves. Corolla white. Berry yellowish, 1-celled, size of a filbert, when young villous, crowned by the lobes of the calyx, which are elongated and linear. Seeds compressed, imbedded in the black pulp.

Round-leaved Randia. Fl. June, Aug. Clt. 1820. Shrub 6 feet.

5 R. echinoca'rpa (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 4. p. 385.) thorns 4 in a whorl, spreading; leaves ovate, acuminated, rather villous, crowded at the tops of the branches; flowers solitary, sessile, almost terminal; fruit globose, echinated. ♄. S. Native of Mexico. Flowers white. Limb of calyx 5-lobed; lobes linear-subulate. Allied to *R. tetracántha*, but differs in the calyx being 5-parted, not tubular and 5-toothed, and in the tube of the corolla being one-half shorter.

Hedgehog-fruited Randia. Shrub 4 to 6 feet.

6 R. dumetòrum (Lam. ill. t. 156. f. 4.) thorns opposite; leaves oval, bluntish, cuneated at the base, glabrous; flowers sessile, solitary, almost terminal; limb of calyx 5-parted, with oblong lobes, which are a little shorter than the corolla, which is villous. ♄. S. Native of the East Indies, frequent on the sea shore. Cánthium coronàtum, Lam. dict. 1. p. 602. Gardènia dumetòrum, Retz, obs. 2. p. 14. Roxb. cor. t. 136. Gardènia spinòsa, Lin. fil. suppl. 164. Rándia spinòsa, Blum. bijdr. p. 981. Posoquèria dumetòrum, Roxb. fl. ind. 2. p. 564. Gardènia spinòsa, Thunb. diss. gard. no. 7. t. 2. f. 4. Ceríscus Malabáricus, Gærtn. fr. 1. t. 28.—Pluk. t. 98. f. 6. Flowers white, clothed on the outside with adpressed villi, sweet-scented. Branches downy while young, but afterwards glabrous. Berry almost globose, yellow, about the size of a small apple, 2-celled, and crowned; cells many seeded. This shrub is employed for fences in the places of its natural growth. The fruit bruised and thrown into ponds where fish are, they are soon intoxicated, and seen floating. Fishermen sometimes follow this mode to enable them to take the fish with more ease. They are not deemed less wholesome from the effects of the fruit. *Cócculus I'ndicus* does not grow in those parts, nor is it known or used there for this purpose.

Bush Randia. Fl. July, Sept. Clt. 1777. Shrub 6 to 10 feet.

7 R.? uliginòsa (D. C. prod. 4. p. 386.) thorns almost terminal, opposite; branches tetragonal; leaves oblong, somewhat cuneated, glabrous; flowers solitary, sessile, almost terminal; limb of calyx tubular, almost entire, a little shorter than the tube of the corolla, which is villous in the throat. ♄. S. Native of the East Indies, delighting in moist places, such as the banks of rivers, low lands, &c. Gardènia uliginòsa, Retz, obs. 2. p. 14. Roxb. cor. t. 135. Posoquèria uliginòsa, Roxb. fl. ind. 2. p. 563. Thorns 1-2-3 or 4 at the extremities of the branchlets. Leaves 2-3 inches long, and 1½ broad. Flowers 1-2 or 3 at the tops of the branchlets, large, white, and fragrant. Berry size and shape of a pullet's egg, ash coloured, or olive grey, 2-celled.

Seeds flattish, nestling in the pulp. The flowers of this species render it deserving of a conspicuous place in a hot-house. The uncommon appearance of the plant is also in its favour.

Bog Randia. Fl. July, Sept. Clt. 1802. Shrub 5 to 8 feet.

8 R. LONGISPÌNA (D. C. prod. 4. p. 386.) thorns opposite or alternate, horizontal; branches long, dependent; leaves obovate-cuneated, smooth; flowers axillary, and almost terminal, solitary on short pedicels; tube of calyx cylindrical, 5-lobed: lobes ovate-cordate, permanent; corolla villous on the outside; berry obovate, smooth. ♄. S. Native of the coast of Coromandel. Posoquèria longispìna, Roxb. fl. ind. 2. p. 566. Link, enum. hort. berol. 225.? Thorns sharp, from 1 to 2 inches long. Leaves on the young shoots opposite, on the old ones in fascicles. Stipulas subulate. Flowers pretty large, pure white, and fragrant. Tube of corolla as long as the calyx, with a villous throat. Berry size of a nutmeg. Seeds immersed in the pulp.

Long-spined Randia. Fl. June, Aug. Clt. 1812. Shrub 5 to 6 feet.

9 R. NU'TANS (D. C. prod. 4. p. 386.) thorns slender, opposite, spreading; branches long, dependent, pubescent while young; leaves narrow-obovate-oblong; flowers axillary, solitary, on short peduncles; corolla silky on the outside; berry globose, crowned by the tube of the calyx, which is entire. ♄. S. Native of the East Indies. Posoquèria nùtans, Roxb. fl. ind. 2. p. 565. Ceríscus Malabáricus, Gærtn. fr. 1. t. 28.? Leaves on short petioles, opposite on the young shoots, but fascicled on the old ones, from 1 to 2 inches long, by about 1 broad. Flowers solitary, under the spines, middle-sized, white, and fragrant; throat of corolla villous. Berry size of a nutmeg, 2-celled.

Nodding-branched Randia. Fl. June, Aug. Clt. 1820. Shrub 3 to 4 feet.

§ 2. *Flowers in fascicles or racemes, in the axils of the leaves, or extremities of the branches.*

10 R.? PARVIFLÒRA (Lam. dict. 3. p. 25.) thorns opposite, very short; leaves ovate, petiolate, glabrous; racemes villous; flowers axillary, disposed in fascicles, on short pedicels; limb of calyx with 5 short teeth. ♄. S. Native of the East Indies. The thorns, according to Lamarck, are arched. Gardènia Sonneráttii, Spreng. syst. 1. p. 762. Perhaps Gardènia macrántha, Thunb. diss. gard. no. 8. t. 1. f. 2. is referrible to this species, but the spines are said to be straight; but the fruit in both are unknown, therefore the genus to which they belong is doubtful. Flowers small, 3-together.

Small-flowered Randia. Fl. April, June. Clt. 1818. Shrub 4 to 5 feet.

11 R. FLORIBU'NDA (D. C. prod. 4. p. 386.) thorns axillary, stiff; leaves opposite and in fascicles, obovate-cuneated, smooth; flowers disposed in lateral fascicles, on short pedicels; tube of calyx longer than the lobes, which are lanceolate; corolla silky outside; berry ovate, cordate, polished. ♄. S. Native of the coast of Coromandel. Posoquèria floribúnda, Roxb. fl. ind. 2. p. 569. A large stiff branched shrub, in a good soil growing to a small tree. Flowers middle-sized, white at first, but soon becoming yellow, and fragrant, produced in fascicles, from short scaly spurs. Segments of corolla obovate. Berry size of a prune, 2-celled, many seeded, crowned.

Bundle-flowered Randia. Shrub or small tree.

12 R. LONGIFLÒRA (Lam. dict. 3. p. 26. ill. t. 156. f. 3. but not of Salisb.) arboreous; thorns opposite, recurved; leaves lanceolate-oblong, smooth; corymbs terminal and axillary, 11-13 flowered; limb of calyx tubular, 5-lobed: lobes semilunar; tube of corolla long and slender. ♄. S. Native of Chittagong, in the East Indies, where it grows to a pretty large tree. Posoquèria longiflòra, Wall. in Roxb. fl. ind. 2. p. 568. Gardènia multiflòra, Willd. spec. 1. p. 1231. Posoquèria multiflòra, Blum. bijdr. p. 980. Branches terete, smooth. Leaves 6 inches long, and 1½ or 2 broad. Flowers large, pale, or nearly white when they first expand, becoming yellow by the second day, fragrant. Berry the size of the cherry, yellow when ripe, smooth, fleshy.

Long-flowered Randia. Fl. Aug. Sept. Clt. 1818. Tree small.

13 R. FASCICULA'TA (D. C. prod. 4. p. 386.) thorns axillary, spreading; leaves ovate-oblong, almost sessile, smooth; fascicles of flowers nearly sessile, axillary, and in the forks of the branches; calyx hairy, with 5 subulate lobes. ♄. G. Native of Silhet, in the East Indies. Posoquèria fasciculàta, Roxb. fl. ind. 2. p. 568. A much branched shrub. Thorns straight. Flowers middle-sized, at first white, but in the course of a day changing to a pale yellow colour. Segments of corolla oblong. Ovarium 2-celled, many seeded.

Fascicled-flowered Randia. Shrub 4 to 5 feet.

14 R. RI'GIDA (D. C. prod. 4. p. 386.) thorns opposite, supra-axillary, each having an annular joint, rarely 2 above the middle, the lower half downy, the upper smooth and shining; branches tetragonal, and are, as well as the calyxes, villous; leaves ovate, smooth, on short petioles; flowers by threes, axillary, and almost terminal; tube of corolla long, slender; berry downy. ♄. S. Native of the valley of Nipaul, and the surrounding mountains; and also at Noakote. Posoquèria rígida, Roxb. fl. ind. 2. p. 570. A strong rigid branchy shrub. Leaves in approximate fascicles, ending each in a cuspidate point. Flowers white and fragrant. Leaves shining above, but with a few short hairs along the nerves beneath. Corolla smooth on the outside. Berry purple, 2-celled, many seeded. Perhaps a true species of *Posoquèria*. Said to be allied to *R. fasciculàta*.

Stiff Randia. Shrub 6 feet.

15 R. STRÍCTA (Roxb. fl. ind. 2. p. 145.) branches stiff, decussate; leaves smooth, oblong, acute, on short petioles; fascicles of flowers sessile, dense, globose, axillary, bracteate; tube of corolla short, hairy inside; berry globose. ♄. S. Native of the East Indies, on the mountains north of Bengal. Macrocnèmum stríctum, Willd. rel. in Rœm. et Schultes, syst. 5. p. 6. Smith, in Rees's cycl. vol. 22. no. 5. Rodelètia stricta, Roth, nov. spec. p. 140. Flowers small, white. Berry size of a pea, 2-celled, smooth. Seeds imbricated in 2 rows in each cell, attached to the partition above its middle. Perhaps a distinct genus.

Straight Randia. Shrub 5 to 10 feet.

16 R. SCA'NDENS (D. C. prod. 4. p. 387.) stem scandent prickly; prickles recurved; leaves oval, acuminated, coriaceous, glabrous; peduncles almost terminal, usually 3-flowered at the apex; tube of corolla short; limb of calyx tubular, rather truncate. ♄. S. Native of Java, on the mountains of Parang and Salak. Tocoyèna scándens, Blum. bijdr. p. 980. Flowers white.

Climbing Randia. Shrub cl.

17 G. TETRA'NDRA (D. C. l. c.) thorns scattered, straight; leaves ovate, acuminated, narrowed at the base, rather coriaceous, and are as well as the branchlets downy; stipulas ovate, acuminated; flowers 6-8 in a fascicle at the tops of the branches, sessile, tetrandrous; bracteas connate; teeth of calyx 4, subulate; corolla clothed with silky hairs outside. ♄. S. Native of New Granada, in temperate places near Guadua. Gardènia parviflòra, H. B. et Kunth, nov. gen. amer. 3. p. 408. t. 293. Flowers small, white.

Tetrandrous-flowered Randia. Shrub 5 feet.

18 R. ARMA'TA (D. C. prod. 4. p. 387.) thorns 4 together at the tops of the branchlets, short, spreading; leaves ovate, acute at both ends; flowers usually 4 on the tops of the branchlets, on short pedicels; lobes of calyx linear-cuneiform; tube of corolla long, cylindrical, glabrous. ♄. S. Native of Cartha-

gena, Martinico, St. Lucia, &c. in woods. Mussæ'nda spinòsa, Lin. mant. p. 45. Jacq. amer. t. 49. Gardènia armàta, Swartz, fl. ind. occ. p. 524. Gardènia tetracántha, Lam. dict. 2. p. 609. Leaves glabrous or downy, cuneated at the base. Tube of corolla an inch long. Flowers pure white, sweet-scented. Berry oval, corticate, 2-celled, crowned by the calyx. Seeds numerous, enveloped in pulp. It differs from *R. tetracántha* in the flowers being one half smaller.

Armed Randia. Clt. 1813. Shrub 5 to 10 feet.

19 R. fe'rox (D. C. l. c.) thorns decussate, spreading, acute; leaves ovate, or oval, glabrous above and pubescent beneath; stipulas pellucid; flowers disposed in cymose fascicles; tube of calyx turbinate, but the limb is acute and 5-cleft beyond the middle; segments of corolla almost orbicular. ♄. S. Native of Brazil, at Rio Padre. Gardènia fèrox, Cham. et Schlecht. in Linnæa. 4. p. 198. Flowers white, sweet-scented.

Fierce Randia. Shrub 4 to 5 feet.

20 R. capita'ta (D. C. l. c.) thorns stiff, short, 4 at the top of each branchlet; leaves ovate, acute, hairy on both surfaces as well as on the branchlets; flowers sessile, 6-8 in a capitate fascicle at the tops of the branchlets; limb of calyx tubular, with stiff, subulate teeth; tube of corolla 3 times longer than the segments, villous on the outside. ♄. G. Native of Mexico. Flowers white, sweet-scented.

Capitate-flowered Randia. Shrub 4 to 6 feet.

21 R. tetraca'ntha (D. C. l. c.) branches opposite, horizontal, bearing each 4 thorns at the apex; leaves lanceolate, acuminated, tomentose; flowers sessile, 4 at the top of each branch; limb of calyx tubular, terminating in 5 subulate teeth; tube of corolla long, villous. ♄. S. Native of Mexico, about Acapulco and Regiomonti. Mussæ'nda tetracántha, Cav. icon. 5. p. 20. t. 435. Gardènia armàta, Bartl. but not of Swartz. Corolla pale yellow. Berry size of a pigeon's egg, not crowned by the calyx.

Four-spined Randia. Fl. Ju. Aug. Clt. 1820. Sh. 5 to 10 ft.

22 R. propi'nqua; branches slightly downy, armed with 4 spines at the apex, placed crosswise; leaves ovate, cordate, undulated, acuminated, downy, petiolate; flowers in terminal fascicles. ♄. S. Native country unknown. Gardènia propínqua, Lindl. bot. reg. t. 975. Thorns straight, infra-axillary. Leaves clustered at the ends of the branches, rather longer than the flowers. Corolla with a long cylindrical tube, and a 5-parted, spreading limb, with cordate, ovate, acute, flat segments, which are rather longer than the tube. Anthers semi-exserted, Flowers large, white.

Allied Randia. Fl. July. Clt. 1823. Shrub 6 to 8 feet.

23 R. Humboldtia'na (D. C. l. c.) branches nearly terete, glabrous, furnished each with 2 spines at the apex; leaves elliptic, short-acuminated, pubescent, membranous; flowers 3-5 together, terminal, pedunculate; corollas pubescent. ♄. S. Native on the shores of the Pacific near Guayaquil. Mussæ'nda pubéscens, H. B. et Kunth, nov. gen. amer. 3. p. 410. Gardènia Humboldtiàna, Rœm. et Schultes, syst. 5. p. 243. Mussæ'nda Humboldtiàna, Steud. nom. Gardènia pubéscens, Bartl. in herb. Hænke, but not of Roth. Flowers white, sweet-scented. Allied to *R. armàta*. Fruit unknown.

Humboldt's Randia. Shrub 5 to 10 feet.

24 R. nítida (D. C. l. c.) branchlets rather angular, furnished with 2 spines at the apex; leaves ovate-elliptic, acute, glabrous, shining; flowers terminal, twin, or by threes or fours, sessile; corollas glabrous. ♄. S. Native of New Granada, near Turbaco. Mussæ'nda nítida, H. B. et Kunth, nov. gen. amer. 3. p. 410. Flowers white, sweet-scented. Fruit unknown.

Shining-leaved Randia. Shrub 5 to 8 feet.

25 R. triflo'ra (Hamilt. in D. Don, fl. nep. p. 138.) thorns opposite, subulate, adnate to the branches above the petioles; petioles and branchlets hairy; stipulas ovate, cuspidate; leaves ovate; peduncles axillary, 3-flowered; calyx campanulate: having the lobes ovate at the base, and linear-subulate at the apex. ♄. G. Native of Nipaul, at Hethaura. Peduncles solitary, very short, usually 3, sometimes 4-flowered. Flowers usually 6-cleft and hexandrous. Anthers semi-exserted.

Three-flowered Randia. Shrub.

26 R. hórrida (Rœm. et Schultes, syst. 5. p. 248.) branches reclinate; branchlets decussate; thorns opposite, horn-formed; leaves ovate-lanceolate, glabrous; racemes trichotomous, almost terminal. ♄. G. Native of Cochin-china, in woods. Oxýceros hórrida, Lour. coch. p. 151. Spines large, acute. Flowers white. Berry black.

Horrid Randia. Shrub 8 feet.

27 R. Sine'nsis (Rœm. et Schultes, l. c.) thorns short, opposite, rather recurved; leaves lanceolate (Lour.): superior ones ovate, nerved, glabrous; corymbs small, terminal, few-flowered; limb of calyx tubular, 5-lobed; tube of corolla long, glabrous: having the throat hardly inflated; anthers linear, exserted, about equal in length to the lobes, which are spreading. ♄. G. Native of China, about Canton. Oxýceros Sinénsis, Lour. coch. p. 151. Rándia Chinénsis, Spreng. syst. 1. p. 768. R. longiflòra, Lam. ill. 156. f. 3.? Flowers white, salver-shaped, with a very long tube. Berry small, roundish, 2-celled, many-seeded.

China Randia. Fl. Ju. Aug. Clt. 1818. Shrub 5 feet.

28 R. Africa'na; shrub spinose; fruit woody, oblong, or roundish. ♄. S. Native of Sierra Leone. Flowers small, greenish yellow.

African Randia. Shrub 3 to 4 feet.

Sect. II. Euclínia (from *ευ, eu*, well, and *κλινω, klino*, to bend; the segments of the corolla are well bent over each other before expansion). D. C. prod. 4. p. 388. Unarmed shrubs. Tube of corolla usually dilated and obconical at the throat. Perhaps a proper genus.

29 R. macula'ta (D. C. prod. 4. p. 388.) shrubby, unarmed; branchlets rather downy; leaves oval, smooth, glandular in the axils of the nerves beneath, not pilose; flowers terminal, solitary from the axils on the ultimate leaves; tube of corolla very long, dilated at the apex. ♄. S. Native of Guinea. Rothmánnia longiflòra, Salisb par. t. 65. Limb of calyx rather villous, 5-toothed. Corolla 5 inches long, white, spotted with purple at the throat; segments ovate, spreading. Ovarium 2-celled.

Spotted-flowered Randia. Fl. Jul. Sept. Clt. 1696. Shrub 5 to 6 feet.

30 R. specio'sa (D. C. prod. 4. p. 388.) shrubby, unarmed, glabrous; leaves elliptic-oblong, shining above; flowers from the tops of the branchlets, solitary in the axils of the ultimate leaves; tube of corolla very long, clothed with adpressed down on the outside: the segments acuminated. ♄. S. Native of Cayenne, where it was collected by Patris. Tube of corolla 9 inches long, hardly dilated at the apex. Genitals inclosed. Berry ovate. Tube of calyx cylindrical, semi-quinquefid; lobes subulate, erect.

Elegant Randia. Shrub.

31 R. Mussæ'nda (D. C. l. c.) shrubby, unarmed; leaves ovate or lanceolate, acute, downy on the veins underneath; flowers solitary, sessile, terminating the branchlets; tube of calyx semi-quinquefid: the lobes subulate; corolla villous on the outside, with a long tube, and acuminated segments. ♄. S. Native of Carthagena in woods (Jacquin.); on the banks of the river Magdalena, near Honda (H. B. et Kunth, nov. gen. amer. 3. p. 408.); Dutch Guiana (Meyer, esseq. p. 128.); Mexico, Demerara, French Guiana, and probably of Tobago. Mussæ'nda formòsa,

Jacq. amer. p. 70. t. 48. Gardènia marítima, Vahl, herb. Gardènia Mussæ'nda, Thunb. diss. no. 5. Perhaps 2 or 3 allied species are here confused. The branches are glabrous in Jacquin's and De Candolle's specimens, but hairy in those of Kunth and Thunberg. Corolla with an incurved or straight tube, villous and green on the outside (ex Jacq.), but the segments are white within. Berry corticate, ovate, crowned by the calyx, 2-celled. Stigmas 2, acute, revolute.

Mussænda-like Randia. Clt. 1820. Shrub 5 to 6 feet?

32 R. RUIZIA'NA (D. C. prod. 4. p. 388.) shrubby, unarmed; leaves lanceolate, acute, on short petioles, glabrous above, rather hairy on the veins underneath; flowers terminal, solitary, sessile; calyx hairy, with subulate, erect segments; corolla hairy on the outside, with a very long tube, an obconical villous throat, and spreading acute segments. ♄. S. Native of Peru, on the Andes, in groves at Pozuzo. Gardènia longiflòra, Ruiz et Pav. fl. per. 2. t. 219. but not of Ait. Branches very long, when young rather tetragonal. Berry cylindrical, large, yellowish, striated longitudinally by 10 brown nerves, 2-celled, containing a sweet edible pulp. Flowers white. Stigmas 2, thick, reflexed.

Ruiz's Randia. Shrub 10 to 12 feet.

33 R. MACRA'NTHA (D. C. l. c.) shrubby, unarmed; leaves oval-oblong, acuminated, rather ciliated; flowers sessile, almost terminal, 5-parted; lobes of calyx subulate, spreading; corolla with a long tube, which is dilated at the apex, and revolute segments. ♄. S. Native of Sierra Leone. Rándia longiflòra, Salisb. par. t. 93. but not of Lam. Gardènia longiflòra, Ait. hort. kew. ed. 2. vol. 1. p. 368. but not. fl. per. Gardènia macrántha, Rœm. et Schultes, syst. 5. p. 235. Flowers 6-7 inches long, cream-coloured, fragrant. Stigmas 2, thick, obtuse, flat inside and convex outside. Ovarium 2-celled. According to Salisbury, this with others he proposes to separate into a distinct genus to be called *Euclínia*.

Long-flowered Randia. Fl. July, Sept. Clt. 1696. Shrub 5 to 6 feet.

34 R. LONGÍSTYLA (D. C. l. c.) shrubby, unarmed; leaves oval, villous above, but villously tomentose beneath, as well as the petioles; stipulas ovate, glabrous, scarious, deciduous; flowers almost terminal, disposed in corymbose fascicles; lobes of calyx parted to the base of the limb, erect, lanceolate, ciliated. ♄. S. Native of Guinea, on the Gambia at Albreda, where it was collected by Leprieur and Perrottet. Flowers black, in the dried state, but probably white when recent, 1½ inch long. Style much exserted; stigma thick, bipartite. Fruit nearly globose, about an inch in diameter. Seeds compressed, separated by gluten and partitions.

Long-styled Randia. Shrub 5 to 6 feet.

35 R. MADAGASCARIE'NSIS (D. C. prod. 4. p. 389.) shrubby, unarmed; leaves ovate, acute, on short petioles, glabrous, coriaceous; flowers axillary, sessile, bibracteate at the base; limb of calyx 5-lobed, obtuse; corolla velvety outside from tomentum, with a terete tube, and 5 oblong obtuse lobes; genitals inclosed. ♄. S. Native of Madagascar. Gardènia Madagascariénsis. Lam. dict. 2. p. 608. Flowers about 3 inches long. (ex Lam.) Tube of corolla 15 lines long. (ex D. C.)

Madagascar Randia. Shrub 5 to 18 feet.

36 R. GENIPÆFLO'RA (D. C. l. c.) shrubby, unarmed; leaves oval-oblong, acuminated at both ends, coriaceous, glabrous, on short petioles; stipulas lanceolate; peduncles axillary, very short, divided at top into many 1-flowered pedicels, which are disposed in a corymb; limb of calyx tubular, permanent, 5-toothed, a little shorter than the corolla. ♄. S. Native of Sierra Leone, where it was collected by Smeathmann. Tube of corolla cylindrical, hardly longer than its lobes. Anthers long, linear. Stigmas 2, slender, acute. Berry dry, 2-celled, crowned by the tubular limb of the calyx; placentas scarcely exserted. Seeds horizontal.

Genipa-flowered Randia. Shrub 5 to 8 feet.

37 R. TALANGNÌNIA (D. C. l. c.) leaves oval-oblong, acute at the base, obtuse at the apex, coriaceous, glabrous; stipulas short, undivided; flowers axillary, solitary, a little shorter than the leaves; calyx long and tubular beyond the ovarium, with 5 short, acute teeth at the apex; corolla with a long terete tube, and is as well as the segments clothed with velvety hairs on the outside. ♄. S. Native of Madagascar, on the east coast, where it was collected by Chapelier, and called by him Talangninia. Berry dry, ovate, rather acuminated.

Talangnin's Randia. Shrub.

† *Doubtful species.*

38 R.? DRUPA'CEA (D. C. l. c.) berry ovate, drupaceous, containing a bony putamen. ♄. S. Native of Java. Posoquèria drupàcea, Gærtn. fil. carp. 3. p. 77. t. 195. f. 1. The rest unknown.

Drupaceous-fruited Randia. Tree or shrub.

39 R.? POLYSPE'RMA (Roxb. fl. ind. 2. p. 146.) shrub bushy and much branched; leaves oblong, acuminated, smooth; stipulas subulate; spikes panicled, axillary. ♄. S. Native of the East Indies, about Chittagong.

Many-seeded Randia. Shrub 5 to 6 feet.

Cult. For culture and propagation see *Gardènia*, p. 499. All the species being very showy, usually bearing large, white, fragrant flowers, are therefore worth cultivating in every collection of stove plants.

XXXVIII. CHAPELIE'RIA (named after M. Chapelier, who collected many plants in Madagascar, during his travels in that island). A. Rich. mem. soc. hist. nat. par. vol. 5. p. 252. D. C. prod. 4. p. 389.

LIN. SYST. *Pentándria, Monogýnia.* Calyx with a 5-parted limb, and erect, acute, permanent lobes. Corolla with a slender tube and a 5-parted limb: rather oblique, spreading, lanceolate, acute segments, and a villous throat. Stamens 5, almost sessile, inclosed, inserted in the middle of the tube. Style short, inclosed; stigma oblong, bipartite, with the lobes approximate. Fruit egg-shaped, fleshy, coriaceous, 2-celled, crowned by the large erect limb of the calyx; cells many-seeded. Seeds distinct, many-sided, of a golden yellow colour, and clothed with adpressed, silky down. Embryo linear, terete, in the center of a horny albumen.—A shrub. Leaves opposite, coriaceous, elliptic, acute, quite glabrous. Stipulas entire, caducous, interpetiolar. Flowers on short pedicels, crowded in the axils of the leaves. Habit almost of an apocyneous plant.

1 C. MADAGASCARIE'NSIS (A. Rich. l. c.). ♄. S. Native of Madagascar.

Madagascar Chapelieria. Shrub 2 to 4 feet.

Cult. For culture and propagation see *Gardènia*, p. 499.

XXXIX. HEI'NSIA (named in memory of the famous philologist Heinsius, the translator of Theophrastus's works). D. C. prod. 4. p. 390.

LIN. SYST. *Pentándria, Monogýnia.* Calyx with an obovate tube and a 5-parted limb; and oblong, foliaceous, permanent lobes. Corolla salver-shaped, with a terete tube, which is longer than the calycine lobes, very hairy inside in the upper part, and 5, oval, acute undulated lobes. Anthers 5, linear, acute, sessile towards the top of the tube, inclosed and hidden among the hairs. Style filiform, shorter than the tube of the corolla; stigmas 2, linear. Fruit globose, crowned by the calyx, dry, hard, indehiscent, 2-celled; placentas 2, thick, adnate to the

dissepiment. Seeds numerous, wingless, nestling on the superficies of the placentas.—A much-branched, unarmed, glabrous shrub or small tree, but there are small permanent spurs, which look like spines. Leaves opposite, oval-oblong or ovate, acuminated, on short petioles. Stipulas twin on each side, small, acute. Flowers 3-4 together at the tops of the branchlets, pedicellate, and disposed in something like racemes, white, about the size of those of *Vinca rosea*, and very similar to those of *Gardènia* and *Rándia*.

1 H. JASMINIFLÒRA (D. C. prod. 4. p. 390.). ♄. S. Native of Sierra Leone, where it was collected by Smeathmann, Afzelius, and G. Don. The plant we have seen at Sierra Leone has numerous 1-flowered, terminal, and axillary pedicels; the tube of the corolla clothed with yellow hairs; and the segments of the corolla hispid. The shrub bears nothing like spurs or spines that we recollect.

Jasmine-flowered Heinsia. Fl. Feb. Clt. 1824. Sh. 5 to 8 ft.

Cult. See *Gardènia*, p. 499. for culture and propagation. A beautiful shrub, clothed with numerous white flowers.

XL. MENESTO'RIA (Menestor was a physiologist cited by Theophrastus). D. C. prod. 4. p. 390.

LIN. SYST. *Pentándria, Monogýnia.* Calyx with a globose tube, a 5-parted limb: and linear, almost subulate, acute, distant segments. Corolla with a long terete tube, 5 oval acute short lobes, and an almost naked throat. Anthers 5, oblong, sessile within the tube of the corolla. Style filiform; stigma bifid, inclosed: lobes linear. Ovarium 2-celled; placentas many-seeded, adnate to the dissepiment. Fruit baccate, almost dry, areolate at the apex, never crowned, from the lobes of the calyx being deciduous. Seeds very small, wingless.—Unarmed shrubs, natives of Nipaul. Leaves opposite. Stipulas solitary on each side, at length deciduous. Corymbs of flowers terminal. This is rather a doubtful genus, differing from *Mussæ'nda* in the tube of the calyx or ovarium being globose, not turbinate, and in the stipulas being solitary on each side, not twin; and from *Tocoyèna* in the limb of the calyx being parted to the base.

1 M. TOCOYE'NÆ (D. C. prod. 4. p. 390.) leaves obovate, obtuse, cuneated at the base, almost sessile, glabrous above, pale beneath, and beset with adpressed villi along the nerves. ♄. G. Native of Nipaul. Branches terete. Stipulas broad, short, very blunt, membranous. Corymbs terminal, trichotomous, on short peduncles; pedicels puberulous. Corolla 15 lines long, puberulous on the outside; segments ciliated, apiculated, clothed with adpressed down on the outside, as well as the tube. Style about equal in length to the tube of the corolla; stigmas 2, linear, applied to each other in the dried state.

Tocoyena-like Menestoria. Shrub 5 to 6 feet.

2 M. HAME'LLIÆ (D. C. l. c.) leaves oval, acuminated at both ends, on long petioles, rather scabrous from scattered hairs above, and along the nerves underneath. ♄. G. Native of Nipaul. Branchlets compressed. Leaves along with the petioles an inch and more in length. Stipulas ovate, broad, short, acutish. Peduncles numerous, spreading, disposed in loose cymes, rising from the top of the stem and forks of the branches. Corolla 6 lines long, scarcely puberulous. Style very short, inclosed, hardly attaining the height of the anthers.

Hamellia-like Menestoria. Shrub 5 to 6 feet.

3 M. MUSSÆ'NDÆ (D. C. l. c.) leaves ovate, acute, on short petioles, pale beneath, and downy on both surfaces; petioles, stipulas and middle nerve of the leaves clothed with rufous hairs. ♄. G. Native of Nipaul. Branches rather hispid and rufous. Stipulas ovate. Corymbs dichotomous, with some of the flowers sessile and solitary in the forks, and others terminal. Calyx hispid; lobes deciduous. Berry ovate-globose, smoothish.

Mussænda-like Menestoria. Shrub 5 to 6 feet.

4 M.? RÍGIDA (D. C. l. c.) leaves cuneated, retuse, and mucronulate, glabrous; stipulas ovate, acute. ♄. G. Native of Nipaul, at Suembu. Gardènia rígida, Hamilt. ex D. Don, prod. fl. nep. p. 138. A much-branched depressed rigid shrub. Segments of the calyx subulate. Limb of corolla 5-lobed; lobes attenuated at the apex.

Stiff Menestoria. Shrub 3 to 4 feet.

Cult. For culture and propagation see *Gardènia*, p. 499.

XLI. HELO'SPORA (from ἥλιος, *helios*, the sun, and σπορα, *spora*, a seed; in reference to the disposition of the seeds). Jack, in Lin. trans. 14. p. 127. t. 4. f. 3. D. C. prod. 4. p. 391.

LIN. SYST. *Tetrándria, Monogýnia.* Calyx with a globose tetragonal tube, and a somewhat campanulate 4-toothed, erect, permanent limb. Corolla tubular, much longer than the calycine limb, with a naked throat, and 4 oblong spreading lobes, which are valvate in æstivation. Anthers 4, linear, inclosed. Style 4-furrowed, and 4-cleft at the apex; stigmas short, spreading. Berry crowned by the calyx, tetragonal, not divided into cells inside, but bearing the seeds disposed crosswise, in 4 double series, immersed in pulp. Seeds linear, curved a little.—A smoothish shrub. Leaves opposite, on short petioles, ovate-lanceolate. Stipulas deciduous, bearing a row of ciliæ inside. Peduncles axillary, 1-flowered, shorter than the leaves. Bracteoles 2, under each ovarium.—This genus is perhaps allied to *Guettárda* or *Gardènia*.

1 H. FLAVE'SCENS (Jack, l. c.). ♄. S. Native of Sumatra. Leaves 3-5 inches long. Corolla yellowish, 3-4 lines long.

Yellowish-flowered Helospora. Tree small.

Cult. For culture and propagation see *Gardènia*, p. 499.

XLII. HIPPO'TIS (from ἱππος *hippos*, a horse, and ους ωτος, *ous otos*, an ear; the form of the calyx has been compared to the ear of a horse). Ruiz et Pav. prod. p. 33. fl. per. 2. p. 55. t. 201. Juss. mem. mus. 6. p. 396. A. Rich, mem. soc. hist. nat. par. 5. p. 255.

LIN. SYST. *Pentándria, Monogýnia.* Calyx with an obovate tube and a spath-formed limb, which is cleft on one side, and drawn out into a mucronate auricle on the other. Corolla a little longer than the calyx, funnel-shaped, with a somewhat incurved tube, and a bluntly 5-lobed limb. Stamens 5, inserted in the middle of the tube; anthers ovate, inclosed. Urceolus 5-crenate, seated on the ovarium. Stigma of 2 adpressed lobes. Berry ovate, crowned by the calyx, 2-celled. Seeds numerous, minute.—An unarmed villous shrub. Leaves obovate-oblong, acuminated, petiolate. Stipulas ovate, acute, caducous, villous on the outside and solitary on each side. Peduncles axillary, hardly one half shorter than the leaves, 3-flowered at the apex. Corolla and berries villous, purplish red.

1 H. TRIFLÒRA (Ruiz et Pav. l. c.). ♄. S. Native of Peru, in forests about Cuchero, Macora, and Marimarchahua. Peduncles furnished with small, subulate, deciduous bracteas. Calyx reddish purple. Corolla crimson, greenish at the base: having the tube yellowish inside.

Three-flowered Hippotis. Shrub 10 to 12 feet.

Cult. For culture and propagation see *Gardènia*, p. 499.

XLIII. POMA'TIUM (from *pomum*, an apple; shape of fruit). Gærtn. fil. carp. 3. p. 252. t. 225. f. 10. D. C. prod. 4. p. 391.

LIN. SYST. *Pentándria, Monogýnia.* Calyx with a subglobose tube, and a 5-toothed limb; teeth short, obtuse, deciduous, leaving only a membranous circle behind. Corolla small, with a terete tube and a 5-parted limb. Anthers ovate, sessile in the throat of the corolla, inclosed. Stigma bifid, with oblong

lobes. Berry almost dry, globose, somewhat didymous, crowned by an areola formed by the falling of the calyx, 2-celled, many-seeded. Placentas rather tumid. Seeds angular. Embryo straight, in fleshy albumen, with a centripetal radicle, and flat ovate-roundish cotyledons.—African shrub. Branches terete, hispid in the young state, and glabrous in the adult state. Leaves opposite, almost sessile, oblong-lanceolate, acuminated. Stipulas foliaceous, solitary on each side, oblong, acuminated, almost an inch long. Thyrse spike-formed, terminal.—Habit of *Bertièra*.

1 P. spica'tum (Gærtn. l. c. D. C. diss. ined. with a figure). ♄. S. Native of Sierra Leone, where it was collected by Smeathmann and G. Don; and in the woods of Casamancia at Itou by Perrottet and Leprieur. Génipa labiàta, Smeathm. in herb. Lher. Flowers small, white.

Spicate-flowered Pomatium. Shrub 6 to 8 feet.

2 P. du'bium; leaves broad-lanceolate, long-acuminated, rather cordate at the base, sessile; flowers panicled, axillary, and terminal. ♄. S. Native of Sierra Leone, on the mountains, in woods. Flowers small, white.

Doubtful Pomatium. Shrub 6 to 8 feet.

Cult. See *Gardènia*, p. 499. for culture and propagation.

XLIV. BERTIE'RA (named by Aublet after a Madam Berthier, who was of great assistance to him while he was collecting plants in Guiana). Aubl. guian. 1. p. 180. t. 69. Lam. ill. t. 165. D. C. diss. ined. 1806. with a figure. prod. 4. p. 391. Gærtn. fil. carp. 3. t. 192. Juss. mem. mus. 6. p. 390. Rich. mem. soc. hist. par. 5. p. 253.

Lin. syst. *Pentándria, Monogýnia.* Calyx with a subglobose tube, and a very short permanent 5-toothed limb. Corolla funnel-shaped, with a terete tube, and a 5-parted spreading limb; segments oval, very acute. Anthers 5, sessile within the throat of the corolla. Stigma bifid; the lobes acute. Berry almost dry, crowned by the calyx, umbilicate, roundish, 2-celled, many-seeded. Seeds fixed to the central placentas, angular, muricated.—Shrubs. Leaves oval-oblong, acuminated, petiolate, villous. Stipulas solitary on both sides, combined at the base, acuminated. Thyrse terminal, racemosely panicled, bracteolate. Flowers small, white, and sometimes red.—Habit of *Lygístum*, but differs in the flowers being 5-parted.—This genus is probably divisible into several.

Sect. I. Bertie'ra (see genus for derivation). D. C. prod. 4. p. 392.—Bertièra, Aubl. Fruit usually striated, crowned by the calycine teeth, which are erectly connivent and subulate. Inflorescence terminal.

1 B. Guiane'nsis (Aubl. guian. 1. p. 180. t. 69.) leaves ovate-oblong or elliptic, acute, with distant villous nerves; stipulas undivided on both sides, acuminated; flowers disposed in a racemose thyrse; fruit sessile, striated, hairy, disposed along the branches of the panicle, crowned by the erect subulate calycine teeth. ♄. S. Native of French Guiana, in woods; and of Cayenne. Vahl, symb. 3. p. 35. Lam. ill. t. 165. Spreng. syst. 1. p. 708. exclusive of some synonymes. Branches villous. Stipulas broad at the base, and rather connate. Leaves 3-4 inches long. Flowers small, white.

Guiana Bertiera. Shrub 6 to 7 feet.

2 B. mucrona'ta (Gærtn. fil. carp. 3. p. 74. t. 192. f. 7.) leaves and flowers unknown; fruit striated, crowned by the erectly connivent calycine teeth, pedicellate, disposed along the branches of the panicle. ♄. S. Native country unknown. Perhaps the same as *B. Guianénsis*.

Mucronate Bertiera. Shrub.

3 B. palu'stris (A. Rich. in mem. soc. hist. nat. par. 5. p. 245.) leaves elliptic-oblong, acute, hairy, with approximate nerves; stipulas bifid on both sides; flowers almost cymose; fruit not striated, hairy, crowned by the subulate teeth of the calyx. ♄. S. Native of Guiana, in marshy parts of woods. A small sub-herbaceous erect shrub, clothed with rusty down. Leaves soft, usually tapering gradually to the base.

Marsh Bertiera. Shrub 1 to 2 feet?

Sect. II. Zaluza'nia (altered from Zaluzianski, an obscure Polish botanist). D. C. prod. 4. p. 392.—Zaluzània, Comm. mss. Fruit smooth, crowned by the calycine teeth, which are spreading or erect, but not connivent. Embryo transverse, ovate-cylindrical, in the albumen.—Inflorescence terminal, racemosely thyrsoid.

4 B. Borbo'nica (A. Rich, l. c.) smoothish; leaves elliptic-lanceolate, acuminated, petiolate; stipulas undivided, drawn out into a setaceous point each, length of petioles; racemes thyrsoid, terminal; fruit glabrous, not striated, crowned by the teeth of the calyx, which are permanent, acute, and straight, but not connivent. ♄. S. Native of the Island of Bourbon. Peduncles angular. Bracteas subulate.

Bourbon Bertiera. Shrub 3 to 4 feet.

5 B. ru'fa (A. Rich, l. c.) leaves elliptic, acute, on very short petioles, clothed with rufous silky down; stipulas broad, connate, acute, silky inside, and smoothish on the outside; racemes elongated; pedicels silky; fruit globose and villous, crowned by the erect calycine teeth. ♄. S. Native of the Island of Bourbon.

Rufous Bertiera. Shrub.

6 B. Zaluza'nia (Gærtn. fil. carp. 3. p. 74. t. 192.) smoothish; leaves rather coriaceous, lanceolate-elliptic, acuminated, on short petioles, ciliated on the edges; stipulas undivided, drawn out into an acumen, length of petioles; racemes thyrsoid, terminal, and are as well as the flowers downy; branches of racemes dichotomous, with a sessile flower in each fork; fruit crowned by the limb of the calyx, which is hardly toothed; teeth spreading. ♄. S. Native of the Mauritius. Mussæ'nda racemòsa, Sieb. fl. maur. 3. no. 362. Stipulas short, broad, concrete. Racemes apparently drooping. Bracteas small, acute. Flowers sessile. Anthers mucronate. Calyx truncate. Corolla widening from the base, with acute segments.

Zaluzianski's Bertiera. Shrub 3 to 4 feet.

Sect. III. Myce'tia (apparently after some botanist of the name of Mycet). Reinwardt. mss. D. C. prod. 4. p. 392.—Bertièra, Blum. bijdr. p. 987. Tube of calyx obovate or turbinate. Berry crustaceous inside, crowned by the calycine teeth, which are spreading. Racemules axillary, somewhat corymbose.

7 B. Java'nica (Blum. bijdr. p. 987.) stem simple; leaves petiolate, cuneate-oblong, acuminated, with a few scattered hairs above, and more so on the nerves beneath; corymbs divaricate, axillary, and terminal, trichotomous, solitary, drooping; tube of corolla short. ♄. S. Native of Java, in shady parts of woods.

Java Bertiera. Shrub 2 to 3 feet.

8 B. fascicula'ta (Blum. bijdr. p. 987.) stem a little branched; leaves cuneate-oblong, acuminated, glabrous above, but somewhat strigose on the veins beneath; corymbs short, axillary, trichotomous, erect; pedicels in fascicles; tube of corolla elongated. ♄. S. Native of Java, on Mount Salak, in humid places. Corymbs often lateral, hardly longer than the petioles. Throat of corolla velvety.

Var. β, macrophýlla (Blum. l. c.) leaves obovate, acute. ♄. S. Native of Java, on Mount Bonkok, in the province of Bantam.

Fascicled-pedicelled Bertiera. Shrub.

9 B. lateriflòra (Blum. bijdr. p. 987.) stem branched; leaves almost sessile, cuneate-oblong, acuminated, glabrous above and puberulous beneath on the veins; corymbs terminal and axillary, solitary or crowded, trichotomous, at length pendulous; tube of corolla elongated. ♄. S. Native of Java, on the mountains. Mycètia, Reinwardt. ex Blum. Corymbs often lateral. Corolla reddish, tubular, with a velvety throat. Berry globose. Teeth of calyx acuminated, separated to the base of the limb. Stipulas triangular, acuminated.

Lateral-flowered Bertiera. Shrub 4 to 5 feet?

† *A species not sufficiently known.*

10 B. coccínea; shrub rambling, villous; leaves opposite, ovate, acuminated, quite entire, petiolate; corymbs panicled, terminal; calyx 5-cleft, hairy, with linear segments; corolla tubular, salver-shaped, with a spreading 5-cleft border, and a villous throat; stamens 5, inclosed. ♄. S. Native of Sierra Leone, among bushes, in the lowlands about Freetown. Flowers about the size and form of those of *Vínca ròsea*, of a deep scarlet colour, and very showy.

Scarlet Bertiera. Shrub rambling.

Cult. See *Mussæ'nda*, p. 492. for culture and propagation.

XLV. POUCHE'TIA (named after M. F. Pouchet, professor of botany in the Jardin des Plantes at Rouen; author of Histoire Naturelle et Medicale de la Famille des Solanees). A. Rich, soc. hist. nat. par. vol. 5. p. 251. D. C. prod. 4. p. 393.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx with an ovate tube, and a small 5-toothed limb. Corolla with a short obconical tube, a glabrous throat, and a 5-lobed limb; lobes oval-oblong, twisted in æstivation. Anthers 5, linear, sessile in the throat of the corolla. Style filiform. Stigmas 2, linear, acute, diverging a little at the apex, hardly exserted. Berry dry, closely crowned by the connivent teeth of the calyx, obovate, 2-celled. Seeds 4-6 in each cell, oblong, deformed from being pressed against each other, and clothed with adpressed silky villi. Albumen fleshy. Embryo unknown.—A glabrous African shrub, with roundish branches. Leaves ovate, acuminated, on short petioles. Stipulas solitary on both sides, ovate, ending each in a short cuspidate point. Peduncles opposite, panicled, few-flowered, axillary: but the upper ones are disposed in a terminal panicle from the leaves being gradually diminished and changed into bracteas. Flowers small, glabrous, white?—This genus differs from *Gardènia* in habit, in the 5-toothed calyx, in the dry 2-celled fruit, and in the cells being few-seeded; in these last characters it agrees with *Cùpia*, but differs from it in the connivent calyx, and in the velvety seeds, and in habit.

1 P. Africa'na (D. C. prod. 4. p. 393.). ♄. S. Native of Sierra Leone, where it was collected by Smeathmann; and in the woods of the Gambia, Casamancia, and Cayor, where it was collected by Leprieur and Perrottet. Gardènia parviflòra, Smeathmann, but not of Poir. dict. suppl. 2. p. 708. which is according to A. Rich. *Psydrax dicóccos*.

African Pouchetia. Shrub 5 to 6 feet.

Cult. For culture and propagation see *Mussæ'nda*, p. 492.

XLVI. CU'PIA (*Cupi* is the Malabar name of one of the species). D. C. prod. 4. p. 393.—Cùpi, Rheed. mal. 2. p. 37. Adans, fam. 2. p. 158.—Chomèlia, Lin. gen. ed. 1737. no. 167. but not of Jacq.—Rondelètia species, Lin. spec.—Webèra, Schreb. gen. 1791. no. 1733. Willd. spec. 1. p. 1224. exclusive of the characters and species no. 3. Gærtn. fil. carp. 3. p. 71. t. 102. Roxb. fl. ind. 2. p. 533. but not of Hedw. (1782.)—Cánthium species, Pers.—Stylocoryna species, Rich. Cánthium, sect. Cùpia, Rœm. et Schultes, syst. 4. p. 306.—Zamària, Rafin. ann. gen. sc. phys. 6. p. 85.?

Lin. syst. *Pentándria*, *Monogýnia*. Calyx with a turbinate tube, and a 5-parted limb; lobes erect, acute, permanent. Corolla funnel-shaped, with a terete tube, which is longer than the calyx, a gradually widened throat, and a 5-parted limb; segments ovate-oblong, recurved. Filaments very short. Anthers oblong, dehiscing at the side in the upper part of the cells. Style clavate, 10-angled or 2-lobed. Berry globose, crowned by the calyx, 2-celled. Placentas spongy, central. Seeds wrinkled at the hylum. Albumen cheesy. Embryo centripetal.—Asiatic glabrous shrubs. Leaves oblong-lanceolate. Stipulas intrafoliaceous, broad, ending each in a short acumen. Corymbs or panicles trichotomous, terminal, axillary, or opposite the leaves. Flowers white, fragrant.

§ 1. *Stigma undivided.*

1 C. corymbòsa (D. C. prod. 4. p. 394.) shrubby; leaves lanceolate-oblong, with revolute margins, shining; corymbs terminal; lobes of calyx 5, about equal in length to the tube of the corolla; mature capsule 4-seeded. ♄. S. Native of the coast of Coromandel, frequent; Malabar; Pulo Penang, on hills; Ceylon, China, &c. Cùpi, Rheed. mal. 2. p. 37. t. 23. Rondelètia Asiática, Lin. spec. 244. Webèra corymbòsa, Willd. spec. 1. p. 1224. Ker. bot. reg. t. 126. Cánthium corymbòsum, Pers. ench. 1. p. 200. Roxb. fl. ind. 2. p. 533. Stylocoryna Webèra, A. Rich. mem. soc. hist. nat. par. 5. p. 248. Leaves 6-7 inches long and 2½ broad: having hairy glands in the axils of the large veins. Corymbs terminal. Flowers small, very numerous, at first white, but finally yellowish, faintly fragrant. Berry size of a large pea, black when ripe. Seeds 4-8 in each cell. The extremities of the young shoots are often found covered with a white resinous matter, like that on the germs of most species of *Gardènia*.

Corymbose-flowered Cupia. Clt. 1759. Shr. 5 to 6 ft.

2 C. macrophy'lla (D. C. prod. 4. p. 394.) leaves broad-lanceolate, acuminated: panicle terminal, villous; tube of corolla long, slender, villous; berries 5-12-seeded. ♄. S. Native of the Prince of Wales Island. Webèra macrophýlla, Wall. in Roxb. fl. ind. 2. p. 534. Young shoots villous. Leaves 6-8 inches long, and from 4-5 broad. Panicle large. Flowers large, white. Anthers as long as the segments of the corolla.

Long-leaved Cupia. Shrub.

3 C. densiflo'ra (D. C. prod. l. c.) sub-arborescent; leaves oblong-lanceolate, acute at the base; panicle rounded, lateral, almost sessile, occupying the place of a leaf or branch, trichotomous, dense-flowered; throat of corolla bearded; ovarium many-seeded. ♄. S. Native of Pulo-Penang, on hills. Webèra densiflòra, Wall. in Roxb. fl. ind. 2. p. 636. Leaves coriaceous, acuminated, shining above, 5-6 inches long. Flowers numerous, by threes, white. Bracteas lanceolate, ciliated. Anthers very long.

Dense-flowered Cupia. Shrub large.

4 C. mollíssima (Hook. et Arn. in Beech. bot. p. 192.) leaves lanceolate, clothed with soft dense hairs on both surfaces; lobes of calyx short, very blunt; fruit pubescent, many-seeded. ♄. G. Native of China. The hairs, which clothe every part of the plant are of a rusty colour. Stigma unknown.

Very-soft Cupia. Shrub.

5 C. oppositifo'lia (D. C. l. c.) shrubby; leaves lanceolate-oblong, firm, and glossy; panicles opposite the leaves, composed of a few stiff, jointed, sub-recurved spikes; corolla with a short tube and a woolly throat; stigma clavate. ♄. S. Native of Chittagong. Webèra oppositifòlia, Roxb. fl. ind. 2. p. 535. Flowers white.

Opposite-leaved Cupia. Shrub.

6 C. odora'ta (D. C. l. c.) shrubby; leaves lanceolate, acuminated, polished; corymbs terminal, and are as well as the bracteas villous; calyx 5-toothed: teeth one half shorter than the tube of the corolla; cells of berries 3-4-seeded. ♄. S. Native of Silhet, where it is called *Patugrooja*. Webèra odoràta, Roxb. fl. ind. 2. p. 535. Leaves 4-6 inches long and 1-2 broad. Stipulas triangular. Flowers numerous, middle-sized, white, very fragrant. Anthers about as long as the segments of the corolla.

Sweet-scented-flowered Cupia. Shrub large.

§ 2. *Stigma 2-lobed.*

7 C. auricula'ta (D. C. l. c.) arborescent, smooth; leaves ovate-oblong, emarginate, and unequally 2-lobed at the base, acuminated, almost sessile, the axils of the veins glandular beneath; panicles terminal and lateral, brachiate, on flattened peduncles; throat of corolla swelled, elevated, and bearded; ovarium many-seeded. ♄. S. Native of Pulo-Penang. Webèra auriculàta, Wall. in Roxb. fl. ind. 2. p. 537. Leaves contracted towards the cordate base, 7 inches long. Flowers white, fragrant.

Auricled-leaved Cupia. Shrub large.

8 C. trunca'ta (D. C. l. c.) shrub twining; leaves ovate, acute; panicles terminal, on flattened peduncles: corolla with a naked throat; ovarium 4-ovulate. ♄. ⌒. S. Native of Pulo-Penang, on hills. Webèra truncàta, Wall. in Roxb. fl. ind. 2. p. 538. Leaves 3-4 inches long, acute at the base, dark and shining above, coriaceous. Bracteas lanceolate, deciduous. Flowers white, fragrant, on short pedicels by threes, or in fascicles. Anthers very long.

Truncate Cupia. Shrub tw.

9 C. sca'ndens (D. C. l. c.) shrubby, scandent, glossy; leaves oblong, acuminated; cymes axillary; stigma of 2 oval plates. ♄. ⌣. S. Native of Silhet, where it is called *Gujer-kota* by the natives. Webèra scándens, Roxb. fl. ind. 2. p. 534. Leaves 6 inches long and 2-3 inches broad. Divisions of cymes generally biternate. Flowers large, funnel-shaped, fragrant when they first open, white, but like *Gardènias* become yellow by the second day. Anthers linear, sessile.

Climbing Cupia. Shrub cl.

† *Species not sufficiently known.*

10 C. cymo'sa (D. C. l. c.) arborescent; branches pubescent; leaves ovate, acute, shining; cymes axillary, pedunculate, many-flowered; stigma capitate, 2-lobed. ♄. S. Native of the East Indies. Webèra cymòsa, Willd. spec. 1. p. 1224. Rondelètia cymòsa, Poir. dict. 6. p. 256. Cánthium cymòsum, Pers. ench. 1. p. 200. Flowers white, fragrant. Berries about the size of juniper berries, but their internal structure has not been noticed.

Cymose-flowered Cupia. Clt. 1811. Tree.

11 C. thyrsoídea (D. C. l. c.) branches woody, clothed with brown pubescence; leaves oblong-ovate, acuminated at both ends; thyrse dense, terminal; corolla glabrous outside and pilose inside; stigma bifid. ♄. S. Native of the East Indies. Webèra thyrsoídea, Roth. nov. spec. p. 149. Cánthium thyrsoídeum, Rœm. et Schultes, syst. 6. p. 207. Flowers white. Fruit unknown.

Thyrse-flowered Cupia. Shrub.

Cult. For culture and propagation see *Rondelètia*, p. 517. All the species are very elegant when in blossom, and the flowers are very fragrant.

XLVII. TARE'NNA (*Tarenna* is the Ceylonese name of the shrub). Gærtn. fruct. 1. p. 139. t. 28. f. 3. D. C. prod. 4. p. 395.

Lin. syst. *Pentándria, Monogýnia.* Calyx with a globose tube, and a 5-parted limb; lobes linear-oblong, reflexed, permanent. Corolla, stamens, and stigma unknown. Berry globose, with 8 stripes, crowned by the limb of the calyx, 2-celled; pulp thin. Placentas central, spongy. Seeds 4-6 in each cell, horizontal, semi-lunate, cuneated, compressed, wrinkled. Albumen fleshy. Embryo dorsal, with the radicle directed to the periphery, and foliaceous cotyledons. This genus appears to be allied to *Cùpia*, but the flowers and all other particulars besides those mentioned are unknown.

1 T. Zeyla'nica (Gærtn. l. c.). ♄. S. Native of Ceylon.

Ceylon Tarenna. Tree or shrub.

Cult. For culture and propagation, see *Rondelètia*, p. 517.

XLVIII. PETE'SIA (the author does not give the derivation of the name). P. Browne, jam. p. 144. Jacq, amer. p. 18.? Swartz, fl. ind. occ. 3. p. 1945.? Bartl. in herb. Hænke, mss. but not of Gærtn. D. C. prod. 4. p. 395.—Petèsia species, Juss.

Lin. syst. *Tetra-Pentándria, Monogýnia.* Calyx with a roundish tube, and a short, 4-5-toothed limb. Corolla funnel-shaped, with an equal 4-5-cleft limb. Stamens 4-5, within the tube. Berry almost globose, naked at the apex, 2-celled, many-seeded. Seeds numerous, rather angular, crustaceous.—Trees and shrubs. Leaves opposite, or 3 in a whorl, on short petioles, often coriaceous. Stipulas intrapetiolar, undivided, solitary, on both sides. Peduncles axillary, shorter than the leaves, bearing each a few-flowered corymb or cyme; rarely terminal, except in the more doubtful species.—Petèsia of Gærtn. is Eumàchia, D. C. a genus among the tribe *Coffeàceæ*. The character given by P. Browne agrees with this genus, but the species given are probably true species of *Rondelètia*. *Petèsia* of Jacq. and Swartz is very doubtful, and will probably constitute a new genus, according to Bartling.

* *Flowers axillary.*

1 P. gra'ndis (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 395.) leaves opposite, rhomboid-ovate, acuminated at both ends, villous on both surfaces while young, but in the adult state they are beset with a little scattered down above, and rather villous on the nerve and veins beneath, reticulated and radiately striated between the veins; corymbs few-flowered. ♄. S. Native of Mexico. Limb of calyx 5-cleft, deciduous. Seeds scrobiculate.

Great Petesia. Tree.

2 P. nítida (Bartl. in herb. Hænke, ex D. C. l. c.) leaves opposite, oblong, attenuated at both ends, glabrous, reticulately veined beneath, and radiately striated between the veins; peduncles axillary, 3-5-flowered, but only bearing one fruit each. ♄. S. Native of the Philippine Islands and Mariane Island. Calyx sinuately 4-toothed. Corolla tomentose, small. Berry globose, hardly the size of a pea. Seed sub-cylindrical. The leaves are striated, almost like those of the first species.

Shining-leaved Petesia. Tree.

3 P. ternifòlia (Bartl. in herb. Hænke, ex D. C. l. c.) leaves 3 in a whorl, obovate-oblong and oblong, acute at both ends; peduncles axillary, bifid, 5-7-flowered, but bearing only 1 fruit each. ♄. S. Native of the Island of Luzon.

Three-leaved Petesia. Tree.

4 P. carno'sa (Hook et Arn. in Beech, voy. pt. bot. p. 64.) leaves opposite, oblong-obovate, obtuse, attenuated at the base, glabrous, fleshy; peduncles axillary, 1-flowered. ♄. S. Native of the Society Islands. Corolla funnel-shaped, 4-lobed: having the anthers sessile in the throat. It differs from most Rubiaceous plants in the fleshy leaves.

Fleshy-leaved Petesia. Tree or shrub.

* * *Flowers terminal.*

5 P.? hi'spida (Bartl. in herb. Hænke. ex D. C. l. c.) leaves opposite, membranous, obovate-oblong, acuminated at both ends, having the middle nerve on both surfaces, and the veins beneath hispid from bristles; corymbs terminal, short. ♄. S. Native of the island of Luzon.

Hispid-leaved Petesia. Tree or shrub.

6 P.? tomentòsa (Jacq. amer. p. 18.) leaves oblong, attenuated at both ends, very soft on both surfaces from hardly conspicuous tomentum; corymbs lateral and terminal. ♄. S. Native of New Spain, in woods about Carthagena. Flowers tetramerous. Fruit unknown. Perhaps a species of *Rondelètia*.

Tomentose Petesia. Tree.

7 P.? spica`ta (Swartz. fl. ind. occ. 3. p. 1945.) leaves elliptic, attenuated, glabrous, pubescent on the nerves beneath; petioles hairy; racemes terminal, spicate. ♄. S. Native of the south of Jamaica, among bushes. Flowers small, white, 4-parted. Berry crowned by the very minute calyx.

Spicate-flowered Petesia. Shrub 5 to 6 feet.

8 P.? simplici'ssima (Lour. coch. p. 77.) stem herbaceous, quite simple, tetragonal; leaves lanceolate-linear, glabrous; racemes erect, almost terminal; calyx 5-toothed. ♃. G. Native of Cochinchina. The fruit is said to be baccate, 2-celled, and many seeded. Flowers white.

Quite-simple-stemmed Petesia. Pl. 1 foot.

9 P.? termina`lis (Hook. et Arn. in Beech. voy. pt. bot. p. 85.) leaves oblong, obtuse at the base, acutish at the apex, membranous, glabrous; panicles terminal, racemose, one-half shorter than the leaves; corolla salver-shaped, having the lobes shorter than the tube. ♄. S. Native of the Sandwich Islands. Stem dichotomously branched. Leaves 4 inches long, and 1 and $1\frac{1}{2}$ inch broad. Corolla funnel-shaped, 4-lobed, inclosing the anthers. Much the habit of Stylocoryna racemòsa, Cav.

Terminal-flowered Petesia. Tree or shrub.

10 P.? coria`cea (Hook. et Arn. in Beech. voy. pt. bot. p. 85.) leaves oblong, acute at the base, and obtuse at the apex, coriaceous, glabrous; corymbs terminal, dense, few-flowered, much shorter than the leaves. ♄. S. Native of the Sandwich Islands.

Coriaceous-leaved Petesia. Tree or shrub.

Cult. For culture and propagation see *Rondelètia*, p. 517.

XLIX. COCCOCY'PSELUM (from κοκκος, *kokkos*, a berry, and κυψελη, *kypsele*, a vase; in allusion to the form of the fruit). Swartz, fl. ind. occid. 1. p. 245. H. B. et Kunth, nov. gen. amer. 3. p. 403. Cham. et Schlecht. in Linnæa. 4. p. 138. D. C. prod. 4. p. 396.—Coccocýpsilum and Sicèlium, P. Browne, jam. 144.—Coccocýpsilum and Tontànea, Juss. mem. mus. 6. p. 394.—Coccocýpselum and Bellárdia, Schreb. gen. no. 1721. and 1723.—Condàlia, Ruiz et Pav. fl. per. prod. p. 11. t. 2. but not of Cav.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with an ovate tube, and a 4-parted permanent limb (f. 94. *a.*); lobes narrow. Corolla funnel-shaped (f. 94. *b.*), with a 4-parted limb (f. 94. *b.*), and a glabrous throat. Stamens 4, inserted in the tube of the corolla, inclosed (f. 94. *b.*); anthers oblong-heart-shaped. Stigma bifid. Berry ovate, crowned (f. 94. *d. e.*), 2-celled (f. 94. *c.*); cells many-seeded. Seeds lenticularly angular, wingless.—Creeping herbs. Leaves opposite, on short petioles. Stipulas subulate, solitary on both sides. Peduncles axillary, solitary, and in the alternate axils, bearing each a few-flowered head, surrounded by a short involucrum. Corollas and berries blue or purple.

FIG. 94.

1 C. re`pens (Swartz, fl. ind. occ. 1. p. 245.) plant prostrate, creeping; leaves ovate, pubescent on both surfaces; peduncles very short while bearing the flowers, but afterwards becoming more elongated; heads few-flowered; bracteas subulate. ☉. S. Native of Jamaica and St. Domingo, in temperate parts on the mountains. Browne, jam. 144. t. 6. f. 2. C. herbàceum, Lam. dict. 2. p. 56. ill. t. 64. Flowers almost sessile, collected in the axils of the leaves, blue. Fruit seated on peduncles, 4-5 lines long, blue, inflated. (f. 94.)

Creeping Coccocypselum. Fl. May. Clt. 1793. Pl. cr.

2 C. umbella`tum (Poir. suppl. 2. p. 307.) leaves ovate, acute, shining, pubescent; peduncles one-half shorter than the leaves; bracteas of the heads of flowers subulate.—Native of Peru, at Pillao, Cuchero, and Chinchao, in woods. Condàlia rèpens, Ruiz et Pav. fl. per. 1. p. 54. t. 84. f. a. C. Condàlia, Pers. ench. 1. p. 132. Cham. et Schlecht. in Linnæa. vol. 4. p. 139. C. capitàtum, Willd. herb. There are glabrous and downy varieties of this plant. Corolla purplish. Berries blue.

Umbellate-flowered Coccocypselum. Pl. creeping.

3 C. ova`tum (Cham. et Schlecht. in Linnæa. 4. p. 141.) plant ascending, rooting at the base; leaves ovate, very blunt at the base, and acute at the apex, beset with minute adpressed down; peduncles alternate, shorter than the leaves, clothed with strigose hairs; heads 8-10-flowered. ♃. S. Native of Brazil. Allied to *C. umbellàtum* and *C. lanceolàtum*.

Ovate-leaved Coccocypselum. Pl. cr.

4 C. lanceola`tum (Pers. ench. 1. p. 132.) plant densely clothed with down; leaves lanceolate, acute; heads many flowered, pedunculate; bracteas lanceolate; berries ovate-oblong. ♃. S. Native of Peru, in shady groves at Cuchero and Chinchao, ex Ruiz et Pav.; and on the mountains about the Orinoco, ex Hænke; and at Caraccas, ex Vargas. Condàlia lanceolàta, Ruiz et Pav. fl. per. 1. p. 54. Corolla of a pale violaceous colour. Berries blue.

Lanceolate-leaved Coccocypselum. Pl. cr.

5 C. hirsu`tum (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 396.) plant ascending, very hairy in every part; leaves broad-ovate, acute; heads axillary when in flower, almost sessile; peduncles a little elongated when in fruit, and recurved. ♃. S. Native country unknown.

Hairy Coccocypselum. Pl. ascending.

6 C. cane'scens (Willd. herb. ex Cham. et Schlecht. in Linnæa. 4. p. 139.) plant prostrate, creeping; leaves ovate, clothed with silky yellow down on both surfaces; heads axillary, and almost terminal, on long peduncles; bracteas of heads 5-6, oblong, acute. ♃.? S. Native of South America, in temperate shady places, near Buenavista, Caraccas, Popayan, and of tropical and extratropical Brazil. C. rèpens, H. B. et Kunth, nov. gen. amer. 3. p. 405. exclusive of the synonymes. Schwenkféldia áspera, Spreng. neu. entd. 1. p. 280. but not of Willd. Bellárdia móllis, Willd. herb. ex Cham. et Schlecht. in Linnæa. vol. 4. Corolla bluish or red. Berries blue.

Canescent Coccocypselum. Pl. cr.

7 C. au'reum (Cham. et Schlecht. in Linnæa. 4. p. 139.) leaves oblong, acute, with parallel veins, clothed with golden silky down; heads axillary, sessile, few-flowered; bracteas 4-5, narrow, acute. ♃. S. Native of tropical Brazil. Schwenkféldia aúrea, Spreng. neu. entd. 1. p. 280. syst. 1. p. 764.

Allied to *C. canéscens*, but differs in the above characters, and in the flowers being larger and slenderer, and less hairy; and in the lobes being more acute and longer.

Golden Coccocypselum. Pl. cr.

8 C. NUMMULARIFÒLIUM (Cham. et Schlecht. in Linnæa. 4. p. 397.) plant very hairy, prostrate, creeping; leaves ovate-roundish, very blunt at the base, obtuse at the apex, and somewhat mucronulate; heads on short peduncles; bracteas linear. ♃. S. Native of equinoxial Brazil. Corolla violaceous, beset with spreading pili at the tops of the lobes. Allied to *C. campanuliflòrum* and *C. cordifòlium*.

Money-wort-leaved Coccocypselum. Pl. cr.

9 C. CORDIFÒLIUM (Nees et Mart. in nov. act. bonn. 12. p. 14.) plant creeping; leaves cordate, obtuse, hairy; peduncles at length equal in length to the petioles; heads of flowers almost globose; calyxes and petioles very villous. ♃. S. Native of Brazil, on the road to Felisbert and of St. Catharine. Corolla white, pubescent. Berries globose, blue. Habit of *Geóphila*.

Heart-leaved Coccocypselum. Pl. cr.

10 C.? ERYTHROCE'PHALUM (Cham. et Schlecht. in Linnæa. 4. p. 144.) branches or stems simple, hairy; leaves ovate, acute, obtuse at the base, hairy on both surfaces, often purplish beneath; heads on short peduncles, beset with purplish hairs. ♃. S. Native of equinoxial Brazil. Flowers and fruit unknown.

Red-headed Coccocypselum. Pl. cr.?

11 C. PEDUNCULA'RE (Cham. et Schlecht. in Linnæa. 4. p. 142.) plant ascending, clothed with adpressed strigose hairs; leaves lanceolate-oblong, with revolute edges; peduncles alternate, longer than the leaves, usually reflexed after flowering; heads 10-12-flowered. ♃. S. Native of equinoxial Brazil.

Peduncular Coccocypselum. Pl. cr.

12 C. TONTA'NEA (H. B. et Kunth, nov. gen. amer. 3. p. 406.) leaves ovate, acutish, clothed with hairy down on both surfaces; heads axillary, pedunculate, 3-5-flowered; bracteas subulate; anthers a little exserted. ♃. S. Native of Cayenne, Guiana, Caraccas, Popayan, and of Jamaica, if C. Sicèlium, P. Browne, jam. 144. be the same. Tontànea Guianénsis, Aubl. guian. 1. p. 108. t. 408. Tontànea rèpens, Pers. Bellárdia rèpens. Willd. spec. 1. p. 626. Bellárdia Tontànea, Rœm. et Schultes, syst. 3. p. 205. Corolla either white or blue, ex Aubl. Berries blue. *Tontanee* is the Guiana name of the plant.

Tontanea Coccocypselum. Pl. cr.

13 C. GLA'BRUM (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 397.) plant creeping, quite glabrous; leaves ovate, subcordate, acutish; heads few-flowered, axillary, when bearing the fruit on longer peduncles, which are deflexed. ♃. S. Native of Panama. Very nearly allied to *C. Tontànea*, and probably only a glabrous variety of that species, but the flowers are unknown.

Glabrous Coccocypselum. Pl. cr.

14 C. CILIA'TUM (Cham. et Schlecht. in Linnæa. 6. p. 414.) leaves roundish-ovate, ciliated, as well as the petioles, having the nerves furnished with long hairs on the upper surface; heads of flowers equal to about half the length of the leaves. ♄. S. Native of Mexico, between Huilamalco and Cuapa. Very like *C. umbellàta*. Leaves an inch and a half long and 14 lines broad.

Ciliated Coccocypselum. Pl. creeping.

† *The generic character of the two following species is doubtful, and according to Kunth, syn. should probably be excluded from the present genus.—Erect suffruticose glabrous plants.*

15 C. OBOVA'TUM (Pers. ench. 1. p. 132.) stem erect, suffruticose; leaves obovate, acuminated; peduncles axillary, aggregate, unequal, racemose. ♄. S. Native of Peru, at Chinchao, on mountains. Condàlia obovàta, Ruiz et Pav. fl. per. 1. p. 54. Corolla greenish white. Berries purple.

Obovate-leaved Coccocypselum. Shrub 3 feet.

16 C. SE'SSILE (Pers. l. c.) stem erect, suffruticose; leaves oblong, acute; flowers sessile, crowded, axillary. ♄. S. Native of Peru, on the mountains about Chinchao. Condàlia séssilis, Ruiz et Pav. fl. per. 1. p. 54. Corolla purplish. Berries ovate, purplish.

Sessile-flowered Coccocypselum. Shrub 2 to 3 feet.

Cult. A mixture of peat and sand is the best soil for the species; and they will be easily increased by separating the creeping stems from the main plant.

L. FERNE'LIA (named after J. Fernel, M. D. physician to Henry II. of France; he died in 1558). Comm. in Juss. gen. p. 196. mem. mus. 6. p. 393. Lam. ill. t. 67. f. 1. Gærtn. fil. carp. 3. p. 61. A. Rich. mem. soc. hist. nat. par. 5. p. 275. D. C. prod. 4. p. 398.—Coccocýpsilum species, Willd. and Spreng.

LIN. SYST. *Tetrándria, Monogýnia.* Calyx with an obovate tube, and a 4-cleft limb; lobes subulate at the apex. Corolla small, with a short tube, and a 4-lobed spreading limb. Stamens 4, inserted in the tube of the corolla, inclosed, or a little exserted. Stigma bifid. Berry crowned by the limb of the calyx, 2-celled, having the dissepiment incomplete and semilunar, and elliptic. Seeds numerous, somewhat compressed. Albumen cartilaginous. Embryo almost dorsal, with a centripetal radicle, and flat roundish cotyledons.—Small glabrous branched trees, having much the habit of box. Leaves obovate, stiffish. Stipulas short, acute, solitary on each side. Pedicels axillary, very short, bracteolate, 1-flowered.

1 F. BUXIFÒLIA (Lam. ill. no. 1478. but not of Gærtn.) lobes of corolla obtuse; berry obovate, crowned by the subulate lobes of the calyx. ♄. S. Native of the Mauritius, where it is called *bois de buis*. F. obovàta, Gærtn. fil. carp. 3. p. 62. t. 191. but not of Lam. Coccocýpselum buxifòlium, Spreng. syst. 1. p. 416. Leaves 5-6 lines long, and 3-4 broad.

Box-leaved Fernelia. Clt. 1816. Shrub.

2 F. OBOVA'TA (Lam. ill. t. 67. f. 1.) lobes of corolla acuminated; berries nearly globose, crowned by the lobes of the calyx, which are bluntish and velvety inside. ♄. S. Native of the Mauritius, where it is called *bois Malabare* and *bois de ronde*. F. buxifòlia, Gærtn. fil. carp. 3. p. 63. t. 197. f. 6. Coccocýpsilum uniflòrum, Willd. spec. 1. p. 618. Sieb. fl. maur. exsic. 2. no. 100. Leaves 8-10 lines long, and 6-7 broad.

Obovate-leaved Fernelia. Clt. 1816. Shrub.

3 F. PEDUNCULA'TA (Gærtn. fil. carp. 3. p. 191. f. 3.) lobes of corolla unknown; berry obovate, tapering a long way into the stipe at the base, crowned by the lobes of the calyx, which are bluntish. ♄. S. Native of the Mauritius. Shrub and flowers unknown.

Pedunculate-fruited Fernelia. Shrub.

Cult. For culture and propagation, see *Rondelètia*, p. 517.

LI. PETU'NGA (Peetunga is the name of *P. Roxbúrghii* in the Bengalee language). D. C. prod. 4. p. 398.—Rándia species, Roxb.—Higgínsia, Blum. bijdr. p. 988. but not of Pers.

LIN. SYST. *Tetrándria, Monogýnia.* Calyx with an ovate tube, and a permanent 4-toothed limb. Corolla funnel-shaped, with a short obconical tube, a 4-parted limb, and a very villous throat. Stamens 4; anthers a little exserted. Style filiform, villous: stigma bidentate, a little exserted. Berry globose, depressed and umbilicate at the apex, 2-celled. Seeds 2-4 in each cell, fixed to the upper part of the dissepiment, ex Roxb., scale-formed, and imbricated downwards, ex Blum. Albumen cartilaginous. Embryo inverted, with linear cotyledons.—Unarmed erect glabrous shrubs, with decussate horizontal branches. Leaves opposite, oblong, attenuated at both ends. Stipulas long-acuminated, deciduous. Spikes axillary, solitary or twin,

simple, many flowered, 3 times shorter than the leaves. Bracteas short, 1-flowered. Flowers disposed in 2 or 4 rows, sessile along the rachis of the spike, small, greenish white. This genus differs from *Rándia* in the flowers being tetramerous, and very much bearded in the throat, and in the spicate inflorescence and whole habit; and from *Higgínsia* in the throat of the corolla being bearded, in the genitals being a little exserted, and in the globose depressed fruit, &c.

1 P. Roxbu'rghii (D. C. prod. 4. p. 399.) leaves elliptic-oblong, glabrous, acuminated at both ends; spikes axillary; bracteas and calyxes glabrous. ♄. S. Native of the East Indies, about Luksmeeapoora, where it is called *Peetunga* by the natives. Rándia racemòsa, Roxb. fl. ind. 2. p. 144. Branches almost horizontal. Leaves drooping, 3-4 inches long, and about 1 broad. Stipulas large, caducous. Spikes about one-half or one-third shorter than the leaves. Flowers small, pale, greenish white. Berries round, smooth, shining, straw coloured, size of a pea.

Roxburgh's Petunga. Clt. 1820. Shrub 3 to 4 feet.

2 P. longifòlia (D. C. l. c.) leaves elliptic-oblong, acuminated at both ends; branches terete; bracteas and calyxes downy. ♄. S. Native of Java. Higgínsia longifòlia, Blum. bijdr. p. 988. Leaves 6-7 inches long, and 2 broad. Spikes about 2 inches long. Flowers small, greenish white.

Long-leaved Petunga. Shrub 3 to 4 feet.

3 P. microca'rpa (D. C. l. c.) leaves oblong-lanceolate, acuminated, finely veined; spikes short, quadrifariously imbricated; tube of corolla very short. ♄. S. Native of Java, where it is called *Ki-Apiet* by the natives. Higgínsia microcárpa, Blum. bijdr. p. 988. Leaves 3 inches long, and 9 lines broad. Spikes 5-6 lines long. Flowers small, greenish white.

Small-fruited Petunga. Shrub 3 to 4 feet.

4 P. glomerula'ta (D. C. prod. 4. p. 399.) leaves oblong-lanceolate, veiny; spikes densely glomerulated. ♄. S. Native of Java, on mount Salak, and in woods on the island of Nusæ-Kambanga.

Glomerulated-spiked Petunga. Shrub.

Cult. For culture and propagation see *Catesbæ'a*, p. 511.

LII. HIGGI'NSIA (named after General O-Higgins, sometime Governor of Chili). Pers. ench. 1. p. 133. D. C. prod. 4. p. 399.—O-Higgínsia, Ruiz et Pav. fl. per. 1. p. 55. Rœm. et Schultes, syst. 3. p. 10. (exclusive of all the species with 4-celled fruit). Evósmia species, Spreng.—Nacíbea species, Juss.

Lin. syst. *Tetrándria*, *Monogýnia*. Calyx with a short obovate tube, and a permanent limb, which is 4-toothed to the base. Corolla funnel-shaped, and somewhat campanulate, with a short tube, a 4-parted spreading limb, and a naked throat. Stamens inserted into the middle of the tube; filaments short; anthers ovate, inclosed. Stigmas 2, exserted. Berry oblong, somewhat tetragonal, bisulcate, 2-celled, crowned by the calyx. Placentas adnate to the dissepiment. Seeds many in each cell, small, wingless.—Shrubs about 3 or 4 feet high, with bluntly tetragonal branches. Leaves opposite or in whorles, obovate or oblong, acute. Stipulas solitary on both sides, small, acute, deciduous. Peduncles axillary, racemose, bearing short unilateral pedicels. Corollas reddish.

1 H. verticilla'ta (Pers. ench. 1. p. 133.) leaves 3 in a whorl, lanceolate, downy beneath; peduncles solitary, dependent, bearing about 4 flowers. ♄. S. Native of Peru, at Muna, where it is called *Carpales*. O-Higgínsia verticillàta, Ruiz et Pav. fl. per. 1. p. 55. t. 85. f. a. Evósmia verticillàta, Spreng. Corolla scarlet. Berries purplish white.

Whorled-leaved Higginsia. Shrub 3 to 4 feet.

2 H. angustifòlia (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 399.) leaves opposite, narrow-oblong-lanceolate, glabrous, tapering much at both ends; fruit axillary, usually twin, oblong, opposite, on short pedicels. ♄. S. Native of Peru, on mountains about the Guanocco. Flowers red.

Narrow-leaved Higginsia. Shrub 3 to 4 feet.

3 H. latifòlia (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 399.) leaves opposite, obovate, acuminated, attenuately cuneated at the base, glabrous, having the nerves and veins clothed with rusty tomentum beneath; flowers axillary, in fascicles, pedicellate, nutant. ♄. S. Native of Peru, on mountains about the Guanocco. Fruit membranous, somewhat tetragonal.

Broad-leaved Higginsia. Shrub 3 to 4 feet.

4 H. obova'ta (Pers. ench. 1. p. 133.) leaves opposite, obovate, short-acuminated, glabrous; peduncles aggregate, unequal, spreading, many flowered. ♄. S. Native of Peru, in shady places at Muna. O-Higgínsia obovàta, Ruiz et Pav. fl. per. 1. p. 56. t. 85. f. b. Evósmia obovàta, Spreng. Corolla flesh coloured. Berries purple.

Obovate-leaved Higginsia. Shrub 3 to 4 feet.

Cult. See *Catesbæ'a*, p. 511. for culture and propagation.

LIII. HOFFMA'NNIA (named by Swartz, in memory of Maurice Hoffmann, professor of botany at Altorff, author of Florilegium Altorfinum, 1660). Swartz, prod. p. 30. fl. ind. occ. 1. p. 241. t. 5. Schreb. gen. no. 1719. Juss. mem. mus. 6. p. 383. but not of Lœfl. nor Willd.

Lin. syst. *Tetrándria*, *Monogýnia*. Calyx with an oblong somewhat tetragonal tube, and a 4-toothed limb: teeth erect, acute. Corolla salver-shaped, with a very short tube, and a 4-parted spreading limb; segments lanceolate. Anthers 4, sessile upon the tube, erectly connivent, linear, acute. Stigma obtuse, hardly emarginate. Capsule baccate, indehiscent, crowned by the calyx, 2-celled, slightly tetragonal. Placentas ovate, distinct in the cells of the fruit. Seeds numerous, minute, roundish.—A herb, which is suffruticose, and branched at the base, having the branches hairy. Leaves ovate, acuminate, rough from dots above, and hairy beneath. Stipulas very short, acute. Peduncles axillary, longer than the petioles, many flowered.

1 H. pedunicula'ta (Swartz, l. c.) ♄. S. Native of the higher mountains of Jamaica, in rather humid shady places. H. Jamaicénsis, Spreng. syst. 1. p. 416. Corolla with a red tube, and the segments of the limb striped with blood-colour at the base, but they are yellow at the apex. Berries scarlet.

Pedunculate Hoffmannia. Shrub 2 to 3 feet.

Cult. See *Catesbæ'a*, p. 511. for culture and propagation.

LIV. CATESBÆ'A (named by Gronovius after Mark Catesby, author of the natural history of Carolina). Gron. in Lin. gen. no. 130. Juss. gen. 199. mem. mus. 6. p. 393. Lam. ill. t. 67. Gærtn. fil. carp. 3. p. 67. t. 192. A. Rich. mem. soc. hist. nat. Par. 5. p. 256. D. C. prod. 4. p. 400.

Lin. syst. *Tetrándria*, *Monogýnia*. Calyx with an obovate tube, and a 4-toothed or 4-parted limb. Corolla funnel-shaped, with a very long tube, gradually widening and dilated to the throat, and a 4-parted limb. Stamens 4; filaments inserted at the base of the tube of the corolla; anthers linear, exserted. Stigma bidentate, from the lamellæ being combined. Berry globose or oblong, 2-celled, crowned by the limb of the calyx; having the dissepiment perforated according to Jussieu, but according to Gærtner, it is entire. Placentas spongy, fixed to the upper part of the dissepiment on both sides. Seeds numerous, scale-formed, inverted, imbricated downwards, collected in 2 bundles in each cell. Albumen fleshy. Embryo minute, inverted.—Glabrous shrubs, bearing supra-axillary simple spines. Leaves small, oval, usually in fascicles. Stipulas solitary on each side, deciduous. Pedicels axillary. Flowers whitish, elongated,

bractless.—This genus comes very near to *Scolosánthus*, but differs in the cells of the fruit being many seeded.

§ 1. *Recurviflòra* (from *recurvus*, recurved, and *flos*, a flower; in allusion to the flowers being pendulous from the pedicels being recurved). *D. C. prod.* 4. *p.* 400. *Pedicels* 1-*flowered, recurved. Flowers pendulous. Corollas glabrous. Stamens exserted.*

1 C. LATIFÒLIA (Lindl. bot. reg. 858.) leaves obovate, shining, convex, rather shorter than the spines; teeth of calyx subulate; tube of corolla very long, obconical at the apex. ♄. S. Native of the West Indies, particularly in Cuba near the Havannah. Corolla pale yellow, 4 inches long. Fruit ovate, crowned by the 4 subulate calycine teeth.

Broad-leaved Lily-thorn. Fl. June, July. Clt. 1823. Shrub 4 to 5 feet.

2 C. SPINÒSA (Lin. spec. p. 159.) leaves ovate, acutish at both ends, rather longer than the spines; teeth of calyx short, acute; berry oval; tube of corolla very long, cylindrical, widening at the apex. ♄. S. Native of the Bahama Islands, but particularly of Providence, near Nasma. Lam. ill. 67. f. 1. Curt. bot. mag. t. 131. Tratt. tab. t. 259. C. longiflòra, Swartz, prod. p. 30.—Catesb. car. 2. t. 100. Corolla pale yellow, 3-6 inches long. Leaves like those of box, roundish, rising in fascicles. Berry about the size of a middling plum, yellowish, with rather tart pulp.

Spinose Lily-thorn. Fl. May, Sept. Clt. 1726. Shrub 10 to 14 feet.

3 C.? VAVASSÒRII (Spreng. syst. 1. p. 416.) leaves elliptic-oblong, obtuse, shining above, and are, as well as the spinescent branches, glabrous; pedicels 1-flowered. ♄. S. Native of St. Domingo. Cinchòna spinòsa, Vavass. journ. phys. oct. 1790. p. 243. t. 2. Lamb. cinch. p. 38. t. 13. C. ellíptica, Spreng. in litt. The fruit is said to be capsular and dehiscent at the apex, and the seeds are said to be edged with a wing, but should this be the case it is certainly not a species of *Catesbæ'a*.

Vavasseur's Lily-thorn. Shrub 4 to 6 feet.

§ 2. *Erectiflòræ* (from *erectus*, erect, and *flos*, a flower; the flowers are erect, not drooping as in the first section). *D. C. prod.* 4. *p.* 401. *Pedicels axillary,* 1-*flowered. Flowers erect, glabrous. Stamens inclosed.—Perhaps all are species of the genus Rándia.*

4 C. PARVIFLÒRA (Swartz, prod. 30. fl. ind. occ. 1. p. 236.) leaves ovate, stiff, with revolute margins, mucronate, and are, as well as the branches, glabrous; teeth of calyx short, acute; flowers sessile among the leaves; tube of corolla short, tetragonal; berries roundish. ♄. S. Native of the north of Jamaica, among bushes by the sea side. Vahl, symb. 2. p. 31. eclog. 1. p. 12. t. 10. f. 1. but not of Lam. Gærtn. fil. carp. t. 192. f. 3. C. parviflòra, ex Jamaica, Spreng. syst. 1. p. 416. exclusive of the diagnosis and synonymes.—Sloan. hist. t. 207. f. 1. Corolla white, with a tetragonal tube, about 4 lines long.

Small-flowered Lily-thorn. Fl. June, July. Clt. 1810. Shrub 4 to 5 feet.

5 C. CAMPANULA'TA (La Sagra, in litt. ex D. C. prod. 4. p. 401.) leaves ovate-roundish, coriaceous, and are, as well as the branchlets, quite glabrous; spines opposite, longer than the leaves; flowers erect, short, sessile in the axils of the leaves. ♄. S. Native of Cuba, near the Havannah, where it was collected by Ramon de la Sagra. Perhaps sufficiently distinct from *C. parviflòra*.

Campanulate-flowered Lily-thorn. Shrub 4 to 5 feet.

6 C. PARVIFÒLIA (D. C. prod. 4. p. 401.) leaves ovate-roundish, mucronate, glabrous; spines axillary, subulate, a little longer than the leaves; branchlets hairy; flowers short, usually twin, axillary, on very short pedicels. ♄. S. Native of St. Domingo. Catesbæ'a parviflòra var. Domingénsis, Spreng. syst. 1. p. 416. Gardènia parvifòlia, Dietr. suppl. gart. lex. 3. p. 441. ex Rœm. et Schultes, syst. 5. p. 247. Rándia parvifòlia, Lam. dict. 3. p. 25. (exclusive of the syn. of Sloane,) ill. t. 156. f. 2. but the flowers in the figure are drawn 5-cleft. Spines opposite, straight, about 5 lines long. Leaves like those of box, in fascicles. Berries globose, almost sessile. Flowers white, changing to yellowish.

Small-leaved Lily-thorn. Fl. July, Sept. Clt. 1818. Shrub 4 to 5 feet.

7 C. ERE'CTA (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 4. p. 401.) leaves oval-oblong, acute; branchlets opposite, spreading, unarmed; flowers almost terminal, nearly sessile, solitary, erect; tube of corolla very long. ♄. S. Native of Mexico. Flowers white, almost like those of *C. spinòsa*, but erect. Spines none in the figure given.

Erect Lily-thorn. Shrub 4 to 5 feet.

Cult. All the species of *Catesbæ'a* are very ornamental while in bloom. They grow best in a mixture of light turfy loam and peat; and cuttings will root if planted in sand plunged in heat, with a bell-glass placed over them. The plants being apt to be infested with insects, they should be kept clean or they will not thrive.

Tribe III.

HEDYOTI'DEÆ (this tribe contains plants agreeing with the genus *Hedyòtis* in particular characters). Cham. et Schlecht. in Linnæa. 4. p. 150. D. C. prod. 4. p. 401. Fruit capsular, 2-celled, dehiscing in the middle of the cells: or rather membranous and indehiscent; cells many seeded. Seeds not winged. Albumen fleshy.—Shrubs and herbs, with opposite leaves, and interpetiolar stipulas.

SUBTRIBE I. RONDELETIE'Æ (plants agreeing with the genus *Rondelètia* in important characters). D. C. prod. 4. p. 401. Stipulas twin on both sides, combined or distinct, neither sheathed nor ending in bristles.

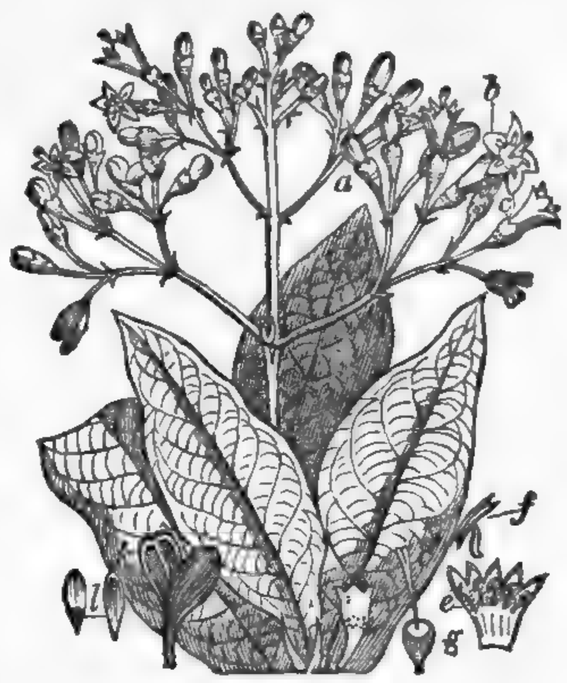
LV. CONDAMI'NEA (in honour of — La Condamine, a famous astronomer, and traveller in South America, and who was the first who described and figured *Cinchòna lanceolàta*). D. C. prod. 4. p. 402.—Macrocnèmum, Ruiz et Pav. fl. per. 2. p. 48. but not of Browne.—Macrocnèmum, sect. 2. Kunth, and A. Rich.

LIN. SYST. *Pentándria, Monogýnia.* Calyx with a cup-shaped tube, and a 5-crenated or 5-toothed limb (f. 95. *a.*), which at length becomes circumcised at the base, and falls off. Corolla funnel-shaped, with a somewhat curved tube (f. 95. *b.*), which is a little longer than the calyx, a dilated throat, and a 5-parted limb (f. 95. *e.*); the segments ovate, acute, spreading, and thickened at the apex (f. 95. *c.*). Stamens 5, inserted above the middle of the corolline tube (f. 95. *b.*), or near its throat; filaments shorter than the corolla; anthers oblong-linear, bifid at the base, length of corolla. Stigma 2-lobed (f. 95. *f.*). Capsule turbinate (f. 95. *g.*), rather compressed, truncate, umbilicate, 2-celled, dehiscing in the middle of the cells (f. 95. *k.*). Seeds small, numerous, cuneiform, not winged.—South American shrubs. Leaves large, opposite, on short petioles. Stipulas intrafoliaceous, bipartite, acuminated, adpressed, usually connate. Corymbs or racemes terminal, many flowered.—This genus differs from *Macrocnèmum* in the form of the calyx, in the stamens being inserted above the middle of the corolline tube, not at its base, as in that genus, and in the seeds being wingless; and from *Sickíngia* in the stigma being double, not simple, and in the seeds not being winged, &c.

1 C. CORYMBÒSA (D. C. prod. 4. p. 402.) leaves ovate-oblong,

acuminated, cordate at the base, sessile, plicate, coriaceous; corymbs large, brachiate, trichotomous; teeth of calyx broad, short, blunt. ♄. S. Native of Peru, on hills towards Chinchao, Acomayo, Pillao, and Muna, &c. ex Ruiz et Pav.; and on mountains about the Guanocco river, ex Hænke; as well as of New Granada about Mariquita, and Santa Anna, ex H. B. et Kunth. Macrocnèmum corymbòsum, Ruiz et Pav. fl. per. 2. p. 48. t. 189. H. B. et Kunth, nov. gen. amer. 3. p. 399. Leaves a foot long. Calyx purplish, fleshy. Corolla white inside and purplish on the outside, with a naked throat. Capsule at first purplish, but at length almost black. Seeds yellow.

FIG. 95.



Corymbose-flowered Condaminea. Tree 40 to 50 feet.

2 C. tinctòria (D. C. prod. 4. p. 402.) leaves elliptic-oblong, acute, rounded at the base, petiolate, glabrous on both surfaces; corymbs sessile, tripartite; flowers crowded into heads; segments of corolla acute. ♄. S. Native of South America, at the Missions of the Orinoco, between Encaramada and Carichana. Macrocnèmum tinctòrium, H. B. et Kunth, nov. gen. amer. 3. p. 399. Willd. rel. in Rœm. et Schultes, syst. 5. p. 6. Corolla white. Corymbs terminal.

Dyers' Condaminea. Fl. Sept. Oct. Clt. 1820. Tree 20 to 30 feet.

3 C. microca'rpa (D. C. prod. 4. p. 402.) leaves oblong, bluntly acuminated, pubescent beneath; racemes terminal; flowers crowded, sessile; teeth of calyx minute. ♄. S. Native of Peru, in hot shady forests near Chinchao and Cuchero. Macrocnèmum microcárpum, Ruiz et Pav. fl. per. 2. p. 48. t. 188. f. a. Leaves shining above. Racemes 8-9 inches long. Corolla white, with reflexed segments, 4 times longer than the calyx. Capsule small, turbinate. Seeds yellow.

Small-fruited Condaminea. Tree 25 feet.

4 C. venòsa (D. C. l. c.) leaves oval-oblong, acuminated, lined with numerous veins; the nerves and veins downy; stipulas connate, with the lobes acuminated; racemes terminal; flowers sessile; teeth of calyx minute. ♄. S. Native of Peru, in groves in hot places towards Acomayo and Pati. Macrocnèmum venòsum, Ruiz et Pav. fl. per. 2. p. 49. t. 190. f. b. Branches tetragonal. Leaves 9 inches long. Stipulas reddish. Racemes downy. Flowers small, white.

Veiny-leaved Condaminea. Shrub 10 feet.

5 C. glabra'ta (D. C. l. c.) leaves obovate, short-acuminated, attenuately cuneated at the base, quite glabrous, lined with the veins; stipulas 2-lobed, shorter than the petioles: lobes rounded; panicle terminal, glabrous; flowers glomerate; teeth of calyx minute. ♄. S. Native of Peru, on mountains about Huanocco. Macrocnèmum glabràtum, Bartl. in herb. Hænke. Very like *C. venòsa*, but differs in the smoothness and shape of the leaves.

Glabrous Condaminea. Shrub 10 feet?

Cult. See *Catesbæ'a*, p. 511. for culture and propagation.

LVI. ALSE'IS (from *αλσος*, *alsos*, a grove; the tree grows in groves). Schott, in Spreng. syst. append. p. 404. D. C. prod. 4. p. 620.

Lin. syst. *Pentándria, Monogýnia.* Limb of calyx superior, 5-parted. Corolla cup-shaped, with a 5-parted limb, and a bearded throat. Stamens 5, almost distinct to the base of the corolla, exserted. Stigma parted. Ovarium 2-celled, many-ovulate.—A middle-sized tree. Leaves oblong, acuminated, rather pilose on both surfaces. Spikes branched, terminal. Flowers small, cream-coloured.—This genus is allied to *Macrocnèmum* and *Machaònia* according to the author.

1 A. floribu'nda (Schott, l. c.) ♄. S. Native of Brazil, in groves.

Bundle-flowered Alseis. Tree.

Cult. For culture and propagation see *Rondelètia*, p. 517.

LVII. MACROCNE'MUM (from *μακρος*, *makros*, long, and *κνημη*, *kneme*, a leg; in reference to the long flower-stalks). P. Browne, jam. p. 165. Lin. amœn. 5. p. 413. Swartz, obs. p. 68. t. 3. f. 1. Juss. mem. mus. 6. p. 386. D. C. prod. 4. p. 402. —Macrocnèmum species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx with a turbinate tube, and a small 5-toothed permanent limb. Corolla tubular, with a wide throat; the tube pentagonal before expansion: and the segments 5, acute, and erectish. Stamens 5, almost free from the corolla, but sometimes adnate to the base of the tube; filaments very hairy above the middle; anthers oblong, inclosed. Style length of the stamens; stigma obtuse, 2-lobed. Capsule 2-celled, 2-valved; valves dehiscing at the sides (ex Swartz). Seeds numerous, imbricated, acute.—Small glabrous trees. Leaves approximate, oblong, short-acuminated. Stipulas solitary on both sides. Peduncles terminal and subaxillary, solitary, trichotomously corymbose above. Flowers rather large, yellowish green.

1 M. Jamaice'nse (Lin. amœn. 5. p. 413.) arboreous; leaves oblong-oval, petiolate, polished; stipulas ovate-triangular, much shorter than the petioles; corymbs on long peduncles. ♄. S. Native of the south of Jamaica, in shady places on the banks of rivulets. Swartz, obs. p. 68. t. 3. f. 1. Lam. dict. 3. p. 670.; and of Guadaloupe at a place called Grand Brandaube, where it was collected by L'Herminier. Branches warted. Corollas rather large, of a yellowish green colour.

Jamaica Macrocnemum. Clt. 1806. Tree 12 to 14 feet.

† *Species not sufficiently known, and do not probably belong to the present genus.*

2 M.? stipula'ceum (Roxb. fl. ind. 2. p. 144.) leaves almost sessile, lanceolate, smooth; stipulas oval, very large; corymbs terminal, supradecompound. ♄. S. Native of the Moluccas. The mouth of the corolla is uncommonly woolly, almost hiding the stamens.

Stipulaceous Macrocnemum. Tree.

3 M.? parviflòrum (Roxb. fl. ind. 2. p. 144.) shrubby; leaves on short petioles, lanceolate, entire, smooth; stipulas annular, truncate; peduncles axillary, many-flowered; corolla acetabuliform. ♄. S. Native of the Moluccas.

Small-flowered Macrocnemum. Shrub.

4 M.? tetra'ndum (A. Rich. mem. soc. hist. nat. Par. 5. p. 279.) leaves elliptic-lanceolate, acute at both ends, discoloured, tomentose beneath; flowers subracemose, terminal, small, tetramerous; calyx woolly; corolla short; stamens exserted; capsule dehiscing at the dissepiment. ♄. S. Native of Brazil.

Tetrandrous Macrocnemum. Shrub or tree.

5 M.? tubulòsum (A. Rich. l. c.) leaves broad-ovate, acuminated at the apex, dimidiate at the base, petiolate, downy; flowers subcymose, terminal; one of the teeth of the calyx is expanded into a large, broad, somewhat heart-shaped petiolate leaf; corolla with a long tube, and a 5-lobed limb; stamens exserted; capsule dehiscing in the middle of the cells. ♄. S. Native of Brazil. This is probably a species of *Calycophýllum*.

Tubular-flowered Macrocnemum. Tree or shrub.

Cult. For culture and propagation see *Catesbæ'a*, p. 511.

LVIII. CHIMA'RRHIS (from χειμαῤῥος, *chimarrhos*, a torrent; the tree grows on the banks of torrents). Jacq. amer. p. 61. Juss. gen. p. 204. mem. mus. 6. p. 381.—Macrocnèmum species, A. Rich.

Lin. syst. *Pentándria, Monogy'nia.* Calyx with an obovate or turbinate tube, and an almost obsolete entire limb. Corolla with a short tube, and a 5-cleft spreading limb; segments hairy in the middle outside. Stamens 5, inserted in the upper part of the corolline tube; filaments hairy at the base; anthers oval. Capsule obovate or turbinate, ligneous, coriaceous, crowned by the marginal limb of the calyx, 2-celled; cells dehiscing from the apex to the base, ex Jacquin, 1-seeded, ex A. Richard, many-seeded; valves semibifid. Seeds pendulous.—American glabrous trees. Leaves opposite, on short petioles. Stipulas interpetiolar, solitary on both sides. Corymbs or cymes terminal. Flowers white.—This genus is nearly allied to *Machaònia.*

1 C. cymòsa (Jacq. amer. p. 61.) leaves ovate, acuminated at both ends; branches of corymb alternate; capsules obovate, very short. ♄. S. Native of Martinico, along the sides of mountain streams or torrents, where it is commonly called *bois de rivière*, or river wood. Macrocnèmum longifòlium, A. Rich. mem. soc. hist. nat. Par. 5. p. 279. A lofty tree, with a handsome head. Leaves a foot long, shining, commonly 8 or 10 at the top of each branch. Flowers small, disposed in racemose corymbs, white. Capsules small. The wood is white, and used for beams and rafters.

Cymose-flowered River-wood. Tree lofty.

2 C. turbina'ta (D. C. prod. 4. p. 404.) leaves oval, obtuse at the apex, and acute at the base; branches of corymbs opposite; capsules turbinate. ♄. S. Native of Cayenne, where it was collected by Patris. Upper leaves 3 inches long and 1½ broad, on short petioles. Stipulas triangular, acuminated. Peduncles and capsules downy.

Turbinate-fruited River-wood. Tree.

Cult. For culture and propagation see *Rondelètia*, p. 517.

LIX. AUGU'STEA (named in compliment to the present empress of Austria, princess Caroline Augusta of Bavaria). D. C. prod. 4. p. 404.—Augústa, Pohl, fl. bras. 2. p. 1. but not of Leand.

Lin. syst. *Pentándria, Monogy'nia.* Calyx 5-cleft, with foliaceous permanent segments. Corolla very long, tubular, incurved, 10-striated, with a spreading limb, which is valvate in æstivation. Anthers sessile, exserted. Stigma cloven. Capsule 2-celled, dehiscing at the apex, 4-cleft. Seeds angular, marginated, truncate at the apex, fixed to a transverse receptacle.—Middle-sized trees. Leaves on short petioles, simple, decussate, entire, oblong, stipulate. Flowers showy, bracteate, in terminal fascicles, deep red or crimson. This genus differs from *Exostémma* by the funnel-shaped corolla, with broad short segments, by the foliaceous calycine lobes, and by the angular seeds.

1 A. lanceola'ta (Pohl, fl. bras. 2. p. 2. t. 101.) leaves lanceolate, and are, as well as the stipulas, glabrous; flowers terminal, 3 in a fascicle; bracteas lanceolate, flat, ciliated. ♄. S. Native of Brazil, in the province of Goyaz, in shady places, on the banks of rivers and ditches, in Serra de Cristaes. Flowers crimson or deep red. Stem bluish red.

Lanceolate-leaved Augustea. Shrub.

2 A. parvifòlia (Pohl, fl. bras. 2. p. 3. t. 102.) leaves lanceolate, equal at the base and apex, acutish; stipulas and bracteas glabrous; flowers terminal, twin; calycine segments oblong, bluntish, retuse at the base, and pilose inside. ♄. S. Native of Brazil, in the province of Rio Janeiro, in shady places on the banks of rivers and rivulets on the road from Engenho da Varge to Agoa de Serra. Stem of a greyish brown colour. Flowers bluish red.

Small-leaved Augustea. Shrub.

3 A. oblongifòlia (Pohl, fl. bras. 2. p. 4. t. 103.) leaves oblong, acuminated at the base and apex, glabrous above, and rather pilose beneath; stipulas, bracteas, and peduncles pilosely tomentose; fascicles first ternate, then bifid. ♄. S. Native of Brazil, in the province of Goyaz, on the mountains among bushes on the banks of rivers and rivulets. Stem greyish black. Flowers deep red or crimson. Panicles terminal, trifid, then bifid, each ultimate division bearing 1 flower.

Oblong-leaved Augusta. Shrub.

4 A. attenua'ta (Pohl, pl. bras. 2. p. 6. t. 104.) leaves oblong, tapering into the petioles at the base, ciliated when examined by a lens, glabrous; stipulas glabrous on the outside, and pilose inside; fascicles of flowers terminal, first ternate, then bifid; bracteas lanceolate, channelled, villous inside. ♄. S. Native of Brazil, in the province of Rio Janeiro, on the margin of rivers and rivulets, in Serra Tingua. Stem greyish brown. Corolla bluish red. Panicles of flowers divided like that of the last.

Attenuated-leaved Augusta. Shrub.

5 A. glauce'scens (Pohl, fl. bras. 2. p. 7. t. 105.) leaves crowded, oblong, tapering to both ends, therefore acute, quite glabrous; stipulas triangular, cuspidate, glabrous; fascicles of flowers terminal, trifurcate; bracteas lanceolate, acuminated, pilose inside. ♄. S. Native of Brazil, in the province of Goyaz, in shady places on the banks of rivers and rivulets at Riveirao Bateiro. Stem bluish black. Corolla deep red or crimson.

Glaucescent Augusta. Shrub.

Cult. The species of *Augústea* are very ornamental; the flowers being long and tubular, of a deep red or crimson colour. Their culture and propagation is the same as that recommended for *Catesbæ'a*, p. 511.

LX. PORTLA'NDIA (so named after the Duchess of Portland, who was a great lover of botany, and well acquainted with English plants). P. Browne, jam. p. 164. Lin. spec. 227. Gærtn. fruct. 1. p. 153. t. 31. D. C. prod. 4. p. 404.—Portlándia species, Schreb. and Swartz.

Lin. syst. *Pentándria, Monogy'nia.* Calyx with an obovate, 5-nerved tube, and a 5-parted limb: lobes large, foliaceous. Corolla large, funnel-shaped, with a short tube, a wide obconical throat, and a bluntly 5-lobed limb. Stamens 5, inserted at the bottom of the throat; anthers long, semi-exserted. Stigma undivided. Capsule obovate, or nearly oblong, ribbed from nerves, crowned by the calyx, retuse, 2-celled; valves dehiscing at the apex. Placentas coriaceous, central. Seeds numerous, elliptic, much compressed, scabrous from elevated dots.—Small glabrous trees, natives of South America. Leaves shining, on short petioles. Stipulas broad, triangular. Peduncles axillary, short, 1-3-flowered. Flowers large, whitish.

1 P. grandiflòra (Lin. spec. 244.) leaves elliptic-lanceolate; flowers axillary, pedicellate, solitary, 4 times the length of the breadth. ♄. S. Native of Jamaica, St. Thomas, &c. among rocks at the foot of the mountains. Smith, icon. pict. 1. t. 6. Curt. bot. mag. 286. Jacq. amer. t. 44. pict. t. 64. Flowers almost like those of *Brugmánsia arbòrea*, white, reddish inside at the throat, 5 inches long and 1½ broad, very fragrant at night; but in the bud state they are yellowish, tipped with red. Tube with 5 hairy angles.

Var. β; leaves ovate, acute. ♄. S. Growing along with the species.

Great-flowered Portlandia. Fl. June, Aug. Clt. 1775. Shrub 10 to 14 feet.

2 P. cocci'nea (Swartz, fl. ind. occ. 1. p. 384.) leaves ovate-roundish, coriaceous; flowers axillary, pedicellate, solitary, hardly twice the length of the breadth. ♄. S. Native of the west of Jamaica, on the precipices of mountains, but rare. P.

coriàcea, Spreng. syst. 1. p. 708. Leaves 3 inches long and 2 broad. Corolla scarlet, 3 inches long, with a 5-sided tube. Anthers yellow. Capsules roundish.

Scarlet-flowered Portlandia. Clt. 1812. Shrub 2 to 3 feet.

† *A species hardly known.*

3 P. acumina'ta (Willd. rel. in Rœm. et Schultes, syst. 5. p. 23.) leaves ovate, acuminated. ♄. S. Native of New Spain, at Caraccas. Perhaps the same as *P. grandiflòra* β.

Acuminated-leaved Portlandia. Shrub.

Cult. The species of *Portlándia* are deserving of a place in every collection of stove plants, for their large showy flowers. They thrive best in a mixture of sandy loam and peat; and cuttings, not having their leaves shortened, will root freely if planted in a pot of sand, plunged in heat, with a hand-glass over them. A strong heat is necessary for flowering the species, and without it they will not even grow freely.

LXI. BI'KKIA (meaning unknown to us; but is probably named after some person). Reinw. in Blum. bijdr. p. 1017. D. C. mem. omb. p. 10. A. Rich. mem. soc. hist. nat. Par. 5. p. 230. D. C. prod. 4. p. 405.—Portlándia species, Forst.—Cormigònus of Rafin. ann. gen. sc. ph. 6. p. 83.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with a turbinately oblong tube, which is angular from 8 filiform ribs, 4 of which are carinal, and 4 sutural: and a 4-parted limb; lobes linear-lanceolate. Corolla clavate, tetragonal, with a 4-parted limb. Anthers 4, linear, not exceeding the limb of the corolla. Stigma unknown. Capsule ovate, dehiscing at the apex, separable from the calyx, and therefore at length becoming naked, 2-celled, but almost 4-celled from the margins of the valves being involute; valves bifid at the apex. Placentas narrow, rather prominent. Seeds innumerable, small, compressed, not winged, but echinated along the margins from membranous crests. Albumen fleshy.—A glabrous shrub. Leaves opposite, obovate, bluntish, cuneated at the base, petiolate, veinless, with the exception of the middle nerve. Stipulas short, truncate, combined. Pedicels axillary, solitary, 1-flowered, naked. Flowers white.

1 B. austra'lis (D. C. prod. 4. p. 405.). ♄. S. Native of the islands in the Pacific. Portlándia tetrándra, Forst. prod. no. 86. Lin. fil. suppl. 143. Willd. spec. 1. p. 935. Poir. dict. 5. p. 575. Hoffmánnia Amicòrum, Spreng. syst. 1. p. 416. Bíkkia grandiflòra, Reinw. in Blum. bijdr. p. 1017. Leaves approximate at the tops of the branches. Corolla white.

Var. α, *Forsteriàna.* ♄. S. Native of Savage Island and Weggio in the Pacific. Leaves obovate, coriaceous, obtuse, cuneated at the base, on short petioles, 2 inches long. Corolla tubular, rather dilated at the apex; with 4 short triangular lobes, which are each terminated by a mucrone. Anthers a little longer than the corolla. Perhaps the flowers are monstrous.

Var. β, *Commersoniàna.* ♄. S. Native at Port Praslin. Leaves broad-obovate, very blunt, hardly coriaceous, cuneated at the base, on short petioles, 3-4 inches long and 2 or more broad. Corolla more than 2 inches long, with an obconical tube, and ovate lobes, which are apiculated by a mucrone at the apex. Anthers shorter than the lobes of the corolla.

Var. γ, *Gaudichaudiàna.* ♄. S. Native of the Island of Rawak. Intermediate between the two preceding varieties. Lobes of corolla triangular, acute, with the recesses broad and obtuse. Anthers equal in length to the corolla.

Southern Bikkia. Tree or shrub.

Cult. For culture and propagation see *Portlándia* above.

LXII. ISIDO'REA (*isidos* is the Latin name of a shrub like coral; the name has been applied to this genus because it is stiff and dry, and grows by the sea side). A. Rich. in mem. soc. hist. nat. par. 5. p. 284. t. 25. f. 1. D. C. prod. 4. p. 405.

Lin. syst. *Pentándria, Monogýnia.* Calyx with a turbinate pentagonal tube, and a 5-parted limb; lobes erect, keeled, lanceolate-subulate. Corolla tubular, pentagonal, with a naked throat, and a 5-cleft limb; segments triangular, acute, short. Stamens inserted in the bottom of the tube of the corolla, and about its length; filaments capillary, villous at the base, and combined together in a monadelphous manner; anthers oblong; obtuse at the apex. Style slender, length of corolla; stigma bilamellate; lamellæ oblong, obtuse. Capsule almost globose, pentagonal, truncate at the apex, crowned by the segments of the calyx, 2-celled; cells dehiscent, many-seeded. Seed angled, from being pressed against each other, girded by a cup-shaped membrane at the base.—A stiff shrub, with the habit of *Ernòdea.* Leaves opposite, linear, stiff, with revolute margins. Stipulas on the younger branches entire and subulate, but those on the older branches are bipartite. Flowers almost terminal, solitary, nearly sessile, often hexamerous.

1 I. amœ'na (Rich. l. c.). ♄. S. Native of the West India Islands. Ernòdea pedunculàta, Poir. suppl. 2. p. 581.? and Ernòdea púngens, Lam. ill. 1. p. 276.? ex Rich. but the descriptions given do not agree.

Pleasant Isidorea. Shrub.

Cult. See *Rondelètia*, p. 517. for culture and propagation.

LXIII. SPALLANZA'NIA (named in honour of Abbe Spallanzani, an Italian celebrated for his researches in natural history, particularly in zoology). D. C. prod. 4. p. 406. but not of Neck, nor Pall.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an obversely pyramidal tube, a 5-parted limb, and foliaceous, linear, distant, acute, erect, permanent lobes, which are longer than the tube. Corolla with a slender, terete tube, which is longer than the segments of the limb, a naked throat, and 5 oval spreading segments. Stamens 5; filaments free from the throat, exserted; anthers oblong. Style filiform; stigmas 2, slender, elongated. Capsule ovate-globose, ribbed by nerves, and crowned by the calycine lobes, 2-celled, obscurely dehiscent: having semi-bifid carpels. Placentas adnate to the dissepiment. Seeds ovate, tubercular.—A smooth shrub. Branches terete, but compressed at the apex. Leaves obovate or oval, rather coriaceous. Stipulas solitary on both sides, ovate, bifid at the apex. Corymbs terminal, many-flowered, with angular branches, which are bracteate at the base.—Very nearly allied to *Lándia* a section of *Mussæ'nda.*

1 S. corymbo'sa (D. C. l. c.). ♄. S. Native of Madagascar, where it is called *Tambaracha* by the natives.

Corymbose-flowered Spallanzania. Shrub.

Cult. For culture and propagation see *Rondelètia*, p. 517.

LXIV. RONDELE'TIA (so named by Plumier, in memory of William Rondelet, a famous physician and natural historian of Montpelier). Plum. gen. p. 15. t. 12. Lam. ill. t. 162. Gærtn. fil. carp. 3. t. 184. Kunth, nov. gen. amer. 3. p. 393. A. Rich. mem. soc. hist. nat. par. 5. p. 271. but not of Roxb.—Rondelètia species, Lin. gen. no. 220.—Petèsia, P. Browne, but not of others.—Arachnimórpha, Desv. in Hamilt. prod. p. 28.—Lightfòotia, Schreb. gen. no. 303. but not of L'Her.—Willdenòvia, Gmel. syst. 1. p. 362. but not of Thunb.

Lin. syst. *Tetra-Pentándria, Monogýnia.* Calyx with a subglobose tube, and a 4-5-parted limb; lobes oblong-linear, acute, permanent. Corolla with a cylindrical tube, which is hardly ventricose at the apex, and a 4-5-lobed spreading limb; lobes roundish. Anthers 4-5, sessile at the top of the tube, inclosed. Stigma bifid. Capsule globose, crowned by the calyx, 2-celled, dehiscing from the apex into 2 valves, which

are usually cleft at the apex, whence it sometimes appears 4-valved; but usually dehiscing at the cells, rarely at the dissepiment. Placentas central. Seeds numerous, small, ovate, angular, usually only 2 in each cell at maturity.—Small trees or shrubs, mostly natives of America. Leaves almost sessile, or more or less petiolate. Stipulas deltoid, or linear-lanceolate, solitary on both sides, undivided, sometimes hairy inside. Peduncles axillary, usually trichotomous, sometimes disposed in a terminal corymbose panicle, rarely 3 or 1-flowered.—All the Asiatic plants referred to this genus are species of *Wendlándia*.

§ 1. *Pentámeræ* (from πεντε, *pente*, five, and μερις, *meris*, apart; in reference to the flowers being pentamerous). *D. C. prod.* 4. *p.* 407. *Calyx 5-lobed. Corolla 5-lobed. Stamens* 5. —*Rondelètia, Juss. mem. mus.* 6. *p.* 384.

* *Tube of corolla hardly longer than the calyx.*

1 R. laurifo'lia (Swartz, fl. ind. occ. p. 363.) leaves lanceolate-oblong, acute, glabrous on both surfaces; stipulas deltoid, glabrous on the outside, with ciliated margins, and villous at top; racemes compound, axillary, erect; tube of corolla very short, clothed with adpressed villi. ♄. S. Native of Jamaica and Guadaloupe, among bushes. Petèsia, no. 2. P. Browne, jam. p. 143. t. 2. f. 2. Tube of calyx turbinate, clothed with adpressed down; limb 5-parted, smoothish; lobes acute, about equal in length to the tube of the corolla. Flowers small, dusky yellow. Capsules about the size of hemp-seed. Leaves 3-4 inches long, on petioles about an inch long.

Laurel-leaved Rondeletia. Fl. July, Aug. Clt. 1824. Sh. 4 to 6 feet.

2 R. racemòsa (Swartz, fl. ind. occ. p. 360.) leaves lanceolate-ovate, acuminated, petiolate, glabrous on both surfaces; stipulas almost deltoid, with somewhat ciliated margins; racemes axillary, trichotomous, spreading. ♄. S. Native of Jamaica, in woods on the mountains. Petèsia, P. Browne, jam. p. 143. t. 2. f. 3. Leaves opposite and 3 in a whorl. Tube of corolla short, clothed with silky hairy down on the outside, a little longer than the calycine teeth, which are very short. Very nearly allied to *R. laurifòlia*, but the petioles are longer, the racemes shorter, the calycine teeth shorter, and probably the stigma is undivided, as mentioned by Swartz. Branches covered with hoary bark; branchlets tetragonal. Corolla hoary.

Racemose-flowered Rondeletia. Fl. July, Aug. Clt. 1820. Shrub 4 to 6 feet.

** *Tube of corolla cylindrical, 2-3 or 4 times longer than the calycine lobes.*

3 R. thyrsoídea (Swartz, prod. p. 41. fl. ind. occ. 1. p. 358.) leaves oblong, acute, petiolate, membranous, glabrous on the upper surface as well as the branches, but downy beneath; stipulas broad ovate, acute, glabrous, stiff; thyrses axillary, shorter than the leaves. ♄. S. Native of Jamaica, on the driest hills in the western parts of the island. Branches bluntly tetragonal. Leaves 3 inches long. Calyx minute, 5-toothed. Flowers small, dull whitish yellow or rust-coloured, with an elongated tube, which swells below the limb, and clothed with silky pubescence on the outside. Capsules roundish, size of coriander seeds. Seeds 2 in each cell at maturity.

Thyrsoid-flowered Rondeletia. Fl. July, Aug. Clt. 1819. Shrub 4 to 6 feet.

4 R. umbellula'ta (Swartz, prod. p. 41. fl. ind. occ. 1. p. 367.) leaves lanceolate-ovate, acute, rather hairy, petiolate; stipulas hairy, ending each in a bristly acumen; peduncles axillary, trichotomous at the apex, somewhat umbelliferous, shorter than the leaves. ♄. S. Native of Jamaica, on rocks near streams. Petèsia, no. 3. P. Browne, jam. p. 144.? and therefore Petèsia villòsa, Smith, in Rees's cycl. no. 4. Calyx very villous, with linear teeth. Corolla larger than in the rest of the species, downy, of a dusky yellow colour; tube elongated. Capsule roundish: having 2 seeds in each cell at maturity.

Umbellate-flowered Rondeletia. Shrub 2 feet.

5 R. tomentòsa (Swartz, prod. p. 41. fl. ind. occ. 1. p. 365.) leaves ovate, acuminated, petiolate, membranous, hairy above, but clothed with hoary villous tomentum beneath; peduncles axillary, tripartite, short. ♄. S. Native of Jamaica, near Spanish Town, on rocky hills. Petèsia stipulàris, Lin. spec. p. 160.? ex Swartz. Stipulas ovate, downy, with a short point. Branchlets villous at the ends. Flowers small, whitish, or dusky yellow, villous outside. Capsules roundish, size of coriander seeds, containing 1 seed in each cell at maturity.

Var. β, Domingénsis (D. C. prod. 4. p. 407.) leaves oval-oblong, cuneated at the base, downy or villous above, but clothed with soft hoary tomentum beneath. ♄. S. Native of St. Domingo, where it was collected by Bertero. R. tomentòsa, ex Hispaniola, Spreng. syst. 1. p. 708. This plant is probably referrible to *Petèsia tomentòsa*.

Tomentose Rondeletia. Fl. July, Aug. Clt. 1819. Sh. 3 ft.

6 R. inca'na (Swartz, prod. p. 41. fl. ind. occ. 1. p. 369.) leaves ovate-lanceolate, petiolate, glabrous above, hairy beneath, and hoary; stipulas very short, truncate, ciliated, white on the margins; peduncles axillary, simple, 3-flowered. ♄. S. Native of Jamaica, on rocky calcareous mountains, but rare. Arachnimórpha incàna, Hamilt. prod. fl. ind. occ. p. 28. R. incàna, ex Hispaniola, Spreng. syst. 1. p. 707. ex herb. Balb. is not different from this plant. Branches rugged. Petioles tomentose. Lobes of calyx ovate, acute, thick, hoary from silky down. Corolla rather large, silky outside. Capsule oblong, ripening 2 seeds in each cell.

Hoary Rondeletia. Shrub 2 to 3 feet.

7 R. hírta (Swartz. prod. p. 41. fl. ind. occ. 1. p. 373. but not of Ait.) leaves oblong, acuminated, on short petioles, hairy, stiff, nerved beneath; peduncles axillary, trichotomous, erect; lobes of calyx linear. ♄. S. Native of Jamaica, among bushes on the mountains. Gærtn. fil. carp. p. 33. t. 184. Lodd. bot. cab. t. 350. Stipulas broad, acuminated, hairy. Branchlets pilose. Flowers yellowish. Mature capsule perfecting 2-4-seeds. Peduncles tripartite to the base; the branches bearing 3 flowers at the apex.

Var. β, Aitònii (D. C. prod. 4. p. 408.) leaves ovate-oblong, acute, pilose; capsules many-seeded. ♄. S. Native of Jamaica. Rondelètia hírta, Ait. hort. kew. 1. p. 227. This differs from the plant of Swartz, in the leaves being shorter, broader, and less acuminated, and in the fruit being dehiscent, and containing a great number of small seeds.

Hairy Rondeletia. Fl. Ju. Aug. Clt. 1776. Sh. 5 to 6 ft.

8 R. Panamé'nsis (D. C. prod. 4. p. 408.) leaves oval-oblong, acuminated at both ends, glabrous above, white beneath, and villous on the nerves and veins; stipulas triangular, acute, villous outside; peduncles axillary, opposite, shorter than the leaves, trifid and densely corymbose at the apex: ultimate ones collected into a short thyrse; calyx villous, with lanceolate segments. ♄. S. Native of Panama. R. hírta, Bartl. in herb. Hænke. Tube of corolla villous; limb of 5 roundish lobes. Capsules almost globose. Seeds numerous, and of 2 forms, appendiculate.

Panama Rondeletia. Shrub 4 to 5 feet.

9 R. hirsu'ta (Swartz, prod. p. 41. fl. ind. occ. 1. p. 371.) leaves oblong, acuminated, hairy on both surfaces, pale beneath, on short petioles; stipulas ovate-lanceolate, hairy; branchlets. peduncles, and flowers hairy; peduncles axillary, trichotomous. loose, about the length of the leaves. ♄. S. Native of the south of Jamaica, among bushes on the mountains near Bath.

Petioles clothed with rufescent villi. Calyx villous. Corolla yellowish, tomentose outside, with a narrow throat. Seeds girded by a wing, according to A. Rich: if this be the case it is referrible to the genus *Bouvárdia*.

Hirsute Rondeletia. Fl. July, Aug. Clt. 1820. Sh. 5 to 6 ft.

10 R. TRIFOLIA'TA (Jacq. amer. p. 60. t. 43. pict. t. 62.) leaves oblong-lanceolate, 3 in a whorl, on short petioles, glabrous above but tomentose beneath; petioles and branches hairy; panicles axillary, shorter than the leaves. ♄. S. Native of Jamaica, at the foot of the mountains. Flowers reddish, small. Leaves 3 inches long. Teeth of calyx acuminated. Corolla with a very long tube. Capsule many-seeded.

Trifoliate Rondeletia. Tree 12 to 14 feet.

11 R. LÆVIGA'TA (Ait. hort. kew. ed. 2. vol. 1. p. 366.) leaves oblong or elliptic, acuminated at both ends, glabrous, paler beneath, petiolate; stipulas deltoid, glabrous on the outside, but bearded inside; peduncles axillary, trichotomous, rather panicled, 3 times longer than the petioles, but one half shorter than the leaves. ♄. S. Native of Cuba, about the Havana; and of Trinidad. Anónyma, Sieb. fl. trin. no. 374. Tube of calyx downy; limb of 3-5 linear lobes, which are 3-times shorter than the tube of the corolla. Capsule downy, smaller than a pea.

Smooth Rondeletia. Fl. Jul. Aug. Clt. 1793. Sh. 5 to 6 ft.

12 R. AMERICA'NA (Lin. spec. 243.) leaves lanceolate or elliptic, acuminated at both ends, glabrous, hardly petiolate, paler beneath; stipulas deltoid, downy outside; peduncles opposite, axillary, a little longer than the leaves, dichotomously cymose at the apex. ♄. S. Native of Cuba, near the Havana; Jamaica, and many other West India islands, ex Plum. ed. Burm. t. 242. f. 1. Flowers white, bibracteolate, with a little scent. Tube of calyx clothed with adpressed villi; lobes of limb oblong-linear, 4 times shorter than the tube of the corolla. Capsule many-seeded.

American Rondeletia. Fl. Aug. Clt. 1752. Sh. 8 to 10 ft.

13 R. CUMANE'NSIS (H. B. et Kunth, nov. gen. amer. 3. p. 394.) leaves oblong, acuminate, almost sessile, glabrous, paler beneath; stipulas rather deltoid, with ciliated silky margins; panicles terminal, sessile. ♄. S. Native of New Andalusia, near Cumanacoa. Panicle sessile, and the peduncles opposite, dichotomous, and 3-5-flowered, ex Kunth. Lobes of calyx ovate-oblong. Flowers white.

Cumana Rondeletia. Shrub 8 to 10 feet.

14 R. MICRODON (D. C. prod. 4. p. 408.) glabrous; leaves oval or oblong, acute at both ends, on very short petioles; stipulas bipartite, obtuse, permanent; corymbs pedunculate, rising from the forks of the branches; calyx truncate, with 5 very short teeth. ♄. S. Native of Cuba, about the Havana, where it was collected by De la Ossa. Flowers white in the dried state, form of those of the other pentamerous species of *Rondelètia*, but the calyx is hardly 5-toothed.

Small-toothed-calyxed Rondeletia. Shrub.

15 R. ODORA'TA (Jacq. amer. p. 59. t. 42. pict. t. 61.) leaves hardly petiolate, ovate, or subcordate, acutish, scabrous above, paler beneath and rather scabrous on the nerves; corymbs terminal. ♄. S. Native of Cuba, on rocks by the sea-side, at the Havana; and of Mexico. Lin. spec. 1671. H. B. et Kunth, nov. gen. amer. 3. p. 394. R. coccínea, Moc. et Sesse, fl. mex. icon. ined. R. obovàta, Lin. syst. veg. Branchlets villous. Stipulas wide, acute. Peduncles trichotomous. Flowers handsome scarlet, with the projecting rim of the tube orange-coloured, having the scent of violets, downy on the outside, either pentamerous or hexamerous. Lobes of calyx linear, erect, one half shorter than the tube of the corolla. Capsule containing many angular seeds.

Sweet-scented Rondeletia. Shrub 5 to 6 feet.

* * * *African species, with pentamerous flowers.*

16 R. FEBRI'FUGA (Afz.) leaves oval coriaceous, deep green, glabrous, petiolate; corymbs terminal. ♄. S. Native of Sierra Leone, in the low lands about Freetown. A branched spreading shrub, with the habit of *Lauristìnus*. Flowers pale red. Stamens 5, a little longer than the tube of the corolla. Calyx 5-cleft.

Febrifugal Rondeletia. Shrub 4 to 5 feet.

17 R. FLORIBU'NDA; leaves ovate, acuminated, membranous, petiolate; corymbs lateral and terminal, numerous; stamens 5, exserted. ♄. S. Native of Sierra Leone, in woods on the mountains. Corolla tubular, 5-cleft, white. Calyx 5-cleft.

Bundle-flowered Rondeletia. Shrub 5 to 6 feet.

18 R. LONICEROÌDES; shrub twining; leaves roundish, ovate, coriaceous, glabrous, petiolate; corymbs panicled; corolla with a long tube and a 5-cleft border; stamens 5, longer than the tube. ♄. S. Native of Sierra Leone, among bushes in the low lands. A branched twining shrub.

Honeysuckle-like Rondeletia. Shrub tw.

§ 2. *Tetrámera* (from τετρας, *tetras*, by fours, and μερις, *meris*, a part; in reference to the flowers being tetramerous). *D. C. prod.* 4. *p.* 409. *Calyx* 4-*lobed*. *Corolla* 4-*lobed*. *Stamens* 4. *Bouvárdia species of Juss.—Hedyòtis species of Spreng.*

* *Unarmed. Panicles terminal.*

19 R. VIRGA'TA (Swartz, prod. p. 41. fl. ind. occ. 1. p. 354.) leaves roundish-cordate, on very short petioles, quite glabrous, paler beneath; stipulas minute, acute; branches filiform, spreading; peduncles elongated, trifid; flowers crowded by threes. ♄. S. Native of the north of Hispaniola, among bushes by the sea-side. Hedyòtis cordifòlia, Spreng. pug. 2. p. 26. Flowers of a dusky purple colour, clothed with silky down outside. Lobes of calyx linear. Capsule pubescent, subdidymous, many-seeded.

Twiggy Rondeletia. Shrub 5 to 6 feet.

20 R. DISCOLOR (H. B. et Kunth, nov. gen. amer. 3. p. 396. t. 291.) leaves ovate-oblong, acuminated, petiolate, with revolute edges, glabrous above and on the branches, but clothed with white tomentum beneath; stipulas linear-subulate; panicles terminal, sessile. ♄. S. Native of New Granada, between Maraquita and Honda. Hedyòtis díscolor, Spreng. syst. 1. p. 411. Flowers pedicellate, sweet-scented, red on the outside. Lobes of calyx ovate-lanceolate. Capsule dehiscing at the dissepiment; valves bifid at the apex.

Discoloured-leaved Rondeletia. Shrub 4 to 6 feet.

21 R. PUBE'SCENS (H. B. et Kunth, nov. gen. amer. 3. p. 396. t. 291.) leaves oblong, acute, petiolate, clothed with fine down above, and with canescent pubescence beneath, as well as on the branchlets; stipulas lanceolate-subulate; panicles terminal, sessile, tripartite. ♄. S. Native of New Granada, between Maraquita and Honda. Lobes of calyx lanceolate, 5-times shorter than the tube of the corolla. Corolla tomentose, outside. Fruit unknown.

Downy Rodeletia. Shrub 4 to 6 feet.

22 R. ELONGA'TA (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 409.) leaves elliptic-oblong, acuminated at both ends, pubescent above, but clothed with white tomentum beneath, but they at length become glabrous from the down being deciduous; stipulas lanceolate, equal in length to the petioles; panicles terminal, on long peduncles; flowers crowded; lobes of calyx linear, 3 times shorter than the tube of the corolla. ♄. S. Native of Mexico, about Acapulco. An intermediate species, between *R. pubéscens* and *R. leucophýllum*.

Elongated Rondeletia. Shrub.

23 R. LEUCOPHY'LLUM (H. B. et Kunth, nov. gen. amer. 3.

p. 395. t. 290.) leaves linear-lanceolate, acuminated, almost sessile, pubescent above, white from woolly tomentum beneath as well as the branches; panicles terminal, on long peduncles, usually formed into a kind of capitulum. ♄. S. Native of Mexico, between Alto del Peregrino, and the river Papagallo. Hedyòtis leucophýlla, Spreng. syst. 1. p. 411. Flowers red, sessile, or on short pedicels. Lobes of calyx linear-lanceolate, 3 times shorter than the tube of the corolla.

White-leaved Rondeletia. Shrub 3 to 4 feet.

** *Unarmed. Peduncles axillary, trichotomously racemose or 3-flowered.*

24 R. Berteria'na (D. C. prod. 4. p. 409.) leaves oval, acute, somewhat cuneated at the base, petiolate, clothed with villous pubescence above, but hoary from soft villous tomentum beneath; branches clothed with velvety tomentum; stipulas lanceolate, acuminated, villous; racemes axillary, shorter than the leaves, many-flowered. ♄. S. Native of St. Domingo, where it was collected by Bertero. R. hirsùta, Spreng. in herb. Balb. but not of Swartz. Calyx villous; lobes linear, 3 times shorter than the tube of the corolla, which is clothed with adpressed villi on the outside.

Bertero's Rondeletia. Shrub 4 to 6 feet.

25 R. pilòsa (Swartz, prod. p. 41. fl. ind. occ. 1. p. 356.) leaves ovate-lanceolate, or oblong, almost sessile, veiny, roughish above, pale and villous beneath; stipulas deltoid, broad, villous; peduncles axillary, 3-flowered, almost the length of the leaves, and are as well as the calyxes pilose. ♄. S. Native of the West India islands, as in Santa Cruz, Montserrat, and Martinico. R. triflòra, Vahl, symb. 3. p. 34. t. 54. Oldenlándia longiflòra, Lam. dict. 4. p. 534. Hedyòtis longiflòra, Spreng. pug. 2. p. 27. Branches hairy towards the top, terete or tetragonal. Leaves 2-3 inches long. Lobes of calyx length of the tube of the corolla. Capsule many-seeded. Tube of corolla silky outside.

Pilose Rondeletia. Shrub 4 to 6 feet.

*** *Unarmed. Pedicels axillary, 1-flowered.*

26 R. buxifòlia (Vahl. ecl. amer. 2. p. 11. t. 12.) leaves obovate-oblong, on very short petioles, mucronulate at the apex, glabrous on both surfaces, and shining above; stipulas small, deltoid; pedicels axillary, very short, 1-flowered. ♄. S. Native of the islands of Montserrat and Porto-Rico. Poir. dict. 6. p. 253. Catesbæ'a inérmis, Spreng. syst. 1. p. 416. Catesbæ'a parviflòra, Spreng. in herb. Balb. Ixòra buxifòlia, Spreng. syst. 1. p. 409. ex syn. The leaves, in the specimens from Porto-Rico, are 8 lines long and 3 lines broad, striated with the nerves, which are oblique. Ovarium globose, pubescent outside. Lobes of calyx short, linear, acute. Tube of corolla $2\frac{1}{2}$ lines long, downy outside. Capsules size of a black pepper, 2-seeded.

Box-leaved Rondeletia. Shrub 2 to 3 feet?

27 R. royenæfòlia (D. C. prod. 4. p. 410.) leaves obovate-oblong, obtuse, on very short petioles, somewhat mucronate, hoary on both surfaces from short down; stipulas lanceolate, acute; pedicels axillary, very short, 1-flowered. ♄. S. Native of St. Domingo, where it was collected by Bertero. R. incàna, ex Hispaniola, Spreng. syst. 1. p. 707. ex herb. Balb. Allied to *R. buxifòlia*, but quite distinct from *R. incàna*.

Royena-leaved Rondeletia. Shrub.

**** *Shrubs with axillary thorns. Perhaps the spines are either rameal or peduncular. Fruit unknown, and therefore the genus to which they properly belong.*

28 R. leptaca'ntha (D. C. prod. 4. p. 410.) spines opposite; leaves broad-oval, acutish, glabrous on both surfaces, but rather pilose when young as well as the branches; peduncles slender, equal in length to the leaves, or longer than them, bearing 3-5 flowers at the apex. ♄. S. Native of Cuba, about the Havana, where it was collected by De la Ossa. Branches slender, glabrous. Spines axillary, long, bearing rudiments of leaves on one side. Peduncles an inch long. Segments of the calyx subulate. Corolla 5 lines long.

Slender-spined Rondeletia. Shrub.

29 R. brachyaca'ntha (D. C. l. c.) spines opposite; leaves elliptic-oblong, acute at the base, and acuminated at the apex, glabrous above, but villous beneath, as well as the branchlets, peduncles, and flowers; peduncles one half shorter than the leaves, 3-4-flowered at the apex. ♄. S. Native of Brazil. Branches dotted by linear-oblong crowded warts. Spines conical, stiff, forming a straight angle, spreading, 4-5 lines long. Segments of the calyx subulate. Anthers inserted at the throat.

Short-spined Rondeletia. Shrub.

† *Species not sufficiently known.*

30 R. parvifloʻra (Poir. dict. 6. p. 252.) leaves oblong, cuneated at the base, obtuse and acuminated at the apex, petiolate, quite glabrous, coriaceous, paler beneath; peduncles axillary, opposite, corymbose, many-flowered. ♄. S. Native of Martinico. Veins of leaves black. Leaves 4 inches long and 2 broad. Stipulas ovate, acute, short. Bracteas glabrous outside and hairy inside. Capsule globose. R. parviflòra, Spreng. syst. ex herb. Balb. appears to be a distinct plant from the present.

Small-flowered Rondeletia. Shrub.

31 R. rhynchóspora (H. B. et Kunth, nov. gen. amer. 3. p. 395.) leaves oblong-elliptic, acute, on short petioles, pubescent above and on the branches, but clothed with canescent tomentum beneath; panicles terminal; seeds beaked at both ends. ♄. S. Native of New Granada, near Honda. The flowers are unknown.

Beaked-seeded Rondeletia. Shrub 4 to 6 feet.

32 R.? dispe'rma (Jacq. amer. p. 59.) leaves oval, obtuse, petiolate, glabrous; racemes axillary, compound, loose, trifid; fruit somewhat baccate, 2-seeded. ♄. S. Native of South America, in the woods of Carthagena, in rocky places; very frequent in the islands of Baru and Tierra Bomba. This plant should probably be removed from the genus as well as from the present tribe. Flowers sweet-scented, purplish white. Perhaps a species of *Cánthium*.

Two-seeded Rondeletia. Tree 15 feet.

33 R.? coria'cea (Spreng. syst. 1. p. 707. but not of Wall.) leaves oval-oblong, coriaceous, shining above, but clothed with very short velvety down beneath as well as on the branchlets; stipulas semi-orbicular, furnished with a pungent tooth in the middle; cymes terminal; calyxes and corollas 5-parted, rather hispid; stamens exserted. ♄. S. Native of equinoxial Brazil. Mussæ'nda coriàcea, Spreng. neu. entd. 2. p. 145. It is probable that the plant is neither a *Mussæ'nda* nor a *Rondelètia*, according to Cham. et Schlecht. in Linnæa. vol. 4. p. 165., but the structure of the fruit is entirely unknown.

Coriaceous-leaved Rondeletia. Shrub.

Cult. The species thrive well in a mixture of sand, loam, and peat; and cuttings of them are easily rooted if planted in a pot of sand, plunged in heat under a hand-glass. All are shrubs of very little beauty or interest.

LXV. WENDLA'NDIA (Henry Ludov. Wendland, Curator of the botanic garden at Hanover, and author of Commentatio de Acaciis Aphyllis). Bartl. ined. ex D. C. prod. 4. p. 411. but

not of Willd. Rondelètia, Roxb. and Wall. fl. ind. 2. p. 133. but not of Plumier.

LIN. SYST. *Tetra-Pentándria, Monogýnia.* Calyx with an almost globose tube, which is often striated, and a very short permanent limb, which is 4-5-toothed to the base. Corolla with a terete tube, which is longer than the calyx, and a spreading 4-5-lobed limb; lobes ovate, acutish. Stamens 4-5; filaments rising from the top of the tube; anthers oblong, exserted. Style exserted; stigma bifid, with the lobes thickish. Capsule ovate-globose, 2-celled, crowned by the calyx, dehiscing at the cells into 2 valves at the apex. Seeds small, numerous in each cell.—Trees and shrubs, all natives of the East Indies. Leaves opposite, coriaceous, oval, petiolate. Stipulas broad at the base, acuminated. Panicles axillary and terminal, many-flowered. Flowers small.—This genus differs from *Rondelètia* as *Exostémma* does from *Cinchòna*.

§ 1. *Pentámeræ* (from πεντε, *pente*, five, and μερις, *meris*, a part; in allusion to the flowers being pentamerous). *D. C. prod.* 4. *p.* 411. *Calyx and corolla with 5-lobed limbs. Stamens* 5.

* *Indian species.*

1 W. PANICULA'TA (D. C. prod. 4. p. 411.) arboreous; leaves almost sessile, oval-oblong, acuminated, smooth; stipulas reniform, sometimes apiculated, at length recurved; panicles terminal and sub-axillary. ♄. S. Native of the Malay islands. Rondelètia paniculàta, Roxb. fl. ind. 2. p. 133. Flowers small, white, very numerous. Bracteas of various forms and sizes, all hairy. Calyx villous. Corolla glabrous, with revolute segments.

Panicled-flowered Wendlandia. Fl. Ju. Aug. Clt. 1820. Tr.

2 W. TINCTO'RIA (D. C. l. c.) arboreous; leaves petiolate, oblong-lanceolate, smooth above, but pubescent on the nerves beneath, as well as on the branches, petioles, peduncles, and calyxes; stipulas triangular, cuspidate; panicles terminal, decussate; flowers by threes. ♄. S. Native of Bengal, about Burdwan and Midnapoor. Rondelètia tinctòria, Roxb. fl. ind. 2. p. 134. Leaves 4-6 inches long and 1-2 broad. Branches of panicle 4-sided, hairy. Bracteas numerous, hairy, those of the ultimate divisions of the panicle ensiform, with a hastate base. Flowers numerous, small, white, almost sessile, fascicled. Segments of corolla spreading. The bark is employed as a mordant by the natives in some of their dyes, and is called by them *Toola-lodh*.

Dyers' Wendlandia. Tree.

3 W. NOTONIA'NA (Wall. cat. no. 2673.) shrub downy in every part, except the corollas; leaves elliptic or obovate-oblong, acuminated, pale beneath; peduncles axillary and terminal, disposed in terminal racemose thyrsoid panicles; corolla with a slender tube, much longer than the calyx, which is woolly; stipulas broad, rounded at the apex. ♄. S. Native of the East Indies, on the Nellighery mountains, where it was collected by Noton. Ixòra congésta, Roxb. Flowers white, in clusters? Leaves usually 3 in a whorl.

Noton's Wendlandia. Shrub or tree.

4 W. GLABRA'TA (D. C. l. c.) arboreous; leaves petiolate, oblong-lanceolate, glabrous on both surfaces, as well as the petioles, branchlets, peduncles, and calyxes; stipulas triangular, cuspidate; panicles terminal, decussate; flowers by threes. ♄. S. Native of Java, on the mountains in woods. Rondelètia tinctòria, Blum. bijdr. p. 974. but differs from the plant under the same name by Roxburgh, in its smoothness, and by the flowers being distinctly pedicellate.

Glabrous Wendlandia. Tree.

5 W. NI'TENS (Wall. cat. no. 6271.) branchlets downy; leaves glabrous, elliptic-lanceolate, tapering to both ends, pale beneath; stipulas broad at the base, and cuspidate at the apex; panicles terminal, downy; flowers almost sessile, in fascicles. ♄. S. Native of Martaban, on the banks of the Atram. Flowers very small.

Shining Wendlandia. Shrub or tree.

6 W. EXSE'RTA (D. C. prod. 4. p. 411.) arboreous; leaves petiolate, broad-lanceolate, glabrous or downy above, pubescent, or tomentose beneath; stipulas semi-lunate, reflexed; panicles terminal, with spreading downy branches; corolla subcampanulate. ♄. S. Native of the interior parts of Bengal, and particularly over the ruins of the ancient city of Gour; and of Nipaul. Rondelètia exsérta, Roxb. fl. ind. 2. p. 135. Rond. thyrsiflòra, Roth. nov. spec. 141. Rond. Héynei, Rœm. et Schultes, syst. 5. p. 234. and Rond. Oryssénsis, Roth. nov. spec. p. 142. ex Wall. fl. ind. 2. p. 135. Branchlets villous. Leaves 4-6 inches long. Bracteas somewhat ensiform, varying much in size. Flowers numerous, small, pure white, fragrant. Calyx hoary. Segments of corolla recurved.

Exserted-stamened Wendlandia. Tree 20 to 30 feet.

7 W. PRÓXIMA (D. C. l. c.) arboreous; leaves elliptic, acuminated, clothed with tomentum beneath, as well as on the branchlets; panicles very hairy; flowers very much crowded; limb of corolla one half shorter than the tube; calycine teeth obtuse, pilose. ♄. S. Native of the east of Bengal, in Silhet. Rondelètia próxima, D. Don, prod. fl. nep. p. 139. Nearly allied to *W. exsérta*, but in that species the leaves are silky beneath, and the branchlets are more canescent; the limb of the corolla is about equal in length to the tube; the stigma is bipartite, and the calycine teeth are ovate and acute.

Allied Wendlandia. Tree.

8 W. LIGUSTRÌNA (Wall. cat. no. 6272.) shrub glabrous in every part; leaves elliptic, tapering to both ends, shining above; stipulas broad at the base, and cuspidate at the apex; teeth of calyx subulate, much shorter than the tube, which is terete and slender; bracteas to the flowers linear. ♄. S. Native of the Burmese empire, on Mount Taong-Dong. Flowers pedicellate, white, disposed in terminal racemose panicles; pedicels solitary. Capsules hardly the size of coriander seeds.

Privet-like Wendlandia. Tree.

9 W. DENTIFLO'RA (D. C. prod. 4. p. 412.) arboreous; leaves petiolate, ovate-oblong, acuminate, acutish at the base, coriaceous, pubescent on the veins beneath; panicle terminal, decussate, densely clothed with tomentum; flowers much crowded. ♄. S. Native of Java, in the province of Cheribon, in woods on the mountains of Tjerimai, where it is called *Kissampang-gunung*. Rondelètia densiflòra, Blum. bijdr. p. 974.

Tooth-flowered Wendlandia. Tree.

10 W. CINE'REA (D. C. prod. 4. p. 412.) arboreous; the upper parts clothed with ash-coloured dense tomentum; leaves lanceolate, petiolate, villous above and tomentose beneath; stipulas recurved at the apex; panicles terminal, much branched, tomentose; flowers in dense fascicles; corolla with a very short tube. ♄. S. Native of the valley of Nipaul, at Bunipa, and at Bheempedi; as also from Noakote and Shreenagur; and is called in the Newar language *Gothina*. Rondelètia cinèrea, Wall. in Roxb. fl. ind. 2. p. 141. Branches quadrangular, with rounded corners. Leaves 4-6 inches long, smooth above, glaucous beneath. Stipulas reniform, emarginate. Bracteas oblong, caducous, sometimes lobed or sub-hastate at the base. the lowermost ones very long, linear. Flowers numerous, small, white. Teeth of calyx small, triangular. Segments of corolla spreading; throat furnished with 5 tubercles. Capsule globular, villous. The wood is brownish, close-grained, and seems well adapted for furniture.

Grey Wendlandia. Tree 12 to 14 feet.

11 W. LUZONIE'NSIS (D. C. l. c.) branches, petioles, and

nerves of leaves hairy; leaves oval-oblong, acuminated at both ends; stipulas semi-orbicular, obtuse, permanent, coriaceous; panicle much branched, many-flowered, rather villous; anthers hardly exserted; stigma bifid. ♄. S. Native of the island of Luzon. Wendlándia multiflòra, Bartl. in herb. Hænke. Allied to *R. pubérula*. Fruit hardly larger than turnip seed. Flowers small, white.

Luzon Wendlandia. Tree.

12 W. CORIA'CEA (D. C. l. c.) arboreous, smooth in every part; leaves oblong-lanceolate, acuminated, tapering at the base, petiolate, coriaceous, shining; stipulas broad, short, rounded, ending each in a cuspidate point: panicles dense, terminal, many-flowered; flowers opposite, very numerous. ♄. S. Native of Nipaul, in the valley, very common in the forest of Thoka, and other places: and from Noakote. The tree is called *Kongeea* in the Parbuteeyan language, and *Julsi* in that of Newar. Rondelètia coriàcea, Wall. in Roxb. fl. ind. 2. p. 142. D. Don, fl. nep. p. 138. Leaves 5-7 inches long. Flowers white, fragrant. Bracteas lanceolate, coriaceous, those of the flowers capillary. Corolla with a cylindrical tube, and a spreading border. The inhabitants of Nipaul use the wood of this tree for various purposes, such as rafters, tools, &c.: it is close grained, and becomes of a brownish colour soon after being cut, not unlike mahogany. A red dye is likewise prepared from it. The leaves and flowers attain sometimes a bluish colour on being dried.

Coriaceous-leaved Wendlandia. Tree 10 to 12 feet.

13 W. PUBE'RULA (D. C. l. c.) branchlets, petioles, nerves of leaves underneath, and panicles hairy; leaves petiolate, oval-oblong, acute at both ends, glabrous above; stipulas adpressed, broad at the base, cuspidate at the apex; panicle terminal, branched, many-flowered; corollas glabrous; stigma clavate. ♄. S. Native of Nipaul. Allied to *W. péndula*, but differs in the stipules being 4 times shorter, in the corolla being glabrous, &c.

Puberulous Wendlandia. Tree.

14 W. PE'NDULA (D. C. l. c.) fruticose; branches pendulous; leaves lanceolate-ovate, acuminated, smooth above and rough underneath; stipulas lanceolate, adpressed, deciduous, rather shorter than the petioles; corymbs terminal, oblong, panicled; tube of corolla filiform, smooth without and pubescent within; segments of corolla recurved. ♄. S. Native of Nipaul, between Hetaunra and Rheempedi, also on Sheopore. Rondelètia péndula, Wall. in Roxb. fl. ind. 2. p. 140. A very elegant shrub. Branches obscurely quadrangular; new shoots downy. Leaves 3-5 inches long, and disposed 3 in a whorl on the robust shoots. Peduncles villous. Flowers fascicled, green, fragrant. Stigma clavate.

Pendulous-branched Wendlandia. Shrub 5 to 6 feet.

15 W. MALAYA'NA; branches somewhat tetragonal; leaves elliptic-lanceolate, acuminated, downy on the nerves, tapering to the base, membranous; stipulas broad; calyx with a roundish tube and a 5-cleft border; corolla with a very slender tube, and a spreading border; panicles terminal, corymbose, hardly longer than the petioles. ♄. S. Native of the Malay islands. Anderosácme Malayàna, Wall. cat. no. 6282.

Malay Wendlandia. Shrub or tree.

16 W. LONGIFO'LIA (D. C. l. c.) fruticose: epidermis falling from the branches; leaves elliptic-oblong, acuminated, tapering at the base, villous underneath; stipulas lanceolate, erect, acute, often bidentate, furnished within their broad base with a series of subulate glands; panicle many times trichotomous, downy; calyx downy, with a yellow gland on each margin of the segments, and sometimes at the points; bracteas villous, glandular. ♄. S. Native of Silhet; and of Nipaul, on Chundagiri, Nagurjoon, and at the foot of Sheopore near Thoka. The Bengalee name of the plant is *Soopari*. Rondelètia longifòlia Wall. in Roxb. fl. ind. 2. p. 137. D. Don, prod. fl. nep. p. 138. Anderosácme longifòlia, Wall. cat. no. 6280. Leaves 6-14 inches long, dark green above. Bracteas with an entire or 3-lobed base, their margins marked with yellow subulate fleshy glands. Flowers large, fleshy, yellow, scentless, with a valvate æstivation. Segments of corolla spreading. Stamens inserted in the bottom of the tube. Capsules round, smooth. All the species of this genus vary considerably in the size of the leaves, the degree of their pubescence, and in their inflorescence, which renders their specific discrimination difficult.

Long-leaved Wendlandia. Shrub.

* * *African species, not sufficiently known.*

17 W. SULCA'TA; leaves oblong-lanceolate, acuminated, glabrous, on short petioles; stipulas sheath-formed, supra-foliaceous; racemes panicled, terminal; capsule round, sulcate. ♄. S. Native of Sierra Leone, in woods on the margins of rivers. Shrub branched.

Furrowed-fruited Wendlandia. Shrub 5 to 6 feet.

18 W. PILO'SA; leaves broad, ovate-lanceolate, acuminated, cordate at the base, almost sessile; stipulas large, sheath-formed, supra-foliaceous, and are as well as the leaves pilose; racemes panicled, terminal; capsules round. ♄. S. Native of Sierra Leone, in woods on the banks of rivulets.

Hairy Wendlandia. Shrub 5 to 6 feet.

19 W. RACEMO'SA; glabrous in every part; leaves elliptic, very long, acuminated, coriaceous, on short petioles; stipulas large, sheath-formed, supra-foliaceous; racemes panicled, terminal; capsules ovate. ♄. S. Native of Sierra Leone, in woods on the banks of rivulets.

Racemose-flowered Wendlandia. Shrub.

20 W. VIRGA'TA: leaves oval, acuminated, petiolate; panicles axillary and terminal. ♄. S. Native of Sierra Leone, on the edges of woods. A branched twiggy shrub. Stamens 5, longer than the corolla. Capsule 1-celled, many-seeded. Corolla funnel-shaped.

Twiggy Wendlandia. Shrub.

§ 2. *Tetrámeræ* (from τετρας, *tetras*, by fours, and μερις, *meris*, a part; in reference to the flowers being tetramerous). *D. C. prod.* 4. *p.* 412. *Limb of calyx and corolla* 4-*lobed. Stamens* 4.—*Doubtful species.*

21 W. SPICA'TA (D. C. prod. 4. p. 412.) leaves elliptic, tapering downwards, villous, as also the panicle; stipulas oblong, acute, smooth, except the elevated rib, which is villous; panicle large, terminal, almost sessile, with opposite compressed peduncles: the secondary divisions of the peduncle dichotomous, terminating in cylindrical slender, twin, or ternate spikes, which are 2 inches long; flowers disposed in one row along one side of the rachis of the spike; corolla pubescent, with a slender tube, widening at the apex; stigma of 2 recurved lobes. ♄. S. Native of Pulo-Penang. Rondelètia spicàta, Wall. in Roxb. fl. ind. 2. p. 139. Leaves 6-12 inches long. Bracteas lanceolate, subhastate, acute. Flowers small. Capsule small, round, villous. Seeds angular. Inflorescence like that of *Tournefórtia*. Perhaps a proper genus.

Spicate-flowered Wendlandia. Shrub or tree.

22 W. TETRA'NDRA (D. C. l. c.) shrubby; branches tetragonal, smooth; leaves lanceolate, sessile, smooth; stipulas pinnatifid, ending each in a subulate point; flowers axillary, glomerate. ♄. S. Native of Pulo-Penang. Rondelètia tetrándra, Roxb. fl. ind. 2. p. 136. Flowers mixed with many lanceolate-ciliated bracteas. Capsule small, black, angular. Seeds numerous, immersed in pits in the placentas. Perhaps a proper genus.

Tetrandrous-flowered Wendlandia. Shrub.

23 W.? corymbo'sa (D. C. prod. 4. p. 413.) leaves obovate-lanceolate; peduncles for the most part terminal, dichotomously corymbose; flowers unilateral, tetrandrous. ♄. S. Native of Pulo-Penang. Rondelètia corymbòsa, Jack, in mal. misc. 1. no. 1. p. 4. Corolla white, tinged with red. Perhaps a separate genus.

Corymbose-flowered Wendlandlia. Tree.

24 W. Wightia'na (Wall. cat. no. 6277.) young branches downy; leaves obovate-oblong, rather acuminate at the apex, tapering much to the base, glabrous; panicle trichotomous; flowers small, sessile, tetrandrous, disposed in a single row, on the upper side of the branches of the panicle. ♄. S. Native of the East Indies. Tournefórtia, herb. Wight. Leaves 1 to 1½ foot long. Stipulas broad, membranous. Very like *W. corymbòsa*.

Wight's Wendlandia. Shrub or tree.

25 W.? Lawso'niæ (D. C. l. c.) sub-arboreous; branchlets quadrangular; leaves lanceolate, acuminated, glabrous; corymbs terminal, trichotomous; fruit oblong. ♄. S. Native of Malabar. Poutaletsje, Rheed. mal. 4. t. 57. Petèsia species, ex Juss. Ligústrum species, ex Comm. Lawsònia purpùrea, Lam. dict. 3. p. 107. Barsoti, anc. enclycl., where the fruit is said to be baccate, but in the figure the fruit is drawn capsular and many-seeded, it is therefore more likely to be a species of *Wendlándia* than *Petèsia*.

Lawson's Wendlandia. Tree.

† *A species hardly known.*

26 W.? sca'ndens; shrubby, scandent, smooth; leaves opposite, petiolate, oblong, entire; panicles axillary, small, brachiate; capsules globular; seeds small, numerous. ♄. S. Native of the Mauritius. Rondelètia scándens, Roxb. fl. ind. 2. p. 137.

Climbing Wendlandia. Shrub cl.

Cult. See *Rondelètia*, p. 517. for culture and propagation.

LXVI. XANTHOPHY'TUM (from ξανθος, *xanthos*, yellow, and φυτον, *phyton*, a plant; so called from the first species being clothed with rufous villi). Blum. bijdr. p. 989. A. Rich. mem. soc. hist. nat. par. 5. p. 275. D. C. prod. 4. p. 413.

Lin. syst. *Tetra-Pentándria, Monogýnia.* Calyx with an ovate tube and a 4-5-cleft limb. Corolla funnel-shaped, with a short tube, a villous throat, and a 4-5-cleft limb. Stamens 4-5, exserted; filaments inserted in the throat, connivent. Style sub-clavate, perforating the disk of the ovarium; stigma thick, 2-lobed, in the throat. Drupe didymous, crowned by the calyx, divisible into 2 many-seeded parts or cells. Placentas prominent, fixed to the middle dissepiment on both sides. Seeds minute, angular, wingless.—This genus is nearly allied to *Wendlándia*, but differs in the fruit not being dehiscent.

1 X. fruticulo'sum (Reinw. in Blum. bijdr. p. 989.) suffruticose, clothed with rufous villi; leaves oblong-lanceolate; stipulas bifid; peduncles axillary, trichotomous, many-flowered. ♄. S. Native of the islands of Java and Nusæ-Kambanga, on the mountains, among bushes. Branches, peduncles, calyxes, and lower surfaces of leaves clothed with adpressed rufous silky villi. Stipulas large, deciduous.

Shrubby Xanthophytum. Shrub.

2 X. spica'tum (Blum. in litt. ex D. C. prod. 4. p. 413.) suffruticose, glabrous, erect; leaves oblong, acuminated at both ends; spikes axillary and terminal, nutant; flowers in heaps. ♄. S. Native of Java, especially on calcareous mountains. Chiocócca spicàta, Blum. bijdr. p. 958. Berries small, indehiscent, dry, didymous, striated. Seeds small, not winged. Stipulas twin on both sides, subulate at the apex, combined into a short sheath at the base. Spikes slender, elongated.

Spicate-flowered Xanthophytum. Shrub.

Cult. For culture and propagation see *Rondelètia*, p. 517.

LXVII. CARPHA'LEA (from καρφαλεος, *carphaleos*, dry; the shrub is stiff and dry). Juss. gen. p. 198. mem. mus. 6. p. 383. Lam. ill. t. 59. A. Rich. mem. soc. hist. nat. par. 5. p. 274. D. C. prod. 4. p. 413.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with a turbinate tube, and a 4-parted limb; lobes large, oval-oblong, rather spatulate, scarious, permanent. Corolla with a long filiform tube, a ventricose throat, which is hairy inside, and a 4-parted limb; lobes oblong, acute. Anthers almost sessile, inclosed, oblong. Stigma 1 (ex Juss.), but slender and bifid according to Lamarck's figure. Capsule crowned by the calyx, 2-celled, dehiscing at the cells: valves semi-septiferous. Seeds many in each cell.—A dry stiff shrub, with the habit of *Serissa*, and leaves like those of hyssop. Leaves sessile, linear, acute. Stipulas unknown. Flowers terminal (ex Lam.); capitate (ex Juss.); corymbose.—It is doubtful which place this genus should occupy in the order, both the seeds and stipulas being unknown.

1 C. Madagascarie'nsis (Lam. ill. 1. p. 258. t. 59.). ♄. S. Native of Madagascar. Poir. suppl. 2. p. 119. C. corymbòsa, Willd. spec. 1. p. 585.

Madagascar Carphalea. Shrub.

Cult. For culture and propagation see *Rondelètia*, p. 517.

LXVIII. SIPA'NEA (Aublet does not give the meaning of this name). Aubl. guian. (1775.) 1. p. 147. t. 56. H. B. et Kunth, nov. gen. amer. 3. p. 397. A. Rich. mem. soc. hist. nat. par. 5. p. 275. D. C. prod. 4. p. 414.—Virécta, Lin. fil. suppl. (1781.) p. 17. Vahl. eclog. 2. p. 211. Gærtn. fil. carp. 3. p. 31. t. 184. Juss. mem. mus. 6. p. 385.—Sipànea and Virécta, Pers. ench. 1. p. 205.—Rœm. et Schultes, syst. 5. p. 2. no. 853-856.

Lin. syst. *Pentándria, Monogýnia.* Calyx with a turbinate tube, and a 5-parted limb; lobes lanceolate-subulate, permanent. Corolla with a terete tube, about 3 times longer than the lobes of the calyx, a bearded throat, and a 5-parted limb; segments ovate. Anthers 5, sessile, inclosed. Stigma bifid, acute. Capsule almost globose, crowned by the calyx, 2-celled, dehiscing at the cells into 2 valves. Placentas central, rather fleshy. Seeds very numerous, wingless, very minutely tuberculated.—Annual green herbs. Leaves ovate. Stipulas linear, acuminated, solitary on both sides. Flowers axillary and terminal.—This genus is nearly allied to *Rondelètia*.

1 S. prate'nsis (Aubl. guian. 1. p. 147. t. 56.) stems creeping at the base; leaves ovate-lanceolate, rather scabrous, ciliated at the base; flowers sessile, almost terminal, sub-corymbose. ⊙. S. Native of Cayenne. Poir. dict. 7. p. 199. Cham. et Schlecht. ex Linnæa. 4. p. 166. with a good description. Virécta praténsis, Vahl. eclog. amer. 2. p. 11. Corolla rose-coloured, with a bearded throat. Stem rather villous. The plant is used in Guiana in astringent ptisans, and in the cure of gonorrhœa; and a decoction of it is used to wash ulcers and other sores.

Field Sipanea. Pl. creeping, 2 feet.

2 S. dichótoma (H. B. et Kunth, nov. gen. amer. 3. p. 397.) stem tetragonal; leaves lanceolate, clothed with silky villi on both surfaces; panicle terminal, dichotomous. ⊙. H. Native of South America, in humid places near Atures, at the cataract of the Orinoco. Corolla rose coloured, pilose on the outside, with a bearded throat. Virécta dichótoma, Spreng. syst. 1. p. 702. Ptychódea dichótoma, Willd. herb. ex Cham. et Schlect. in Linnæa. 4. p. 166. Stem villous, branched.

Dichotomous Sipanea. Pl. 2 to 3 feet.

3 S. glomera'ta (H. B. et Kunth, nov. gen. amer. 3. p. 398.) stems unknown; leaves oblong-lanceolate, clothed with silky tomentum on both surfaces, with undulated margins; flowers glomerate, terminal, and axillary. ♃. S. Native on the banks of the Orinoco, between Atures and Carichana, in inundated places. Virécta glomeràta, Spreng. syst. 1. p. 702. Ptychòdea sessiliflòra, Willd. herb. ex Cham. et Schlecht. l. c. Corolla yellow, with a silky tube, which is 4 times longer than the calyx.

Glomerate-flowered Sipanea. Pl. creeping?

4 S. biflòra (Lin. fil. suppl. p. 134.) stem creeping; leaves ovate, obtuse; peduncles terminal, rising from the forks of the branches, 2-flowered. ⊙. S. Native of Surinam and Brazil, in humid places. Cham. et Schlecht. in Linnæa. 4. p. 168. Rondelètia biflòra, Rottb. pl. sur. 7. t. 2. f. 2. A. Rich. mem. soc. hist. nat. par. 5. p. 271. Virécta vìrens, Vahl. symb. 2. p. 38. Gærtn. fil. carp. t. 184. There is a tooth between each of the calycine lobes, according to Lin. fil., but according to Gærtn. there are none; but in the specimens examined there are 5 subulate teeth, and 5 minute ones between these.

Two-flowered Sipanea. Pl. creeping.

Cult. The species of this genus possess no beauty, and are therefore only worth cultivating in botanical gardens. The seeds should be sown in spring, on a hot-bed, and the plants, when of sufficient size, should be planted into separate pots, and shifted from size to size of pots as they grow.

LXIX. VIRE'CTA (from *viréctum*, a green place; from the agreeable greenness of the leaves). D. C. prod. 4. p. 414.—Virécta species, Smith, but not of Lin. fil.—Sipànea species, A. Rich. ?—Phyteumoìdes, Smeathmann, in herb. L'Her.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an ovate short tube, and 5 linear-setaceous lobes. Corolla funnel-shaped, with an obconical tube, about equal in length to the lobes of the calyx, a naked throat, and 5 linear-oblong ciliated lobes. Stamens 5: having the filaments much exserted beyond the throat; anthers linear, oscillatory, bifid at the base. Style filiform, equal in length to the stamens. Stigma hardly thickened, undivided. Capsule globose, crowned by the calycine lobes in the young state, but almost naked in the adult state, 2-celled, and at length dehiscing at the cells. Seeds innumerable, 4-5-sided, and a little muricated.—Hairy herbs, with opposite branches. Leaves opposite, oval-oblong. Stipulas twin on each side, lanceolate. Flowers white or yellow, disposed in dense cymose corymbs: branchlets of cyme elongated after flowering.—This genus is nearly allied to *Sipànea*, but differs in the genitals being exserted; it differs also from *Hedyòtis* in the quinary number of the floral parts, and in the exserted stamens, &c.

1 V. multiflòra (Smith, in Rees's cycl. no. 4.) stem erect; leaves ovate-lanceolate, almost sessile.—Native of Sierra Leone, where it was collected by Smeathmann. Phyteumoìdes hirsùta, Smeathm. in herb. L'Her. Perhaps Sipànea angustifòlia, A. Rich. mem. soc. hist. nat. par. 5. p. 276. is the same as the present plant. Flowers white.

Many-flowered Virecta. Pl. 2 to 3 feet.

2 V. procu'mbens (Smith, l. c. no. 2.) stem procumbent; leaves ovate, 3 times longer than the petioles. ♃. S. Native of Sierra Leone.

Procumbent Virecta. Pl. procumbent.

3 V. lu'tea; leaves ovate-lanceolate, acuminated, hairy; pedicels aggregate, axillary; calyx 5-toothed; corolla tubular, 5-cleft, hairy. ♃. S. Native of Sierra Leone, in cultivated places. Flowers yellow. Habit of *Lithospérmum*. Perhaps the same as *V. procúmbens*.

Yellow-flowered Virecta. Pl. rambling.

4 V. ela'tior (D. C. prod. 4. p. 415.) leaves oval-lanceolate, rounded at the base and abruptly petiolate, acute at the apex, smoothish; flowers terminal, almost aggregate; calycine segments very unequal, smoothish; tube of corolla very long. ♃. S. Native of Angola, in south-western Africa. Sipànea elàtior, A. Rich. mem. soc. hist. nat. par. 5. p. 276.

Taller Virecta. Pl.

5 V.? paniculà'ta; suffruticose, branched, clothed with brown or copper-coloured hairs; leaves oval-lanceolate; corymbs panicled, axillary, and terminal. ♄. S. Native of Sierra Leone, on the mountains. Flowers small, greenish.

Panicled-flowered Virecta. Shrub.

Cult. For culture and propagation see *Sipànea* above.

LXX. OPHIORHI'ZA (from *οφις, ophis*, a snake, and *ῥιζα. rhiza*, a root; used for the cure of the bite of the riband snake). Lin. fl. zeyl. no. 402. Gærtn. fruct. 1. p. 264. t. 55. R. Br. prod. 1. p. 450. A. Rich. mem. soc. hist. nat. par. 1823. vol. 1. p. 67. Roxb. fl. ind. 2. p. 554. Blum. bijdr. p. 976. D. Don, prod. fl. nep. p. 135. D. C. prod. 4. p. 415.—Ophiorhìza species, Lin. gen. no. 210. and others.

Lin. syst. *Pentándria, Monogýnia.* Calyx with a short turbinate tube, which is adnate to the ovarium at the base, and a 5-cleft permanent limb. Corolla tubularly funnel-shaped, 3-times longer than the limb of the calyx, hairy inside; with 5 ovate segments. Stamens 5, inclosed. Style filiform, girded by an urceolus at the base; stigma 2-lobed, shorter than the corolla. Capsule broad, compressed, 2-lobed, almost mitre-formed, crowned by the calycine teeth, internally divided into 2 cells by a transverse partition, opening between the remains of the 2 fleshy nectareal lips, or by a transverse chink round the apex. Seeds numerous, small, hexagonal. Embryo straight, slender, in fleshy or rather horny albumen.—Dwarf perennial herbs, natives of the East Indies. Leaves opposite, petiolate, membranous, those opposite each other often unequal in size. Stipulas twin on each side, small. Peduncles axillary and terminal, solitary, cymose at the apex, with sub-umbellate branches. Flowers disposed along the branches of the peduncles in a single unilateral row.

1 O. Mu'ngos (Lin. amœn. 2. p. 117. spec. 213. mat. med. 27. with a bad figure, but not of Burm.) suffruticose; leaves elliptic-lanceolate, acuminated at both ends, glabrous, papery; stipulas small, truncate; cymes pedunculate, terminal, branched; tube of corolla short, funnel-shaped. ♃. S. Native of Java, Ceylon, Sumatra, Pulo Penang, &c. Blum. bijdr. p. 976. Roxb. fl. ind. 2. p. 544. Gærtn. fr. 1. t. 55.? A. Rich. l. c. t. 2. Radix. Mungo. Kœmpf. amœn. 573. and 577. Stipulas a slight connecting membrane. Nectary a 2-lipped terminal body, surrounding the base of the style. Flowers white. The root is very bitter, and is celebrated as an alexiteric, the trunk of which is horizontal, and the fibres perpendicular. The plant is called in Ceylon *Ekawerya* and *Naghawalli*, from *nagha*, the riband-snake, for the bite of which it is accounted a specific.

Mungos' Snake-root. Fl. May, Dec. Clt. 1820. Pl. 1 to 2 ft.

2 O. bracteola'ta (Wall. cat. no. 6228.) stem ascending, villous above, simple, or a little branched; leaves unequal in size in each pair, as is the case in most of the species; stipulas ensiform, pubescent; common peduncles slender, villous, from 3-5 inches long. ♃. S. Native of the valley of Nipaul, in dark moist situations.

Bracteolate Snake-root. Pl. 1 foot.

3 O. oblongifòlia (D. C. prod. 4. p. 415.) suffruticose, downy at the apex as well as on the peduncles; leaves oblong, bluntish, attenuated at the base, glabrous above, pale and rather velvety beneath; stipulas small, triangular, acute; cymes pedunculate, branched; tube of corolla short. ♄.? ♃.? S.

Native of the Island of Luzon, one of the Philippines. O. Múngos, Bartl. in herb. Hænke. Herb hardly a hand high, erect, suffruticose at the base, and throwing out a few roots from the lower part.

Oblong-leaved Snake-root. Shrub ½ foot.

4 O. villo'sa (Roxb. fl. ind. 2. p. 546.) stem suffruticose, erect, villous; leaves ovate-oblong or lanceolate, villous on the veins beneath; stipulas ensiform, villous; cymes or corymbs terminal, on long peduncles, villous; corolla funnel-shaped. ♃. S. Native of Chittagong and Silhet, on the hills in shaded moist places. O. Múngos, Gærtn. fruct. 1. p. 264. t. 55.? ex Roxb. Corymbs almost globular, with numerous white almost sessile flowers, and recurved branches. Urceolus bilabiate, surrounding the base of the style. Capsule opening round the apex.

Villous Snake-root. Pl. ½ foot.

5 O. argen'tea (Wall. cat. no. 6229.) suffruticose; stem hispid; leaves ovate, acuminated, tapering at the base, glabrous, green above and white beneath; peduncles axillary and terminal, trichotomous at the apex; tube of corolla longer than in *O. villòsa*. ♄. S. Native of Silhet and Chittagong. O. villòsa, Wall. but not of Roxb. Peduncles downy.

Silvery Snake-root. Pl. ½ to 1 foot.

6 O. margina'ta (Blum. bijdr. p. 976.) stem suffruticose, erect; leaves lanceolate, acuminated at both ends, glabrous, except the margins, which are scabrous; stipulas semi-lanceolate, small, acuminated; cymes or corymbs pedunculate, terminal, almost trifid; corolla funnel-shaped, with an angular tube. ♃. S. Native of Java, on Mount Tjerimai. Allied to *O. Múngos*, but differs in the flowers being larger and in the stipulas being subulate at the apex.

Marginate-leaved Snake-root. Pl. ½ to 1 foot.

7 O. fasciula'ta (D. Don, prod. fl. nep. p. 136.) stem suffruticose, erect, branched; leaves elliptic, acuminated, glabrous above and downy beneath; flowers in terminal fascicles; calycine segments ovate, acute. ♄. S. Native of Nipaul, in moist shaded places, near Suembu. Virécta fasciculàta, and O. suffruticòsa, Hamilt. mss. Differs from *O. Múngos* in the leaves being downy beneath, and in the flowers being in terminal fascicles.

Fascicled-flowered Snake-root. Pl. ½ foot.

8 O. rugòsa (Wall. in Roxb. fl. ind. 2. p. 547.) stems herbaceous, creeping at the base, and ascending at the apex, villous; leaves elliptic-lanceolate, attenuated at both ends, shining, rugose and rather scabrous above, paler beneath and rather downy along the veins; stipulas semi-lanceolate, acuminated; cymes or terminal corymbs pedunculate, bifid or trifid, equalling the uppermost pair of leaves. ♃. S. Native of Nipaul, in forests, on Shivapoor and other high mountains near the valley; and of Java, on Mount Gede in woods. Blum. bijdr. p. 976. Root consisting of a number of long pink-coloured fibres. Petioles villous. Peduncles furnished with 2 subulate bracteas about the middle, villous. Flowers white, downy, twin, the one sessile, and the other pedicellate. Urceolus 2-lobed.

Wrinkled-leaved Ophiorhiza. Pl. ½ to 2 feet.

9 O. di'scolor (R. Br. in Wall. cat. no. 6232.) leaves elliptic-oblong, much acuminated, tapering to the base, glabrous, green above, and reddish beneath; stems and peduncles downy; peduncles terminal, corymbose, trichotomously branched. ♄. S. Native of Penang. O. Mungos, Wall. in Roxb. fl. ind. 2. p. 547. O. corymbòsa, Hamilt. herb.

Discoloured-leaved Snake-root. Shrub 1 to 2 feet.

10 O. cane'scens (Blum. bijdr. p. 977.) stems herbaceous; leaves oblong-lanceolate, attenuated at both ends, whitish beneath, and rather downy along the veins; stipulas broad, short, subulate at the apex; cymes on short peduncles, terminal, and axillary, naked, usually quadrifid; stamens about equal in length to the tube of the corolla. ♃. S. Native of Java, on the mountains of Seribu, in shady places. Allied to *O. rugòsa*, but is distinguished from it in the cymes being naked.

Canescent Snake-root. Pl. ½ to 1 foot.

11 O. trichoca'rpa (Blum. bijdr. p. 977.) stems herbaceous, tomentose; leaves on short petioles, ovate-lanceolate, acutish, rather downy on the veins beneath; capsules downy; stipulas subulate; cymes pedunculate, axillary, and terminal, dichotomous. ♃. H. Native of the islands of Java and Nusa-Kambanga. Said to be nearly allied to *O. villòsa*.

Hairy-fruited Snake-root. Pl. ½ to 1 foot.

12 O. longiflòra (Blum. bijdr. p. 977.) stem suffruticose; leaves oblong-lanceolate, acuminated at both ends, hairy beneath; stipulas semi-lanceolate, acuminated; cymes pedunculate, terminal, loose-flowered; tube of corolla very long, velvety. ♄. S. Native of Java, on Mount Gede, in woods near the top.

Long-flowered Snake-root. Shrub ½ to 1 foot.

13 O. sanguínea (Blum. bijdr. p. 977.) stem herbaceous; leaves ovate or elliptic-lanceolate, acuminated, rather oblique at the base, glabrous; stipulas foliaceous, ovate-oblong, bifid; cymes pedunculate, terminal. ♃. S. Native of Java, on the mountains in shady places. Leaves reticulately veined in the dry state; the veins blood coloured.

Bloody-veined Snake-root. Pl. ½ to 1 foot.

14 O. negle'cta (Blum. herb. ex D. C. prod. 4. p. 416.) stem herbaceous, erect, dark purple, glabrous; leaves oblong-lanceolate, acuminated, pale beneath; peduncles axillary, clothed with rusty down; cymes bifid or quadrifid, having the branchlets elongated. ♃.? S. Native of Java. Nerves of leaves purplish beneath. Stipulas deciduous.

Neglected Snake-root. Pl. ½ to 1 foot.

15 O. quadri'fida (Blum. bijdr. p. 977.) stem herbaceous; leaves ovate or oblong, acute at both ends, smooth, with simple veins; stipulas linear, obtuse; cymes pedunculate, axillary, and terminal, usually quadrifid. ♃. S. Native of Java, in shady mountain woods.

Quadrifid-cymed Snake-root. Pl. ½ to 1 foot.

16 O. Japónica (Blum. bijdr. 977.) stem herbaceous, radicant; leaves ovate or oblong-lanceolate, roughish above, and downy on the veins beneath; corymbs terminal, pedunculate, dichotomous; corolla funnel-shaped, with a very long tube, and having the segments hairy inside. ♃. G. Native of Japan, where it was collected by Siebold.

Japan Snake-root. Pl. ½ foot.

17 O. prostra'ta (D. Don, prod. fl. nep. p. 136.) stem prostrate, radicant, downy; leaves ovate or elliptic, rough above, and downy beneath; calycine segments oblong. ♃. G. Native of Nipaul, at Narainhetty. Virécta? prostràta, Hamilt. mss. Differs from *O. Múngos* in the plant being smaller, and more pubescent, and in the stems being radicant.

Prostrate Snake-root. Pl. prostrate.

18 O. tomentòsa (Jack, in Roxb. fl. ind. 2. p. 546.) the whole plant is clothed with very soft villi; stem herbaceous, erect, branched; leaves lanceolate-oblong, finely acuminated, on longish petioles, villous and hoary underneath, with reddish veins; stipulas subulate; cymes pedunculate, terminal. ♄. S. Native of the islands of Pulo-Penang and Sumatra, on the hills. Stem reddish. Petioles villous. Flowers almost sessile. Peduncles and calyxes tomentose. Corollas white. Urceolus bilabiate, glandular. Very like *O. bracteolàta*.

Tomentose Snake-root. Pl. 1 foot.

19 O. erube'scens (Wall. cat. no. 6233.) stem clothed with rusty down at the top; leaves elliptic-lanceolate, acuminated, tapering at the base, glabrous above, and downy beneath; stipulas broad at the base, and cuspidate at the apex; flowers ter-

minal, corymbose. ♄. S. Native of the East Indies, at Cheppadong.

Reddish Snake-root. Shrub 1 foot.

20 O. hispi'dula (Wall. cat. no. 6234.) stem and petioles downy: leaves elliptic, tapering to both ends; peduncles terminal, downy, corymbose, dichotomously branched; capsules downy. ♄. S. Native of the East Indies, at Tavoy.

Hispid Snake-root. Shrub $\frac{1}{2}$ to $\frac{3}{4}$ foot.

21 O. heterophy'lla (Jack, mal. misc. 2. no. 7. p. 85. Wall. in Roxb. fl. ind. 2. p. 547.) stem erect, tomentose; leaves roundish-ovate, those opposite each other very unequal in size; cymes small, terminal. ♄. S. Native of Sumatra, in the interior of the island. Leaves with a bluntish acumen, smooth, pale, and whitish beneath. Capsules compressed, obcordate.

Variable-leaved Snake-root. Pl. $\frac{1}{2}$ to 1 foot.

22 O. acumina'ta (D. C. prod. 4. p. 416.) stem suffruticose, clothed with rufous velvety down above, as well as the petioles; leaves lanceolate, acuminated, glabrous, velvety on the nerves beneath; stipulas broad at the base, and awned by a bristle at the apex; cymes pedunculate, of 5 velvety branches. ♄. S. Native of the island of Luzon, at Sorzogon. O. subumbellàta, Bartl. in herb. Hænke. Perhaps the same as O. subumbellàta, Forst.

Acuminated-leaved Snake-root. Shrub.

23 O. Richardia'na (Gaud. in Freyc. voy. p. 473. t. 97.) plant suffruticose, quite glabrous; leaves oblong, much acuminated at both ends, petiolate, with smooth margins; corymbs terminal, on short peduncles, trifid or quadrifid; tube of corolla short; calycine teeth very short. ♄. S. Native of the Moluccas.

Richard's Snake-root. Shrub $\frac{1}{2}$ to 1 foot.

24 O. perpusi'lla (Blum. herb. ex D. C. prod. 4. p. 417.) stem erect, dwarf, simple; leaves elliptic, glabrous; flower terminal, solitary, nutant, on a short pedicel; corolla funnel-shaped, glabrous; calycine teeth obtuse. ♃. S. Native of Java. Herb hardly an inch long. Fruit unknown.

Smallest Snake-root. Pl. 1 inch.

25 O. Harrisònii (Heyne, ex Wall. cat. no. 6236.) stem, petioles, peduncles, and nerves of leaves on the under side downy; leaves ovate or roundish-ovate, acutish, glabrous and green above, and pale beneath; peduncles terminal, corymbose, and dichotomously branched at the apex. ♃. S. Native of the East Indies. Root creeping much.

Harrison's Snake-root. Pl. $\frac{1}{2}$ to 1 foot.

26 O.? gemina'ta (Wall. cat. no. 6237.) stem, petioles, peduncles, and nerves on the under surface of the leaves, downy; leaves large, obovate-oblong, tapering much at the base, and running down the petioles, and acute at the apex, glabrous and green above, but pale or reddish beneath; peduncles long, terminal, racemose. ♄. S. Native of the East Indies, in Silhet and Gualpara. Dentélla? geminàta, Herb. Ham. Root creeping. Stem dwarf. Racemes numerous, crowded, secund, alternate, short, recurved, on each peduncle. Perhaps a proper genus.

Twin Snake-root. Pl. $\frac{1}{2}$ to 1 foot.

† *A doubtful species.*

27 O.? subumbella'ta (Forst. prod. no. 66.) stem shrubby; leaves lanceolate, acute; umbels axillary, trifid. ♄. S. Native of the island of Otahiti.

Subumbellate-flowered Snake-root. Shrub.

Cult. The species of Snake-root will grow in a mixture of loam, sand, and peat; and they may either be increased by cuttings under a hand-glass in heat, or by seeds.

LXXI. ARGOSTE'MMA (from *αργος, argos*, white, and *στεμμα, stemma*, a crown; in reference to the terminal racemes or umbels of snow white flowers). Wall. in Roxb. fl. ind. 2. p. 324. Blum. mss. ex D. C. prod. 4. p. 417.—Pomángium, Reinw. ex Blum.

Lin. syst. *Tri-Pentándria, Monogýnia.* Calyx with a short obconical tube, and a 3-4-5-cleft limb: lobes acute, valvate in æstivation. Corolla rotate, spreading, with a 3-5, rarely with a 3-4-parted limb. Stamens alternating with the lobes of the corolla. Anthers large, exserted, cohering at the apex. Style perforating a fleshy disk; stigma globose. Capsule crowned by the calyx and an opercular disk, 2-celled, dehiscing in a radiant manner at the apex; receptacles convex, adnate to the dissepiment. Seeds numerous, angular.—Herbs, for the most part hairy from short down. Leaves quite entire, opposite, one usually smaller than the other, rarely verticillate. Stipulas foliaceous, ovate, solitary on both sides. Peduncles terminal, and almost axillary, bearing fascicled umbels of flowers at the apex, very rarely only one flower. Flowers white. The species of this genus have the habit of those of *Ophiorhìza*.

1 A. sarmento'sum (Wall. in Roxb. fl. ind. 2. p. 324.) plant rather villous, creeping at the base, and stoloniferous, the upper part of the stem erect; leaves ovate, obtuse, almost sessile, downy above, and villous on the nerves beneath, in two approximate pairs; flowers 3 or 4-parted, disposed in a terminal umbel or corymb-formed raceme. ♄. S. Native of the East Indies, on rocks on the hills at Schukragiri, near Rujmahul; and of Nipaul, on the mountains to the northward of the valley on the route to Gosaingsthan. Stem and leaves rather pubescent. Flowers snow white. Corolla 5 times longer than the calyx. Leaves at end of stem.

Sarmentose Argostemma. Pl. $\frac{1}{2}$ foot.

2 A. verticilla'tum (Wall. l. c. p. 325.) plant erect, downy, and tufted; leaves 4 in a whorl, linear-lanceolate, rather falcate; peduncles 2-3, rarely solitary, bearing a few umbellate flowers each; flowers 4-5-parted. ♃. S. Native of Nipaul, on rocks at Moreko in the valley. Root fleshy, and almost tuberous. Stems furnished with a pair or two of lanceolate connate scales. Leaves ciliated. Flowers snow white, rather smaller than those of the preceding species. The mouth of the corolla is marked with 10 minute tubercles, alternately receiving the basis of the filaments. Ovarium smooth. Wall. pl. rar. asiat. 2. p. 80. t. 185.

Whorled-leaved Argostemma. Pl. 4 inches.

3 A. rostra'tum (Wall. l. c. p. 326.) plant erect, smooth; leaves in 2-4 approximate pairs, narrow-lanceolate, acuminated, petiolate; stipulas ovate, recurved, permanent; umbels pedunculate, terminal, many flowered; segments of corolla and tube of the anthers acuminated. ♃. S. Native of the East Indies, on the Pundua mountains near Silhet. Stem furnished with several remote pairs of lanceolate-ciliated stipulas: the upper ones becoming enlarged and foliaceous. Pedicels an inch long, clavate, a little ventricose above the middle. Corollas white, nearly an inch in diameter. Habit of *Trientàlis Europæ'a*.

Beaked-anthered Argostemma. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

4 A. pi'ctum (Wall. l. c. p. 327.) plant glabrous; stem short; leaves smooth, ovate, subcordate, painted with reticulated white nerves, on very short petioles; umbels terminal, pedunculate, many flowered; flowers pentandrous. ♃. S. Native of Pulo-Penang, growing on rocks near the water-fall. Leaves only 2, or in 2 remote pairs, slightly ciliated. Peduncle simple, or having 2 opposite branches, each bearing a round umbel of many small flowers. Unripe berry as large as a coriander seed, smooth.

Painted-leaved Argostemma. Pl. 1 to 2 inches.

5 A. borragi'neum (Blum. mss. ex D. C. prod. 4. p. 417.) stem creeping at the base, but erect above, and scabrous at the apex; leaves elliptic, acute at both ends, petiolate, with a few

scattered hairs above, but more crowded on the nerves beneath, and on the petioles; umbels pedunculate, terminal, subtrifid; flowers pentamerous, at length secund. ⊙. S. Native of Java, in mountain woods in humid places. Stem 4-6 inches long. Leaves 4-6 along each stem.

Borrage-like Argostemma. Pl. ½ foot.

6 A. montà'num (Blum. mss. ex D. C. prod. 4. p. 418.) stem tomentosely hairy, ascending; leaves ovate, acuminated, ciliated, petiolate, beset with scattered hairs above, and with bristle-like hairs on the nerves beneath; umbel terminal, pedunculate, bracteated, 5-6-flowered.—Native of Java. Pomángium montànum, Blum. mss. Stem branched a little, 3-4 inches long. Leaves 10-12 on each stem, disposed in nearly equal distant pairs. Peduncles hardly longer than the leaves.

Mountain Argostemma. Pl. ¼ foot.

7 A. pauciflo'rum (Blum. mss. ex D. C. prod. 4. p. 418.) stem creeping at the bottom, but branched, and rather scabrous above; leaves petiolate, ovate, acute, tapering a little at the base, hairy; umbels pedunculate, shorter than the leaves, terminal, subtrifid, few-flowered. ♄. S. Native of Java, on Mount Salak in shady places. Leaves 16-20 on each plant, membranous, pale beneath. Flowers white, smaller than those of the preceding species.

Few-flowered Argostemma. Pl. ½ foot.

8 A. uniflòrum (Blum. mss. ex D. C. prod. 4. p. 418.) stem creeping below, clothed with hairy pubescence; leaves opposite, very unequal, one of which in each pair hardly exceeds a stipula in size, the other is lanceolate, with an unequal base, rather pilose; peduncle terminal, 1-flowered. ⊙. S. Native of Java, in woods on the higher mountains.

One-flowered Argostemma. Pl. creeping.

Cult. For culture and propagation, see *Ophiorhìza*, p. 523. The species are all remarkable in their appearance.

LXXII. SPIRADI'CLIS (from *σπειρα, speira*, a spire, and *δικλις, diclis*, valves with folding doors; in allusion to the valves being divided into 2 parts, and also twisted at the apex). Blum. bijdr. p. 975. D. C. prod. 4. p. 418.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an oblong turbinate tube, and a 5-toothed limb. Corolla with a short tube, and a 5-parted spreading limb. Stamens 5, inclosed. Style girded by 4 glands; stigma 2-lobed in the throat. Capsule oblong, crowned by the calyx, 2-celled, 2-valved; valves bipartite, at length twisted. Seeds numerous, angular.—This genus is nearly allied to *Tùla*, with the tufted habit of *Nertèra*. Leaves opposite, ovate, rather undulated, glabrous. Spikes terminal and lateral, few-flowered. Flowers small, secund, each furnished with one bractea.

1 S. cæspitòsa (Blum. l. c.)—Native of Java, at the foot of Mount Salak in humid places.

Tufted Spiradiclis. Pl. tufted.

Cult. For culture and propagation see *Tùla* below.

LXXIII. TU'LA (like the rest of Adanson's names this is also probably without a meaning). Adans. fam. 2. p. 500. Juss. mem. mus. 6. p. 385. Rœm. et Schultes, syst. 4. p. 25. D. C. prod. 4. p. 418.

Lin. syst. *Pentándria, Monogýnia.* Limb of calyx 5-toothed. Corolla with an oblong tube, and a 5-cleft blunt toothed curled limb. Anthers inclosed. Capsule 2-celled; cells many seeded.—A small procumbent branched tufted herb. Leaves reniform, petiolate. Pedicels axillary, short, 1-flowered. This genus was alone known to Feuillée, and is therefore very doubtful. Habit of *Nertèra*, but differing in the flowers being pentamerous, and in the cells of the fruit being many seeded; it is perhaps, however, only that genus badly described.

1 T. Adansònii (Rœm. et Schultes, syst. 4. p. 355.) ♃. G. Native of Peru, on rocks by the sea-side. Soldanélla facie, Feuill. obs. 3. pt. 2. p. 63. t. 44.

Adanson's Tula. Pl. tufted.

Cult. A mixture of loam, peat, and sand will be a good soil for this little plant; and it may either be increased by cuttings planted in sand under a hand-glass, or by seeds. The pot in which it is grown should be half filled with sherds.

LXXIV. DENTE'LLA (a dim. of *dens*, a tooth; the lobes or segments of the corolla are furnished with a small tooth on each side). Forst. gen. p. 26. t. 13. Lam. ill. t. 118. D. C. prod. 4. p. 418. Juss. mem. mus. 6. p. 385.—Oldenlándia species, Lin. —Hedyòtis species, Lam.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an ovate-globose tube, and a 5-cleft limb. Corolla funnel-shaped, 5-cleft; lobes furnished with a small tooth on each side; throat hairy. Anthers 5, inclosed, almost sessile. Style short; stigmas 2, thick. Capsule almost indehiscent, nearly globular, 2-celled, crowned by the limb of the calyx. Placentas fleshy, prominent on both sides within the cells. Seeds small, ovate.—A creeping tufted marsh annual herb. Stems filiform, glabrous. Leaves oblong, glabrous, ciliated at the base, as well as the petioles. Stipulas small, acute. Pedicels axillary, alternate, 1-flowered, short. Fruit hispid. Flowers small, white.

1 D. re'pens (Forst. l. c.) ⊙. F. Native of the East Indies, as in Java, Coromandel, Timor, Luconia, New Caledonia, &c., in humid shady places along the banks of rivers, and on the margins of rice fields. Blum. bijdr. p. 990. Roth. nov. spec. 139. Roxb. fl. ind. 2. p. 159. Cham. et Schlecht. in Linnæa. 4. p. 150. Hedyòtis rèpens, Lam. ill. no. 1424. Oldenlándia rèpens, Lin. mant. p. 40. but O. rèpens of Burm. fl. ind. according to his herbarium is nothing but Péplis Pórtula.—Rumph. amb. 6. t. 170. f. 4. Flowers small, in the divisions of the branchlets.

Creeping Dentella. Fl. July. Clt. 1802. Pl. creeping.

Cult. The seeds require to be sown on a gentle hot-bed in spring; and the plants when of sufficient size may be planted out into a moist shady situation in the open ground.

LXXV. DE'PPEA (named after M. Deppe, who has collected and sent home many plants from Mexico). Cham. et Schlecht. in Linnæa. 5. p. 167. D. C. prod. 4. p. 618.

Lin. syst. *Tetrándria, Monogýnia.* Teeth of calyx 4, triangular. Corolla somewhat rotate, quite glabrous; lobes elliptic. Anthers 4, linear, exserted; filaments very short. Style longer than the stamens; stigma thicker than the style. Capsule membranous, elliptic, crowned by the calycine teeth beneath the vertex, 2-celled; cells 1-seeded, with a loculicidal dehiscence. Seeds fixed to the middle dissepiment.—A small shrubby plant, with a woody root, and reddish inner bark. Leaves petiolate, elliptic, acuminated at both ends, rather pilose above and on the margins. Stipulas triangular, deciduous. Cymes terminal and axillary, pedunculate, of 3 or 4 branches. Flowers yellow. Habit, fruit, and capsule of *Hedyòtis*, but the cells are 1-seeded as in the tribe *Spermacòceæ*.

1 D. erythrorhìza (Cham. et Schlecht. l. c. p. 168.)—Native of Mexico, in shady places near the Hacienda de la Laguna. D. hydyotídea, D. C. prod. 4. p. 618.

Red-rooted Deppea. Shrub 1 to 2 feet.

Cult. For culture and propagation see *Dentélla* above.

Subtribe II. HEDYO'TEÆ (this tribe contains plants agreeing with *Hedyòtis* in important characters). D. C. prod. 4. p. 419. Stipulas resembling a sheath on both sides, and ending in many bristles at the apex.

LXXVI. HEDYO'TIS (from *ἡδυς, hedys*, sweet, and *ους ὠτος, ous otos*, an ear; the leaves are oval, soft, and firm, from

which circumstance they have been compared to ears). Roxb. fl. ind. 1. p. 368. Cham. et Schlecht. in Linnæa. 4. p. 153. D. C. prod. 4. p. 419.—Hedyòtis species of Lin. and all authors.

Lin. syst. *Tetrándria, Monogynia.* Calyx with an ovate tube, and a 4-toothed limb: teeth erect, permanent, also separated on the fruit by acute narrow recesses. Corolla with a short tube, a bearded throat, and a 4-lobed limb. Stamens exserted a little; anthers ovate or roundish, small. Capsule ovate, somewhat attenuated at the apex, crowned by the calycine teeth, which are connivent, but separate, 2-celled, and dehiscing in the middle of the cells. Seeds minute, angular, many in each cell. —Herbs, sometimes suffruticose at the base, with a habit like that of *Spermacòce*. Stems tetragonal or nearly terete. Leaves opposite. Stipulas adhering to the petioles on both sides, ending in many bristles. Flowers axillary, usually glomerate.—This genus differs from *Houstònia*, to which St. Hil. pl. rem. bras. p. xxi. has joined it, in the calyx being adnate to the fruit the whole length. It differs from *Oldenlándia* in the teeth of the calyx being separated on the fruit by narrow recesses, not by broad ones.

* *Pedicels axillary, 1-flowered, solitary, and sometimes twin.*

1 H. gra'cilis (D. C. prod. 4. p. 419.) plant decumbent and elongated, scabrous from hairs; leaves linear, acute; stipulas cleft into many bristles; pedicels axillary, 1-flowered, solitary, equal in length to the leaves; corolla hardly longer than the calycine teeth.—Native of New Caledonia. Capsule downy, ovate, rather compressed: lobes of calyx lanceolate, separated by narrow recesses.

Slender Hedyotis. Pl. decumbent.

2 H. Adsce'nsionis (D. C. l. c.) stem suffruticose, branched, glabrous; leaves linear, acute, with revolute margins, and are, as well as the calyxes, rather scabrous; pedicels axillary, solitary, 1-flowered, shorter than the flowers. ♄. S. Native of the island of Ascension, where it was collected by Lesson, G. Don, &c. Herb becoming black on drying. Capsule compressed. Seeds very minute. Corolla white. Lobes of calyx long, linear.

Ascension Hedyotis. Pl. ½ foot.

3 H. pauciflòra (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 419.) plant suffruticose, glabrous; branches tetragonal, smooth; leaves linear, very acute, with revolute margins; stipulas with many stiff erect bristles; flowers solitary, axillary, hardly pedicellate. ♄. S. Native of the island of Luzon, one of the Philippines. Leaves 1 or 1½ inch long, and a line broad. Fruit unknown, but the lobes of the calyx are separated by narrow recesses, indicating it to belong to this genus.

Few-flowered Hedyotis. Pl.

* * *Flowers axillary, almost sessile, disposed in glomerate whorles.*

4 H. tenelliflòra (Blum. bijdr. p. 971.) stems suffruticose, kneed, procumbent; leaves on short petioles, lanceolate, veinless beneath, with scabrous margins; bristles of stipulas long and setaceous; flowers usually twin, axillary, sessile. ♄. S. Native of the island of Nusa Kambanga, near Java.

Slender-flowered Hedyotis. Shrub procumbent.

5 H. angustifòlia (Cham. et Schlecht. in Linnæa. 4. p. 153.) stems branched a little, tetragonal, when young the angles are hairy; leaves linear, very narrow, acute, with revolute scabrous margins; stipulas hairy, membranaceously fringed; flowers 3-6-together, axillary, almost sessile, glomerate. ⊙. F. Native of the island of Luzon, one of the Philippines.

Narrow-leaved Hedyotis. Pl. ½ foot.

6 H. Bóscii (D. C. prod. 4. p. 420.) plant glabrous; stems herbaceous, ascending, branched, slender, tetragonal; leaves linear; bristles of stipulas shorter than the fruit; flowers few, axillary, somewhat verticillate; fruit ovate, crowned by the teeth of the calyx, which are acute. ⊙.? H. Native of Carolina, where it was collected by Bosc, and sent home under the name of *Diòdia*. Leaves almost an inch long, and a line broad. Seeds very minute.

Bosc's Hedyotis. Pl. ascending.

7 H. auricula'ria (Lin. spec. 147.) stem almost simple, tetragonal, rather hairy at the apex; leaves lanceolate-ovate, nerved; stipulas ciliated with bristles; flowers glomerate, axillary, somewhat verticillate. ♃. S. Native of Ceylon, Malabar, also of Silhet and Nipaul, ex Roxb. fl. ind. 1. p. 369. Rheed. mal. 10. t. 32.—Burm. fl. zeyl. t. 108. f. 1.? H. nervòsa, Lam. dict. 3. p. 79.? Flowers white, sessile.

Auricled Hedyotis. Pl. ½ foot, procumbent.

8 H. geniculà'ta (Roxb. fl. ind. 1. p. 368.) plant weak, decumbent; stems nodose, terete, smooth; leaves almost sessile, lanceolate, smooth; flowers on short peduncles, disposed in whorles.—Native of the Malay Islands. The rest unknown.

Kneed-stemmed Hedyotis. Pl. decumbent.

9 H. Lapeyrou'sii (D. C. prod. 4. p. 420.) stem erect, glabrous, terete, rather angular at the apex, and hardly branched; leaves oblong-lanceolate, acuminated at both ends, glabrous; stipulas of many bristles; flowers few, axillary, almost sessile, verticillate; capsules globose. ⊙. F. Native of the island of Vanikoro, where it was collected by Lesson. Stem 1½ foot high. Leaves 4 inches long, and 8-10 lines broad, lined with 5-6 oblique nerves on each side.

La Peyrouse's Hedyotis. Pl. 1½ foot.

10 H. crassifòlia (Blum. bijdr. p. 971.) stems diffuse, rather hairy; leaves lanceolate, cuspidate, almost veinless, except the middle nerve, scabrous beneath and on the margins, on very short petioles; stipulas setigerous; flowers disposed in dense whorles; filaments exserted.—Native of the west of Java, in humid shady places. Said to be allied to *H. híspida*. Bristles of the stipulas long. Teeth of calyx very acute. Perhaps the same as *H. cratæogònum*.

Thick-leaved Hedyotis. Pl. 2 to 3 feet.

11 H. cratæogònum (Spreng. pug. 2. p. 35.) stems terete, glabrous, articulated; leaves lanceolate, acuminated, veiny, scabrous; stipulas setaceously jagged; flowers sessile, disposed in glomerate whorles.—Native of Amboyna, ex Rumph. amb. 6. p. 25. t. 10.; and of Java, ex Lin. not in Jamaica, as said by Rœm. et Schultes, syst. 3. p. 199. Oldenlándia verticillàta, Lin. mant. 40.

Strong-jointed Hedyotis. Pl. 1 foot.

12 H. hi'spida (Retz, obs. 4. p. 23. but not of Roth,) stems diffuse, branched, tetragonal, rooting at the nodi; leaves sessile, lanceolate, with hispid margins; stipulas with many bristles; flowers axillary, almost sessile, disposed in glomerate whorles; filaments inclosed.—Native of China, ex Retz; of the Moluccas, ex Roxb. fl. ind. 1. p. 368.; of Java, Blum. bijdr. p. 971. Oldenlándia híspida, Poir. dict. 4. p. 536. Stamens shorter than the style, which is clavate, ex Retz. Capsule hispid, ex Spreng. pug. 2. p. 32.

Hispid Hedyotis. Pl. ½ foot, decumbent.

13 H. uncine'lla (Hook. et Arn. in Beech. voy. pt. bot. p. 192.) plant suffruticose, glabrous; branches simple; leaves petiolate, oblong-lanceolate, with almost simple longitudinal veins; flowers axillary and terminal, numerous, almost sessile, disposed in glomerate whorles; capsules turbinate, glabrous, crowned, bipartite at the dissepiment; tube of calyx contracted, and the lobes subulate and recurvedly uncinate, long, and ciliated. ♄. G. Native of China. This may be the type of a new genus, and is probably the H. cephalóphora, R. Br. in Wall. cat. no. 842.

Hooked-calyxed Hedyotis. Shrub.

14 H. rotundifo'lia (Spreng. pug. 3. p. 197.) plant decumbent, branched a little; leaves petiolate, broad-ovate, somewhat 3-nerved; stipulas scarious, ciliated; flowers axillary, almost sessile, disposed in whorles; capsules hispid.—Native of the East Indies, in humid places. Oldenlándia trinérvia, Retz, obs. 4. p. 23.

Round-leaved Hedyotis. Pl. decumbent.

15 H. perpusi'lla (Hook. et Arn. in bot. misc. 3. p. 259.) glabrous; stems tufted, diffuse, branched, weak; leaves oblong; stipulas minute, not setigerous; pedicels terminal, and from the forks of the branches, 1-flowered, about equal in length to the leaves; tube of calyx globose, hispid from bristles; teeth of calyx erect, ovate, obtuse.—Occasionally found in inundated places by the shores of La Plata, near Buenos Ayres. Stem 1 to 2 inches long, branched; the branches are furnished with several short lateral ramuli, from the axils of which springs a peduncle, which after flowering becomes reflexed. Very closely allied to *H. uniflòra*, but seems to differ from the genus by the stipulas not being furnished with bristles.

Least Hedyotis. Pl. tufted.

16 H. nodiflòra (Wall. cat. no. 855.) glabrous; stems quadrangular; petioles downy; leaves ovate-elliptic, acuminated, veined; flowers much crowded, axillary, subverticillate, sessile. ♃. S. Native of the East Indies, in Tavoy.

Knot-flowered Hedyotis. Pl. 1 to 2 feet.

17 H. arge'ntea (Wall. cat. no. 858.) glabrous; stem quadrangular; leaves broad-ovate, acuminated, whitish above, and rusty beneath; flowers in axillary heaps. ♃. S. Native of the Burmese Empire, on the banks of the Irrawaddy.

Silvery Hedyotis. Pl. 2 to 3 feet.

18 H. costa'ta (R. Br. in Wall. cat. no. 849.) stem downy, quadrangular; leaves lanceolate, tapering to both ends, glabrous, with many parallel veins; flowers disposed in crowded axillary heaps, subverticillate; teeth of calyx separated by distant recesses. ♃. S. Native of Pulo-Penang and Silhet.

Ribbed Hedyotis. Pl. 2 to 3 feet.

19 H. pinifòlia (Wall. cat. no. 850.) plant much branched; branches quadrangular; leaves linear, with revolute edges; flowers disposed in axillary and terminal verticillate heaps. ⊙. S. Native of Pulo-Penang, and of the Burmese Empire, at Prome and Amherst. Perhaps a species of *Oldenlándia*.

Pine-leaved Hedyotis. Pl. ½ to 1 foot.

20 H. conge'sta (R. Br. in Wall. cat. 844.) herbaceous, glabrous; stem and branches quadrangular; leaves ovate-lanceolate, acuminated, pale beneath; flowers crowded, axillary; stipulas somewhat pinnatifid; lobes of calyx rounded, separated by narrow blunt recesses. ♃. F. Native of Pulo-Penang.

Crowded-flowered Hedyotis. Pl. 3 to 4 feet.

21 H. macrophy'lla (Wall. cat. no. 841.) stem and branches quadrangular; leaves large, roughish, veined, tapering to both ends; stipulas pinnatifid; flowers much crowded, axillary, forming glomerate whorles. ♃. S. Native of Pulo-Penang. Calyx downy, with the lobes separated by narrow recesses.

Large-leaved Hedyotis. Pl. 2 to 3 feet.

* * * *Peduncles axillary, many-flowered: flowers crowded.*

22 H. capita'ta (Lam. dict. 3. p. 80.) stem terete, almost simple, downy; leaves almost petiolate, ovate-lanceolate, acute, nerved, glabrous above, velvety on the nerves beneath; stipulas setaceously jagged; peduncles axillary, solitary, much shorter than the leaves, bearing each a dense head of flowers.—Native of the East Indies, particularly in Java, in moist parts of mountains. Blum. bijdr. p. 973. Habit of *Euphórbia capitàta*.

Capitate-flowered Hedyotis. Pl. ½ foot.

23 H. linea'ta (Roxb. fl. ind. 1. p. 369.) plant diffuse, pilose; leaves sessile, ovate-lanceolate, with longitudinal simple parallel veins; peduncles axillary, many flowered, rather long, 2-3-together; capsules round, pilose. ⊙. F. Native of the East Indies, in Chittagong. The rest unknown.

Lined-leaved Hedyotis. Pl. diffuse.

24 H. ulmifòlia (Wall. in Roxb. fl. ind. 1. p. 370.) plant ascending, clothed with soft hairs; leaves oval-lanceolate, acute, nerved, very villous on the nerves on both surfaces; stipulas cup-shaped, acuminated at both ends, joined to both sides of the petioles; peduncles axillary, much shorter than the leaves, bearing many subcorymbose flowers; flowers usually by threes; calyx villous, with acute lobes. ♃. G. Native of Nipaul. H. lineàta, D. Don, fl. nep. p. 134. but not of Roxb. Spermacòce lineàta, Hamilt. mss. Stipulas coriaceous, acuminated in the middle. Stems many from the same root, woody, simple. Calycine segments lanceolate, spreading.

Elm-leaved Hedyotis. Pl. 1 to 2 feet.

25 H. vesti'ta (R. Br. in Wall. cat. no. 847.) stems, peduncles, and petioles villous; stem quadrangular; leaves ovate-lanceolate, much acuminated, tapering at the base, downy, particularly on the veins beneath; stipulas villous, bearing 3 long bristles each; peduncles axillary, trichotomous, each division bearing a head of flowers. ♃. S. Native of Pulo-Penang and Silhet. Leaves with parallel veins.

Clothed Hedyotis. Pl. 2 to 3 feet.

26 H. macroste'mon (Hook. et Arn. in Beech. voy. pt. bot. p. 192.) plant suffruticose, branched; branches pubescent; leaves on short petioles, ovate-lanceolate, clothed with soft down beneath, rather scabrous and shining above, with longitudinal simple parallel veins; peduncles axillary, solitary, shorter than the leaves, many flowered; flowers capitate; stamens much exserted; capsules hairy, free at the apex. ♄. G. Native of China. Closely allied to the two preceding species.

Long-stamened Hedyotis. Pl. ½ foot.

27 H. serpyllifòlia (Poir. suppl. 3. p. 14.) stem herbaceous, branched, rather angular; leaves ovate, acuminately mucronate, somewhat ciliated; stipulas bipartite, acuminated; flowers 2-4 in each heap, axillary and terminal, on short peduncles; tube of calyx downy.—Native of the island of Bourbon, where it was collected by Bory de St. Vincent. Corolla white, shorter than the calyx. Seeds innumerable, very minute. Stem hispid.

Wild Thyme-leaved Hedyotis. Pl. ½ to ¾ foot.

28 H. re'pens; stem creeping, filiform, branched, rooting at every joint; leaves small, oval or obovate, linear-lanceolate, ex Lour, smooth; flowers axillary, solitary, on very short pedicels; capsule nearly globular, covered with hollow pellucid hairs. ♃. S. Native of the East Indies and China. Oldenlándia rèpens, Burm. fl. ind. 38. t. 15. f. 2. Lour. coch. p. 78. Corolla bell-shaped, white.

Creeping Hedyotis. Pl. creeping.

29 H. uniflòra (D. C. prod. 4. p. 421.) plant glabrous; stems creeping, branched, weak; leaves ovate-roundish, obtuse; stipulas small; pedicels terminal, 1-flowered, longer than the leaves; tube of calyx rather hispid. ⊙. F. Native of Chili, in sandy places along the banks of streams. Oldenlándia uniflòra, Ruiz et Pav. fl. per. 1. p. 57. Corolla with a broad tube, which is bearded inside. Lobes of calyx ovate, acutish.

One-flowered Hedyotis. Pl. creeping.

30 H. glomera'ta (Ell. sketch. 1. p. 185.) stem nearly erect, herbaceous, downy, branched; leaves lanceolate, attenuated at the base, downy; stipulas acutely bidentate; flowers almost sessile, capitate, axillary and terminal, rarely almost solitary; tube of calyx hispid. ⊙. ex Torrey, ♃. ex Ell. H. Native of North America, in humid places, from Carolina to New York. Torr. fl. un. st. 1. p. 171. Oldenlándia glomeràta, Michx. fl. bor. amer. 1. p. 83. H. auriculàta, Walt. car. p. 85. but not of Lin. Oldenlándia uniflòra, Lin. ex Willd. spec. 1. p. 674. H.

uniflòra, Lam. ill. p. 271.? H. Virgínica and H. glomeràta, Spreng. syst. 1. p. 412, 413. Lobes of calyx 4, ovate, acuminated. Corolla subrotate, shorter than the calyx; with the lobes rather spinose. Stamens short, opposite the lobes of the corolla, ex Torrey. Style almost wanting; stigma thick, undivided. Seeds innumerable, very minute, as in the genus *Oldenlándia*.

Glomerate-flowered Hedyotis. Pl. ½ creeping.

31 H. GOREE'NSIS (D. C. prod. 4. p. 421.) plant diffuse, many stemmed; stems rather angular, glabrous, except at the nodi, where they are downy; leaves lanceolate, acute, glabrous; peduncles axillary and on the tops of the branches, disposed in umbellate heaps, a little shorter than the fruit; fruit downy, crowned by the calycine teeth, which are subulate, and somewhat involutely uncinate at the apex. ⊙. F. Native of the coast of Africa, in the island of Goree. Habit of Chickweed. Leaves oval-oblong or lanceolate. Capsule dehiscing but slowly. Seeds very minute. Corolla not seen.

Var. β, érecta (D. C. l. c.) stems erect, much shorter than those of the species; heads of flowers solitary, terminal, umbellate. ⊙. S. Native in humid parts of woods.

Goree Hedyotis. Pl. diffuse.

* * * * *Panicles or corymbs terminal, loose, rarely axillary. The species are very different from each other, and from the rest of the genus.*

32 H.? LA'XA (D. Don, prod. fl. nep. p. 135.) stem herbaceous, weak, dichotomously branched, angular, glabrous; leaves ovate, acute, rather hairy on both surfaces, ciliated; stipulas divided into bristles; peduncles axillary, dichotomous; flowers usually by threes. ♃. G. Native of Nipaul. Habit of a species of *Ophiorhìza*. Anthers in some specimens examined exserted, and in others almost inclosed. Teeth of calyx acutely mucronate, 3 times shorter than the corolla. Capsule somewhat didymous, free at top, and dehiscing in the middle of the cells. Seeds ovate-roundish.

Loose-flowered Hedyotis. Pl. 1½ foot.

33 H. POLYCA'RPA (Wall. cat. 838.) branches tetragonal; leaves elliptic-lanceolate, acuminated, tapering to the base; stipulas joined to the petioles, and forming a sheath with them, furnished with a tooth on each side; panicle terminal, corymbose, trichotomous; lobes of calyx separated by broad recesses. ♃. S. Native of Silhet. Perhaps a species of *Oldenlándia*.

Many-fruited Hedyotis. Pl. 2 to 3 feet.

34 H. MÓLLIS (Wall. cat. no. 859.) plant clothed with soft white down in every part, but particularly so on the under side of the leaves; peduncles axillary and terminal, panicled; pedicels corymbose; stipulas with 3 bristles. ♃. S. Native of Pulo-Penang.

Soft Hedyotis. Pl. 1 to 2 feet.

35 H. VAGINA'TA (Blum. herb. and mss. ex D. C. prod. 4. p. 421.) plant suffruticose, glabrous; leaves lanceolate, much acuminated, nerved; stipulas long, sheathing, drawn out on both sides into one puberulous bristle; corymbs terminal, trichotomous; throat of corolla bearded; stamens exserted. ♄. S. Native of the island of Ternate, one of the Moluccas.

Sheathed-stipuled Hedyotis. Shrub.

36 H. ELONGA'TA (R. Br. in Wall. cat. no. 865.) plant puberulous; leaves lanceolate or linear; stipulas jagged; peduncles terminal, elongated, dichotomously branched; flowers distant on the branches of the peduncle, usually by twos, and one in each fork, almost sessile. ⊙. S. Native of the East Indies. Perhaps a species of *Oldenlándia*.

Elongated-peduncled Hedyotis. Pl. 1 to 2 feet.

37 H.? SCA'NDENS (Roxb. fl. ind. 1. p. 369.) stem terete, scandent, glabrous; leaves on short petioles, broad-lanceolate, acuminated, glabrous, shining; stipulas entire, joined to the petioles, furnished with a short mucrone on both sides; corymbs panicled, axillary, and terminal, with the branchlets rather villous; lobes of corolla and throat hairy inside; style villous at the apex; stigma bilamellate. ♃. ◡. S. Native of Nipaul and Silhet, where it is called *Gujee*. Petèsia Hìta, Hamilt. mss. ex D. Don, fl. nep. p. 134.

Climbing Hedyotis. Pl. cl.

38 H. CAPITELLA'TA (Wall. cat. 837.) glabrous; leaves elliptic, acuminated, tapering at the base; stipulas joined to the petioles, furnished with a tooth on both sides; panicle terminal, composed of round heads of flowers. ♃. ◡. S. Native of Pulo-Penang, and Tavoy.

Headed-flowered Hedyotis. Shrub cl.

39 H.? LESCHENAU'LTII (D. C. prod. 4. p. 422.) suffruticose; branches glabrous, tetragonal at the apex; leaves lanceolate, pilose beneath; stipulas combined with the petioles, forming a kind of cupula, and furnished with 3 bristles on both sides; panicle terminal, with glabrous branches; limb of calyx with 4 short teeth; lobes of corolla hairy above; style shorter than the corolla. ♄. S. Native of the East Indies, on the Nelligherry mountains, where it was collected by Leschenault. Allied to *H. scándens*, and with it will probably form a distinct genus.

Var. β, Wallíchii (D. C. prod. 4. p. 422.) branches compressedly angular; leaves acuminated; limb of calyx 4-cleft to the middle: lobes oblong-linear; limb of corolla very hairy above. ♄. G. Native of Nipaul, at Katmandu. Perhaps the same as H. scándens, Roxb. ex Wall. fl. ind. 1. p. 369, but it does not exactly agree with the description given of that plant by Roxburgh.

Leschenault's Hedyotis. Shrub cl.?

40 H. ARTICULA'RIS (R. Br. in Wall. cat. no. 854.) plant dense and dwarf; leaves much crowded, lanceolate, veiny; stipulas jagged; peduncles terminal and axillary, forming panicles. ♃. G. Native of the Nelligherry mountains.

Jointed Hedyotis. Pl. ½ foot.

41 H.? ARBÒREA (Roxb. in Beats. voy. append. p. 310.) arboreous; leaves on short petioles, oblong, acuminated, shining, recurved at the apex; stipular sheath cylindrical, furnished with 1-3 unequal teeth; corymbs terminal, brachiate, almost globular; capsules globose. ♄. S. Native of the island of St. Helena, in woods towards the tops of the mountains, where it is called *dogwood* by the inhabitants. Lobes of calyx oval. Corolla short, glabrous. Perhaps a proper genus.

Tree Hedyotis. Shrub.

42 H. STYLÒSA (R. Br. in Wall. cat. no. 853.) stems quadrangular; leaves glabrous, elliptic-lanceolate, tapering to both ends, coriaceous; stipulas pinnatifid; peduncles axillary and terminal, trichotomous, forming panicled corymbs; corolla very hairy inside. ♄. G. Native of the Nelligherry mountains.

Long-styled Hedyotis. Shrub 1 to 2 feet.

† *Doubtful species.*

43 H. CRASSIFO'LIA and H. RO'SEA, Rafin. fl. lud. 77. are very doubtful plants, and are probably species of *Anòtis*.

Cult. None of the species of this genus are worth cultivating except in botanic gardens. Any light soil will suit them; and cuttings of the shrubby and herbaceous perennial species will root in the same kind of soil, with a hand-glass over them, in a little heat. The annual kinds require the same treatment as other tender annuals. All are easily increased by seeds.

LXXVII. OLDENLA'NDIA (named by Plumier in memory of Henry Bernh. Oldenland, a Dane, who collected plants at the Cape of Good Hope in 1695. They came into the possession of Burmann, and there is an account of them in the 6th volume of Linnæus's Amœnitates Academicæ). Lin. gen. no. 154.

Roxb. fl. ind. 1. p. 444. D. C. prod. 4. p. 424. but not of Smith.—Gerontògea, Cham. et Schlecht. in Linnæa. 4. p. 154. —Hedyòtis species, Spreng. Smith, and Blume.—Hedyòtis and Oldenlándia, Gærtn. fr. 1. t. 30.—Oldenlándia and Listèria, Neck. elem. no. 345 and 346.—Listèria, Rafin. ann. gen. sc. phys. 6. p. 81. but not of R. Br.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with a sub-globose tube, and 4 sub-approximate teeth, which remain on the fruit and are separated by very wide recesses. Corolla with a short tube, a 4-cleft limb, and a villous or glabrous throat. Stamens a little exserted; anthers ovate or orbicular. Stigma undivided or bifid. Capsule almost globose, crowned by the small distant teeth of the calyx, 2-celled, dehiscing at top by a loculacidal chink. Seed small, innumerable, fixed to sub-globose placentas, and as if they were half immersed in them.—Small, herbaceous, or suffruticose plants, with the habit of chickweed. Leaves opposite, with the stipulas adhering to both sides of the petioles. Peduncles axillary and terminal, bearing 1-2 or many flowers, usually elongated and slender. Flowers usually white. This genus hardly differs from *Hedyòtis*, except in the teeth of calyx being separated by wide recesses on the fruit instead of narrow ones, which character we think would scarcely constitute a sectional distinction. The species, however, have a different habit, and are more readily distinguished by it, than by any other character.

* *Pedicels axillary, 1-flowered, usually solitary, rarely by twos or threes.*

1 O. brachy'poda (D. C. prod. 4. p. 424.) plant glabrous and decumbent; leaves linear; stipulas furnished with 2 bristles on both sides; pedicels axillary, 1-flowered, shorter than the flowers, solitary or twin; corolla tubular; anthers exserted to the length of the lobes of the corolla. ⊙. F. Native of Java, Philippine Islands, and Nipaul. Hedyòtis herbácea, var. *a.* Blum. bijdr. p. 970. H. radìcans, Bartl. in herb. Hænke. Allied to *O. herbàcea* but distinct, and it is probably the same as *O. ramosíssima* or *O. diffùsa.*

Short-pedicelled Oldenlandia. Pl. ½ foot.

2 O. ramosíssima (Fisch. mss. in Spreng. mant. 1. p. 35.) stems herbaceous, diffuse; leaves lanceolate, bluntish; stipulas toothed; fruit almost solitary, axillary, sessile. ♃. F. Native country unknown. Hedyòtis ramosíssima, Spreng. pug. 2. p. 31. Flowers white. Probably distinct from *O. brachýpoda.*

Much-branched Oldenlandia. Fl. June, Aug. Clt. 1819. Pl. ⅛ foot.

3 O. sabulòsa (D. C. prod. 4. p. 424.) an herbaceous, tufted, diffuse, much-branched plant, which is roughish from short scattered hairs in every part; leaves linear, acute; stipulas membranous, furnished with many bristles; pedicels 2-3 together, axillary, 1-flowered, much shorter than the leaves, deflexed in the fructiferous state; corolla length of the lobes of the calyx. ⊙. F. Native of Senegal, in sandy places at Walo, where it was collected by Perrottet and Leprieur. Flowers white. Perhaps only a luxuriant variety of *O. ripària.*

Sand Oldenlandia. Pl. ½ foot.

4 O. ripa'ria (D. C. prod. 4. p. 424.) stem branched, erectish, tetragonal, smoothish; leaves linear, acute, rather scabrous; pedicels axillary, 1-flowered, twin, 3 times shorter than the leaves; corolla tubular, about the length of the calyx. ⊙. F. Native of Senegal, in humid sandy places, on the banks of the river, where it was collected by Perrottet and Leprieur. Very nearly allied to *O. scábrida*, but is easily distinguished from it in the pedicels being much shorter, and the lobes of the calyx being longer.

River-side Oldenlandia. Pl. ½ foot.

5 O. Cape'nsis (Thunb. prod. p. 29. fl. cap. 1. p. 537.) stem decumbent, branched, villous; leaves linear, acute, glabrous; pedicels numerous, 1-flowered, shorter than the leaves; lobes of calyx ciliated; throat of corolla villous. ⊙. F. Native of the Cape of Good Hope, in sandy places by the margins of rivers. Hedyòtis Capénsis, Lam. ill. no. 1425. Stigma clavate (ex Thunb.). Capsule ovate, didymous.

Cape Oldenlandia. Pl. decumbent.

6 O. linea'ris (D. C. prod. 4. p. 425.) plant glabrous, erect, branched; stem tetragonal; leaves linear, acute; stipulas cupulate, furnished with many bristles; pedicels axillary, twin, 1-flowered, about the length of the leaves: but the uppermost ones are longer than them; capsule globose; teeth of calyx acute, very short. ⊙. F. Native of Senegal, in sandy places, at St. Louis, where it was collected by Leprieur and Perrottet.

Linear-leaved Oldenlandia. Pl. ½ foot.

7 O. lancifo'lia (D. C. l. c.) stem simple, weak, somewhat dichotomous, creeping, glabrous; leaves linear-lanceolate, glabrous, with rather scabrous margins; bristles of the stipulas distant; peduncles axillary, solitary, rarely twin. ⊙.? F. Native of Guinea. Hedyòtis lancifòlia, Schum. pl. guin. p. 72.

Lance-leaved Oldenlandia. Pl. ½ foot.

8 O. herba'cea (D. C. l. c.) plant glabrous, decumbent; leaves linear or linear-lanceolate; stipules of many bristles; pedicels axillary, 1-flowered, solitary or twin, shorter than the leaves, but 2-3 times longer than the flowers; tube of corolla cylindrical; anthers hardly exserted from the throat. ⊙. F. Native of the East Indies, Madagascar, Senegal, St. Domingo, Mexico, &c. O. Madagascariénsis, Desf. cat. hort. par. 1815. —Rheed. mal. 10. t. 23. and 35. Hedyòtis herbàcea, Lin. fl. zeyl. p. 65. H. herbàcea, var. *β*, Blum. bijdr. p. 970. Flowers white.

Herbaceous Oldenlandia. Fl. Ju. Aug. Clt. 1819. Pl. ½ ft.

9 O. tenuifo'lia (Forst. prod. no. 57. but not of Burm. ex D. C. prod. 4. p. 425.) stem erect, tetragonal, branched; leaves linear, attenuated at both ends: stipulas ciliated a little, rather scarious; peduncles axillary, 1-flowered, shorter than the leaves, reflexed while in flower, and erect when bearing the fruit. ⊙.? F. Native of the Island of Tanna. Hedyòtis tenuifòlia, Smith, in Rees's cycl. 17. no. 19. Spreng. pug. 2. p. 30, where it is confused with *O. Capénsis* and *O. herbàcea.* O. tenuifòlia, Burm. fl. ind. 38. t. 14. f. 1. is probably distinct from this but is not sufficiently known. Flowers white.

Fine-leaved Oldenlandia. Pl. ½ foot.

10 O. sca'brida (D. C. prod. 4. p. 425.) stem erectish, branched; tetragonal, scabrous along the angles; leaves linear, acute; pedicels axillary, 1-flowered, a little shorter than the leaves; corolla tubular, hardly longer than the calyx. ⊙. F. Native of Nipaul. Oldenlándia tenuifòlia, Burm. fl. ind. t. 14. f. 1. is referrible to this species, as the figure given agrees very well with it.

Scabrous Oldenlandia. Pl. ½ foot.

11 O. graminifo'lia (D. C. l. c.) plant decumbent, much branched, smoothish; leaves linear; stipulas of 2-3 setaceous divisions; pedicels axillary, 1-flowered, about equal in length to the leaves, twin or crowded; corolla hardly longer than the calyx. ⊙. F. Native of the East Indies and Arabia. Hedyòtis graminifòlia, Lin. fil. suppl. p. 119. Vahl. symb. 2. p. 27. Spreng. pug. 2. p. 29. exclusive of the syn. of Pluk. which is referrible to Mollùgo Cerveàna. Hedyòtis herbàcea, Forsk. cat. arab. no. 88. Old. strícta, Lin. mant. 200. ex Vahl. Corolla and anthers blue.

Grass-leaved Oldenlandia. Pl. decumbent.

12 O. pu'mila (D. C. l. c.) stems decumbent, tetragonal, scabrous; leaves almost sessile, elliptic, acute at both ends, with scabrous margins; stipulas having 2-3 setaceous divisions; peduncles axillary, solitary, 1-flowered, about equal in length

to the leaves. ⊙. F. Native of Tranquebar and Java. Hedyòtis pùmila, Lin. fil. suppl. 119. Spreng. pug. 2. p. 34. bijdr. p. 971. Flowers white.

Dwarf Oldenlandia. Pl. decumbent.

13 O. LINIFO'LIA (D. C. l. c.) leaves linear, attenuated at both ends; peduncles 1-flowered, longer than the leaves. ⊙.? F. Native of the East Indies. Hedyòtis linifòlia, Willd. mss. in Rœm. et Schultes, syst. 3. p. 526. The rest unknown.

Flax-leaved Oldenlandia. Pl. decumbent.

14 O. VIRGA'TA (D. C. l. c.) plant very slender, glabrous; stems tetragonal; leaves linear; stipulas furnished with very short bristles, at length truncate; peduncles twin, 1-flowered, elongated: the ultimate ones disposed into a kind of terminal panicle; pedicels opposite, from the axils of the bracteas, longer than them, and about equal in length to the internodes. ⊙. F. Native of Guinea (ex Willd.), in the rice-fields of Casamancia and Gambia (ex Perrottet and Leprieur), and Sierra Leone (ex Smeathmann). Hedyòtis virgàta, Willd. spec. 1. p. 167. Schum. pl. guin. p. 69.? Flowers and fruit very small. Leaves 8-9 inches long. Stamens a little exserted.

Twiggy Oldenlandia. Pl. ½ foot.

15 O. ASPE'RULÆ (D. C. l. c.) plant glabrous; stem erect, branched, tetragonal; leaves distant, linear, ciliated at the base; stipulas entire, cupular, truncate; pedicels straight, 1-flowered, rising from the axils of the upper leaves, which are almost abortive. ⊙.? F. Native of Ceylon, where it was collected by Leschenault. Habit almost of the species of *Aspérula*. Corolla greenish in the dried state, also glabrous in the throat, 4-cleft. Anthers pedicellate, shorter than the lobes of the corolla. Stigmas 2, elongated. Capsule oblong. Seeds minute. Lobes of calyx short, distant. Perhaps this plant ought to be removed from the genus.

Woodroof-like Oldenlandia. Pl. ½ foot.

16 O. DIFFU'SA (Roxb. fl. ind. 1. p. 444.) stem terete, flaccid, spreading, scabrous; leaves linear-lanceolate, acute, smooth; stipulas at length of many bristles; peduncles axillary, 1-flowered, 4-times shorter than the leaves. ⊙. F. Native of the East Indies, at Banda. Corolla smooth, white. Stigma profoundly bifid. Capsule roundish. Perhaps only a variety of *O. biflòra*.

Diffuse Oldenlandia. Fl. Ju. Aug. Clt. 1821. Pl. diffuse.

* * *Peduncles 2-3 or many-flowered.*

17 O. BIFLÒRA (Lin. spec. 174.) stems erect, weak, scabrous; leaves linear-lanceolate, rather scabrous while young; stipulas membranous, lanceolate, with ciliated fringed edges; peduncles axillary, shorter than the leaves, 2-3-flowered: corolla glabrous inside; anthers length of the lobes of the corolla. ⊙. F. Native of the East Indies, Philippine Islands; and of Guinea, at Cape Coast, plentiful in the rainy season. Roxb. fl. ind. 1. p. 445. Hedyòtis biflòra, Smith, in Rees's cycl. 17. no. 15. Spreng. pug. 2. p. 31. Horn. hort. hafn. 1. p. 130. Gerontògea biflòra, Cham. et Schlecht. in Linnæa. 4. p. 155. Hedyòtis diffùsa, Willd. spec. 1. p. 566. Old. dichótoma, Willd. herb. ex Cham. et Schlecht. Burm. fl. zeyl. t. 11. Flowers small, white.

Two-flowered Oldenlandia. Fl. Ju. Aug. Clt. 1821. Pl. ½ ft.

18 O. ALSINIFÒLIA; glabrous; leaves membranous, lanceolate, tapering to both ends; peduncles axillary, few-flowered; stipulas bristly at top; teeth of calyx distant. ⊙. F. Native of Pulo-Penang. Hedyòtis alsinifòlia, R. Br. in Wall. cat. no. 873. Plant diffuse.

Chickweed-leaved Oldenlandia. Pl. ¼ to ½ foot.

19 O. BRACHY'PODA; plant glabrous, diffusely branched; leaves linear, with revolute edges; peduncles short, axillary, bearing at the top an umbel of short pedicellate flowers, or the pedicels solitary and axillary. ⊙. F. Native of the Island of Singapore. Hedyòtis brachýpoda, R. Br. in Wall. cat. no. 874.

Short-peduncled Oldenlandia. Pl. diffuse, ¼ foot.

20 O. BURMANNIA'NA; plant glabrous, diffuse; stems quadrangular; leaves linear; pedicels short, axillary, twin, or solitary. ⊙. F. Native of the East Indies. Hedyòtis Burmanniàna, R. Br. in Wall. cat. no. 868. Old. biflòra, Roxb. but not of Lin.

Burmann's Oldenlandia. Pl. ½ to 1 foot.

21 O. LONGIFÒLIA (D. C. prod. 4. p. 426.) plant procumbent, glabrous, branched; branches diverging; leaves linear, rather papillose: upper ones with scabrous margins; stipulas ciliated a little; peduncles elongated, axillary, 2-flowered: but the terminal ones are 3-flowered. ⊙. F. Native of Guinea. Hedyòtis longifòlia, Schum. pl. guin. p. 70. Flowers small, white.

Long-leaved Oldenlandia. Pl. procumbent.

22 O. CRYSTA'LLINA (Roxb. fl. ind. 1. p. 443.) plant diffuse, much branched; stems tetragonal; leaves sessile, lanceolate-oblong, marked with crystalline dots beneath; stipulas joined to the petioles, many-toothed; peduncles axillary, 2-flowered, one half shorter than the leaves; throat of corolla pilose. ⊙. F. Native of Bengal. This plant is very distinct from *O. pùmila* and *O. biflòra*.

Crystalline-dotted Oldenlandia. Pl. diffuse.

23 O. CORYMBO'SA (Lin. spec. p. 174.) plant glabrous, erect, or diffuse; stems tetragonal, smooth; leaves linear-lanceolate; stipulas joined to the petioles, membranous, each furnished with 3 bristles; peduncles axillary, 2-5-flowered; flowers disposed in umbellate corymbs; throat of corolla bearded; anthers a little exserted; stigma sub-capitate. ⊙. F. Native of Guiana, and elsewhere in South America; also of the west coast of Africa, at Cape Verd, near Kounoun, and of the Moluccas. Cham. et Schlecht. in Linnæa. 4. p. 156.—Plum. ed. Burm. t. 212. f. 1. Flowers small, white. There are varieties of this species, having the peduncles either longer or shorter than the leaves. Hedyòtis corymbòsa, Spreng. is very different from this plant.

Corymbose-flowered Oldenlandia. Fl. Ju. Aug. Clt. 1739. Pl. diffuse or ½ foot high.

24 O. RAMO'SA (Roxb. fl. ind. 1. p. 445.) plant diffuse, glabrous, branched; stems tetragonal; leaves sessile, linear-lanceolate, paler beneath; stipulas membranous, joined to the petioles, furnished with 3-4 bristles each; peduncles axillary, 3-5-flowered; corolla roundish, with a bearded throat. ⊙. F. Native of Pegu and the west of Java. Hedyòtis ramòsa, Blum. bijdr. p. 973. Flowers small, white; anthers blue (ex Roxb.).

Branched Oldenlandia. Pl. diffuse.

25 O. UMBELLA'TA (Lin. spec. 174.) stem diffuse, tetragonal, smoothish; leaves narrow-linear, acute, with revolute margins, rather scabrous above and paler beneath; stipulas joined to the petioles, ciliated by bristles; peduncles axillary, umbelliferous. ♂. S. Native of Java and Coromandel, in sandy places; and probably on the west coast of Africa, at Joal; and of Mexico. Burm. fl. ind. p. 37. Roxb. fl. cor. 1. t. 3. Root long, orange-coloured; in the cultivated sort it is longish with few fibres. Stem in the cultivated plant erect and terete, from ½ to 1 foot high, and branched: in the wild kind there is hardly any stem, but many scraggy branches. Flowers small, white; the whole forming a panicle composed of small 3-cleft umbellets. This plant is cultivated on the coast of Coromandel, where its roots descend to a great depth in the sand. It is used in dying red, purple, a deep clear brown orange, and to paint the red figures on chintz, of all which Dr. Roxburgh has given a full account in his pl. cor. 1. p. 2. t. 3. and also Dr. Anderson, in trans. roy. soc. edinb. 1792. p. 16.

The woody part of the *Chay* or *Che* root, as it is called, is

white and tasteless; it is the bark only that is possessed of the colouring principle; when fresh it is orange-coloured, tinges the spittle yellow, and leaves a slight degree of acrimony on the point of the tongue, for some hours after chewing; to appearance it loses its yellow colour on drying, but still retains the above property on being chewed. It impregnates cold water or spirits with a straw-colour, and to boiling water it gives a brownish porter colour. The watery infusions and spirituous tinctures are changed into a bright and deep red by alkaline substances, and are rendered paler or nearly destroyed by acids. The colouring powers of this root are said to improve by keeping 3 or 4 years. When the wild sort can be had in any quantity, it is esteemed one-third or fourth stronger, and yields a better colour; and when these roots can be had of two years' growth they are reckoned still better. This plant is the *Tsherivello* of the Telingas; and the *Saya-ver* or *Imburel* of the Tamuls. The Telinga physicians do not give any part of the plant a place in their Materia Medica; but the Malabar physicians say that the roots cure poisonous bites, colds, and cutaneous disorders, and warm the constitution.

Umbel-flowered Oldenlandia or Indian Madder. Fl. July, Aug. Clt. 1792. Pl. $\frac{1}{2}$ to 1 foot.

26 O. PUBE'RULA; downy in every part; leaves linear-lanceolate, mucronate; peduncles axillary or from the forks of the stems, bearing each a simple umbel of flowers, or 3 pedunculate umbels of flowers, rising from 2 leaves. ⊙. H. Native of the East Indies. O. pubérula, R. Br. in Wall. cat. no. 884.

Downy Oldenlandia. Pl. $\frac{1}{2}$ foot.

27 O. CAPILLA'RIS (D. C. prod. 4. p. 426.) stem ascending, teretely tetragonal, and rather scabrous along the angles, much branched; leaves linear-lanceolate, rather scabrous; stipulas small, with setaceous bristles; peduncles axillary and terminal, loosely panicled, longer than the leaves, very slender, 2-4-6-flowered; flowers opposite, on long pedicels. ⊙. F. Native of Madras. Corolla small, tubular. Capsule globose, glabrous.

Capillary Oldenlandia. Pl. $\frac{1}{2}$ foot.

28 O. PANICULA'TA (Lin. spec. p. 1667.) plant glabrous, erectish, branched; branches tetragonal; leaves ovate-lanceolate; stipulas small, undivided; racemes axillary and terminal, almost naked; pedicels longer than the leaves; corolla with a gibbous tube and a villous throat. ♂. S. Native of the East Indies, Moluccas, and Philippines.—Burm. fl. ind. 38. t. 15. f. 1. Hedyòtis racemòsa, Lam. dict. 3. p. 76. ill. t. 62. f. 2. Leaves smooth. Flowers small. Hedyòtis dichótoma, Cav. icon. 6. p. 573. f. 2. and H. mèdia, Cav. icon. 6. p. 574. f. 1. according to Bartling is probably distinct from this. Flowers small, red, on long pedicels.

Var. β, *arenarioìdes* (D. C. prod. 4. p. 427.) leaves lanceolate, acuminated, stiffish. ♂. S. Native of the coral island Radak. Gerontògea racemòsa, Cham. et Schlecht. in Linnæa. 4. p. 155. Habit of *Arenària trinérvia*.

Panicled Oldenlandia. Pl. creeping.

29 O. PENTA'NDRA (D. C. prod. 4. p. 427.) plant procumbent, glabrous; leaves lanceolate, cordate at the base, or ovate-oblong, sessile, discoloured; racemes axillary, naked; flowers pentamerous.—Native of Guinea. Hedyòtis pentándra, Schum. pl. guin. p. 71.

Pentandrous Oldenlandia. Pl. procumbent.

30 O. MULTIFLO'RA (Cav. icon. 6. p. 53. t. 574. f. 2.) glabrous; stem branched, furrowed, ascending; leaves sessile, ovate-oblong; stipulas small, undivided; panicles axillary, opposite, and terminal, many-flowered: peduncles 3-flowered, elongated.—Native of the Philippine Islands, about Manilla, not of the Friendly Islands, as said by Poiret and Rœmer. Very nearly allied to *O. paniculàta*.

Many-flowered Oldenlandia. Pl. $1\frac{1}{2}$ foot.

31 O. CRASSIFO'LIA (Bartl. in herb. Hænke, under Hedyòtis) plant glabrous, suffruticose, diffuse; branches tetragonal; leaves ovate or oblong, obtuse, fleshy; peduncles axillary and terminal, 3-flowered, usually shorter than the leaves; pedicels shorter than the flowers; segments of calyx lanceolate, short.—Native of the Island of Luzon, one of the Philippines.

Thick-leaved Oldenlandia. Pl. diffuse.

32 O. STRIGULO'SA (Bartl. in herb. Hænke, under Hedyòtis, ex D. C. l. c.) plant herbaceous, branched, erectish; leaves obovate-oblong, beset with very minute callous dots above, and with adpressed strigæ beneath; stipulas undivided, linear-subulate; peduncles axillary and terminal, longer than the leaves, 3-flowered; pedicels hardly any; calycine segments ovate-triangular.—Native of the Island of Mariane.

Strigulose Oldenlandia. Pl. $\frac{1}{2}$ foot.

33 G. OVATIFO'LIA (D. C. prod. 4. p. 427.) plant almost stemless, villous; stem short, simple; leaves ovate, ciliated, on short petioles, white beneath; peduncles 3-4 together, rising from the top of the stem, trichotomous, slender, twice the length of the leaves. ⊙. F. Native of the Philippine Islands at Manilla. Hedyòtis ovalifòlia, Cav. icon. 6. p. 52. t. 573. f. 1. Spreng. syst. 1. p. 414. Corolla pale red, hardly a line long. Stamens exserted.

Ovate-leaved Oldenlandia. Pl. $\frac{1}{4}$ foot.

34 O. ALA'TA (Kœn. in Roxb. fl. ind. 1. p. 442.) plant glabrous, erect; stem tetragonal, branched; leaves almost sessile, elliptic-oblong, smooth, rather fleshy; stipulas broad, erosely toothed, obtuse; panicle terminal, leafy; corolla ventricose, with the throat closed by villi; capsule somewhat compressed, furnished with a somewhat winged nerve on both sides. ⊙. F. Native of the East Indies, Java, Timor, &c. on the edges of rice-fields. Old. alāta, Wall. in herb. Puer. Hedyòtis ramosíssima, Blum. bijdr. p. 972. but not of Fisch. Perhaps Hedyòtis paniculàta, Lam. ill. 1412. but the figure in Burm. ind. t. 71. f. 2. cited for this plant has 5-cleft flowers, and is consequently not it. From the capsules being furnished with a somewhat winged nerve on each side, it comes very near to the genus *Gonothèca*. Flowers small, white.

Winged-nerved-capsuled Oldenlandia. Pl. $\frac{1}{2}$ foot.

35 O. MACROPHY'LLA (Lepr. et Perr. mss. under Hedyòtis, ex D. C. prod. 4. p. 427.) plant glabrous, erect, branched; leaves sessile, lanceolate, acuminated: stipulas undivided; peduncles axillary, racemose, longer than the leaves; pedicels in 4-5 opposite pairs.—Native of the Gambia, in rice-fields at Albreda, where it was collected by Leprieur and Perrottet. Allied to *O. alàta*. Capsule somewhat turbinate, and probably furnished with a nerved wing on each side.

Long-leaved Oldenlandia. Pl. $\frac{1}{2}$ foot.

36 O. LA'CTEA (Cham. et Schlecht. in Linnæa. 4. p. 159. under Gerontògea) stem terete, pubescent; leaves linear-lanceolate, acute at both ends, flat; stipulas bidentate, scarious; peduncles terminal; corollas villous inside; anthers oblong, exserted. ⊙. F. Native of the East Indies. Hedyòtis láctea, Willd. enum. hort. berol. 1. p. 149. H. cymòsa, Spreng. syst. 1. p. 413.? Flowers cream-coloured.

Milk-coloured-flowered Oldenlandia. Pl. $\frac{1}{2}$ foot.

37 O. FŒ'TIDA (Forst. prod. p. 55.) plant suffruticose; leaves spatulate; stipulas almost entire; corymbs trichotomous. ♄. S. Native of the Island of Tongatabu. Hedyòtis fœ'tida, Spreng. pug. 2. p. 28. Gerontògea fœ'tida, Cham. et Schlecht. in Linnæa. 4. p. 154. The leaves in Forster's specimen are elliptic and acute.

Fetid Oldenlandia. Pl. $\frac{1}{2}$ foot.

38 O. MICROTHE'CA (Cham. et Schlecht. in Linnæa. 4. p. 169. under Gerontògea) plant herbaceous, erect, much branched;

leaves petiolate, ovate-lanceolate, acuminated, scabrous above; stipulas small, downy, dentately ciliated; flowers disposed in loose cymose terminal panicles. ⊙. F. Native of Mexico, at Baranca de Tioselos, in shady places, where it was collected by Deppe and Schiede.—Chichia-tzonpatonic de Ocopetlaycic. Hern. mex. p. 366.? Corolla funnel-shaped, a line or more long. Capsules small. A larger variety of this is found about Tampico, ex Cham. et Schlecht. in Linnæa. 6. p. 414.

Small-sheathed Oldenlandia. Pl. 1 to 1½ foot.

39 O. Deppea'na (Cham. et Schlecht. in Linnæa. 5. p. 169. under Gerontògea) plant shrubby, much branched, erect, glabrous; leaves petiolate, ovate-lanceolate, tapering into the petioles, firm, much acuminated, rather revolute, and scabrous on the margins; stipulas white, beset with glandular down, setosely jagged: the bristles thickened and glandular at the apex; flowers disposed in loose panicles at the ends of the branches. ♄. S. Native of Mexico, at San Andres, where it was collected by Schiede and Deppe. Gerontògea Deppeàna, Link and Otto, neu abhild. t. 36. Leaves large, but hardly an inch long. Corolla about 3 lines long. Anthers blueish. Flowers sometimes only 3-parted.

Deppe's Oldenlandia. Shrub 1 foot.

40 O. spergula'cea (D. C. prod. 4. p. 428.) plant erect, almost simple, hairy; leaves oval-oblong; stipulas cupulate, mucronate; peduncles almost terminal, elongated, many-flowered, naked; calyx glabrous; corolla tubular; anthers sessile; style at length bipartite to the base. ⊙. H. Native of Nipaul. Herb a finger in height, with the habit of *Spérgula*. Upper leaves usually 4 in a whorl. Peduncles glabrous. From the dehiscence of the capsule it agrees with *O. conóstyla;* but is very different in habit.

Spurrey-like Oldenlandia. Pl. ¼ foot.

41 O. rotundifo'lia (Ham. ex Wall. cat. no. 6190. under Hedyòtis) leaves elliptic-ovate, rounded at the apex, downy, but most particularly so on the veins beneath, close together; peduncles long, axillary, and terminal, panicled. ⊙. H. Native of the East Indies, at Goalpara. Hedyòtis scapígera, R. Br. in Wall. cat. no. 881.

Round-leaved Oldenlandia. Pl. ¼ to ½ foot.

42 O. marítima; plant glabrous; stems erect; leaves linear or lanceolate, acute, with revolute edges; panicles terminal, erect; peduncles swelling toward the top, angular, erect; teeth of calyx distant. ♃. S. Native of the East Indies, by the sea-side. Hedyòtis marítima, Wall. cat. no. 6192. Old. graminifòlia, Vahl.? Old. stricta, herb. Russ.

Sea-side Oldenlandia. Pl. 1 foot.

43 O. oxyphy'lla; glabrous; leaves linear-lanceolate, tapering to both ends; peduncles terminal and axillary, dichotomous, panicled; pedicels short, bracteate; teeth of calyx distant. ♃. S. Native of the mountains of Silhet. Hedyòtis oxyphýlla, Wall. cat. no. 6193. Leaves like those of the weeping willow. Stipulas broad at the base, ending in 2 subulate points at the apex, and a small tooth on each side.

Sharp-leaved Oldenlandia. Pl. 2 to 3 feet.

44 O. He'ynii; glabrous; leaves linear; stems diffusely branched, panicled; pedicels slender, 2-6 together; stipulas bifid, short; teeth of calyx distant. ⊙. F. Native of the East Indies. Hedyòtis Héynii, R. Br. in Wall. cat. no. 867. Oldenlándia herbàcea, Heyne and Roxb. but not of Lin. Flowers white.

Heyne's Oldenlandia. Pl. 1 foot, diffuse.

45 O. tubulo'sa; glabrous, erect: leaves ovate, acute; peduncles terminal and axillary, umbellate or capitate; flowers crowded, almost sessile; tube of corolla long, slender. ⊙. F. Native of the East Indies. Hedyòtis tubulàris, R. Br. in Wall. cat. no. 876. Hedyòtis mínima, Heyne, in Wall. cat. no. 857.

Tubular-flowered Oldenlandia. Pl. ¼ to ½ foot.

46 O. Mysore'nsis; downy; stems quadrangular; leaves ovate, acute, clothed with rusty down on the nerve and veins beneath, and on the petioles, ciliated on the margins; peduncles terminal and axillary, racemose, branched; flowers almost sessile. ⊙. F. Native of Mysore. Hedyòtis Mysorénsis, Heyne ex Wall. cat. no. 882.

Mysore Oldenlandia. Pl. 1 foot.?

† *Species not sufficiently known.*

47 O.? híspida (Roth, nov. spec. p. 95. under Hedyòtis) the whole plant is hispid from bristles; stem ascending, dichotomous, terete; leaves petiolate, ovate-lanceolate; stipulas setosely toothed; peduncles axillary, bearing few-flowered umbels; corolla twice the length of the calycine lobes.—Native of the East Indies. Anthers linear, length of corolla. Hedyòtis I'ndica. Rœm. et Schultes, syst. 3. p. 195.

Hispid Oldenlandia. Pl. ½ foot, procumbent.

48 O. a'spera (Roth, nov. spec. p. 94. under Hedyòtis) the whole plant is roughish from papillæ; stem straight, filiform, terete; leaves linear-subulate; stipulas linear-subulate, a little toothed; raceme terminal, pedunculate, sub-fastigiate, naked; teeth of calyx linear, 4-times shorter than the tube of the corolla.—Native of the East Indies. Hedyòtis áspera, Spreng. syst. 1. p. 415. The stamens being inclosed, it is very doubtful whether it belongs to this genus.

Rough Oldenlandia. Pl. ½ foot.

49 O. affìnis (Rœm. et Schultes. syst. 3. p. 194. under Hedyòtis) plant erect, much branched; branches rather tetragonal, scabrous at the angles; leaves linear, acuminated, finely ciliated; stipulas tridentate; peduncles disposed in a loose, divaricate, dichotomous panicle; corolla twice the length of the calyx.—Native of the East Indies. Hedyòtis dichótoma, Roth. nov. spec. p. 93. but the Oldenlándia dichótoma of Spreng, now called Vàhlia dichótoma, is a very distinct plant. Corolla blue. Anthers inclosed, and therefore it ought to be excluded from the present genus, but it is said to be nearly allied to *O. biflòra* and *O. herbàcea*.

Allied Oldenlandia. Pl. ½ foot.

50 O. hirsu'ta (Lin. fil. suppl. p. 127.) stem herbaceous, diffuse, and are as well as the calyxes hispid; leaves ovate, acute, petiolate, veiny; peduncles axillary, bearing few-flowered umbels.—Native of Java. Hedyòtis hirsùta, Spreng. pug. 2. p. 35.

Hairy Oldenlandia. Pl. diffuse.

51 O. pusílla (Roth, in Willd. act. amœn. nat. cur. berol. 4. p. 216.) stem branched, tetragonal, rough; leaves linear, acuminated; racemes axillary, simple, few-flowered.—Native of the East Indies. Hedyòtis attenuàta, Willd. l. c. Said to be allied to *O. graminifòlia*.

Small Oldenlandia. Pl. ½ foot.

52 O. de'bilis (Forst. prod. no. 56.) leaves ovate, sessile; umbels axillary, pedunculate, few-flowered.—Native of the Island of Tongatabu. The rest unknown.

Weak Oldenlandia. Pl.?

53 O. Zanqueba'riæ (Lour. coch. p. 78.) stem herbaceous, much branched; leaves linear, glabrous; peduncles terminal, few-flowered, erect; stigmas lanceolate. ⊙. F. Native of Zanquebar, on the east coast of Africa. Hedyòtis Zanquebárica, Rœm. et Schultes, syst. 3. p. 192. Corolla purple, salver-shaped. Capsule didymous.

Zanquebar Oldenlandia. Pl. ¾ foot.

54 O. depre'ssa (Willd. spec. 1. p. 675.) stem diffuse; leaves elliptic, petiolate, glabrous; peduncles axillary, twin, 1-flowered.—Native of the East Indies. Hedyòtis deprèssa,

Rœm. et Schultes, syst. 3. p. 200. A very obscure species, and syn. in Rheed. mal. 10. t. 31. cited for this species is referrible to *Portulácca Meridiàna*.

Depressed Oldenlandia. Pl. prostrate.

N. B. Oldenlándia nudicaúlis, Roth, nov. spec. p. 96. and Old. marítima, exclusive perhaps of the synonyme of Lin., differs from this genus in the flowers being of 4 distinct petals, and in the want of stipulas; they therefore even do not belong to *Rubiàceæ*, but are probably Caryophyllaceous plants.

Cult. The species are not worth cultivating, unless in botanic gardens. A very sandy soil suits them best, and cuttings of the shrubby kinds will root in sand, under a hand-glass, or by seeds. The annual kinds should be treated like other tender annuals, by being raised on a hot-bed, and afterwards planted out. All the species require a considerable degree of moisture.

LXXVIII. GONOTHE'CA (from *γωνια, gonia*, an angle, and *θηκη, theke*, a sheath; in reference to the capsule, which is furnished with a double wing on each side). Blum. mss. ex D. C. prod. 4. p. 429. but not of Rafin.—Hedyòtis species, Blum. bijdr.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with a somewhat compressed tube, and a short truncate somewhat 4-toothed limb. Corolla having the tube inflated at the base, the throat villous, and the lobes keeled. Stamens inclosed. Style wanting; stigmas 2, obtuse. Capsule compressed, margined by a double wing on both sides, which runs down the pedicel, crowned by the tube and short limb of the calyx, and dehiscing between the stigmas, membranous, 2-celled. Seeds numerous, ovate, small, scrobiculate.—A glabrous, erect herb, with the habit of *Oldenlándia*. Stem divaricate, quadrangular. Leaves lanceolate, almost sessile. Stipulas toothed. Cymes pedunculate, axillary, and terminal, few-flowered.

1 G. Blume'i (D. C. prod. 4. p. 429.). ⊙.? F. Native of the islands of Timor and Java, in the latter island on calcareous hills at Kuripan. Hedyòtis pterìta, Blum. bijdr. p. 972. Conyza Chinénsis, N. L. Burm. fl. ind. p. 179. exclusive of the synonyme Oldenlándia alàta, herb. mus. par.

Blume's Gonotheca. Pl. $\frac{1}{2}$ foot.

Cult. See *Kàdua*, p. 533. for culture and propagation.

LXXIX. KOHAU'TIA (in memory of Francis Kohaut, who collected many plants and other objects of natural history in Senegal). Cham. et Schlecht. in Linnæa. 4. p. 156. D. C. prod. 4. p. 429.—Knóxia and Hedyòtis species of authors.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with an obovate tube; teeth acute, separated by acute recesses while in flower, but at last by very broad ones. Corolla with a long terete tube, and oval-lanceolate lobes, which are usually cuspidate by a mucrone. Anthers sessile, within the tube, inclosed under the throat. Style shorter than the anthers, bifid at the apex. Capsule globose, membranous, crowned by the teeth of the calyx, 2-celled, dehiscing at the cells. Seeds innumerable, small, half immersed in pits on the placentas, which are globose and stand on short pedicels.—Erect, twiggy, glabrous, branched herbs, with the habit of *Aspérula*. Leaves opposite, linear, or linear-lanceolate. Stipulas joined to the petioles, furnished with one or few bristles. Cymes terminal, corymbose, or loosely spicate.

1 K. grandiflo'ra (D. C. prod. 4. p. 430.) leaves linear, lower ones the broadest, and nearly lanceolate: uppermost ones very slender and subulate; stipulas membranous, connecting the petioles: lower ones cuspidate in the middle, the rest furnished with 2 bristles on both sides; flowers trichotomously corymbose; lobes of corolla oval, mucronate. ♄. S. Native of Senegal, from which place it was sent by Bacle, under the name of *Hedyòtis herbàcea;* and in sandy places at Kounoun, where it was collected by Perrottet and Leprieur. Tube of corolla 6 lines long, and the lobes 3 lines long and $1\frac{1}{2}$ broad.

Great-flowered Kohautia. Shrub $\frac{1}{2}$ to 1 foot.

2 K. Senegale'nsis (Cham. et Schlecht. in Linnæa. 4. p. 156.) leaves linear: floral ones subulate; stipulas with very narrow margins, joining the petioles, furnished with 2 bristles; flowers on short pedicels along the branches and at their tops, distant; lobes of corolla lanceolate. ♄. S. Native of Senegal. Knóxia Senegalénsis, Reichb. in Sieb. fl. seneg. exsic. no. 9. Tube of corolla $4\frac{1}{2}$ lines long; and the lobes $2\frac{1}{2}$ lines long.

Senegal Kohautia. Shrub $\frac{1}{2}$ to 1 foot.

3 K. stricta (D. C. prod. 4. p. 430.) leaves linear, with sub-revolute margins; stipulas joined to the petioles by a very narrow margin, furnished each with 2 short bristles; flowers trichotomously corymbose; lobes of corolla oblong-linear. ⊙. S. Native of Senegal at Walo and Lampsar, where it was collected by Leprieur and Perrottet; and at Sierra Leone by Afzelius. Hedyòtis stricta, Smith, in Rees's cycl. vol. 17. no. 21. but not of Wall. Root simple, perpendicular, white. Tube of corolla 5 lines long; and the lobes $2\frac{1}{2}$ lines long and hardly a line broad.

Straight Kohautia. Pl. $\frac{1}{2}$ foot.

4 K. longiflo'ra (D. C. prod. 4. p. 430.) leaves linear, hardly acute; stipulas short, with many bristles: bristles spreading a little, length of membrane; flowers pedicellate along the branches on one side; corolla with a very long tube, and linear, hardly acute lobes. ♄. G. Native of the south of Africa, where it was collected by Burchell, ex cat. geogr. no. 1987. Tube of corolla 7 lines long; and the lobes 3 lines long, and scarcely a line in breadth. Teeth of calyx short. Pedicels 2-4 lines long.

Long-flowered Kohautia. Pl. $\frac{1}{2}$ foot.

5 K. cyna'nchica (D. C. prod. 4. p. 430.) leaves linear, acute; stipulas membranous, joining the petioles: bristles reflexed, twin on both sides, at last deciduous; corymbs few-flowered; lobes of corolla linear, hardly acute. ♄. G. Native of the south of Africa, where it was collected by Burchell, ex cat. geogr. no. 772. Capsule turbinate. Teeth of calyx short. Tube of corolla 3 lines long; with the lobes a little shorter than the tube.

Cynanchica-like Kohautia. Shrub $\frac{1}{2}$ to 1 foot.

6 K. setífera (D. C. prod. 4. p. 430.) leaves linear, cuspidately mucronate, with somewhat revolute edges; stipulas membranous, joining the petioles, cleft into 4 spreading bristles on both sides, which are longer than the membrane; corymbs few-flowered; lobes of corolla short, oval. ♄. G. Native of the south of Africa, where it was collected by Burchell, ex cat. geogr. no. 2322. Plant hardly a hand high. Bracteas stipulaceous, membranous, multifid. Tube of corolla hardly 2 lines long.

Bristle-bearing Kohautia. Pl. $\frac{1}{2}$ foot.

7 K. gra'cilis (D. C. l. c.) leaves linear; branches and peduncles compressed; stipulas truncate, fringed, at length naked; flowers on long peduncles, rising from the forks and from the tops of the branches; lobes of corolla linear-lanceolate, bluntish, a little shorter than the tube. ⊙. F. Native of Nipaul. Hedyòtis stricta, Wall. act. soc. asiat. 13. p. 369. but not of Smith. Hedyòtis gràcilis, Wall. in Roxb. fl. ind. 1. p. 377. Hed. fúsca, Hamilt. ex D. Don, prod. fl. nep. p. 134. Tube of corolla 4 lines long; and the lobes 3 lines long, and hardly a line broad.

Slender Kohautia. Pl. $\frac{1}{2}$ to 1 foot.

Cult. For culture and propagation see *Oldenlándia* above.

LXXX. KA'DUA (named in memory of M. Kadu, a native of Ulea, who sailed with Kotzebue, for the purpose of collecting plants). Cham. et Schlecht. in Linnæa. 4. p. 157. D. C. prod. 4. p. 430.

LIN. SYST. *Tetrándria, Monogýnia.* Calyx with a hemispherical tube, and a 4-cleft or 4-toothed limb. Corolla coriaceous, glabrous inside, salver-shaped: with a long tube and a 4-cleft limb. Genitals inclosed. Anthers linear or oblong, almost sessile within the tube. Style filiform, thickest at the apex and bifid: lobes bearing papillæ inside. Capsule globose or elliptic, 2-celled, half adnate to the calyx, which is sometimes dry and sometimes fleshy, usually crowned by the segments of the calyx, dehiscing at the cells at the apex. Seeds innumerable, small, angular, inserted in the placentas, which are spongy, and fixed to the middle dissepiment.—Smooth Australian subshrubs. Leaves opposite. Stipulas solitary on each side, acute, entire. Flowers in terminal cymes or solitary and axillary, pedunculate.

1 K. COOKIA'NA (Cham. et Schlecht. in Linnæa. 4. p. 158.) branches opposite, terete; leaves linear, acute, with revolute margins; flowers few, terminal; capsule beaked at the apex. ♄. G. Native of the Island of O-Wahu. The beak of the capsule having both a loculicidal and septicidal dehiscence at the same time, hence the capsule is at length apparently 4-beaked.

Cook's Kadua. Shrub ½ to 1 foot.

2 K. CORDA'TA (Cham. et Schlecht. l. c. p. 160.) branchlets almost terete; leaves sessile: upper ones cordate, acuminated, coriaceous; cymes dichotomous and trichotomous, leafy; capsule turbinately hemispherical, beakless. ♄. G. Native of the Island of O-Wahu. Lower leaves oblong-lanceolate.

Cordate-leaved Kadua. Shrub ½ to 1 foot.

3 K. GLOMERA'TA (Hook. et Arn. in Beech. voy. pt. bot. p. 85.) lower parts of branches almost terete, upper part compressed; leaves oblong-lanceolate, suddenly contracted at the base into a very short petiole; panicle terminal, with elongated opposite branches, bearing each 2 foliaceous bracteas at the apex, and glomerate flowers; calyx and corolla downy. ♄. G. Native of the Sandwich Islands. The flowers may be said to be axillary, pedunculate, capitate, if the axils of the panicle be viewed as a continuation of the branch. Teeth of calyx linear, stiff.

Glomerated-flowered Kadua. Shrub ½ to 1 foot.

4 K. ARNÓTTII; plant erect, glabrous, branched; leaves oblong, on short petioles; stipulas undivided, triangular; flowers disposed in fascicles in the axils of the superior leaves, the whole forming interrupted racemes; calyxes downy; tube of corolla very long, terete: lobes obtuse, revolute; style bipartite to the base. ♄. G. Native of the Sandwich Islands, where it is called by the natives *Kiore*. Hedyòtis conóstyla, Gaud. in Freyc. voy. pt. bot. p. 471. t. 94. Oldenlándia conóstyla, D. C. prod. 4. p. 428. Nearly allied to the preceding species, according to Arnott.

Arnott's Kadua. Shrub ½ to 1 foot.

5 K. MENZIESIA'NA (Cham. et Schlecht. l. c. p. 160.) branches tetragonal; leaves elliptic, petiolate, bluntly acuminated, downy beneath at the base; stipulas glandular, truncate; cymes terminal, few-flowered; peduncles compressed, downy; drupe rather convex at the apex. ♄. G. Native of the Island of O-Wahu.

Menzies's Kadua. Shrub ½ to 1 foot.

6 K. SMÍTHII (Hook. et Arn. in Beech. voy. pt. bot. p. 86.) branches terete, but compressed towards the tops; leaves coriaceous, ovate-elliptic, glabrous, petiolate; stipulas triangular, bluntly apiculated; panicle terminal, trichotomous, dense; calyxes and corollas downy. ♄. G. Native of the Sandwich Islands. Hedyòtis coriàcea, Smith, in Rees's cycl. vol. 17. no. 11. The tube of the corolla is long, and the segments of the limb are deflexed, with long-acuminated recurved points.

Smith's Kadua. Shrub ½ to 1 foot.

7 K. CENTRANTHOÌDES (Hook. et Arn. in Beech. voy. pt. bot. p. 85.) branchlets terete at the base, and compressed at the apex; leaves cordate-lanceolate, almost sessile; panicle terminal, with short opposite branches, bearing naked heaps of flowers at their tops; calyx and corolla glabrous. ♄. G. Native of the Sandwich Islands.

Centranthus-like Kadua. Shrub ½ to 1 foot.

8 K. ROMANZOFFIE'NSIS (Cham. et Schlecht. in Linnæa. 4. p. 162.) branches tetragonal, densely leafy; leaves obovate, obtuse, or somewhat acuminated, on short petioles, rather coriaceous; stipulas furnished with a sub-glandular mucrone; flowers terminal, 1-3 together, pedicellate; drupe obovate. ♄. G. Native on the coral island, called Romanzoff's Island.

Romanzoff-island Kadua. Shrub ½ to 1 foot.

9 K. ACUMINA'TA (Cham. et Schlecht. l. c. p. 163.) branches terete, compressed towards the tops; leaves lanceolate, long-acuminated, distinctly petiolate, rather coriaceous; stipulas triangular, acuminated; flowers axillary, usually twin, pedicellate; teeth of calyx narrow-lanceolate, equal in length to the tube of the corolla; capsule globose. ♄. G. Native of the Sandwich islands, particularly of O-Wahu.

Acuminated-leaved Kadua. Shrub ½ to 1 foot.

10 K.? AFFÌNIS (Cham. et Schlecht. l. c. p. 164.) branches tetragonal, wrinkled transversely; leaves elliptic-lanceolate, acute, obtuse at the base, on short petioles; stipulas membranous, deciduous, toothed a little on both sides; cyme thyrsoid, terminal; drupe nearly globose, crowned by the remaining part of the calyx, indehiscent. ♄. G. Native of the Island of O-Wahu. Flowers unknown.

Allied Kadua. Shrub ½ to 1 foot.

Cult. None of the species are worth cultivating, except in botanic gardens. They will grow in any light soil; and will be easily increased by cuttings planted under a hand-glass, or by seed, which latter mode will be preferable.

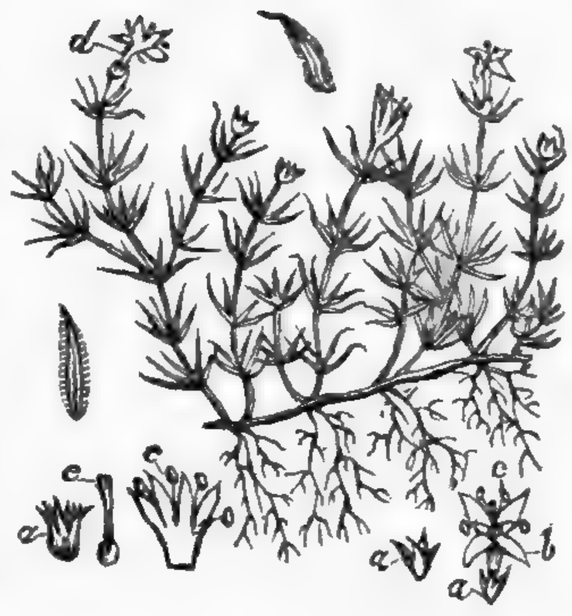
LXXXI. ANO'TIS (from *a* priv. *ους ωτος, ous otos*, an ear; there are no accessory teeth to the calyx). D. C. prod. 4. p. 431. —Hedyòtis species, Ruiz et Pav. and Cav.—Houstònia species, Lin. and others.

LIN. SYST. *Tetrándria, Monogýnia.* Calyx with an obovate tube, and a 4-toothed limb (f. 96. *a.*); teeth acute, separated by acute recesses, with no accessory ones. Corolla salver-shaped (f. 96. *b.*), having the tube a little longer than the lobes; limb 4-cleft; throat almost glabrous. Anthers inclosed or a little exserted (f. 96. *c.*). Stigma somewhat 2-lobed (f. 96. *e.*). Capsule ovate, crowned by the calyx, 2-celled, with a loculicidal dehiscence at the apex. Seeds 4-8 in each cell, ovate, and rather angular.—Subshrubs and herbs, natives of America. Leaves opposite, linear, mucronate or oval. Stipulas undivided or toothed. Flowers terminal, solitary or corymbose. This genus is nearly allied to *Rachicállis*, but differs from that genus in the want of accessory teeth to the calyx, whence the generic name. The genus probably contains the types of 3 different genera, which it may hereafter be necessary to separate.

SECT. I. ERICIÒTIS (this name has been given to this section on account of the plants contained in it having the habit of heaths). D. C. prod. 4. p. 431. Heath-like small shrubs, rarely herbs. Leaves linear, mucronate. Corolla salver-shaped, having the tube longer than the lobes (f. 96. *d.*) Tube of calyx almost adnate with the ovarium to the apex.

1 A. filifo'rmis D. C. prod. 4. p. 431.) stems herbaceous, creeping, much branched, tetragonal, glabrous; leaves sessile, linear, apiculated, rather ciliated; stipulas small, ciliated; flowers solitary, terminal, almost sessile; anthers exserted. ♃. F. Native of Peru, on the Andes, in frigid places. Hedyòtis filifórmis, Ruiz et Pav. fl. per. 1. p. 67. t. 87. f. b. Habit of a species of *Gàlium*. Corolla white; limb spreading at first, but reflexed at last. Lobes of calyx lanceolate, acute. Capsule ovate. (f. 96.)

FIG. 96.



Filiform Anotis. Pl. proc.

2 A. confe'rta (D. C. prod. 4. p. 431.) stem creeping, much branched; branches ascending, tetragonal; leaves linear, apiculated, flat, glabrous; stipulas subulate; flowers terminal, solitary; anthers at the throat. ♃. F. Native of Peru, on the Andes of Tarma and Cantua. Hedyòtis conférta, Ruiz et Pav. fl. per. 1. p. 57. t. 87. f. a. Leaves 2-3 lines long. Corolla white. Capsule glabrous, emarginate.

Crowded Anotis. Pl. creeping.

3 A. hypnoìdes (D. C. prod. 4. p. 432.) stems suffruticose, creeping, tufted; branches tetragonal; leaves sessile, linear-lanceolate, glabrous, piliferous at the apex; stipulas subulate at the apex; flowers terminal, solitary, sessile; anthers exserted. ♃. F. Native of the province of Quito, in very cold places of the Andes, about Assuaya. Houstònia bryoìdes, Willd. herb. ex Kunth. Hedyòtis hypnoìdes, H. B. et Kunth, nov. gen. amer. 3. p. 389. Leaves hardly a line long. Corollas white.

Hypnum-like Anotis. Pl. creeping.

4 A. juniperifo'lia (D. C. prod. 4. p. 432.) plant suffruticose, procumbent, much branched; branchlets tetragonal; leaves linear, apiculated, sessile, with revolute edges; stipulas ovate, acute; flowers terminal, tern, pedicellate. ♄. F. Native of Peru, in high frigid places of the Andes, of Tarma, and Cantua. Hedyòtis juniperifòlia, Ruiz et Pav. fl. per. 1. p. 57. t. 87. f. c. Corollas unknown.

Juniper-leaved Anotis. Pl. proc.

5 A. microphy'lla (D. C. l. c.) stems suffruticose, creeping; branchlets nearly terete; leaves oblong, glabrous on short petioles, piliferous at the apex; stipulas tridentate at the apex; flowers solitary, sessile, terminal, but at length lateral; anthers exserted; cells of capsule 4-5-seeded. ♄. F. Native of Peru, near the mines of Gualyagoc, and the city of Micuipampa. Hedyòtis microphýlla, H. B. et Kunth, nov. gen. amer. 3. p. 389. Willd. in Schultes, syst. 3. p. 526.

Small-leaved Anotis. Pl. creeping.

6 A. Cervante'sii (D. C. l. c.) stems tufted, diffuse, quadrangular, rather scabrous, corymbose at the apex; leaves sessile, linear, acute, flat, glabrous; stipulas ovate, toothed; flowers pedunculate, 2-3-together, terminal, rarely axillary; anthers exserted. ♄. F. Native of Mexico. Hedyòtis pygmæ'a, Rœm. et Schultes, syst. 3. p. 526. Hed. pùmila, Willd. herb. Hed. Cervantèsii, H. B. et Kunth, nov. gen. amer. 3. p. 390. Cham. et Schlecht. in Linnæa. 5. p. 168. Corolla funnel-shaped, violaceous? glabrous, size of those of *Aspérula cynánchica*. Capsule subglobose, didymous; cells 4-8-seeded.

Cervantes's Anotis. Shrub diffuse and tufted.

7 A. thymifo'lia (D. C. l. c.) plant shrubby, erect, much branched; branchlets hairy; leaves sessile, linear, glabrous, with revolute margins; stipulas acutely bifid; corymbs terminal, trichotomous; cells of capsule 8-seeded. ♄. F. Native of Peru, on high hills in the provinces of Tarma and Caxatambo. Hedyòtis thymifòlia, Ruiz et Pav. 1. p. 56. t. 88. f. a. Leaves 5-6 lines long. Corollas white. Capsule obcordate. Branchlets subtetragonal.

Var. β, *thesioìdes* (D. C. prod. 4. p. 432.) plant erect; branchlets terete; flowers lateral and terminal, usually by threes, on very short peduncles; cells of capsule 9-12-seeded. ♄. F. Native near Pasto and Quito. Hedyòtis thymifòlia, H. B. et Kunth, nov. gen. amer. 3. p. 391. Hed. thesioìdes and Hed. coarctàta, Willd. herb. ex Kunth, nov. gen. amer. 3. p. 391. Hed. thuyoìdes and Hed. coarctàta, Willd. in Schultes, syst. 3. p. 527. Leaves 5-6 lines long. Corolla funnel-shaped: with the lobes one-half shorter than the tube. Capsule subglobose-elliptic. Anthers exserted.

Var. γ, *hyssopifòlia* (D. C. l. c.) plant suffruticose; leaves an inch long; corymbs terminal, trichotomous. ♄. F. Native of Chili, near Coquimbo; and of Peru, at Guamantanga and St. Bonaventura. Hedyòtis hyssopifòlia, Cav. icon. 6. p. 54. t. 575. f. 2. Corolla as in var. β. Branches bluntly tetragonal. Seeds larger than in any of its congeners, and is perhaps a proper species.

Thyme-leaved Anotis. Shrub 1 to 2 feet.

8 A. laricifo'lia (D. C. l. c.) plant suffruticose, erect, branched, glabrous; leaves sessile, linear, acute, with hardly revolute margins; stipulas acute; peduncles 3-5-flowered, rising from the forks of the branches; anthers exserted. ♄. F. Native of the Cordillera of Chili, on the highest mountains. Hed. laricifòlia, Cav. icon. 6. p. 54. t. 575. f. 1. Corolla of a reddish brown colour, funnel-shaped. Capsule ovate, truncate.

Larch-leaved Anotis. Shrub ½ to 1 foot.

9 A. seto'sa (D. C. l. c.) plant shrubby, erect, much branched; leaves on short petioles, ovate, acute, ciliately serrulated, glabrous; stipulas connate, ovate, furnished with many bristles at the apex; flowers terminal, usually by threes. ♄. F. Native of Peru, on the Andes at Churupallana and Huassa-Huassi. Hed. setòsa, Ruiz et Pav. fl. per. 1. p. 56. t. 88. f. a. Corolla large, purple, with a broad terete tube, and having the lobes almost one-half shorter than the tube. Habit of *Rachicállis nítida*, but differs from it in the calyx being 4-lobed, without any accessory teeth. Anthers inclosed.

Bristly Anotis. Shrub 2 to 4 feet.

10 A. ericoìdes (D. C. prod. 4. p. 433.) leaves linear, in fascicles, furrowed; flowers terminal, subcorymbose. ♄. F. Native of Peru, ex Rœm. ex Schultes; and of New Granada, in icy places on the Andes, between Ona and Paramo de Saraguru, ex Kunth. The rest unknown. Hed. ericoìdes, Willd. herb. in Schultes, syst. 3. p. 527. and in Kunth, nov. gen. amer. 3. p. 393.

Heath-like Anotis. Shrub ¼ to ½ foot.

Sect. II. Amphio'tis (*αμφι, amphi*, on both sides, and *ους ωτος, ous otos*, an ear). D. C. prod. 4. p. 433. Herbs erect. Leaves ovate, or lanceolate. Corymbs trichotomous. Corolla salver-shaped. Calyx drawn out to half the length of the ovarium only; the capsule is therefore naked at the apex.

11 A. lanceola'ta (D. C. diss. ined. with a figure, ex prod. 4. p. 433.) plant glabrous; stem erect, tetragonal, with the angles a little winged; leaves sessile, lanceolate, acute, glabrous; stipulas lanceolate, membranous; corymbs trichotomous, terminal; corolla funnel-shaped; anthers exserted; capsule globose, half-adnate to the calyx. ⊙. F. Native of the south of Carolina, where it was detected by Bosc. Hed. lanceolàta, Poir. suppl. 3. p. 14. Genus novum, Fraser, mss. in herb. L'Her. Seeds nearly globose, 4-5 in each cell. Lobes of calyx linear, permanent, exceeding the capsule a little. Corolla purplish.

Lanceolate-leaved Anotis. Pl. ¼ to ½ foot.

12 A. longifo'lia; stems erect, branched, tetragonal, very downy at the joints; leaves linear-oblong: radical ones attenuated at the base; stipulas broad, ovate, entire, bidentate or tridentate, membranous, white; corolla funnel-shaped. ♃. H. Native of Florida, in exposed places by the sea side; of Canada, about Lake Huron, and abundant about Lake Winepeg and the Saskatchawan. Houstònia longifòlia, Gærtn. fruct. 1. p. 2266. t. 49. f. 8. Hook. in bot. mag. 3099. Houstònia angustifòlia, Michx. fl. amer. bor. 1. p. 160. Hedyòtis longifòlia, Hook. fl. amer. bor. 1. p. 286. Flowers scarlet, terminal, almost sessile, 3 in a fascicle. Capsules subturbinate.

Long-leaved Anotis. Fl. May, July. Pl. ⅓ foot.

13 A. ciliolo'sa; radical leaves ovate, obtuse, attenuated at the base, with ciliated edges: cauline ones ovate-spatulate, sessile; flowers corymbose, terminal, pedicellate; peduncles trichotomous; calycine segments linear-lanceolate; stem glabrous, branched at the top. ♃. H. Native of North America, in Goat Island, and at the Falls of Niagara. Houstònia ciliolòsa, Torrey, fl. un. st. 1. p. 174. Hedyòtis ciliolòsa, Hook. fl. amer. bor. 1. p. 286.

Ciliated-leaved Anotis. Pl. 1 foot?

14 A. purpu'rea; stems erect, branched at the top, and downy at the joints; leaves ovate-lanceolate or linear-lanceolate, sessile; corymbs terminal. ♃. H. Native from Pennsylvania to Carolina, in dry woods. Knóxia purpùrea, Lam. ill. p. 259. Houstònia purpùrea, Lam. ill. 251. Hedyòtis umbellàta, Walt. fl. car. 85. Hed. vàrians, Michx. fl. amer. bor. 1. p. 80. Flowers purple.

Purple-flowered Anotis. Fl. May, Aug. Clt. 1800. Pl. 1 ft.

Sect. III. Pane'tos (the plants flower all the year round). Rafin. in ann. gen. sc. phys. 5. p. 227. D. C. prod. 4. p. 433. Prostrate or creeping plants, with the habit of *Anagállis*. Leaves ovate-roundish. Flowers axillary and terminal, solitary. Calyx not adnate to the ovarium at the apex, and therefore the capsule is naked at the top.

15 A. rotundifo'lia (D. C. prod. 4. p. 433.) stems herbaceous, prostrate, branched; branches tetragonal; leaves nearly orbicular, on short petioles, glabrous, hardly ciliated; stipulas small; flowers axillary, solitary, on short pedicels; corolla salver-shaped, having the tube 3 times longer than the calyx; capsule half-adnate to the calyx. ♃. F. Native of Carolina and Florida, in dry exposed places by the sea side. Houstònia rotundifòlia, Michx. fl. bor. amer. 1. p. 85. Ell. sketch. 1. p. 193. Anónymos procúmbens, Walt. car. p. 86. Poirètia procúmbens, Gmel. syst. 263. Habit of *Verónica nummularifòlia*. Flowers white.

Round-leaved Anotis. Pl. prostrate.

16 A. Salzma'nni (D. C. l. c.) stems herbaceous, prostrate, branched; leaves nearly orbicular, on short petioles, glabrous, hardly ciliated; stipulas hardly any; flowers axillary, solitary, having the pedicels exceeding the leaves; corolla campanulate, twice the length of the lobes of the calyx, which are oval. ♃. S. Native of Brazil, about Bahia frequent. Intermediate between the preceding and following species. Corollas pale red.

Salzmann's Anotis. Pl. prostrate.

17 A. se'rpens (D. C. prod. 4. p. 433.) stems suffruticose, creeping, much branched; branches tetragonal; leaves roundish-ovate or elliptic, petiolate, acutish, glabrous, with spinulosely ciliated edges; stipulas dentately ciliated; flowers axillary, solitary, pedunculate; corolla subrotate, ciliated a little; anthers a little exserted. ♄.? F. Native of Quito, on the burning Mount Antisana. Hedyòtis sérpens, H. B. et Kunth, nov. gen. amer. 3. p. 390. t. 289. Hed. microphýlla, Willd. herb.? in Rœm. et Schultes, syst. 3. p. 527. Houstònia microphýlla, Willd. herb.? Corolla white, with a very short tube, and the lobes of the calyx distant as in *Oldenlándia*. Seeds usually 5 in each cell.

Creeping Anotis. Pl. creeping.

18 A. cœru'lea; plant tufted; stems erect, dichotomous; leaves ovate-lanceolate, attenuated at the base: radical ones spatulate, and a little hairy; peduncles elongated, 1-flowered; corollas salver-shaped, with acute lobes. ♃. H. Native of Virginia; and of Canada, about Quebec. Houstònia cœrùlea, Lin. spec. p. 152. Pursh. fl. amer. sept. 1. p. 106. Sims, bot. mag. t. 370. Houstònia Linnæ'i α, Michx. fl. bor. amer. 1. p. 84. Hedyòtis cœrùlea, Hook. fl. bor. amer. 1. p. 286. A small tufted plant, with the habit of *Anagállis tenélla*, with light blue flowers. The first peduncles are 2-flowered. There is also a variety of this with white flowers.

Blue-flowered Anotis. Fl. May, Aug. Clt. 1785. Pl. ¼ foot.

19 A. serpyllifo'lia; plant tufted; stems very short; leaves oval, attenuated at the base; peduncles terminal, very long, solitary, divaricate; corolla salver-shaped, with acute lobes. ♃. H. Native of Carolina, on the banks of rivulets in the mountains; and of Canada, about Lake William and Lake Superior. Houstònia serpyllifòlia, Michx. fl. bor. amer. 1. p. 85. Pursh, fl. amer. sept. 1. p. 106. Graham, in bot. mag. 2822. Houstònia cœrùlea β minor, Pursh, fl. amer. sept. 1. p. 106. Houstònia Linnæ'i β, Michx. fl. amer. bor. 1. p. 85. Houstònia pàtens, Elliott. fl. carol. 1. p. 191. Hedyòtis cœrùlea β, Hook. fl. bor. amer. 1. p. 286. Flowers white. A small tufted plant, very like the last.

Wild-thyme-leaved Anotis. Fl. June, Aug. Clt. 1826. Pl. ¼ ft.

20 A. tene'lla; stems creeping, filiform; leaves orbicular, acute, nerved; peduncles terminal, one-flowered, very long. ♃. F. Native of North Carolina, on high mountains. Houstònia tenélla, Pursh, fl. amer. sept. 1. p. 106. Flowers purple. Very like *A. serpyllifòlia*.

Slender Anotis. Pl. creeping.

Cult. This is a genus of pretty little plants. All the species require to be grown in small pots, well drained with sherds, in a mixture of peat and sand. They are increased by dividing at the root. Those natives of warm climates require protection in winter, by placing them in a frame or green-house.

LXXXII. RACHICA'LLIS (from ραχια, *rachia*, a crag by the sea side, and καλλος, *kallos*, beauty; because the plants ornament the rocks by the sea side). D. C. prod. 4. p. 433.—Hedyòtis species, Swartz, Kunth, &c.

Lin. syst. *Tetrándria, Monogýnia*. Calyx with a hemispherical tube, and a 4-lobed limb, furnished with from 1-3 accessory teeth between each of the lobes. Corolla with a long terete tube, a short spreading bluntly 4-lobed limb, and a beardless throat. Anthers at the throat, inclosed. Stigma 2-lobed. Capsule rather didymous, dehiscing by 2 valves at the cells, and crowned by the teeth of the calyx. Seeds 8-20 in each cell. —Small shrubby South American plants, inhabitants of rocks by the sea side, with the habit of *Passerìna*. Leaves oblong, fleshy, with revolute edges, sessile. Stipulas connate, undivided or tridentate. Flowers solitary, sessile.

1 R. ni'tida (D. C. prod. 4. p. 433.) plant shrubby, much branched; branches crowded, densely leafy; leaves linear, acute, fleshy, with revolute margins, glabrous, and shining on both surfaces; stipulas connate, short, trifid at the apex; flowers solitary, terminal, sessile; corolla glabrous. ♄. S. Native near Santa Fe de Bogota. Hedyòtis nítida, H. B. et Kunth, nov. gen. amer. 3. p. 392. Lobes of calyx 4, linear-lanceolate, fur-

nished with 2-3 linear accessory teeth between each. Anthers exserted. Capsule globose, turbinate at the base. Seeds ovate, angular, 8-9 in each cell.

Shining Rachicallis. Shrub 2 to 3 feet.

2 R. rupe'stris (D. C. prod. 4. p. 434.) plant shrubby, much branched; branches twisted, corky; leaves crowded in stellate fascicles, oblong, fleshy, with revolute edges, shining above; stipulas connate, pubescent inside; flowers axillary, solitary, sessile; corollas villous, with a curved tube. ♄. S. Native of the Caribbee Islands, on rocks by the sea side; as of Cuba, Jamaica, &c. Hedyòtis rupéstris, Swartz, prod. p. 29. H. B. et Kunth, nov. gen. amer. 3. p. 391. Hed. Americàna, Jacq. amer. p. 20. Oldenlándia rupéstris, Lam. dict. 4. p. 535. —Sloane, jam. t. 202. f. 1. Habit of *Passerìna*. Corolla yellow. Calyx 4-cleft; lobes woolly inside, with 4 accessory teeth between each. Seeds ovate, angular, about 20 in each cell. This plant has been incautiously referred to the genus *Buchnèra* by Smith in Rees's cycl. vol. 17.

Rock Rachicallis. Shrub 2 to 3 feet.

3 R. Caracasa'na (D. C. l. c.) plant suffruticose, much branched; branches leafy at top; leaves oblong, acute, fleshy, with revolute margins, spreading, glabrous, and shining; flowers terminal and axillary, solitary, sessile. ♄. S. Native of South America, on the southern declivities of the mountains called Silla de Caraccas. Hedyòtis Caracasàna, H. B. et Kunth, nov. gen. amer. 3. p. 393. Corolla violaceous.

Caraccas Rachicallis. Shrub 8 feet.

Cult. Elegant shrubby plants of difficult culture. A mixture of peat and sand will probably be the best soil for them, and they should be grown in pots half filled with pot-sherds. They may either be increased by seeds or by cuttings planted in sand, with a bell-glass over them. They should be placed on shelves in a green-house.

LXXXIII. LU'CYA (named by De Candolle after the late Lucy Dunal, who made many observations upon the Rubiaceous plants growing in the neighbourhood of Montpelier, as may be seen by comparing the fl. fr. ed. 3. vol. 5. p. 499., sister to Michel Felix Dunal, professor of botany at Montpelier). D. C. prod. 4. p. 434.—Dunàlia, Spreng. but not of Kunth.—Hedyòtis species, Swartz and A. Rich.—Pèplis species, Lin.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with a hemispherical tube, and the limb of 8 twin teeth or of 4 bifid ones, permanent. Corolla with a very short tube, and a 4-lobed limb; lobes obtuse. Stamens shorter than the corolla. Style short, bifid. Capsule globose, didymous, 2-celled, with a loculicidal and half septicidal dehiscence; hence the capsule appears 8-valved at the apex. Seed 2 in each cell, ex Spreng., 5-6, ex Rich.—A small herb, with the habit of *Péplis*. Roots fibrous and tuberous. Stems short, glabrous. Leaves almost sessile, cordate-ovate, downy beneath: upper ones usually by fours. Flowers axillary, and nearly terminal, solitary on very short pedicels, small, white.

1 L. tubero'sa (D. C. prod. 4. p. 434.) ⊙. F. Native of the West India Islands, in shady dry places at the bottom of the mountains, and on the roots of trees; as of Jamaica, St. Domingo, &c. Ammánnia hírta, P. Browne, jam. p. 145. Péplis tetrándra, Lin. spec. 474. Jacq. amer. p. 100. t. 180. f. 29. Oldenlándia tuberòsa, Lam. dict. 4. p. 535. Hedyòtis tuberòsa, Swartz, obs. bot. p. 136. t. 1. f. 2. Dunàlia tuberòsa, Spreng. pug. 1. p. 25.

Tuberous-rooted Lucya. Herb small.

Cult. This plant should be treated like other tender annuals. It is not worth growing except in botanic gardens.

LXXXIV. POLYPRE'MUM (from πολυς, *polys*, much, and πρεμνον, *premnon*, a trunk; but the application is not evident). Lin. act. ups. 1741. p. 78. gen. no. 137. Gærtn. fruct. 1. t. 62. Lam. ill. t. 71. Juss. ann. mus. 5. p. 255. mem. mus. 6. p. 382. D. C. prod. 4. p. 434.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with a very short tube, adnate to the bottom of the ovarium, and a 4-parted limb; lobes subulate. Corolla with a very short tube, a bearded throat, and a 4-parted limb; lobes or segments oval. Stamens 4, with very short filaments, and inclosed anthers. Style 1, undivided. Capsule ovate, compressed, 2-celled, with a loculicidal dehiscence. Placentas oblong, ascending, adnate to the bottom of the dissepiment. Seeds numerous, very minute, angular, diaphanous. Embryo straight, slender, in fleshy albumen.—A glabrous herb, with the habit of *Gàlium* or *Buffònia*. Leaves opposite, linear-subulate, having their bases connate from the almost entire stipular sheaths. Corymbs terminal, dichotomous, cymose, with small sessile flowers in the forks and tops of the branchlets, each flower propped by 2-4 bracteas. Corollas white.

1 P. procu'mbens (Lin. act. ups. 1741. p. 78.) ♃. F. ex Ell. sketch. 1. p. 200. ⊙. ex Pursh, fl. amer. sept. 1. p. 99. Native of Carolina and Virginia, in barren places. P. Linnæ'i, Michx. fl. amer. bor. 1. p. 83. Lìnum Caroliniànum, Petiv. gaz. 9. t. 5. f. 6.

Procumbent Polypremum. Pl. procumbent.

Cult. This plant should be treated as other tender annuals.

Tribe IV.

ISERTIE'Æ (this tribe contains plants agreeing with the genus *Isértia*, in having a drupaceous fruit, containing many seeded pyrenæ or nuts). A. Rich. mem. soc. hist. nat. Par. 5. p. 108. and 235. D. C. prod. 4. p. 435. Fruit drupaceous (f. 97. *g.*), composed of numerous many seeded pyrenæ (f. 97. *c.*). Albumen of seeds fleshy.—Shrubs or herbs. Leaves opposite. Stipulas interpetiolar.

LXXXV. META'BOLOS (from μεταβολος, *metabolos*, changeable; but the application is not evident). Blum. bijdr. p. 990. D. C. prod. 4. p. 435.—Sclerocóccus, Bartl. in herb. Hænke.

Lin. syst. *Tetra-Pentándria, Monogýnia.* Calyx with an obovate roundish tube, and a 4, rarely 5-parted limb. Corolla funnel-shaped, with a 4, rarely 5-cleft or parted limb. Stamens 4-5, inserted in the throat of the corolla. Style filiform; stigma thickened, 2-4-parted. Berry dry, crowned by the calyx, divisible into 2-4 many-seeded pyrenæ or nuts. Seeds angular, fixed to prominent placentas.—Suffruticose herbs. Stems tetragonal. Leaves opposite, with parallel veins. Stipulas twin on both sides, cut. Flowers disposed in whorles or axillary heads. This genus is evidently very distinct from *Hedyòtis* in the fruit being indehiscent (ex Blum), and in the cells being usually 4 or 5.

1 M. veno'sus (Blum. bijdr. p. 991.) stem suffruticose, prostrate; leaves on short petioles, ovate-lanceolate, acuminated, lined with veins, rather scabrous; whorles of flowers glomerate, axillary. ♄. S. Native of Java, in the province of Buitenzorg, in shady places.

Veiny-leaved Metabolos. Shrub prostrate.

2 M. latifo'lius (Blum. l. c.) stem suffruticose, divaricate; leaves on longish petioles, elliptic-lanceolate, acuminated at both ends, rather scabrous; flowers disposed in dense axillary glomerate whorles. ♄. S. Native of Java, on the mountains.

Broad-leaved Metabolos. Shrub diffuse.

3 M. rugo'sus (Blum. l. c.) stem shrubby, decumbent; leaves

oblong-lanceolate, acuminated, wrinkled, a little ciliated, downy beneath; flowers in dense axillary heaps; fruit containing 4 pyrenæ. ♄. S. Native of Java, on the top of Mount Gede. Stigma exserted, 4-cleft.

Wrinkled Metabolos. Shrub procumbent.

4 M. PROSTRA'TUS (Blum. l. c.) stem suffruticose, prostrate; leaves oblong-lanceolate, glabrous; heads of flowers axillary, sessile or pedunculate. ♄. S. Native of Java, in woods on the mountains.

Prostrate Metabolos. Shrub prostrate.

5 M. RI'GIDUS (Blum. l. c.) stem suffruticose, erect; leaves elliptic-oblong, acuminated at both ends, stiff, glabrous; heaps of flowers axillary, bibracteate; calyx campanulate, quadrifid. ♄. S. Native of Java, on Mount Seribu, and on Mount Bonkok, in the province of Bantam. Leaves 6 inches long.

Stiff Metabolos. Shrub.

6 M. LINEA'TUS (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 435. under the name of *Sclerocóccus*) stem herbaceous, erectish, and are, as well as the branches, beset with hairs; leaves on short petioles, ovate-lanceolate, acuminated, downy, lined with veins; heads of flowers somewhat corymbose, axillary, on short peduncles. ♄. S. Native of Mexico, according to Hænke, herb.; but probably of the Philippine Islands. Very like the following species, and probably only a variety of it. Stipulas membranous, and connate at the base, ending in long subulate bristles, as in *M. cærùlea*. Flowers small. Stamens a little exserted.

Lined-leaved Metabolos. Pl. erect.

7 M. CŒRU'LEA (Blum. bijdr. p. 991.) stem suffruticose, procumbent, and is, as well as the branches, beset with soft hairs; leaves lanceolate, on short petioles, acuminated, downy, lined with veins; heads of flowers subcorymbose, axillary. ♄. S. Native of Java, about Buitenzorg, in humid shady places.

Blue-flowered Metabolos. Shrub procumbent.

8 M. RADI'CANS (Bartl. in herb. Hænke, under the name of *Sclerocóccus*,) stem herbaceous, radicant at the base, glabrous, having 2 downy lines at the apex; leaves lanceolate, petiolate, glabrous, pale beneath; teeth of stipulas setaceous; pedicels axillary, very short, disposed in a kind of half whorles, very short.—Native of the island of Luzon, one of the Philippines.

Rooting Metabolos. Pl. creeping.

9 M. ANGUSTIFO'LIUS (Bartl. in Hænk. herb. under the generic name of *Sclerocóccus*,) stems shrubby; leaves linear-lanceolate, almost sessile, lined with veins, downy on the nerves beneath, as well as the branchlets; stipulas ovate-lanceolate, cuspidate, downy, a little toothed at the apex; flowers on short pedicels, disposed in axillary and terminal heaps. ♄. S. Native of the island of Manilla, near Sorzogon.

Narrow-leaved Metabolos. Shrub.

10 M. FERRUGÍNEUS (Bartl. in herb. Hænke, under the generic name *Sclerocóccus*, ex D. C. prod. 4. p. 436.) plant shrubby; leaves linear-oblong, attenuated at the base, glabrous above in the adult state, and clothed with rusty wool beneath, particularly on the nerves, as well as the branchlets; stipulas ovate, acute, quite entire; flowers axillary, glomerate, almost sessile. ♄. S. Native of Luzon, one of the Philippines, at Sorzogon. Some of the fruit examined have 3 cells only.

Rusty Metabolos. Shrub.

11 M. LÆVIGA'TUS (Bartl. in herb. Hænke, under the generic name of *Sclerocóccus*, ex D. C. l. c.) plant shrubby, smoothish; leaves ovate-lanceolate, petiolate, glabrous above, rather scabrous on the nerves beneath, as well as on the petioles and branchlets; stipulas lanceolate, pectinately ciliated; flowers axillary, glomerate, almost sessile. ♄. S. Native of the island of Luzon, one of the Philippines.

Smooth Metabolos. Shrub.

Cult. For culture and propagation see *Hamèlia*, p. 542.

LXXXVI. GONZA'LEA (*this genus is dedicated by Ruiz and Pavon to F. Gonzaler Laguna, a Spanish botanist*). Pers. ench. no. 265. Juss. mem. mus. 6. p. 400. Rœm. et Schultes, syst. no. 466. D. C. prod. 4. p. 436.

LIN. SYST. *Tetrándria, Monogýnia.* Calyx with a subglobose tube, and a 4-lobed limb. Corolla funnel-shaped or salver-shaped, villous outside: with a long cylindrical tube, ovate lobes or segments, and a downy or hairy throat. Stamens 4, inclosed. Style filiform; stigma usually 4, somewhat pressed together into a head. Berry containing 4 pyrenæ, rarely 3-2-celled; cells or pyrenæ many seeded. Seeds minute, angular, dotted.—South American shrubs, with terete villous branches. Leaves oval-lanceolate, acuminated. Spikes terminal, or from the axils of the upper leaves, very long. Flowers disposed in fascicles on one side of the spikes, and sessile along its axis.—*This genus is possibly divisible into two or three.*

SECT. I. GONZALAGU'NIA (see genus for derivation). Ruiz et Pav. fl. per. prod. p. 12. t. 3. Berries fleshy, containing 4 bony pyrenæ. Stipulas twin on both sides.

1 G. PE'NDULA (Pers. ench. 1. p. 132.) leaves ovate, acute, bullately crenated; flowering branches pendulous; teeth of calyx bluntish; stipulas twin on both sides, subulate. ♄. S. Native of Peru, in groves in the province of Chinchao. Gonzalagùnia depéndens, Ruiz et Pav. fl. per. 1. p. 56. t. 86. quinol. suppl. p. 84. t. 1. f. a. Corolla of a purplish rose-colour, woolly, with a bearded throat and acutish lobes. Berries black, woolly.

Pendulous-branched Gonzalea. Shrub 10 to 12 feet.

2 G. PARVIFLÒRA; young parts of plant and inflorescence canescent from down, but the older parts are smoothish; leaves elliptic-lanceolate, acuminated at both ends; stipulas triangular, acute, keeled; cymes 3-7-flowered, on short peduncles, the whole disposed in a terminal, elongated raceme. ♄. S. Native of Mexico, at Cuesta Grande de Jalacingo. Gonzalagùnia? parviflòra, Cham. et Schlecht. in Linnæa. 6. p. 415. Leaves half a foot long, feather-nerved, and reticulately veined. Tube of calyx tomentose outside. Corolla smoothish outside, and segments downy, and tube hairy inside. Stigma 2-lobed.

Small-flowered Gonzalea. Shrub.

SECT. II. LYGISTOÌDES (from *lygistum* and *idea*, similar; the plants contained in this section resemble species of *Lygístum*). D. C. prod. 4. p. 436.—Buèna, Cav. icon. 6. p. 50. t. 571. anal. hist. nat. hisp. 2. p. 279. but not of Pohl.—Lygístum spec. Lam. Kunth.—Coccocýpselum species, Kunth. Berry almost dry, containing 4, rarely 3 or 2 chartaceous pyrenæ. Stipulas solitary on each side.

3 G. TOMENTÒSA (Humb. et Bonpl. pl. equin. 1. p. 225. t. 64.) leaves oblong, petiolate, acuminated, glabrous and bullate above, and clothed with white tomentum beneath, and on the branchlets; stipulas short, ovate, acute. ♄. S. Native of Peru, in hot places between Loxa and Gonzanama. H. B. et Kunth, nov. gen. amer. 3. p. 416. Corolla white, tomentose on the outside, with a hairy throat, and obtuse lobes.

Tomentose Gonzalea. Shrub 8 to 9 feet.

4 G. NÌVEA (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 436.) leaves oval-oblong, cuneated at the base, and acuminated at the apex, smoothish and flat above, and clothed with white tomentum beneath, as well as the branchlets and racemes; stipulas subulate. ♄. S. Native of Mexico. Very nearly allied to *G. tomentòsa*.

Snowy Gonzalea. Shrub 6 to 8 feet.

5 G. PULVERULE'NTA (Humb. et Bonpl. pl. equin. 1. p. 228.) leaves lanceolate, obtuse at the base, clothed with powdery pubescence beneath, as well as the branches; stipulas subulate. ♄. S. Native of Peru, in hot places near Gonzanama. Corolla white. The rest unknown.

Powdery Gonzalea. Shrub 8 to 9 feet.

6 G. Panamé'nsis (Pers. ench. 1. p. 132.) leaves oblong, acuminated, acute at the base, petiolate, hairy from very short down above, and whitish from short tomentum beneath; stipulas broad at the base, and subulate at the apex, length of the petioles. ♄. S. Native of Panama and Mexico. Buèna Panaménsis, Cav. icon. 6. p. 571. Branches sub-tetragonal. Corolla reddish yellow.

Panama Gonzalea. Shrub 5 to 7 feet.

7 G. cornifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 416.) leaves oblong or ovate-oblong, acuminated, acute at the base, petiolate, glabrous above, and downy on the nerves and veins beneath, as well as the branchlets; stipulas ovate-subulate, length of the petioles. ♄. S. Native of New Granada, in rocky places near Honda. Perhaps only a variety of *G. Panaménsis*.

Dogwood-leaved Gonzalea. Shrub.

8 G. spica'ta (D. C. prod. 4. p. 437.) leaves oblong, acuminated, downy on both surfaces; stipulas subulate at the apex; spikes terminal, elongated; calycine lobes linear; fruit almost always 2-celled. ♄. S. Native of Cuba, near Havannah, Porto-Rico, and Guadaloupe. Lygístum spicàtum, Lam. ill. no. 1477. Gonzàlea Panaménsis, ex Guadalupa, Spreng. syst. 1. p. 417. ex herb. Balb. Barlèria hirsùta, Jacq. obs. with a good figure.

Var. β, *arbòrea* (D. C. prod. 4. p. 437.) stem arboreous. ♄. S. Native of Cumana, near Santa Cruz, in humid shady places; and of New Granada. Coccocýpselum spicàtum, H. B. et Kunth, nov. gen. amer. 3. p. 406. Spreng. syst. 1. p. 416.

Var. γ, *glabràta* (D. C. l. c.) leaves smoothish; branchlets downy. ♄. S. Native of Porto-Rico. Hedyòtis secúnda, Spreng. in herb. Balb.

Spiked-flowered Gonzalea. Shrub 8 to 10 feet.

9 G. incane'scens (D. C. prod. 4. p. 437.) leaves pubescent above, and canescent from adpressed silky villi beneath; lobes of calyx oblong. ♄. S. Native of Tobago?

Hoary Gonzalea. Shrub.

Cult. For culture and propagation see *Hamèlia*, p. 542.

LXXXVII. ISE'RTIA (named after P. E. Isert, a German, in the Danish service as a surgeon at Danish Accra, on the coast of Guinea; who rendered valuable services to botany during his residence there). Schreb. gen. no. 602. Vahl, eclog. 27. Juss. mem. mus. 6. p. 399. D. C. prod. 4. p. 437. Phosánthus, Rafin. ann. gen. sc. phys. 6. p. 82.

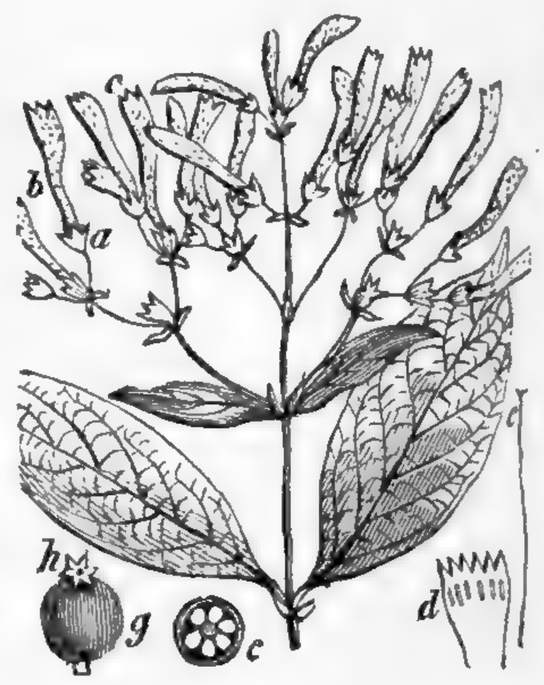
Lin. syst. *Hexándria*, *Monogýnia*. Calyx with a subglobose tube, and a short permanent 4-6-toothed limb (f. 97. *a*.), ex Rich. Corolla with a long tube (f. 97. *b*.), which is more slender in the middle than any where else (f. 97. *b*.); and with 6 short obtuse erect lobes at the apex (f. 97. *c*.), which appear a little twisted before expansion, densely clothed with yellow down inside, having the recesses or sinuses between the lobes drawn out into little crests. Stamens 6, inclosed (f. 97. *d*.). Stigmas linear, erectly stellate (f. 97. *e*.). Berries globose (f. 97. *g*.), crowned by the calyx (f. 97. *h*.), containing 6 brittle many seeded triquetrous pyrenæ (f. 97. *c*.), which are furrowed inside. Seeds subglobose, truncate at the base. Albumen fleshy.—South American trees or shrubs, with striated or quadrangular branches. Leaves oval, acuminated at both ends, on short petioles, clothed with short down beneath. Stipulas twin on each side, lanceolate-subulate. Thyrse terminal, many-flowered, spike-formed or panicle-formed; peduncles opposite. Flowers scarlet

1 I. spicæfo'rmis (D. C. prod. 4. p. 437.) leaves oval-oblong, acuminated, acute at the base; thyrse spike-formed; flowers on very long pedicels along the axis. ♄. S. Native of Guiana or Cayenne, where it was collected by Patris. Leaves and flowers like those of *I. coccínea*, but differing in the inflorescence. Spike cylindrical, having the flowers on the lower part remote and opposite, and those at the top crowded. Corollas scarlet.

Spike-formed Isertia. Shrub 10 to 12 feet.

2 I. cocci'nea (Vahl. eclog. amer. 2. p. 27.) leaves oval, acuminated, acute at the base; thyrse oblong, panicled. ♄. S. Native of Guiana, Cayenne, and Maranham, as also on the banks of the Magdalena, among bushes. Guettárda coccínea, Aubl. guian. 1. p. 317. t. 123. Lam. ill. t. 259. Corolla an inch long, velvety on the outside, scarlet. Berries red. There is a variety of this plant, according to Kunth, having the leaves disposed 3 in a whorl. The wood is bitter. A decoction of the leaves is used by the Creoles in fomentations.

FIG. 97.



Scarlet-flowered Isertia. Fl. July, Aug. Clt. 1820. Shrub 8 to 12 feet.

3 I. Hænkea'na (D. C. prod. 4. p. 437.) leaves oval, acuminated at both ends; thyrse ovate, panicle-formed, with verticillate branches. ♄. S. Native of Mexico. Isértia coccínea, Bartl. in herb. Hænke, ex D. C. l. c. Calyxes as in *I. parviflòra*. Corollas scarlet, a little smaller than those of the preceding, but one-half larger than those of the following, clothed with fine velvety down on the outside.

Hænke's Isertia. Shrub 8 to 10 feet.

4 I. parviflòra (Vahl, ecl. amer. 2. p. 28. t. 15.) upper leaves oblong: lower ones cordate at the base; thyrse ovate, panicle-formed, with opposite branches. ♄. S. Native of Trinidad. Leaves almost glabrous, except on the nerves. Teeth of calyx 4, and 2 of these are larger than the rest, and are probably formed of 2 combined ones each. Corolla scarlet, unguicular, glabrous on the outside. Fruit unknown.

Small-flowered Isertia. Shrub 8 to 10 feet.

Cult. The species are worth cultivating in every collection of stove plants, for the sake of their leaves and panicles of showy scarlet blossoms; their culture and propagation are the same as that recommended for *Hamèlia*, p. 542.

Tribe V.

HAMELIE'Æ (this tribe agrees with the genus *Hamèlia* in the many-celled many-seeded fruit). D. C. prod. 4. p. 438.—Hameliàceæ, A. Rich. mem. soc. hist. nat. par. 5. p. 108.—Hameliàceæ genera, Kunth, syn. 3. p. 63.—Rubiàceæ, sect. v. Juss. mem. mus. 6. p. 398. Fruit baccate, many celled (f. 98. *f. h.*); cells many seeded. Albumen of seeds fleshy.—Trees and shrubs, with opposite or verticillate leaves, and interpetiolar stipulas.

LXXXVIII. TEPE'SIA (meaning unknown to us). Gærtn. fil. carp. 3. p. 72. t. 192. D. C. prod. 4. p. 438.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx with an oblong tube, and a 5-toothed limb, 2 of the teeth opposite each other, larger than the rest, outer ones erect, incurved, the 2 smaller teeth connivent. Corolla and stamens unknown. Berry oblong, crowned by the limb of the calyx, 4-celled. Seeds many, nestling in the pulp. Albumen fleshy.—Perhaps this genus is distinct from *Gonzàlea* or *Evósmia*, but it is hardly known.

1 T. du'bia (Gærtn. l. c.) ♄. G. Native of Chili. Nothing is known of this plant except the fruit.

Doubtful Tepesia. Shrub.

Cult. For culture and propagation see *Hamèlia*, p. 542.

LXXXIX. EVO'SMIA (from εv, *eu*, well, and οσμη

osme, a smell; the young fruit of *E. Caripénsis* is sweet-scented). Humb. et Bonpl. pl. equin. 2. p. 165. t. 134. Juss. mem. mus. 6. p. 398. D. C. prod. 4. p. 438.—Euósmia, H. B. et Kunth, nov. gen. amer. 3. p. 418.—Evósma, Steud.—Euósma, Willd. but not of Andr.—Evósmia species, Spreng.

Lin. syst. *Tetrándria*, *Monogýnia*. Calyx with an ovate tube, and a very short 4-toothed limb (f. 98. *a*.). Corolla subrotate, 4-cleft beyond the middle (f. 98. *e.b.*). Stamens 4, inserted in the throat (f. 98. *b*.), a little exserted or inclosed; anthers ovate. Style filiform; stigma thick or 4-lobed. Fruit ovate (f. 98. *f*.), crowned by the calyx (f. 98. *g*.), 4-celled (f. 98. *h*.); cells many seeded.—Glabrous shrubs or small trees, with terete branches, natives of South America. Leaves petiolate, oval, acute at both ends, membranous. Stipulas ovate, acute, short, deciduous. Racemes short, by twos or threes from the axils of the lower leaves; pedicels elongated, capillary. Flowers red. The young fruit in *E. Caripénsis* is sweet-scented; hence the generic name.

1 E. Caripe'nsis (Humb. et Bonpl. l. c.) leaves oval, acuminated at both ends; racemes loose, a little longer than the petioles; pedicels slender, elongated. ♄. S. Native of South America, in the province of Cumana, near Caripe. Flowers red (f. 98.).

FIG. 98.

Caripe Evosmia. Tree 20 ft.

2 E. aggrega'ta (Spreng. syst. 1. p. 417.) leaves lanceolate, acuminated; flowers in fascicles; pedicels shorter than the calyx. ♄. S. Native of Peru, in groves on the Andes at Cuchero, Chinchao, and Muna. O-Higgínsia aggregàta, Ruiz et Pav. fl. per. 1. p. 55. t. 83. f. b. Higgínsia aggregàta, Pers. ench. 1. p. 133. According to Jussieu, this plant is referrible to *Sabìcea*, but according to Kunth to *Gonzàlea*. But it certainly differs from all the other species of O-Higgínsia of the fl. per. in the fruit being 4-celled and many-seeded. Flowers red.

Aggregate-flowered Evosmia. Shrub.

Cult. For culture and propagation see *Hamèlia*, p. 542.

XC. SABI'CEA (altered from Sabisabi, the name of *S. áspera* in Guiana). Aubl. guian. 1. p. 192. Lam. ill. t. 165. Juss. mem. mus. 6. p. 400. D. C. prod. 4. p. 439.—Schwenkfélda, Schreb. gen. no. 306.—Schwenkféldia, Willd. spec. 1. p. 982.

Lin. syst. *Tetra-Pentándria, Monogýnia*. Calyx with an oblong or turbinate tube, and a 4-5-parted permanent limb. Corolla salver-shaped, with a long slender tube, a hairy throat, and a 4-5-parted limb: with the lobes acute. Stamens 4-5, inclosed or hardly exserted. Style filiform, clavate at the apex, 4-5-lobed. Berry almost globose, crowned by the calyx, 4-5-celled; cells many seeded. Seeds minute, angular.—Climbing shrubs or subshrubs. Leaves oval, acute, on short petioles. Stipulas solitary on both sides. Flowers white, axillary, in sessile fascicles, or corymbose and pedunculate. Corollas pilose.

§ 1. *Parts of flowers quinary.*

1 S. cine'rea (Aubl. guian. 1. p. 192. t. 75.) leaves ovate, acutish, villous above in the young state, but at length becoming glabrous, and clothed with dense white tomentum beneath; stipulas broad-ovate, acutish; flowers bracteate, disposed in axillary fascicles. ♄. ◡. S. Native of Guiana and Cayenne, in hedges and among bushes. Schwenkféldia cinèrea, Swartz, fl. ind. occ. 1. p. 452. Willd. spec. 1. p. 492. Flowers white. Berries villous, red, ex Aubl. Branches hispid. Branchlets villous.

Grey Sabicea. Shrub cl.

2 S. hi'rta (Swartz, prod. 1. p. 46.) leaves ovate-lanceolate, acuminated, hairy on both surfaces; stipulas cordate-ovate, large, membranous; umbels 3-flowered, on short peduncles; involucrum of 4 leaves. ♄. ◡. S. Native of Jamaica, and probably of Trinidad, if the specimen in Sieb. fl. trin. no. 327. be the same; of Porto-Rico, according to specimens from Bertero; and of Mexico, ex icon. fl. mex. ined. Flowers white. Berries snow white when ripe, ex Swartz; but in the figure in fl. mex. they are painted reddish, and is therefore probably a distinct species. Branches striated, hairy.

Hairy Sabicea. Shrub cl.

3 S. hirsu'ta (H. B. et Kunth, nov. gen. amer. 3. p. 417.) leaves elliptic-oblong, acuminated, pilose above, and hairy beneath; stipulas roundish-ovate, acute, reflexed; flowers disposed in verticillate fascicles, sessile. ♄. ◡. S. Native of South America, on the banks of the Orinoco; of Mexico, ex Hænke, and probably of Peru. S. villòsa, Rœm. et Schultes, syst. 5. p. 265. Schwenkféldia villòsa, Willd. rel. mss. Schwenféldia hirsùta, Spreng. syst. 1. p. 765. Flowers white.

Hirsute Sabicea. Shrub cl.

4 S. eria'ntha (D. C. prod. 4. p. 439.) leaves elliptic-oblong, acuminated, pilose above, and clothed with hoary tomentum beneath; branches very hairy; stipulas ovate, acute, glabrous inside; flowers numerous, axillary, sessile; lobes of calyx linear; tube of corolla very pilose on the outside. ♄. ◡. S. Native of Brazil, at Bahia, in hedges, where it was collected by Salzmann, G. Don, &c.

Woolly-flowered Sabicea. Shrub cl.

5 S.? triflòra (D. C. prod. 4. p. 439.) stems twiggy, velvety; leaves on short petioles, oblong-lanceolate, acuminated, pale and villous beneath; stipulas lanceolate-subulate, undivided; flowers axillary, 1-3-together, rising from a short peduncle; bracteoles ciliated; ovarium long, glabrous, crowned by the elongated linear-subulate calycine teeth. ♄. ◡. S. Native of Madagascar. Triósteum triflòrum, Vahl, symb. 3. p. 37.

Three-flowered Sabicea. Shrub cl.?

6 S.? diversifòlia (Pers. ench. 1. p. 203.) under side of leaves and branchlets hoary: the opposite leaves very unequal among themselves, the larger one broad, elliptic or ovate, obtuse, glabrous above, and hoary beneath; the smaller one bractea-formed; flowers almost sessile, glomerate in the axils of the smaller leaves. ♄. S. Native of Madagascar and the Mauritius. Stamens half exserted. Berry pea-formed, 5-celled, crowned by 5 bristles, ex A. Rich. Schwenkféldia diversifòlia, Spreng. syst. 1. p. 765. The rest unknown. Perhaps this plant is properly referred to the present genus.

Diverse-leaved Sabicea. Shrub cl.

§ 2. *Parts of flowers usually or always quaternary.*

7 S. a'spera (Aubl. guian. 1. p. 194. t. 76.) leaves elliptic, acuminated, rough above, and villous beneath; stipulas oval-oblong, acute; flowers sessile, disposed in subverticillate fascicles. ♄. ◡. S. Native of Guiana, on the banks of the river Sinemari. Lam. ill. t. 165. Schwenkféldia áspera, Willd. spec. 1. p. 982. Flowers white. Berries red. Parts of flowers and fruit varying from quaternary to quinary, ex Aubl.

Rough Sabicea. Shrub cl.

8 S. umbella'ta (Pers. ench. 1. p. 203.) leaves oval, acuminated, acute at the base, scabrous on both surfaces from adpressed down, pale beneath; stipulas ovate, spreading; corymbs many-flowered, pedunculate. ♄. ◡. S. Native of Peru, in groves on the Andes at Cuchero, Macora, and Chinchao.

Schwenkféldia umbellàta, Ruiz et Pav. fl. per. 2. p. 55. t. 200. f. 2. Flowers white. Berries white, roundish.

Umbellate-flowered Sabicea. Shrub cl.

9 S. pu'mila (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 440.) stem herbaceous, glabrous; leaves oblong-lanceolate, glabrous, ciliated with silky down; stipulas subulate; heads pedunculate, axillary, few-flowered, glabrous.—Native of Peru, on the mountains about the Guanocco.

Dwarf Sabicea. Pl. cl.?

Cult. For culture and propagation see *Olóstyla* below.

XCI. OLO'STYLA (from ὁλος, *holos*, entire, and στυλος, *stylos*, a style; the style is undivided). D. C. prod. 4. p. 440.—Stylocorìna, Labill. sert. caled. p. 47. but not of Cav.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx with an ovate tube, and a very short 5-toothed limb. Corolla sub-rotate, with a short tube, which is pilose inside, and a 5-lobed limb; lobes valvate in æstivation, linear-lanceolate, with inflexed edges. Stamens 5, inserted in the throat of the corolla; anthers linear, exserted. Style clavate, undivided. Berry glabrous, crowned by the teeth of the calyx and urceolus, 4-celled; cells many-seeded. Seeds minute, elliptic, nestling in the pulp.—A glabrous unarmed shrub. Leaves opposite, obovate-oblong, coriaceous, on short petioles. Stipulas broad, short, apiculated. Flowers disposed in a terminal somewhat thyrsoid corymb.—This genus differs from *Stylocorỳna* in the fruit being 4-celled, not 2-celled as in that genus.

1 O. corymbòsa (D. C. prod. 4. p. 440.). ♄. G. Native of New Caledonia. Stylocorìna corymbòsa, Labill. sert. cal. p. 48. Perhaps the same as Gardènia corymbòsa of Rchb. icon. exot. 2. p. 103. t. 106.

Corymbose-flowered Olostyla. Shrub 5 to 6 feet.

Cult. A mixture of loam, peat, and sand will suit this shrub; and cuttings will root in sand under a hand-glass. It is a very pretty shrub, and therefore worth cultivating.

XCII. AXA'NTHES (from αξων, *axon*, an axle-tree, and ανθος, *anthos*, a flower; the flowers are disposed in axillary heads or corymbs). Blum. bijdr. p. 1002. D. C. prod. 4. p. 440.—Wallíchia, Reinw. cat. hort. buit. ex flora. 1825. p. 107. but not of Roxb. nor D. C.—Maschalánthe, Blum. herb. ex D. C. l. c.

Lin. syst. *Pentándria*, *Monogýnia*. Flowers hermaphrodite, or dioecious by abortion. Calyx with an urceolate tube and almost entire limb. Corolla rotate, with a short cylindrical tube, which is furnished with 5 fascicles of hairs in the throat, and spreading lobes. Stamens 5 in the hermaphrodite flowers, inserted in the throat of the corolla, hardly exserted. Ovarium and style wanting in the male flowers, but the ovarium in the female flowers is covered by a sulcate disk. Style short; stigma 5-lobed: lobes at first connivent. Berry globose, crowned by the permanent calyx, 5-celled, many-seeded; placentas fleshy. Seeds minute, beset with depressed dots.—Shrubs or trees. Leaves opposite. Flowers disposed in axillary heads or cymes, rarely in corymbs.

* *Flowers dioecious by abortion.*

1 A. macrophy'lla (Blum. bijdr. p. 1002.) stem shrubby; ultimate branches rather tetragonal; leaves oblong, much acuminated, acutish at the base, shining above, but clothed with adpressed silky down beneath; heads of flowers axillary, sessile, involucrated. ♄. S. Native of Java, in mountain woods.

Long-leaved Axanthes. Shrub.

2 A. tomentòsa (Blum. herb. and mss. ex D. C. prod. 4. p. 440.) stem unknown; branches geniculated, clothed with velvety tomentum; leaves oblong, much acuminated, glabrous above, but clothed with velvety tomentum on the nerves beneath as well as on the petioles; cymes pedunculate, axillary. ♄. S. Native of Pulo Penang.

Tomentose Axanthes. Shrub.

3 A. strigòsa (Blum. bijdr. p. 1002.) stem arborescent; ultimate branches geniculated, strigose; leaves oblong, attenuated at both ends, glabrous above, but rather strigose on the veins beneath; flowers on short peduncles, crowded, axillary. ♄. S. Native of Java, on the mountains of Seribu.

Strigose Axanthes. Tree small.

4 A. arbòrea (Blum. l. c.) stem arborescent; branches terete, glabrous; leaves oblong-lanceolate, acuminated at both ends, glabrous; cymes pedunculate, axillary. ♄. S. Native of Java, on the higher mountains, in woods. Wallíchia arbòrea, Reinw. cat. hort. buit. p. 11. ex Blume.

Arboreous Axanthes. Tree.

5 A. Timorie'nsis (D. C. prod. 4. p. 441.) stem unknown; branchlets terete, and are as well as the petioles villous; leaves oblong, acuminated at both ends, glabrous above, but clothed with adpressed villi beneath on the veins; cymes axillary, pedunculate, bifid. ♄. S. Native of the Island of Timor. Calyx downy. Corolla clothed with strigose villi on the outside.

Timor Axanthes. Tree.

** *Flowers hermaphrodite.*

6 A. corymbòsa (Blum. l. c.) stem arborescent; ultimate branchlets somewhat tetragonal, puberulous; leaves glaucous, oblong-lanceolate, much acuminated at both ends, shining above, but downy beneath as well as the corymbs, which are axillary. ♄. S. Native of Java, on the top of Mount Burangrang.

Corymbose-flowered Axanthes. Tree.

Cult. See *Hamèlia*, p. 542. for culture and propagation.

XCIII. UROPHY'LLUM (from ουρα, *oura*, a tail, and φυλλον, *phyllon*, a leaf; the leaves terminate in very long taper points). Jack and Wall. in Roxb. fl. ind. 2. p. 184. D. C. prod. 4. p. 441.—Wallíchia, Roxb. ined. but not of others.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx with an ovate tube, and a short, campanulate rather 5-cleft limb. Corolla funnel-shaped, with a bearded throat and a 5-parted limb; the lobes ovate, and valvate in æstivation. Stamens 5, shorter than the limb; anthers linear. Stigma thick, 5-lobed. Ovarium crowned by a glandular disk. Berry globose, 5-celled; cells many-seeded. Seeds minute, shining, marked by pentagonal pores, as in *Pomàtium*.—Erect shrubs. Leaves on short petioles, oblong-lanceolate, ending each in a very long taper point. Stipulas oblong, acute, deciduous. Peduncles axillary, short, bearing verticillate heads of flowers. Bracteas numerous, acute, surrounding the heads of flowers. Corollas greenish.

1 U. villòsum (Jack and Wall. l. c.) shrub villous; branches terete; calyx 5-lobed. ♄. S. Native of Pulo Penang. Branches as well as the veins of the leaves densely clothed with soft hairs. Leaves shining above and villous beneath, 10 inches long.

Villous Urophyllum. Shrub.

2 U. gla'brum (Jack and Wall. l. c.) shrub glabrous; branches tetragonal; calyx almost entire. ♄. S. Native of Pulo Penang, where it is called *Loda Utan* by the Malays. Leaves about 6 inches long.

Glabrous Urophyllum. Shrub.

Cult. See *Hamèlia*, p. 542. for culture and propagation.

XCIV. HAME'LIA (so named in honour of Henry Louis du Hamel du Monceau, the celebrated author of several valuable

works on trees). Jacq. amer. p. 71. Lin. gen. no. 232. Juss. gen. 207. mem. mus. 6. p. 398. Lam. ill. t. 155. Gærtn. fil. carp. p. 68. D. C. prod. 4. p. 441.—Duhamèlia, Pers. ench. no. 454. Rœm. et Schultes, syst 5. p. xx.—Lonicèra species, Plum. gen. 17. t. 33.—Tangáraca, Adans. fam. 2. p. 147.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an oval tube, and a 5-toothed limb (f. 99. *a.*); teeth erect, short, acute, permanent. Corolla with a somewhat pentagonal tube (f. 99. *b.*), and a small, 5-lobed equal limb (f. 99. *c.*), which hardly spreads at all. Stamens 5, inserted in the middle of the tube (f. 99. *b.*) of the corolla, inclosed; anthers oblong-linear (f. 99. *f.*). Stigma obtuse, somewhat pentagonal (f. 99. *c.*). Berry oval, 5-furrowed, 5-celled (f. 99. *d.*), crowned by the calyx; cells membranous, many-seeded. Seeds small, compressed. Albumen fleshy.—American shrubs. Leaves opposite, or 3 or 4 in a whorl, petiolate, oval-oblong, acute at both ends. Stipulas lanceolate-subulate, solitary on both sides. Cymes dichotomous or trichotomous, disposed usually in terminal panicles or corymbs. Bracteas small. Flowers of a croceous red colour.

* *Leaves verticillate.*

1 H. pa'tens (Jacq. amer. p. 72. t. 50. pict. t. 72.) leaves 3 in a whorl, oval-oblong, acuminated at both ends, clothed with villous pubescence; cymes di-trichotomous, coloured, disposed in a terminal pedunculate umbel; corollas cylindrical. ♄. S. Native of St. Domingo, Cuba, Mexico, Brazil, Peru, &c. in hedges on the mountains. Lin. spec. 246. Smith, exot. bot. t. 24. Gærtn. fil. carp. 3. p. 196. f. 3. H. coccínea, Swartz, prod. p. 46. Duhamèlia pàtens, Pers. ench. 1. p. 203. H. pàtens, Ruiz et Pav. fl. per. 2. p. 221. f. a.? Flowers almost scarlet. Berries black. Branches villous at top. There are varieties of this species with velvety, villous, or downy leaves, always most so on the under surface.

FIG. 99.

Var. β, erécta (Lam. dict. 3. p. 68.) racemes erect. ♄. S. Native of Carthagena, in woods; and of Mango Island. H. erécta, Jacq. amer. p. 71.

Var. γ, quinifòlia; leaves and branches of cymes 5 in a whorl. ♄. S. Native of Mexico, on the mountains of Mahatlano. H. pàtens, Moc. et Sesse, fl. mex. icon. ined. H. verticillàta, fl mex. mss. ined. Perhaps a proper species.

Spreading Hamelia. Fl. Jul. Aug. Clt. 1752. Sh. 5 to 10 ft.

2 H. Xorulle'nsis (H. B. et Kunth, nov. gen. amer. 3. p. 414) leaves 3 in a whorl, elliptic-oblong, acuminated, acute at the base, glabrous above and downy beneath; cymes composed of 5-6 spikes, terminal; corollas campanulately ventricose. ♄. S. Native of Mexico, on the burning Mount Xorullo. Flowers of a yellowish red colour.

Xorullo Hamelia. Shrub 4 to 5 feet.

3 H. sphæroca'rpa (Ruiz et Pav. fl. per. 2. p. 69. t. 221. f. b.) leaves 3 in a whorl, oblong, hairy on both surfaces; cymes coloured, disposed in a terminal panicle; corollas cylindrically pentagonal. ♄. S. Native of Peru, in groves. Duhamèlia sphærocárpa, Pers. Petioles and peduncles red. Flowers unilateral, pedicellate. Corollas of a reddish coppery colour. Berry dark purple, globose, hispid.

Round-fruited Hamelia. Fl. July, Aug. Clt. 1811. Shrub 8 to 10 feet.

4 H. latifo'lia (Rich. in Sieb. fl. trin. no. 32.) leaves 3 in a whorl, ovate-lanceolate, acuminated, acute at the base, glabrous on both surfaces; cymes dichotomous, few-flowered, disposed in a terminal pedunculate umbel; corollas cylindrical. ♄. S. Native of Trinidad. Flowers smaller than those of *H. pàtens*, but similar in colour.

Broad-leaved Hamelia. Fl. July, Aug. Clt. 1819. Shrub 4 to 6 feet.

5 H. ventricòsa (Swartz, prod. p. 46. fl. ind. occ. 1. p. 445.) leaves 3 in a whorl, quite glabrous, oval-oblong, acuminated; racemes terminal (rarely axillary); flowers on long pedicels: corollas tubularly campanulate, ventricose. ♄. S. Native of Jamaica, on hills, and among bushes in arid places, where we have seen it in great abundance from Kingston to the bottom of the Port Royal mountains, by the road side, and about Spanish Town; and of Mexico, about Real del Monte. Lindl. bot. reg. t. 1195. Sims, bot. mag. t. 1894. H. grandiflòra, L'Her. sert. angl. 4. t. 7. Salisb. par. t. 55. Duhamèlia ventricòsa, Pers. ench. 1. p. 203.—Sloane, hist. jam. 2. no. 63. t. 183. f. 2. Margins of leaves at length becoming reddish. Flowers yellow, almost an inch long. Berries oblong, scarlet. This species grows to a considerable sized tree, affording boards for tables and cabinets, of the softness and grain of elm, whence its name Spanish elm. The cabinet makers, who use it much, call it Prince-wood. Perhaps H. pauciflòra, Willd. rel. in Rœm. et Schultes, syst. 5. p. 207. is the same.

Ventricose-flowered Hamelia. Fl. Sept. Nov. Clt. 1778. A large shrub or small tree.

6 H. suave'olens (H. B. et Kunth, nov. gen. amer. 3. p. 414.) leaves 3-4 in a whorl, oblong, acuminated, glabrous; cymes branched, of 5-6 rays; flowers almost sessile; corolla tubular, ventricose at the base. ♄. S. Native of New Granada, on the banks of the Magdalena, near Carapata and Badilla. Duhamèlia odoràta, Rœm. et Schultes, syst. 5. p. 267. Stipulas linear-subulate, not pinnatifid, as said by Willdenow. Corollas glabrous, purple. There is a variety of this species having a 6-cleft corolla and 6 stamens.

Sweet-scented Hamelia. Fl. Jul. Aug. Clt. 1824. Sh. 4 to 6 ft.

* * *Leaves opposite.*

7 H. chrysa'ntha (Swartz, prod. p. 46. fl. ind. occ. 1. p. 444.) leaves opposite, oval-oblong, cuneated, acuminated, quite glabrous; racemes terminal; flowers pedicellate; corollas cylindrical. ♄. S. Native of Jamaica, on the mountains among bushes; and according to Hænke, herb. of Mexico; and at Caraccas, according to Vargas.—Browne, jam. 166. t. 14. f. 1.—Plum. amer. ed Burm. t. 218. f. 1.—Duhamèlia chrysántha, Pers. ench. 1. p. 203. exclusive of the syn. of Jacq. H. pàtens, West. St. Croix. p. 200. Flowers yellow, almost an inch long, inflated in the middle.

Golden-flowered Hamelia. Fl. Oct. Dec. Clt. 1822. Shrub 4 to 5 feet.

8 H. lu'tea (Rohr, ex Smith, in Rees's cycl. vol. 17. no. 4.) leaves opposite, oval, acuminated, acute at the base, glabrous; cymes terminal; flowers almost sessile; corollas short, with a ventricose throat. ♄. S. Native of Santa Cruz, and at Caraccas. H. chrysántha, Jacq. coll. 3. p. 204. icon. rar. 2. t. 335. but not of Swartz. Hamèlia species, no. 2 without a name. West. St. Cr. p. 273. Corollas yellow, 4-5 lines long.

Yellow-flowered Hamelia. Shrub 4 to 5 feet.

9 H. axilla'ris (Swartz, prod. p. 46. fl. ind. occ. 1. p. 443.) leaves opposite, ovate-lanceolate, glabrous; stem suffrutescent; cymes bifid or trifid, pedunculate, rising from the forks of the branches; flowers secund, sessile; corollas tubular, pentagonal; berry oval-oblong, crowned by the 5 distant subulate teeth of the calyx. ♄. S. Native of Jamaica, in rocky places among

bushes; and of St. Domingo near rivers. Branches sub-herbaceous. Flowers pale yellow. Berries small.

Var. β, appendiculàta (D. C. prod. 4. p. 442.) leaves on longer petioles, and more distinctly acuminated. ♄. S. Native of Porto Rico. H. appendiculàta, Gærtn. fil. carp. 3. p. 64. t. 91. f. 4. H. lùcida, Desf.

Axillary Hamelia. Fl. Aug. Sept. Clt. 1822. Sh. 2 to 3 ft.

10 H. rostra'ta (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 442.) leaves usually opposite, rarely 3 in a whorl, ovate, acuminated, downy beneath, as well as the petioles and branchlets; cymes terminal, 3-4-parted, downy; corollas glabrous; berries ovate-globose, glabrous, beaked. ♄. S. Native of Mexico, at Acapulco. Branches terete or trigonal.

Beaked-berried Hamelia. Shrub 4 to 5 feet.

Cult. All the species of this genus are very ornamental while in blossom. They are free flowerers and of easy culture. A mixture of loam and peat is the best soil for them; cuttings strike root freely in the same kind of soil, under a hand-glass, in a moist heat.

XCV. ALIBE'RTIA (named after M. Alibert, a celebrated French chemist, author of Traite des Fievres attaxique; in which work he mentions the effects of Peruvian bark). A. Rich. mem. soc. hist. nat. par. 5. p. 234. t. 21. f. 1. D. C. prod. 4. p. 443.—Genipélla, L. C. Rich. ined.—Melanopsídium, Poit. ined. herb. mus. par.

Lin. syst. *Pentándria, Monogýnia.* Flowers incompletely unisexual by abortion. Limb of calyx tubular, 5-toothed. Corolla tubular, longer than the calyx; limb spreading, 5-parted: segments oval, acute. Stamens 5, almost sessile, inserted in the tube; anthers linear, inclosed. Style simple, in the male flower it is clavate, striated, and terminated by an acute simple stigma; in the female and hermaphrodite flowers the anthers are shorter than in the males, and the stigmas are 5 and linear. Berry somewhat corticate, globose, depressed, crowned by the tubular limb of the calyx, 5-celled; cells many-seeded. Seeds wrapped in thin pulp.—A small tree. Leaves opposite, coriaceous, oblong, acuminated. Stipulas rather connate, entire, acute. Flowers solitary or in fascicles, terminating the branches, cream-coloured, almost sessile.—Habit of *Génipa*.

1 A. edu'lis (A. Rich, l. c.). ♄. S. Native of French Guiana, where it is called *Goiave noire*. Génipa edùlis, Rich. act. soc. hist. nat. par. p. 107. Gardènia edùlis, Poir. suppl. 2. p. 708. Melanopsídium nìgrum, Coll. hort. rip. t. 35. Leaves shining above and bearded in the axils of the veins beneath. Fruit edible.

Edible-fruited Alibertia. Clt. 1823. Tree 12 feet.

Cult. See *Hamèlia* above for culture and propagation.

XCVI. SCHRADE'RA (so named by Vahl, in honour of Henry Adolph. Schrader, author of Spicelegium Flora Germanicæ, Hanover 1794.). Vahl. eclog. 1. p. 35. Juss. mem. mus. 6. p. 403. D. C. prod. 4. p. 443.—Fúchsia, Swartz, but not of Lin.—Urceolària Willd. in Coth. disp. p. 10. Gmel. syst. 1. p. 390. but not of Molino nor others.

Lin. syst. *Penta-Octándria, Monogýnia.* Calyx with an obovate tube, and a short truncate or sub-denticulated limb. Corolla funnel-shaped, with a terete tube, and a rather dilated pilose throat; lobes or segments 5-8, spreading, thickened inside, and sometimes furnished with a retrograde callous toothlet. Anthers 5-8, sessile, linear, inserted in the throat of the corolla, hardly exserted. Style short; stigma bifid (ex Vahl and Rich), quadrifid (ex Swartz). Berries pea-formed, 3-4-sided, crowned by the limb of the calyx, 2-4-celled; cells many-seeded. Seeds very minute, nestling in the pulp.—Glabrous radicant shrubs, growing on trees. Leaves petiolate, oval or lanceolate, coriaceous. Stipulas oval-oblong, falling off at length, but those at the base of the peduncles are more permanent, and may be called bracteas. Peduncles solitary or numerous, longer than the petioles. Flowers 4-12 together, sessile, capitate, girded by an orbicular, entire, or rather lobed involucrum, which is formed from two combined bracteas.

1 S. capita'ta (Vahl, ecl. 1. p. 35. t. 5. exclusive of the syn. of Swartz) leaves elliptic, bluntish, but more acute at the base; peduncles solitary, terminal; head of flowers girded by a sub-lobate involucrum; limb of calyx truncate, quite entire; corolla 5-6-lobed. ♄. S. Native of Mont-Serrat, on the higher mountains. Urceolària exótica, Gmel. syst. 2, p. 390. Branches square. A climbing sub-parasitical shrub.

Capitate-flowered Schradera. Shrub cl.

2 S. Brasilie'nsis (Mart. in Schultes, syst. 7. p. 164.) leaves elliptic, obtuse; peduncle terminal, solitary; head of flowers surrounded by an entire involucrum; limb of calyx quite entire; corolla 5-6-lobed: the segments reflexed. ♄. S. Native of Brazil, in woods at Lake d'Almada, in the province of Bahia.

Brazilian Schradera. Shrub cl.

3 S. cephalòtes (Willd. spec. 2. p. 238.) leaves oblong, acuminated; peduncle terminal, solitary, short; head of flowers surrounded by an entire involucrum; limb of calyx somewhat denticulated; corolla 7-8-lobed. ♄. S. Native of the interior of Jamaica, in woods on the mountains. Fúchsia involucráta, Swartz, prod. p. 62. fl. ind. occ. 2. p. 674. Flowers 4-8, within the involucrum, white. Stigma quadrifid. Berry 4-celled, ex Swartz.

Headed Schradera. Fl. July, Aug. Clt. 1820. Shrub cl.

4 S. polyce'phala (D. C. prod. 4. p. 444.) leaves oval, acutish; peduncles numerous, terminal; heads surrounded by entire involucra; limb of calyx quite entire; corolla 5-lobed. ♄. S. Native of French Guiana, where it was collected by Patris. Berries ovate, crowned by the entire limb of the calyx, 2-3-celled; cells many-seeded.

Many-headed Schradera. Shrub cl.

Cult. The species of this genus are elegant when in flower. Vegetable mould is the best soil for them; and they will be easily increased by separating the rooted branches.

XCVII. BRIGNO'LIA (in honour of J. L. Brignoli, a professor of Verona, author of Fasciculus rariorum plantarum Forajuliensium, 4to. Urbina, 1810). D. C. diss. ined. with a figure, prod. 4. p. 444. but not of Bertol.

Lin. syst. *Hexándria, Monogýnia.* Calyx with a short roundish tube, and a 4-toothed limb; 2 of the teeth larger than the other 2, and probably made up of 2 combined ones each. Corolla with a short tube, and a 6-lobed limb; lobes linear-oblong, bluntish, longer than the tube, very hairy inside as well as the throat. Stamens 6, inserted in the tube, alternating with the lobes; filaments very short; anthers linear. Style filiform; stigma capitate, undivided. Fruit globose, fleshy, many-seeded, crowned by the calyx. The rest not sufficiently known. A shrub or tree. Branches terete, villous. Leaves opposite, petiolate, oval-oblong, obtuse at the base, acuminated at the apex, downy on the petioles and nerves, the rest glabrous. Stipulas twin on both sides, lanceolate, acuminated, but when young combined into an inter-petiolar stipula, but at length separating from the base to the apex into 2 parts each. Corymbs terminal, pedunculate, with a short hairy rachis, and downy crowded, trichotomous branches. Bracteas ciliated. Flowers sessile in the forks of the corymb, and at the tops of the pedicels.—This genus is nearly allied to *Isértia*, but from the fruit not being sufficiently known, its place in the order is very doubtful.

1 B. acumina'ta (D. C. prod. 4. p. 444.). ♄. S. Native of Trinidad, where it was collected by Lockhart. Leaves almost

a foot long and 3 inches broad, pale beneath. Petioles 8-12 lines long, a little longer than the stipulas. Corymbs much shorter than the leaves.

Acuminated-leaved Brignolia. Shrub.

Cult. For culture and propagation see *Hamèlia*, p. 542.

XCVIII. PATI'MA (altered from *Patima-Rana*, the name of the first species). Aubl. guian. 1. p. 196. t. 77. Juss. mem. mus. 6. p. 401. A. Rich. mem. soc. hist. nat. par. 5. p. 25. f. 2. D. C. prod. 4. p. 444.

LIN. SYST. *Pentándria, Monogýnia.* Calyx with an ovate tube, and a loose, entire, urceolate, tubular, somewhat pentagonal limb, with a very short 5-toothed sinuated border. Corolla tubular, hardly dilated towards the apex, with a 5-parted limb: having the segments long-acuminated, and the inner surfaces clothed with dense silky down. Stamens 5, inserted in the tube; filaments short; anthers cordate-oblong, inclosed. Style simple. Berry roundish, crowned by the limb of the calyx, 4-6 but usually 5-celled; cells many-seeded. Seed very minute, fixed to a rather fleshy, 2-lobed, prominent trophosperm.—Small perennial, glabrous subshrubs. Stems straight, terete, simple. Leaves opposite, petiolate, ovate-oblong, acute at both ends. Stipulas solitary, short, broad, acute, permanent. Peduncles axillary, short, 1 or few-flowered.

1 P. GUIANE'NSIS (Aubl. guian. 1. p. 196. t. 77.) leaves on long petioles; pedicels numerous, 1-flowered, shorter than the petioles. ♃. S. Native of Guiana, in marshes. Leaves a foot long and 4 inches broad. Berries green.

Guiana Patima. Shrub 2 to 3 feet.

2 P. FORSY'THII (D. C. prod. 4. p. 444.) leaves hardly petiolate; racemes few-flowered, longer than the petioles. ♄. S. Native country as well as the flowers unknown. This plant was received from Mr. Forsyth under the name of *Patìma Guianénsis* of Aubl. but differs from the plant of Aubl. in the characters indicated.

Forsyth's Patima. Shrub 2 to 3 feet.

Cult. For culture and propagation see *Hamèlia*, p. 542.

XCIX. POLYPHRA'GMON (from πολυ, *poly*, many, and φραγμος, *phragmos*, a dissepiment; there is a small transverse septum separating each seed). Desf. mem. mus. 6. p. 5. t. 2. Juss. mem. mus. 6. p. 399. D. C. prod. 4. p. 445.

LIN. SYST. *Decándria, Monogýnia.* Calyx with an ovate tube, and a short, permanent, entire, or 5-toothed limb. Corolla salver-shaped, bristly, with a terete tube, and a 10-parted limb: lobes elliptic-oblong. Stamens 10, inserted in the middle of the tube of the corolla; anthers linear, inclosed. Style 1, thickened, furrowed lengthwise; stigmas 6-7 or more. Berry globose, 10-20-celled. Seeds oblong, disposed in 1 row in each cell, and as if they were imbricated, separated by small transverse dissepiments.—Shrubs. Leaves opposite, oval, lanceolate, acuminated at both ends, clothed with adpressed silky down beneath. Stipulas deciduous. Peduncles short, axillary, 1-flowered.

1 P. SERÍCEUM (Desf. mem. mus. 6. p. 6. t. 2.) calyx quite entire. ♄. S. Native of the Island of Timor.

Silky Polyphragmon. Shrub.

2 P.? MÌNUS (A. Rich, diss. ex D. C. prod. 4. p. 445.) calyx 5-toothed. ♄. S. Native country unknown. Eríthalis uniflòra, Gærtn. fil. carp. 3. p. 93. t. 196. f. 4. Perhaps this plant is referrible to *Timònius*.

Smaller Polyphragmon. Shrub.

Cult. For culture and propagation see *Hamèlia*, p. 542.

C. MORE'LIA (evidently called after some person of the name of Morel, of whom we know nothing). A. Rich. mem. soc. hist. nat. par. 5. p. 23. D. C. prod. 4. p. 617.

LIN. SYST. *Pentándria, Monogýnia.* Limb of calyx marginal, erect, nearly entire. Corolla short, tubular, with a 5-parted limb; segments lanceolate, spreading, imbricate in æstivation. Stamens 5, inserted in the throat, exserted; anthers linear. Style simple, thickened and fusiform towards the apex; stigma bifid: lobes approximate. Ovarium 4-5-celled; cells 3-5-ovulate; ovula fixed to the inner angle of the cell. Fruit rather fleshy, 4-5-celled; cells 2-3-seeded, crowned by the short neck of calyx.—A small glabrous tree, native of Senegal, with the habit of *Bacònia*. Branches terete, cinereous, glabrous. Leaves opposite, elliptic, coriaceous, glabrous. Stipulas interpetiolar, deciduous. Flowers axillary, racemose; racemes somewhat trichotomous.

1 M. SENEGALE'NSIS (A. Rich. l. c.). ♄. S. Native of Senegal, where it was collected by Leprieur and Perrottet.

Senegal Morelia. Shrub.

Cult. For culture and propagation see *Hamèlia*, p. 542.

Tribe VI.

CORDIE'REÆ (this tribe contains plants agreeing with the genus *Cordièra* in having baccate many-celled fruit, and in the cells being 1-seeded). A. Rich. mem. soc. hist. nat. par. 5. p. 107. and 222. D. C. prod. 4. p. 445. Fruit baccate, of many 1-seeded cells. This differs from Tribe *Guettardàceæ* in the fruit not containing pyrenæ, but true cells; and from Tribe *Hamelièæ* in the cells being 1-seeded, not many-seeded.

CI. TRICALY'SIA (meaning unknown to us). A. Rich, mem. soc. hist. nat. par. 5. p. 224. D. C. prod. 4. p. 445.

LIN. SYST. *Penta-Hexándria, Monogýnia.* Limb of calyx 5-6-toothed, wide. Corolla with a shortish tube, a naked throat, and a 5-6-parted limb; segments narrow, spreading. Stamens 5-6, inserted in the throat of the corolla, exserted; filaments short; anthers linear. Stigmas 2, linear, shorter, somewhat recurved, exserted. Ovarium 2-celled; cells biovulate; ovula collateral.—Shrub. Leaves opposite, linear-lanceolate, gradually tapering at the base, and joined by the broad, acuminated, entire stipulas. Flowers downy, almost sessile, crowded in the axils of the leaves.

1 T. ANGOLE'NSIS (A. Rich, l. c.). ♄. S. Native of Angola.

Angola Tricalysia. Shrub.

Cult. For culture and propagation see *Hamèlia*, p. 542.

CII. CORDIE'RA (in honour of Niccolo Cordieri, a celebrated French sculptor). A. Rich, mem. soc. hist. nat. par. 5. p. 230. t. 10. f. 2. D. C. prod. 4. p. 445.

LIN. SYST. *Monoècia, Pentándria.* Flowers unisexual. with the sexes on different branches. Male flower. Calyx cup-shaped, solid, with an entire limb. Corolla salver-shaped, with a long tube, which gradually tapers to the apex, and is a little incurved, coriaceous, shining, and as if it were horny; with a 5-parted limb: having oblong acute lobes, and a very narrow naked throat. Stamens 4-5, inclosed, inserted in the middle of the tube; anthers rising from the bottom of the calyx. Styles only vestiges.—Female flower. Calyx sub-globose, adnate to the ovarium, with an entire marginal limb. Corolla straight, less attenuated at the apex than in the male flowers, with a 4-5-parted limb. Stamens small, abortive. Disk depressed in the middle. Stigmas 4-5, subulate. Berry globose, depressed, umbilicate, fleshy, 4-8-celled; cells 1-seeded. Seeds black, smooth. Albumen fleshy. Embryo parallel with the hylum, having a terete radicle, and subcordate cotyledons, which are the length of the radicle.—Bushy shrubs, 4-5 feet high. Leaves opposite, elliptic, acuminated, glabrous; stipulas very acute, combined at the base. Flowers white, occupying the tops of the branches: male ones by threes, sessile, girded by 4 scale-formed brac-

teas: the female ones solitary, and furnished with 4 bracteas each.

1 C. triflòra (D. C. prod. 4. p. 445.). ♄. S. Native of Guiana, on the banks of the river Kourou.

Three-flowered Cordiera. Shrub 4 to 5 feet.

Cult. For culture and propagation see *Hamèlia*, p. 542.

Tribe VII.

GUETTARDA'CEÆ (this tribe contains shrubs and trees agreeing with *Guettárda* in the fruit containing many 1-seeded pyrenæ). Kunth, nov. gen. 3. p. 419. Cham. et Schlecht. in Linnæa. 4. p. 181. A. Rich, mem. soc. hist. nat. par. 5. p. 107. D. C. prod. 4. p. 446. Rubiàceæ, sect. vi. Juss. mem. mus. 6. p. 395. Fruit drupaceous (f. 101. *d.* f. 103. *f.*), containing from 2-5 1-seeded pyrenæ (f. 103. *g.*). Seeds terete, elongated, usually erect. Albumen fleshy.—Shrubs or small trees. Leaves opposite, rarely by threes, with interpetiolar stipulas.

Sub-tribe I. Morínde*æ* (this sub-tribe only contains the genus *Morínda*). D. C. prod. 4. p. 446. Flowers and fruit collected into heads and combined.

CIII. MORI'NDA (altered from *Morus Indica*, or Indian mulberry; so named by Vaillant, from the shape of its fruit and country). Vaill. act. acad. par. 1722. p. 275. Lin. gen. no. 235. Juss. mem. mus. 6. p. 402. Lam. ill. t. 153. Gærtn. fr. 1. t. 29. A. Rich, mem. soc. hist. nat. par. 5. p. 211. D. C. prod. 4. p. 446.—Roiòc. Plum. gen. p. 11. t. 26.

Lin. syst. *Pentándria, Monogýnia.* Tube of calyx obovate, usually combined with those nearest it: limb short, hardly toothed. Corolla funnel-shaped, with a nearly terete tube, and a spreading, 5-lobed, rarely 4-lobed limb. Stamens 5, rarely 4; filaments short; anthers inclosed, except in one species. Style filiform, usually exserted; stigma bifid, except in one or two species, in which it is entire. Berries containing 2-4 1-seeded pyrenæ each, usually combined, compressed or angular from being so close together, areolate from the vestiges of the calyx. Embryo terete, in fleshy albumen.—Shrubs or small trees, natives within the tropics. Leaves opposite, rarely 3-4 in a whorl. Stipulas intrapetiolar, usually obtuse and membranous. Peduncles solitary or numerous, axillary or terminal, sometimes combined at the base, when this is the case they are said to be branched. Flowers aggregate, sessile, upon a sub-globose naked receptacle, forming dense, globose, or ovate heads: having the berries at length combined into a spurious fruit or compound berry. The bark of the roots is styptic, and is used by dyers.

Sect. I. Roiòc (*Royoc* is the American name of *M. Royoc*). Plum. gen. 11. t. 26. D. C. prod. 4. p. 446.—Morínda of most authors. Flowers pentamerous, pentandrous. Stigma bifid. Berries containing 2-4 1-seeded pyrenæ each.

* *Peduncles terminal, twin, or lateral and opposite the leaves, in the latter case one of the opposite leaves is deficient or half abortive.*

1 M. citrifòlia (Lin. spec. 250.) plant glabrous, almost arboreous; branchlets tetragonal; leaves oblong, attenuated at both ends, shining; stipulas semi-lunar, membranous, obtuse; heads on short peduncles, opposite the leaves, bractless; berries combined into an ovate mass. ♄. S. Native of the East Indies, as in Malabar and Pegu, &c. as well as of the Society Islands. Gærtn. fruct. 1. p. 144. t. 29. Roxb. fl. ind. 2. p. 196. Ham. in Lin. trans. 13. p. 533. Lour. coch. p. 140.—Rheed. mal. 1. p. 97. t. 52.—Rumph. amb. 3. p. 158. t. 99. Peduncles opposite to a solitary leaf, on the upper side of the branchlets, each supporting a small head of small white flowers. Anthers half hid in the tube of the corolla. Berries combined in the head, white and polished. The root of this species is employed by the natives of India to dye red.

Var. β, *papyràcea* (D. C. prod. 4. p. 446.) leaves oblong, acuminated at both ends, on long petioles, papery; stipulas triangular. ♄. S. Native of the East Indies, where it was collected by Labillardiere.

Var. γ, *latifòlia* (D. C. l. c.) leaves ovate, blunt at the base, hardly acute; stipulas broad, membranous, very blunt. ♄. G. Native of the Islands of O-Wahu and Radak, where it was collected by Chamisso. M. citrifòlia, Cham. et Schlecht. in Linnea. 4. p. 149.

Citron-leaved Indian-mulberry. Clt. 1793. Tree small.

2 M. tinctòria (Roxb. fl. ind. 2. p. 197.) glabrous and somewhat arboreous; leaves oblong, almost sessile, smooth, but not shining; peduncles opposite the leaves, solitary, much longer than the petioles; heads ovate; stamens inclosed. ♄. S. Native of the East Indies, almost every where. M. citrifòlia, Hunt. in asiat res. 4. p. 35. Trunk seldom above a few feet in height, but supporting a pretty large shady head of branches. Leaves pale beneath, from 6-10 inches long. Peduncles supporting each an oval head of pure white jasmine-like sweet-scented flowers. Fruit like that of *M. citrifòlia.* The bark of the root is used to dye red; the colour is fixed with alum, but it is neither bright nor durable. In some parts of India it is cultivated for the sake of its roots. In the Circars the dyers use the bark of the fresh roots bruised and gently boiled in water for a short time. The cloth or yarn is prepared in a cold infusion of the powdered galls of *Terminàlia Chebùla*, in milk and water; it is then dried and moistened with alum water, and again dried, and receives from the above decoction a pretty bright but fugitive red. The green fruit are picked by the Hindoos, and eaten with their curries. The wood is hard and very durable, variegated with red and white, and is employed for gun-stocks in preference to all other kinds.

Dyers' Indian-mulberry. Tree small.

3 M. bractea'ta (Roxb. fl. ind. 2. p. 198.) glabrous and sub-arborescent, stiff; leaves oblong, shining, on short petioles; stipulas large, semi-circular at the apex; peduncles solitary, opposite the leaves, bracteate. ♄. S. Native of the East Indies, in the Gamjam district; also of the Moluccas and Philippines. Cham. et Schlecht. in Linnæa. 4. p. 149. Ham. in Lin. trans 13. p. 534. Blum. bijdr. p. 1006.—Rumph. amb. 3. p. 157. t. 98. Leaves deep green and polished on both sides. The crown of the germ has frequently a small portion of it growing to be a long linear-lanceolate leaf. The anthers are inclosed, and the stigmas exserted, as in most of the other species of the genus. Peduncles supporting each a small head of small pure white flowers. Berries combined, 4-seeded. Corolla with a very villous throat.

Bracteate Indian-mulberry. Tree small.

4 M. exse'rta (Roxb. fl. ind. 2. p. 199.) arboreous; branches somewhat tetragonal, sometimes villous; leaves on short petioles, oval, acute, smooth, or downy beneath; stipulas emarginate; peduncles opposite the leaves, generally solitary, but sometimes rising by twos or threes; heads roundish; stigma inclosed; stamens exserted. ♄. S. Native of Bengal. Branches spreading in every direction. Peduncles supporting each a head of many pure white jasmine-like flowers. Berries 4-seeded, combined.

Exserted-stamened Indian-mulberry. Shrub 6 to 12 feet.

5 M. gemina'ta (D. C. prod. 4. p. 447.) branches tetragonal, puberulous; leaves obovate or oval, cuneated at the base, hardly petiolate, rather downy beneath; peduncles twin, opposite the leaves; stigma and anthers at the throat. ♄. S. Native of

Gambia and Casamanca, among bushes, where it was collected by Leprieur and Perrottet. Flowers white.

Twin-peduncled Indian-mulberry. Shrub.

6 M. MULTIFLÒRA (Roxb. fl. ind. 2. p. 200.) sub-arboreous; leaves oval-oblong, acute, with undulated margins, downy on both sides, but particularly so beneath; peduncles terminal and opposite the leaves, solitary or twin or tern, villous, usually compound; heads nearly globose, many-flowered. ♄. S. Native of the East Indies, in Berar. Stamens inclosed. Style exserted. Berries combined in a head, about the size of a mulberry, each containing 4 seeds This plant is cultivated about Nagpore for the sake of its roots, as the other species are in various other parts of India, and for the same purpose.

Many-flowered Indian Mulberry. Tree small.

7 M. PUBE'SCENS (Smith, in Rees's cylc. vol. 24. no. 3.) young branches tomentose; leaves elliptic-lanceolate, acuminated at both ends, scabrous, but with villous veins; peduncles hairy, opposite the leaves, and terminal; heads globose, few-flowered; corollas elongated, almost glabrous. ♄. S. Native of the Mauritius.

Downy Indian-mulberry. Tree or shrub.

8 M. SQUARRÒSA (Ham. in Lin. trans. 13. p. 535.) shrubby, erect, glabrous; leaves elliptic or lanceolate, undulated; peduncles naked, opposite the leaves, solitary, twice the length of the petioles; heads ovate, nodose in the fructiferous state from the berries being prominent. ♄. S. Native of the East Indies, among bushes at Camprura. Berries of a livid whitish colour: having the pulp white and diaphanous, each containing 4 seeds never combined or conferruminated, many of them abortive.

Squarrose Indian-mulberry. Shrub.

9 M. ANGUSTIFÒLIA (Roxb. fl. ind. 2. p. 201. but not of Roth.) shrubby, erect, glabrous; leaves elliptic or lanceolate, blistered, almost sessile; stipulas somewhat cordate, united into a ring; peduncles short, solitary, almost terminal, but usually opposite the leaves; heads globose, many-flowered; berries distinct in the head. ♄. S. Native of the East Indies, at Chittagong. Roxb. cor. 3. t. 237. Peduncles seemingly terminal when they begin to blossom, but soon afterwards a branch shoots out from between each peduncle and its respective opposite leaf, which marks their proper situation to be opposite the leaves, supporting each a head of pure white jasmine-like flowers. Anthers hid in the middle of the tube. Berries succulent, of a deep shining black, with very dark-coloured pulp, containing 4 seeds each. The root of this species is used by the natives of India for dyeing, where the plant is in plenty.

Narrow-leaved Indian-mulberry. Fl. April, July. Clt. 1816. Shrub 4 to 5 feet.

10 M. PERSICÆFÒLIA (Ham. in Lin. trans. 13. p. 535.) suffruticose, diffuse, glabrous; branches tetragonal; leaves elliptic, acute, on short petioles; stipulas subulate, longer than the petioles; heads sessile, solitary, opposite the leaves, usually containing about 10 flowers, and sometimes bracteated by a leaf. ♄. S. Native of Pegu and Ava, in woods. Corolla incurved, much longer than the head.

Peach-leaved Indian-mulberry. Shrub 1 to 2 feet.

11 M. TURBACE'NSIS (H. B. et Kunth, nov. gen. amer. 3. p. 380.) shrub downy, twining; leaves obovate-oblong, acute; stipulas connate at the base, acute, downy; heads terminal and opposite the leaves, on very short peduncles; corollas villous on the outside. ♄. S. Native of New Granada, between Turbaco and Carthagena. Flowers white.

Turbaco Indian-mulberry. Shrub cl.

** *Terminal peduncles twin, but the lateral and axillary ones are solitary.*

12 M. ROIO'C (Lin. spec. 250.) glabrous, procumbent at the base; leaves lanceolate, acuminated at both ends, on short petioles; stipulas broad, very short, mucronate; heads small, axillary, and nearly terminal, on short peduncles. ♄. S. Native of St. Domingo, Cuba, and Mexico. Jacq. hort. vind. t. 16. Lin. hort. cliff. p. 73. Roiòc humifûsum fructu Cupressino. Plum. gen. p. 11. t. 26. Pluk. alm. t. 212. f. 4. Flowers white. Berries 1-seeded, ex Plum., but 2-seeded, ex Lin., combined into a globose head. The roots dye linen of a dark colour.

Roioc Indian-mulberry. Fl. July, Oct. Clt. 1793. Shrub procumbent.

13 M. LONGIFLÒRA; a branched rather climbing shrub; leaves elliptic-lanceolate, acuminated; peduncles short, axillary, bearing each a head of 6-7 flowers. ♄. S. Native of Sierra Leone, among bushes. Corolla white, with a very long tube.

Long-flowered Morinda. Shrub cl.

14 M. QUADRANGULA'RIS; shrubby; branches rather quadrangular; leaves broad, oblong, acute, membranous, veiny; peduncles axillary, bearing each a head of 9-10 flowers. ♄. S. Native of Sierra Leone, among bushes on the mountains, and in the lowlands. (V. S. in herb. Lamb.).

Quadrangular-branched Indian-mulberry. Shrub 3 to 4 ft.

15 M. PEDUNCULA'RIS (H. B. et Kunth, nov. gen. amer. 3. p. 380.) glabrous, erect; leaves elliptic-oblong, acuminated, shining; stipulas short, connate, acuminated; heads axillary, on long peduncles; bracteas ovate, acuminated. ♄. S. Native of South America, in woods on the banks of the Orinoco, near San Borja. Branchlets tetragonal. Corollas white, glabrous. Tube of calyx downy.

Peduncular-flowered Indian-mulberry. Shrub 4 to 5 feet.

16 M. RETU'SA (Lam. and Poir. dict. 4. p. 316.) arboreous, glabrous; leaves obovate, obtuse, attenuated at the base, on short petioles, shining above; stipulas connate, membranous, obtuse; heads globose, on short peduncles, terminal? ♄. S. Native of Madagascar, where it is called Lingo. Poiret says, in his diagnosis of this species, that the heads are lateral, but in his description he says they are exactly terminal.

Retuse-leaved Indian-mulberry. Tree.

17 M. PALMETÒRUM (D. C. prod. 4. p. 448.) shrubby, glabrous; leaves oval-lanceolate, acuminated, on short petioles; stipulas broad-ovate, cuspidate, membranous, foliaceous; heads almost terminal, solitary, globose, on peduncles, which are shorter than the leaves. ♄. S. Native of Africa, in Cayor and Gambia at the roots of palm-trees, where it was collected by Leprieur and Perrottet. Peduncles variable in length, from ½ an inch to 3 inches long. Limb of calyx campanulate, hardly 5-toothed. Corolla villous on the outside. Style short. Anthers almost exserted.

Palm Indian-mulberry. Shrub.

18 M. STENOPHY'LLA (Spreng. syst. 1. p. 749.) branches nearly terete, glabrous, but when young rather tetragonal, and clothed with grey tomentum; leaves elliptic-lanceolate, acuminated at both ends, on short petioles, grey from very short tomentum; stipulas lanceolate, at length reflexed; peduncles axillary. solitary, tomentose. ♄. S. Native of the East Indies, near Beddir, where it is cultivated for its roots, which are used for dyeing. M. angustifòlia, Roth, nov. spec. p. 147. but not of Roxb. The figure in Rumph. amb. 3. t. 98. is sometimes referred to for this species, but is probably distinct.

Narrow leaved Indian-mulberry. Shrub or tree.

19 M. TOMENTÒSA (Heyn. in Roth, nov. spec. 147.) branchlets angular, glabrous; leaves sub-cordate, ovate, acuminated, clothed with grey tomentum beneath, and on the veins above; petioles long, channelled; peduncles axillary, solitary. ♄. S. Native of the East Indies. Perhaps the same as the following, but it differs in the glabrous branches and long petioles.

Tomentose Indian-mulberry. Shrub.

20 M. Mu'dia (Ham. in Lin. trans. 13. p. 536.) sub-arboreous; branchlets tetragonal, tomentose; leaves cordate-elliptic, acuminated, tomentose on both surfaces, on very short petioles; stipulas usually bifid; peduncles axillary, solitary, bractless, shorter than the petioles. ♄. S. Native of the coast of Coromandel, in the woods of Carnata, where it is called *Mudi*. Each head contains 5-6 flowers.

Mudi Indian-mulberry. Tree small.

21 M. Chachu'ca (Ham. l. c.) sub-arboreous; branches hexagonal; leaves elliptic, acute, often 3 in a whorl, scabrous above, pubescent beneath, and bearded at the axils of the ribs; stipulas semi-circular, often 2-lobed; peduncles axillary, solitary, naked, a little longer than the petioles. ♄. S. Native of Bengal, in woods at Matsia and Magadha, where it is called *Chakhuca*, i. e. six eyes, from the heads containing only 6 flowers. The bark of the root is used in dyeing red, like others of the species.

Chachuka Indian-mulberry. Shrub.

22 M. nodòsa (Ham. l. c.) sub-arboreous; branches obtuse-angled; leaves opposite, or 3-4 in a whorl, glabrous, elliptic, acute, on very short petioles; stipulas marcescent; heads axillary and terminal, pedunculate, egg-shaped, nodose from many of the berries being abortive. ♄. S. Native of the East Indies, in the woods of Magadha. Very like *M. Corèia*.

Nodose-headed Indian-mulberry. Tree.

23 M. Core'ia (Ham. l. c.) arboreous; branches with obtuse angles, glabrous; leaves elliptic, acute, undulated, glabrous, on very short petioles; stipulas marcescent; peduncles axillary, and terminal, much longer than the petioles, glabrous, bracteate at the apex; heads roundish. ♄. S. Native of the East Indies, in the woods of Mithila, where it is called by the natives *Koreia*. Flowers white, large, sweet-scented, 10-12 in each head.

Koreia Indian-mulberry. Tree.

* * * *Peduncles crowded, umbellate.*

24 M. umbella'ta (Lin. spec. 250.) arboreous, erect: leaves petiolate, lanceolate-ovate; peduncles crowded, terminating the branches. ♄. S. Native of Ceylon. This plant is unknown at the present day, and probably the same as *M. microcéphala*.

Umbellate-flowered Indian-mulberry. Clt. 1809. Tr. or sh.

25 M. microce'phala (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 449.) shrub glabrous, climbing a little; branches terete; leaves ovate-oblong, acute; stipulas ovate-triangular, acuminated, 3 times shorter than the petioles; heads pedunculate, 4 together, forming umbels at the tops of the branches. ♄. S. Native of the Island of Luzon. Flowers white.

Small-headed Indian-mulberry. Shrub cl.

26 M. Cochinchine'nsis (D. C. prod. 4. p. 449.) arboreous; branches spreading; leaves lanceolate, hispid; peduncles crowded, lateral. ♄. S. Native of Cochin-china, in woods. M. umbellàta, Lour. coch. p. 140. Fruit-bearing heads round, small, yellowish, composed of many berries. Flowers white.

Cochin-china Indian-mulberry. Tree.

27 M. sca'ndens (Roxb. fl. ind. 2. p. 202.) shrubby, climbing; leaves oblong-lanceolate, acuminated at both ends, on short petioles; stipulas membranous, obtuse; peduncles numerous, umbellate, terminal. ♄. ◡. S. Native of the East Indies, on the east side of Point de Galle Bay. Leaves 3 inches long, and an inch broad. Petioles hardly longer than the stipulas. Peduncles 7-8, short. Fruit-bearing heads globose, about the size of a pea. Flowers white, few in each head.

Scandent Indian-mulberry. Shrub cl.

28 M. sarmentòsa (Blum. bijdr. p. 1006.) climbing; leaves oblong-lanceolate, acuminated, glabrous; peduncles terminal by twos or threes, and twin and axillary, concrete at the base, or they may be said to be solitary and bifid; heads usually containing only 4 flowers. ♄. ◡. S. Native of Java, on Mount Burangrang in the province of Krawang. Allied to *M. scándens*.

Twiggy Indian-mulberry. Shrub cl.

29 M. la'xa (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 449.) leaves oblong, acuminated at both ends, membranous, downy beneath as well as on the branchlets; stipulas semi-circular, cuspidate; floriferous branchlets rising from the axils of the superior leaves, opposite, bearing each 2 leaves, and numerous small peduncled heads, which are disposed in an umbellate manner. ♄. S. Native of Mexico.

Loose Indian-mulberry. Shrub.

Sect. II. Padava'ra (*Pada-vara* is the Malabar name of *M. tetrándra*). D. C. prod. 4. p. 449. Flowers tetramerous, tetrandrous. Style bifid at the apex. Berries containing each 4 1-seeded pyrenæ. Perhaps a proper genus.

30 M. tetra'ndra (Jack, in mal. misc. 1. no. 2. p. 13. and in fl. ind. 2. p. 203.) shrubby, diffuse, glabrous; leaves lanceolate, ciliated with glands in the axils of the veins beneath; stipulas truncate; peduncles terminal, umbellate. ♄. S. Native of the Malay Islands. Pada-vara, Rheed. mal. 7. p. 51. t. 27. M. Padavàra, Juss. in Rœm. et Schultes, syst. 5. p. 216. M. Royòc, Lour. coch. p. 140. but not of Lin. Peduncles 5-10 together. Segments of corolla bearded inside. Berries yellow, combined into heads. Anthers 4, inclosed. A small diffuse shrub.

Tetrandrous Indian-mulberry. Shrub diffuse.

31 M. parvifòlia (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 449.) shrubby, glabrous; sterile branches twining; leaves linear-oblong, cuspidate, glabrous, as well as in the axils of the veins; stipulas combined into a truncate sheath; heads terminal, 4-5 together in an umbel, pedunculate. ♄. S. Native of the Island of Luzon. Very like the last species, but the number of the parts of the flower is unknown.

Small-leaved Indian-mulberry. Shrub.

Sect. III. Phylliræa'strum (from *Phylliræ'a* and *astrum*, an affixed signification, like; the shrub contained in this section has much the habit of *Phylliræ'a*). D. C. prod. 4. p. 449. Flowers tetramerous, tetrandrous. Style clavate, undivided. Berries containing each 4 1-seeded pyrenæ. Perhaps a proper genus.

32 M.? phylliræoìdes (Labill. nov. caled. p. 49. t. 49.) shrubby, glabrous, erect; leaves elliptic-oblong, acute, on short petioles; stipulas short, membranous, marcescent; heads axillary, opposite, almost sessile, few-flowered. ♄. S. Native of New Caledonia. Leaves rather sulphur-coloured beneath when dry. Heads smaller than a pea. Calyx nearly entire. Corolla 4 cleft, short. Style clavate. Berry 4-celled; cells 1-seeded.

Phylliræa-like Indian-mulberry. Shrub 5 feet.

Sect. IV. Chrysorhìza (from χρυσος, *chrysos*, gold, and ῥιζα, *rhiza*, a root; the roots are yellow). D. C. prod. 4. p. 450. Flowers pentamerous, pentandrous. Berries 2-celled, 2-seeded, Heads of flowers opposite the leaves. Habit of the other species of *Morinda*, but probably a proper genus.

33 M. chrysorhìza (D. C. prod. 4. p. 450.) shrub much branched; branchlets glabrous, bluntly tetragonal; leaves oblong-elliptic, on short petioles, pubescent in the axils of the veins beneath; stipulas roundish, foliaceous, entire; heads pedunculate, opposite the leaves. ♄. S. Native of Guinea, where it is called by the natives *Boj-tegi-tjo*. Psychótria? chrysorhìza, Schum. pl. guin. p. 111. Corolla salver-shaped, white. Stigma bipartite.

Golden-rooted Indian-mulberry. Shrub.

† *A species not sufficiently known.*

34 M. MACROPHY'LLA (Desf. cat. hort. par. ed. 3. p. 404.) stem erect; branches quadrangular; leaves broad-elliptic, acute, glabrous, on short petioles; stipulas twin, ovate, spreading. ♄. S. Native country unknown. Cultivated in the stove of the Jardin du Roi, Paris, but has never flowered.

Long-leaved Indian-mulberry. Shrub.

Cult. For culture and propagation see *Hamèlia*, p. 542.

SUBTRIBE II. GUETTA'RDEÆ (this sub-tribe contains shrubs agreeing with *Guettárda* in the flowers being distinct). D. C. prod. 4. p. 450. Flowers distinct, never combined.

CIV. MYRMECO'DIA (from μυρμηξ μυρμηκος, *myrmex myrmekos*, an ant or emmet; ants form nests in the tubers of the roots). Jack, in Lin. trans. 14. p. 122. Blum. bijdr. p. 1001. D. C. prod. 4. p. 450.—Lasiόstoma species, Spreng.

LIN. SYST. *Tetrándria, Monogýnia.* Limb of calyx tubular, with an entire border. Corolla funnel-shaped, 4-cleft, having the throat closed by arched scales or hairs. Stamens 4, inclosed. Ovarium covered by a fleshy disk. Style 1. Stigma simple (ex Jack.), quadrifid (ex Blum.). Drupe baccate, crowned by the annular base of the calyx, containing each 4 triquetrous, 1-seeded, chartaceously arillate pyrenæ. Embryo erect.—Half parasitical suffruticose plants, tuberous at the base. Leaves opposite, crowded, petiolate, glabrous. Stipulas petiolar, ciliated. Flowers sessile. The germinating plant has a tumid base (ex Blum.).

1 M. INE'RMIS (Gaud. in Freyc. voy. p. 472. t. 95.) tubers unarmed; leaves obovate-oblong; limb of calyx almost entire; tube of corolla pilose inside; stigma simple, tomentose. ♄. S. Native of the Moluccas and Pulo Nias, parasitical upon trees. M. tuberòsa, Jack. in Lin. trans. 14. p. 122. Lasiόstoma tuberòsum, Spreng. syst. 1. p. 423. Nìdus gérminans, Rumph. amb. 6. p. 119. t. 55. f. 2.

Unarmed Myrmecodia. Shrub.

2 M. ARMA'TA (D. C. prod. 4. p. 450.) tubers covered with rows of prickles; leaves oblong-cuneated; limb of calyx quite entire; throat of corolla closed with arched scales; stigma quadrifid. ♄. S. Native of the western provinces of Java, in the mountains, upon trees, where it is called by the natives *Tankurah*. M. tuberòsa, Blum. bijdr. p. 1001.—M. echinàta, Gaud. in Freyc. voy. pt. bot. t. 96. has the stem beset with rows of prickles; stipulas twin on both sides, connected by their bases within the petioles into a bifid limb; leaves petiolate, elliptic, acute at both ends; but perhaps both plants are the same.

Armed Myrmecodia. Shrub.

Cult. For culture and propagation see *Schradera*, p. 542.

CV. HYDNOPHY'TUM (from ὑδνον, *hydnon*, a tuber, and φυτον, *phyton*, a plant; the trunks of the species are irregularly formed tubers). Jack. in Lin. trans. 14. p. 124. Blum. bijdr. p. 955. D. C. prod. 4. p. 450.—Lasiόstoma species, Spreng.—Myrmecòdia species, Gaud. A. Rich. mem. soc. hist. nat. par. 5. p. 224.

LIN. SYST. *Tetrándria, Monogýnia.* Limb of calyx short, entire. Corolla with a short tube, which is hairy inside, and a flat, 4-lobed limb. Stamens 4, inserted in the throat; filaments short. Style filiform; stigma 2-lobed. Drupe juicy, containing 2 1-seeded pyrenæ, which are flat inside, and convex on the back, coriaceous. Embryo erect, in the center of the albumen. —Falsely parasitical shrubs, growing upon trees, tuberous at the base. Leaves oval, on short petioles. Stipulas small, linear. Flowers axillary, sessile, white.—Habit of the *Myrmecòdia*.

1 H. FORMICA'RUM (Jack. l. c. Blum. l. c.) leaves almost sessile, oval, rounded at the apex. ♄. S. Native of the Moluccas, Sumatra, and Nusa-Kambanga, upon trees in the woods. Lasiόstoma formicàrum, Spreng. syst. 1. p. 428. Nìdus gérminans formicarum nigrarum. Rumph. amb. 6. p. 119. t. 55. The trunk of this plant is an irregular tuber, fixed to trees by fibres like the stems of ivy; it is hollow inside, and becomes the nest of black ants.

Ants' Hydnophytum. Shrub parasitical.

2 H. MONTA'NUM (Blum. bijdr. p. 956.) leaves on short petioles, oblong, obtuse. ♄. S. Native of Java, on the mountains, in the province of Buitenzorg, upon trees. The base of the stem is swollen, as in the first species.

Mountain Hydnophytum. Shrub parasitical.

Cult. For culture and propagation see *Schradera*, p. 542.

CVI. HYPOBA'THRUM (from ὑπο, *hupo*, upon, and βαθρον, *bathron*, a seat; flowers seated on flat axillary receptacles). Blum. bijdr. p. 1007. A. Rich. mem. soc. hist. nat. par. 5. p. 198. D. C. prod. 4. p. 451.

LIN. SYST. *Tetrándria, Monogýnia.* Limb of calyx small, 4-toothed. Corolla small, sub-campanulate, with a villous throat, and a 4-cleft spreading limb. Stamens 4, inserted in the mouth of the tube; filaments very short. Style short, perforating the disk; stigma bifid in the throat. Drupe crowned by the calyx, 2-celled; cells containing each 2 1-seeded pyrenæ. Embryo inverted in the albumen.—A shrub, having the habit of *Coffèa*, with divaricate branches. Leaves distich. Flowers densely crowded on sessile hemispherical, axillary receptacles, sessile, bracteate, umbellate; but the fruit is pedicellate.

1 H. FRUTE'SCENS (Blum. l. c.). ♄. S. Native of Java, in woods on Mount Burangrang.

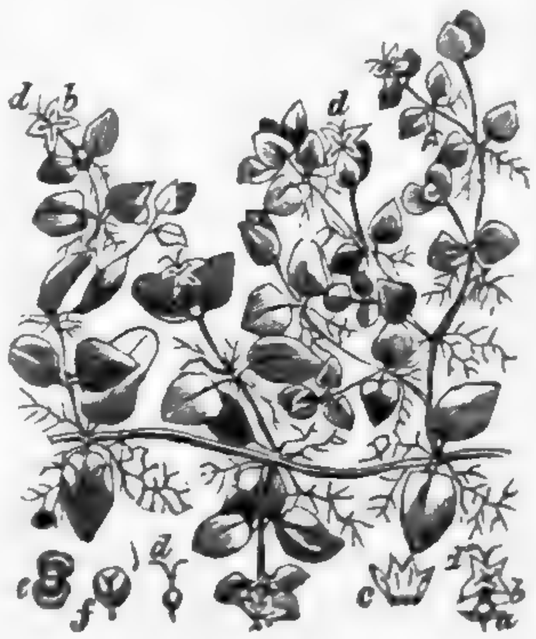
Shrubby Hypobathrum. Shrub 4 to 5 feet.

Cult. For culture and propagation see *Hamelia*, p. 542.

CVII. NERTE'RA (νερτερος, *nerteros*, inferior; in allusion to the plant creeping on the ground). Banks, in Gærtn. fr. 1. p. 124. t. 26. Juss. mem. mus. 6. p. 376. A. Rich, mem. soc. hist. nat. par. 5. p. 219. D. C. prod. 4. p. 451.—Nertèria, Smith, icon. ined. 2. p. 28. t. 28.—Gomòzia, Mutis, in Lin. fil. suppl. p. 17.—Erythrodànum, Pet. Th. fl. trist. d'ac. p. 41.

LIN. SYST. *Tetrándria, Monogýnia.* Calyx with an ovate tube and a small 4-toothed limb. Corolla funnel-shaped, sub-campanulate, 4-cleft (f. 100. *b.*), glabrous inside. Filaments rising from the bottom of the corolla (f. 100. *c.*), but not adnate to its tube; anthers roundish, hardly exserted. Style filiform; stigmas 2, hairy (f. 100. *d.*). Berry roundish (f. 100. *f.*), umbilicate, containing 2-4 1-seeded, coriaceous pyrenæ. Seeds semi-ovate, convex on the outside, flat and furrowed inside. Albumen horny. Embryo dorsal, straight, inverted (ex Gærtn.), erect (ex Pet. Th. and Blum.).—Creeping herbs, with the habit of *Michélla*. Leaves opposite, rather fleshy, oval. Stipulas small. Flowers terminal, sessile, solitary, white. Berries red.—Perhaps this genus is sufficiently distinct from *Michélla*.

FIG. 100.



1 N. DEPRE'SSA (Banks, in Gærtn. l. c.) stems low, creeping; leaves petiolate, flat, sub-acuminated. ♃. G. Native of New Granada on Silla de Caraccas, Peru, Chili, Falkland Islands, Tristan d'Acunha, Java, &c. in humid or marshy places. N. depréssa, Smith, icon. ined. 2. t. 28. Tratt. arch. 3. p. 129. D'Urv. fl. mal. p. 45. Gaud. fl. mal. p. 16. Erythrodànum alsinefόrme, Pet. Th. fl. trist. p. 42. t. 10. Gomòzia Granaténsis, Mut. in Lin. fil. suppl.

p. 49. N. rèpens, Ruiz et Pav. fl. per. 1. p. 60. t. 90. The figure in Smith's icon. ined. exhibits much exserted anthers, and the figure of fl. per. a long exserted style, but the figure in Pet. Th. trist. has neither the anthers nor style exserted. There are therefore two distinct species confounded under this name. The specimens from Madagascar have pentamerous flowers (ex Rich.), and those from Java have acuter leaves, on longer petioles than any other; these are probably specifically distinct.

Depressed Nertera. Pl. creeping on the ground.

2 N. adsu'rgens (Pet. Th. fl. trist. d'ac. t. 11.) stems rooting at the base, but at length ascending at the points; leaves almost sessile, oval, undulated, with callous edges. ♃. F. Native of the Island of Tristan d'Acunha. Carm. in Lin. trans. vol. 12. p. 505. Erythrodànum màjus, Pet. Th. fl. trist. d'ac. p. 42. A larger plant than the preceding.

Rising Nertera. Pl. creeping.

3 N.? alsinòides (Cham. et Schlecht. in Linnæa. 6. p. 413.) leaves pubescent, and ciliated at first, but at length becoming glabrous; peduncles axillary, deflexed when in fruit, about equal in length to the leaves; drupes juicy, globose. ♃. F. Native of Mexico, at Cuesta Grande de Jalacingo. Herb beset with a few stiffish white hairs. Drupe bluish-black, containing 2 coriaceous 1-seeded pyrenæ.

Chickweed-like Nertera. Pl. creeping.

Cult. The species of *Nertèra* are small creeping suffruticose evergreen plants, of little beauty even when in flower; they grow best in a mixture of turfy peat and sand; and are increased easily by separating the rooted creeping stems. They may be placed among the alpine plants in summer, but in winter they will require the protection of a green-house. They should be grown in pots well drained with sherds, placed in pans of water.

CVIII. MITCHE'LLA (so named by Linnæus in honour of John Mitchell, M.D. a physician in Virginia, who described many genera of Virginian plants, which were published in act. nat. cur. for. 1748). Lin. gen. no. 134. Juss. gen. 205. mem. mus. 6. p. 373. Lam. ill. t. 63. Gærtn. fil. carp. 3. p. 70. t. 192. A. Rich. mem. soc. hist. nat. Par. 5. p. 220. D. C. prod. 4. p. 452.—Chamædáphne, Mitch. gen. p. 17. but not of Buxb.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with an ovate-globose tube, and a large 4-toothed limb. Corolla funnel-shaped, with a terete tube, and a 4-lobed spreading limb, having the throat and lobes of the limb hairy inside. Filaments adnate to the tube, almost to the throat; anthers ovate, hardly exserted. Style filiform; stigmas 4, inclosed. Berries almost globose, crowned by the teeth of the calyx, containing 4 horny 1-seeded pyrenæ each; and sometimes containing 8, when 2 berries are combined. Albumen somewhat cartilaginous. Embryo minute, erect, with very short cotyledons.—American glabrous creeping evergreen herbs, with the habit of *Linnæ'a* or *Nertèra.* Leaves roundish or ovate. Stipulas small, solitary on each side. Flowers axillary and terminal, sometimes combined by twos at the tops of the peduncle, and sometimes solitary and sessile.

1 M. re'pens (Lin. spec. p. 161.) leaves roundish; flowers 2 on the top of each peduncle, combined; berries combined. ♃. H. Native of North America, from Boston to Carolina; Upper Canada; and of Mexico between Pueblo-Viejo and Real del Monte, in shady woods at the roots of trees, and among moss.—Pluk. alm. t. 444. f. 2.—Cat. car. t. 20.—Petiv. gaz. t. 1. f. 13. Corollas white, tinged with purple, usually 2 together on the top of each peduncle, and seated on two combined ovaries; the flowers are sometimes also combined, and therefore 8-cleft, according to the obs. of Torrey. Berries red, insipid.

Creeping Mitchella. Fl. June. Clt. 1761. Pl. cr.

2 M. ova'ta (D. C. prod. 4. p. 452.) leaves ovate, acutish; flowers solitary, sessile. ♃. F. Native of South America, in humid places at the foot of the burning mount Tunguragua, in the kingdom of Quito. Flowers white, solitary, not by twos. Nertèra tetraspérma, H. B. et Kunth, nov. gen. amer. 3. p. 379. Spreng. syst. 1. p. 492. exclusive of the synonymes.

Ovate-leaved Mitchella. Pl. cr.

Cult. These are small creeping evergreen plants of very little beauty; they will grow very well in a peat border, or in pots filled with a mixture of peat and sand, placed among other alpine plants; they are easily increased by separating the creeping stems.

CIX. MEPHITI'DIA (from *mephitis*, a damp of the earth; in reference to the ungrateful smell of the shrubs). Reinw. in Blum. bijdr. D. C. prod. 4. p. 452.—Lasiánthus, Jack, in Lin. trans. 14. p. 125. Blum. bijdr. p. 995. A. Rich. mem. soc. hist. nat. par. 5. p. 210. but not of Lin.

Lin. syst. *Tetra-Hexándria, Monogýnia.* Limb of calyx 3-6-parted or toothed. Corolla funnel-shaped, regular, 4-6-cleft, for the most part hairy. Stamens 4-6, inserted towards the throat; filaments very short; anthers linear, exserted or inclosed. Stigmas 4-9, linear, thick. Drupe baccate, crowned by the permanent calyx, containing 4-9 triquetrous coriaceously arillate 1-seeded pyrenæ.—Shrubs or subshrubs, natives of India, usually with an ungrateful smell. Flowers crowded or in dense heads, axillary and terminal, bracteate. Drupes usually blue.—This genus, according to Blume, is nearly allied to *Ancylánthus* and *Psathùra.*

* *Limb of calyx 3-6-parted.*

1 M. cyanoca'rpa (Jack, in Lin. trans. 14. p. 125. under *Lasiánthus,*) plant suffruticose, hairy; leaves oblong, acuminated, attenuated at the base; flowers usually by threes, involucrated by bracteas. ♄. S. Native of Sumatra and Java, in shady places on the mountains. Blum. bijdr. p. 996. Bracteas cordate. Corollas yellow, ex Jack, whitish, ex Blume. Berry blue, pilose, size of a gooseberry.

Blue-fruited Mephitidia. Shrub.

2 M. attenua'ta (Jack, l. c. p. 126. under *Lasiánthus,*) plant suffruticose, villous; leaves oblong, attenuated at the apex, but roundly cordate at the base, glabrous above; flowers axillary, 3-4-together, almost sessile, involucrated by lanceolate bracteas. ♄. S. Native of the interior of Bencoolen. Calyx 4-parted. Corolla yellow, pilose. Berries deep blue, smaller than those of the preceding species.

Attenuated-leaved Mephitidia. Shrub.

3 M. inæqua'lis (Blum. bijdr. p. 996. under *Lasiánthus,* as well as all the following species,) shrubby, hairy; leaves oblong, acuminated, unequally rounded at the base; flowers axillary, crowded, involucrated by bracteas. ♄. S. Native of Java, on mounts Salak and Seribu. Corolla white.

Unequal-leaved Mephitidia. Shrub.

4 M. rhinocerò'tis (Blum. bijdr. p. 996.) shrubby; leaves oblong, acuminated, rounded at the base, glabrous above, but hairy beneath, as well as the branches and calyxes; flowers crowded, axillary. ♄. S. Native of Java, in the higher woods on mounts Salak, Gede, &c. Corollas white.

Horn-snouted Mephitidia. Shrub.

5 M. capita'ta (Blum. bijdr. p. 996.) shrubby; leaves oblong-lanceolate, acuminated, attenuated at the base, glabrous above, and hairy beneath, as well as the branches, peduncles, and calyxes; heads of flowers pedunculate, axillary. ♄. S. Native of Java, in woods on the mountains. Flowers white.

Capitate-flowered Mephitidia. Shrub.

6 M. tomento'sa (Blum. bijdr. p. 997.) shrubby; leaves oblong, long-acuminated, acute at the base, glabrous above, but

tomentose on the veins beneath, as well as on the branches; flowers axillary, solitary or twin, sessile. ♄. S. Native of Java, in woods on mounts Salak, Gede, &c. Corollas white.

Tomentose Mephitidia. Shrub.

7 M. OBSCU'RA (Blum. mss. ex D. C. prod. 4. p. 453.) shrubby; leaves oblong, acuminated, rather obliquely attenuated at the base, clothed with tomentum beneath, as well as on the rib above and the branches; heads of flowers axillary, almost sessile. ♄. S. Native of Java, in the western parts on the mountains. Corolla white. This species differs from *M. tomentòsa* in the stipulas being larger, and in the flowers being more numerous, &c.

Obscure Mephitidia. Shrub.

8 M. LU'CIDA (Blum. bijdr. p. 997.) shrubby; branches glabrous; leaves ovate-oblong or lanceolate, cuspidate, shining above, rather pubescent beneath at the margins, and on the veins; flowers crowded, axillary, rarely solitary. ♄. S. Native of Java, in the more elevated woods. Flowers white.

Shining-leaved Mephitidia. Shrub.

9 M. STIPULA'RIS (Blum. bijdr. p. 997.) shrubby; branches glabrous; leaves oblong, acuminated, attenuated at the base, and are as well as the branches glabrous, but ciliated at the apex; stipulas large, roundish, rather membranous; flowers crowded, axillary; calyxes hairy. ♄. S. Native of Java, on mount Salak. Corollas white.

Stipular Mephitidia. Shrub.

10 M. LÆVIGA'TA (Blum. bijdr. p. 998.) shrubby; leaves oblong, acuminated, acutish at the base, and are as well as the branches glabrous; fascicles of flowers axillary; calyx 3-parted. ♄. S. Native of Java, in mountain woods. Flowers white. There is a variety of this with lanceolate leaves.

Smooth Mephitidia. Shrub.

11 M. LATIFÒLIA (Blum. mss. ex D. C. prod. 4. p. 453.) shrubby; leaves oval, acute at both ends, reticulately veined, and are as well as the branches glabrous; flowers crowded, axillary, on short peduncles. ♄. S. Native of Java, on mount Salak in shady parts of woods. Corollas white. Fruit globose, orange coloured. Lobes of calyx lanceolate, parted to the base, at length becoming connivent.

Broad-leaved Mephitidia. Shrub.

* * *Limb of calyx with short lobes.*

12 M. INODO'RA (Blum. bijdr. p. 998.) shrubby; branches glabrous; leaves oblong or oblong-lanceolate, acuminated at both ends, glabrous, downy on the veins beneath; flowers crowded, axillary, girded by blunt bracteas. ♄. S. Native of Java, in woods at mount Gede. The leaves of this species are without any ungrateful smell.

Scentless Mephitidia. Shrub.

13 M. HEXA'NDRA (Blum. bijdr. p. 998.) shrubby; leaves lanceolate, long-acuminated, clothed with strigose down on the rib above, and on the veins beneath, as well as the branchlets; flowers axillary, usually solitary, hexandrous. ♄. S. Native of Java, in the more elevated woods on mount Salak. Corollas white.

Hexandrous Mephitidia. Shrub.

* * * *Limb of calyx with short teeth.*

14 M. VENÒSA (Blum. bijdr. p. 999.) shrubby; leaves on short petioles, oblong, acuminated, obliquely attenuated at the base, very veiny, glabrous above, downy on the veins beneath, as well as on the branchlets; flowers crowded, axillary, sessile. ♄. S. Native of Java, in woods on the Seribu mountains. Corollas white.

Veiny Mephitidia. Shrub.

15 M. SYLVE'STRIS (Blum. bijdr. p. 999.) shrubby; leaves on short petioles, oblong-lanceolate, acuminated at both ends, glabrous, veiny, clothed with adpressed down on the veins beneath, as well as on the branchlets; flowers crowded, axillary, sessile; fruit containing 4-5 pyrenæ. ♄. S. Native of Java, along with the preceding, from which it differs in the smaller leaves, which are unequally narrowed at the base, in the fewer and remoter veins, and in the more obsoletely toothed calyx.

Wild Mephitidia. Shrub.

16 M. RETICULA'TA (Blum. bijdr. p. 1000.) shrubby; leaves large, on short petioles, oblong, acuminated, acute at the base, glabrous above, and reticulately veined, rather tomentose on the veins and branches; flowers crowded, axillary, almost sessile. ♄. S. Native of Java, on the Seribu mountains. Flowers white.

Reticulated-leaved Mephitidia. Shrub.

17 M. PURPU'REA (Blum. bijdr. p. 1000.) shrubby; leaves lanceolate, long-acuminated, and are as well as the branches glabrous; peduncles crowded, 1-flowered, axillary, or lateral from the leaves having fallen. ♄. S. Native of Java, on mounts Salak, Gede, &c. in shady places. Flowers purple.

Purple-flowered Mephitidia. Shrub.

18 M. STERCORA'RIA (Blum. bijdr. p. 1000.) shrubby; leaves lanceolate, long-acuminated, acute at the base, glabrous except the veins beneath, which are clothed with adpressed down, as well as the branches; flowers crowded, axillary, sessile; fruit globose, containing 7-9 pyrenæ. ♄. S. Native of Java, on the mountains. Allied to *M. sylvéstris;* but the fruit is evidently distinct. Flowers white.

Stinking Mephitidia. Shrub.

Cult. See *Hamelia*, p. 542. for culture and propagation.

CX. VANGUE'RIA

(altered from *Voa-Vanguer*, the Madagascar name of the first species). Comm. in Juss. gen. p. 266. mem. mus. 6. p. 396. A. Rich. mem. soc. hist. nat. Par. 5. p. 217. D. C. prod. 4. p. 454.—Vanguièra, Pers. ench. 1. p. 459. —Vavánga, Rohr, in act. soc. hist. nat. hafn. 2. pt. 1. p. 208. t. 7.—Mèynia, Link.

LIN. SYST. *Pentándria, Monogýnia.* Calyx with a short obovate tube, and a small spreading 5-toothed deciduous limb. Corolla campanulately globose, 5-cleft, hairy inside at the throat: lobes lanceolate, acute, reflexed. Stamens 5, with very short filaments, and oblong hardly exserted anthers. Stigma capitate, (bilamellate, ex Vahl.) 4-5-lobed (ex Roxb.). Berry apple-shaped, not crowned at the apex by the calyx, but marked by a sinuated areola, indicating the place from which the limb of the calyx had fallen off, containing 5 bony 1-seeded pyrenæ, which are obtuse at the base, and acute at the apex. Seed oblong, fixed to the inner angle of the cell, near the middle. Albumen fleshy. Embryo large, inverted, with long plano-convex cotyledons, and a bluntly cordate compressed superior radicle.—Small trees. Leaves petiolate, ovate. Stipulas solitary on both sides, lanceolate. Cymes branched, subpanicled, axillary, or rising beneath the leaves from the cicatrices, occasioned by the falling of the old leaves. Flowers white.—This genus is anomalous in the order, from the structure and situation of the seeds; it is allied to *Cánthium*, but differs from that genus in the ovarium being 5-celled, not 2-celled.

1 V. EDU'LIS (Vahl, symb. 3. p. 36.) unarmed; leaves ovate, membranous, glabrous; cymes rising beneath the leaves. ♄. S. Native of Madagascar, from whence it has been introduced to China and the Mauritius. Lam. ill. t. 159. Sieb. fl. maur. exs. 2. no. 77. and no. 138. V. cymòsa, Gærtn. fil. carp. 3. p. 75. t. 193. V. Madagascariénsis, Gmel. syst. 1. p. 367. V. Commersònii, Desf. ex Steud. Jacq. hort. vind. 1. t. 44. Vavánga Chinénsis, Rohr, and Vavánga edùlis, Vahl, act. soc. hist. nat. hafn. 2. pt. 1. p. 207. and p. 208. t. 7. The habit of the tree

is much like that of *Callicárpa*. The fruit is eaten by the natives of Madagascar and the Mauritius under the names of *Voa-vanga* and *Voa-vanguer*. Flowers white.

Edible-fruited Vangueria. Clt. 1809. Tree 10 to 15 feet.

2 V. SPINO'SA (Roxb. fl. ind. 2. p. 172.) spines decussate; leaves ovate-oblong, smooth; cymes axillary, in fascicles. ♄. S. Native of Bengal and China; in Bengal it is called *Mayna*. Mèynea spinòsa, Link, jahrb. 1-3. H. p. 32. Rœm. et Schultes, mant. 1. p. 67. and 84. Leaves opposite or three in a whorl, 3-4 inches long. Flowers axillary, fascicled on a short peduncle, with proper longer pedicels, small, of a pale greenish colour. Anthers small, cordate. Stigma 4-5-lobed. Berry size of a cherry, turbinate, smooth, yellow when ripe, succulent, and edible. The flowers and habit of the whole plant are exceedingly like *Cánthium parviflòrum*.

Spinose Vangueria. Fl. June, July. Clt. 1816. Shrub large.

3 V. INFAU'STA (Burch. cat. geogr. pl. afr. austr. no. 2629. trav. 2. p. 258. and 259. with a figure,) unarmed; leaves tomentose, roundish-ovate, usually acuminated; cymes axillary. ♄. S. Native of the south of Africa, without the tropic, in the territory of Bachapin, where it is considered unlucky by the inhabitants. Fruit round, an inch in diameter, but not edible.

Unlucky Vangueria. Shrub 5 to 10 feet.

N. B. Vanguèria verrucòsa, Sieb. fl. maur. does not belong to the present order, but is probably a species of *Logànea or Solànum*.

Cult. For culture and propagation see *Hamèlia*, p. 542.

CXI. GUETTA'RDA (so named by Linnæus in honour of John Etienne Guettard, member of the academy of sciences at Paris, who published, in 1747, a catalogue of the plants growing in the vicinity of Estampes). Vent. choix. no. 1. A. Rich. mem. soc. hist. nat. par. 5. p. 201. D. C. prod. 4. p. 455.—Guettárda species and Matthìola, Lin. gen.—Guettárda species and Laugèria, Jacq. Juss.—Guettárda spec. Lam. Pers.—Halèsia, P. Browne, jam. but not of Lin.—Viviània, Rafin. spech. 1. p. 117. but not of Cav. nor Colla, nor Raddi.

LIN. SYST. *Tetra-Enneándria, Monogýnia*. Calyx with ovate or globose tube; and a tubular permanent or deciduous limb, which is either truncate or irregularly toothed (f. 101. *a*.). Corolla salver-shaped, with a cylindrical tube (f. 101. *c*.), and from 4-9 oval-oblong lobes (f. 101. *b*.). Anthers 4-9, sessile in the throat of the corolla, inclosed. Stigma capitate, rarely 2-lobed. Drupe roundish or ovate, crowned by the tube of the calyx (f. 101. *d*.), containing a bluntly angled 4-9-celled putamen (f. 101. *e*.), having the cells straight or curved, 1-seeded. Seeds erect, nearly terete.—Small trees or shrubs, natives of South America, and a few of India. Leaves ovate or lanceolate, rarely cordate. Stipulas lanceolate, deciduous, except in one species in which they are sheathing and truncate. Peduncles axillary, bifid, rarely twice bifid. Flowers sessile and unilateral along the branches of the peduncles, and solitary in the forks.

SECT. I. CADA'MBA (vernacular name of *G. speciòsa*). D. C. prod. 4. p. 455.—Cadámba, Sonner. trav. 2. p. 228. t. 128. Limb of calyx soon falling off. Cells of drupe curved at top.

1 G. SPECIÒSA (Lin. spec. 1408.) leaves broad, ovate or obovate, usually subcordate at the base, obtuse and apiculated at the apex, downy beneath; stipulas ovate or lanceolate, acuminated, deciduous; cymes pedunculate, velvety, much shorter than the leaves; flowers of from 4 to 9 parts; fruit depressed, marked by an areola at the apex. ♄. S. Native of the East India islands; coast of Coromandel and Malabar, &c. Lam. ill. t. 154. f. 2. Roxb. fl. ind. 2. p. 521. Lindl. bot. reg. t. 1393. Cadámba jasminiflòra, Sonn. trav. 2. p. 128. Rava-Pou, Rheed. mal. 4. p. 47. and 48. Leaves canescent from villi in the young state, but the adult ones only along the nerves. Branches horizontal, forming a large shady head. Peduncles twice bifid. Flowers unisexual, large, white, exquisitely fragrant, partaking much of the scent of cloves. Seeds much curved, with the concave part of the curve outwards. Leaves sometimes downy on both surfaces. (f. 101.)

Var. β, glabràta (D. C. prod. 4. p. 455.) young leaves downy along the nerves and veins, but the adult ones are glabrous. ♄. S. Native of Mexico, but probably only cultivated in gardens. There are varieties of this with the leaves either subcordate or subattenuated at the base.

Showy Guettarda. Fl. June, July. Clt. 1771. Tree 30 ft.

SECT. II. GUETTARDA'RIA (altered from the generic name). D. C. prod. 4. p. 455. Limb of calyx usually permanent, truncate or irregularly subdentate. Corolla silky on the outside, with the lobes flat. Drupe having the cells of the putamen straight.

§ 1. *Tube of corolla silky, villous or downy. Drupe containing a 4-7-celled putamen.*

2 G. ARGE'NTEA (Lam. dict. 3. p. 54. ill. t. 154. f. 1.) leaves ovate, acuminated, on short petioles, glabrous and smooth above, but clothed with silky velvety down beneath, with the transverse nerves parallel; stipulas villous on the outside, ovate, terminating in a subulate point; cymes pedunculate, bifid, velvety; flowers hexamerous, with a villous tube, which is 10 times longer than the ovarium. ♄. S. Native of Cayenne. G. speciòsa, Aubl. guian. 1. p. 320. but not of Lin. Peduncles about the length of the leaves. Leaves 5 inches long and 3 broad. Petioles 5 lines long. Corolla 15 lines long, white. Ovarium 6-celled, 6-ovulate.

Silvery Guettarda. Tree 20 feet.

3 G. HAVANE'NSIS (D. C. prod. 4. p. 455.) leaves obovate, acutish at the base, and mucronate at the apex, scabrous above, and tomentose beneath; stipulas acuminated, 3 times shorter than the petioles; peduncles hairy, about the length of the leaves; cymes trifid; tube of corolla 4 times longer than the ovarium, and the limb 5-6-cleft. ♄. S. Native of Cuba, about the Havannah. Allied to *G. ambígua*. Flowers white?

Havannah Guettarda. Tree.

4 G. MISSIÒNIS (Wall. cat. no. 6221.) leaves oblong, acuminated, paler beneath, glabrous in every part, except on the mid-rib beneath; cymes pedunculate, axillary, dichotomous; calyx 5-parted, permanent; corolla villous on the outside; fruit roundish, crowned by the calyx. ♄. S. Native of the East Indies. Stipulas ovate. Flowers white, not so large as those of *G. speciòsa*.

Mission Guettarda. Shrub or tree.

5 G. AMBÍGUA (D. C. prod. 4. p. 455.) leaves ovate or obovate, cordate at the base, and rather mucronate at the apex, scabrous above, but clothed with downlike tomentum beneath; stipulas acuminated, one-half shorter than the petioles; peduncles hairy, about the length of the leaves; cymes bifid; fruit globose, reticulated, crowned by the tubular calyx. ♄. S. Native of Guadaloupe, and also of Jamaica, if, as is suspected, this be the Halèsia, P. Browne, jam. p. 205. t. 20. f. 1. Flowers white?

Ambiguous Guettarda. Shrub 8 to 10 feet.

6 G. CORDA'TA (H. B. et Kunth, nov. gen. amer. 3. p. 420.) leaves ovate-elliptic, deeply cordate, rounded at the apex, rather pilose above, and clothed with white tomentum beneath; stipulas ovate, acute, length of petioles; peduncles 3 or 4 times longer than the petioles; cymes 3-flowered; flowers hexamerous, with a downy tube, which is 4 times longer than the ovarium. ♄. S.

Native of New Granada, near Ibague and Cuesta de Tolina, in hot places. Said to be nearly allied to *G. scàbra*.

Cordate-leaved Guettarda. Tree or shrub.

7 G. RUGO'SA (Swartz, prod. p. 59. fl. ind. occ. 1. p. 632.) leaves ovate-subcordate, mucronate, scabrous above, and tomentose beneath; peduncles 3 or 4 times longer than the leaves, compressed, villous; cymes bifid; flowers hexamerous, with a villous tube, which is 3 times longer than the ovarium. ♄. S. Native of the Caribbee islands, as of Santa Cruz, Antigua, and Dominica. Vahl, symb. 3. p. 50. Tube of corolla an inch and a half long, silky. Very nearly allied to *G. scàbra*, but differs in the nervules of the leaves being less prominent and straight, not reticulated. Drupe purplish, containing a 6-seeded putamen.

Wrinkled Guettarda. Clt. 1793. Tree.

8 G. SCA'BRA (Lam. ill. t. 154. f. 3.) leaves obovate, mucronate, coriaceous, scabrous above, reticulated and pubescent beneath; stipulas lanceolate, acuminated, caducous; peduncles compressed, villous, almost 4 times longer than the petioles; cymes bifid; limb of corolla 6-7-parted; stamens 6-7; tube of corolla villous, 3 times longer than the ovarium. ♄. S. Native of the West Indies, as of Porto-Rico. Vent. choix. t. 1. Mathìola scàbra, Lin. spec. 1661. Mathìola, Plum. ed. Burm. t. 173. f. 2. Flowers white. Drupe containing an angular 4-7 celled putamen, and crowned by the somewhat crenate limb of the calyx.

Scabrous Guettarda. Clt. 1818. Tree.

9 G. VIBURNOÌDES (Cham. et Schlecht. in Linnæa. 4. p. 182.) leaves ovate, acute, on long petioles, smoothish above, but not scabrous, and clothed with silky tomentum beneath, as well as the branchlets and inflorescence; stipulas elongated, triangular, very soon falling off; peduncles shorter than the leaves, twice bifid, with the branches expanded; limb of calyx very short, somewhat truncate; drupe globose, depressed. ♄. S. Native of Brazil within the tropic. Leaves 4 inches long and $2\frac{1}{2}$ broad, on petioles about 15 lines long. Corolla densely clothed with silky down, having the tube almost an inch long, and the limb 4-6-parted.

Viburnum-like Guettarda. Shrub 10 feet.

10 G. PEDUNCULA'RIS (Wall. cat. no. 6222.) leaves ovate-oblong, acuminated, glabrous; peduncles axillary, solitary, 1-flowered, girded by a ring just under the fruit, which is extended into 2 opposite subulate points; fruit oblong, crowned by the 4 permanent teeth of the calyx. ♄. S. Native of Sirinagur.

Peduncular-flowered Guettarda. Shrub or tree.

11 G. PLATY'PODA (D. C. prod. 4. p. 456.) leaves oval, mucronulate, acute at the base, on short petioles, glabrous and smooth above, but hoary beneath; stipulas triangular, acute; peduncles compressed, smoothish, length of the leaves, cymose at the apex, and bearing 5-7 flowers; limb of calyx short, tubular, a little toothed: fruit globose, depressed. ♄. S. Native of Brazil, in the sand by the sea side at Bahia, where it was collected by Salzman.

Broad-peduncled Guettarda. Shrub.

12 G. MÓLLIS (D. C. prod. 4. p. 456.) leaves elliptic, somewhat mucronate, downy above and villous beneath; peduncles 5 times longer than the petioles; cymes capitate, villous; flowers hexamerous, with a villous tube, which is 2 or 3 times longer than the ovarium. ♄. S. Native of St. Domingo. G. elliptica, ex Hispaniola, Spreng. syst. 1. p. 789.

Soft Guettarda. Tree or shrub.

13 G. XYLOSTEOÌDES (H. B. et Kunth, nov. gen. amer. 3. p. 420.) leaves oblong, acute, rounded at the base, glabrous above, and downy beneath, but hairy on the veins, as well as on the branchlets; stipulas lanceolate, length of the petioles; peduncles 6 times longer than the petioles; cymes 3-7-flowered; flowers hexamerous, having the tube 8 times longer than the ovarium. ♄. S. Native on the banks of the Orinoco, between Angustura and Ferreras. Dicrobótryum divaricàtum, Willd. in Schultes, syst. 5. p. 221. Flowers white. Fruit globose, downy, containing a 5-6-celled putamen.

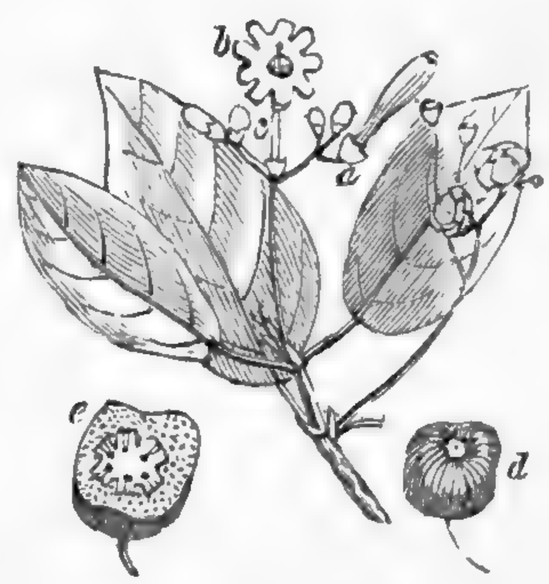
Fly-Honeysuckle-like Guettarda. Tree 20 feet.

14 G. PARVIFLÒRA (Vahl, ecl. amer. 2. p. 26.) leaves oblong, polished, and glabrous on both surfaces, but having the middle nerve rather downy; stipulas small, subulate; peduncles crowded at the tops of the branches, rather shorter than the leaves, 3-flowered, rarely bifid, each branch bearing 3 flowers; flowers small, either pentamerous or hexamerous; ovarium striated; tube of calyx often obscurely bifid; tube of corolla villous. ♄. S. Native of Santa Cruz, Montserrat; and of Mexico, at Acapulco. Edechi, Lœfl. trav. 259. and p. 271. ex Rohr. Ixòra pentándra, West. mss. Fruit globose, about the size of a pea, not crowned.

Small-flowered Guettarda. Shrub 6 to 8 feet.

15 G. ODORA'TA (Lam. ill. t. 154. f. 4.) leaves oval, acute at both ends, glabrous above, but rather villous on the nerve beneath, as well as on the petioles and branchlets; stipulas subulate, deciduous; peduncles almost one-half shorter than the leaves, villous, as well as the cymes, which are bifid; flowers pentamerous; tube of calyx unequal, 7 times longer than the ovarium. ♄. S. Native about Carthagena and Havannah, among bushes by the sea side. Laugèria odoràta, Jacq. amer. p. 64. t. 177. f. 21. pict. t. 259. f. 16. Drupe containing a roundish 5-furrowed 5-celled putamen. Flowers of a dirty reddish colour, 9-10 lines long, villous on the outside, very sweet-scented at night. Fruit black, size of a pea. There is a spinescent variety of this species according to Jacquin.

FIG. 101.



Sweet-scented-flowered Guettarda. Clt. 1818. Sh. 6 to 10 ft.

16 G. MEMBRANA'CEA (Swartz, prod. p. 59. fl. ind. occ. 1. p. 635.) leaves ovate, acuminated, membranaceous, rather hispid on both surfaces; down very minute, curved; peduncles length of the petioles, dichotomous; flowers secund, tetramerous; limb of calyx rather bifid, truncate; tube of corolla downy. ♄. S. Native of Hispaniola, among bushes on the mountains. Corolla white, half an inch long. Drupe oblong, 4-seeded.

Membranous Guettarda. Shrub.

17 G. ELLI'PTICA (Swartz, prod. p. 59. fl. ind. occ. 1. p. 634.) leaves elliptic, obtuse, smoothish above, and downy beneath, as well as on the branches; peduncles shorter than the leaves; cymes bifid; flowers tetramerous, with a silky tube, which is 3 times longer than the calyx. ♄. S. Native of Jamaica, in dry fields. Drupe roundish, 4-seeded. Stigmas 2, blunt. Flowers small. This species is easily distinguished from *G. móllis*, with which it has been confused by Sprengel in his syst.

Elliptic-leaved Guettarda. Tree 20 feet.

18 G. MICROPHY'LLA (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 457.) leaves ovate-oblong and oblong, smoothish above, and rather downy beneath; peduncles 3 or 4 times shorter than the leaves, 3-flowered; calyx quadrifid, with acute segments; corolla silky on the outside, with rounded lobes. ♄. S. Native of Luzon, one of the Philippines. Very like *G. parviflòra*.

Small-leaved Guettarda. Shrub.

19 G. URUGUE'NSIS (Cham. et Schlecht. in Linnæa. 4. p. 183.) leaves elliptic-oblong, acuminated, rather pilose above, and

canescent from tomentum beneath, as well as the petioles, branchlets, and inflorescence; stipulas lanceolate, triangular, caducous; peduncles twice bifid, shorter than the leaves; limb of calyx very short, somewhat truncate; corolla silky; drupe oblong, 3-4-seeded. ♄. S. Native of the south of Brazil, on the banks of the Uruguay. Leaves 2 inches long, and an inch broad, on petioles 1-2 lines long. Tube of corolla 2-3 lines long; lobes 5, roundish.

Uruguay Guettarda. Shrub 10 feet.

20 G. FINLAYSONIA'NA (Wall. cat. no. 6223.) leaves obovate-oblong, obtuse at the apex; calyx truncate; pedicels solitary, axillary, 1-flowered, much shorter than the leaves; corolla villous outside. ♄. S. Native of the East Indies.

Finlayson's Guettarda. Shrub.

21 G. WALLICHIA'NA; leaves oblong, acuminated, glabrous; pedicels 1-flowered, rising in numbers from short axillary peduncles; calyx truncate; corolla glabrous, apparently purple, ½ inch long. ♄. S. Native of the East Indies; fruit roundish, not crowned. Perhaps belonging to the first section.

Wallich's Guettarda. Shrub.

§ 2. *Doubtful species, having 4-cleft silky corollas, and the drupes containing a 2-3-celled putamen. Perhaps species of the genus Stenóstomum.*

22 G.? PROTRA'CTA (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 457.) leaves ovate or ovate-lanceolate, acuminated, rather villous on both surfaces, silky on the nerves and veins beneath; peduncles cymose, bifid, having the branches recurved. ♄. S. Native of Mexico. Perhaps a species of *Stenóstomum*.

Var. α, brévipes (D. C. prod. 4. p. 457.) leaves ovate, with 9 very prominent nerves on each side of the mid-rib; peduncles twice the length of the petioles; limb of calyx truncate, irregularly sublobate; corolla 4-cleft? clothed with silky tomentum outside. ♄. S. Native of Mexico.

Var. β, lóngipes (D. C. l. c.) leaves ovate-lanceolate, with 7-8 rather prominent nerves on each side of the mid-rib; peduncles 4 times longer than the petioles; drupes ovate-oblong, acute, 2, sometimes 3-celled. ♄. S. Native of Mexico, at Acapulco.

Protracted Guettarda. Shrub.

23 G.? ARMA'TA (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 457.) armed with opposite spines; leaves ovate, acuminated, smoothish above, but clothed with hoary tomentum on the nerve and veins beneath, as well as on the branchlets; peduncles cymosely bifid, 3 or 4 times longer than the petioles; segments of calyx 4, narrow-lanceolate, acute; corolla silky, with acute lobes; drupe ovate-oblong, (ex Bartl.) 2-3-celled. ♄. S. Native of Mexico. Very nearly allied to *G. protrácta*.

Armed Guettarda. Shrub 6 to 8 feet.

24 G.? PANICULA'TA (Bartl. in herb. Hænke, ex D. C. l. c.) leaves ovate, acuminated, glabrous above, clothed with silky tomentum on the nerve and veins beneath, as well as on the branchlets; cymes dichotomous, many-flowered, on long peduncles, axillary, but the ultimate ones are disposed in a panicle; corolla clothed with silky tomentum outside, with ovate-oblong lobes. ♄. S. Native of Peru, on the mountains. Corolla 6 lines long. Teeth of calyx acute, smoothish. Fruit unknown.

Panicled-flowered Guettarda. Shrub 6 to 8 feet.

SECT. III. ULO'LOBUS (from *ουλος, oulos*, curled, and *λοβος, lobos*, a lobe; in reference to the curled lobes of corolla). D. C. prod. 4. p. 457.—Laugèria, Ruiz et Pav. fl. per. 2. p. 22. but not of Jacq. Limb of calyx short, 5-parted almost to the base, permanent. Corolla silky on the outside, with 5 lobes, which are curled on the margins.

25 G. CRISPIFLÒRA (Vahl, eclog. 1. p. 36. t. 6.) leaves broad-ovate, acuminated, obtuse at the base, having the lower lateral nerves approximate. ♄. S. Native of the Island of Montserrat, towards the tops of the mountains, ex Vahl; and of St. Vincent, on the edges of mountains, in inundated places, ex Forsyth; and about Santa Fe de Bogota, ex Mutis, in H. B. et Kunth, nov. gen. amer. 3. p. 420. G. crispiflòra var. α, Pers. Rœm. et Schultes. Stipulas large, undulated, foliaceous, ovate, acuminated. Guettárda membranàcea, Sieb. pl. exsic. mart. no. 57. from Martinico, is the same, or a very nearly allied species.

Curled-flowered Guettarda. Tree or shrub.

26 G. HIRSU'TA (Pers. ench. 1. p. 200.) leaves ovate-oblong, acuminated, acute at the base; stipulas longer than the petioles; drupes ovate. ♄. S. Native of Peru, and in the hot parts of New Granada. Laugèria hirsùta, Ruiz et Pav. fl. per. 2. p. 22. t. 145. f. a. Guettárda hirsùta, H. B. et Kunth, nov. gen. amer. 3. p. 420. Peduncles equal to the petioles, even to the bifurcation, having the branches subrevolute and many flowered.

Hairy Guettarda. Clt. 1820. Tree 20 feet.

27 G. DEPE'NDENS (D. C. prod. 4. p. 458.) leaves oval-oblong, acuminated, acute at the base; stipulas shorter than the petioles; drupes oblong, 3-4-celled. ♄. S. Native of Peru, in groves about Muna. Laugèria depéndens, Ruiz et Pav. fl. per. 2. p. 23. t. 145. f. b. Branches of cyme spreading, usually dependent. G. crispiflòra var. β, Pers. and Rœm. et Schultes, but is more nearly allied to *hirsùta* than to *G. crispiflòra*.

Dependent-cymed Guettarda. Tree 20 feet.

SECT. IV. LAUGE'RIA (named after Albert Laugier, professor of botany and chemistry at Vienna). D. C. prod. 4. p. 458.—Laugèria, Jacq. Juss. but not of Ruiz et Pav. Limb of calyx truncate or toothed. Corolla glabrous, 4-5-lobed. Stamens 4-5.

28 G. CORIA'CEA (Pers. ench. 1. p. 200.) quite glabrous; leaves elliptic-ovate, rather coriaceous, bluntish, almost nerveless, rather paler beneath; stipulas acuminated, deciduous; peduncles about equal in length to the leaves, compressed, bifid or twice bifid; flowers tetramerous, glabrous, unilateral, and distant along the branches of the peduncle; tube of calyx bluntly 4-toothed. ♄. S. Native of the Island of Montserrat, ex Vahl; and Guadaloupe, at Pointe-a-Pitre. Laugèria coriàcea, Vahl, eclog. 1. p. 26. Laugèria tubulòsa, Fors. in herb. L'Her. Drupe oblong, ex Vahl, containing a 4-celled putamen. Corolla 6-7 lines long. Perhaps Viviània Domingénsis, Rafin. specch. 1. p. 117.

Coriaceous-leaved Guettarda. Tree or shrub.

29 G. RESINÒSA (Pers. ench. 2. p. 200.) leaves lanceolate, attenuated at both ends, glabrous, glaucous beneath; stipulas combined into a somewhat truncate ciliated sheath; branchlets and cymes clothed with clammy resin; peduncles a little shorter than the leaves; cymes bifid, crowded with flowers; flowers pentamerous, glabrous; limb of calyx short, truncate, or hardly 5-toothed. ♄. S. Native of Montserrat, on the mountains, ex Vahl; of Guadaloupe, where it was collected by Perrottet; of Porto Rico, Riedley; of Trinidad, ex Sieber, fl. trin. no. 112; and of Mexico, ex herb. Puerari. Laugèria resinòsa, Vahl, ecl. 1. p. 27. t. 10. f. 6. with a figure. Terebrària, Sesse, fl. mex. icon. ined. Drupe oblong, containing a 4-celled, 4-seeded putamen, ex Vahl, but in the specimen examined the drupe contains a 4-5-celled 4-5-seeded putamen; there are therefore 2 species confused under this name.

Resinous Guettarda. Shrub 8 to 10 feet.

30 G.? BRUNÒNIS (Wall. cat. no. 6220.) leaves elliptic, acuminated, coriaceous, quite glabrous; peduncles axillary, solitary, or twin; cymes dichotomous; stipulas ovate, acuminated. ♄. S. Native of the East Indies, in Sirinagur. Flowers small. Calyx a little twisted.

Brown's Guettarda. Shrub.

† *Species not sufficiently known.*

31 G. Fontane'sii (D. C. prod. 4. p. 458.) stem arborescent; leaves broad-ovate, acuminated, and are, as well as the divaricate branches, villous; stipulas ovate, acute, deciduous. ♄. S. Native country unknown. G. hirsùta, Desf. cat. hort. par. ed. 3. p. 404. but not of Pers. Habit of *G. argéntea*.

Desfontaines's Guettarda. Shrub.

32 G.? umbella'ta (Spreng. neu entd. 3. p. 48.) leaves oblong, quite glabrous on both surfaces; branches tubercular, compressed, dilated at the top; peduncles axillary, aggregate; flowers pentamerous, glabrous. ♄. S. Native of Brazil. The calyx is said to be 5-toothed, and the drupe 6-celled. This plant ought probably to be excluded from the order.

Umbellate-flowered Guettarda. Shrub or tree.

Cult. For culture and propagation see *Hamiltònia*, p. 555. The species bear very fine leaves and flowers, and are therefore worth cultivating.

CXII. MALA'NEA (Aublet does not mention the meaning of this word). Aubl. guian. 1. p. 106. t. 41. Juss. mem. mus. 6. p. 376. D. C. prod. 4. p. 459.—Malànea species, Lam. A. Rich.—Cunninghàmia species, Schreb. Willd.—Chomèlia species, Spreng. Scop.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with a very short tube, and a 4-toothed limb. Corolla small, almost rotate, with a very short tube, and a 4-lobed spreading limb. Stamens 4, with exserted filaments, which are about equal in length to the limb of the corolla, and roundish anthers. Drupe dry, thin, ovate, crowned by the calyx, containing a 2-celled nut; cells 1-seeded.—A sarmentose shrub, native of Guiana, climbing among bushes. Leaves opposite, petiolate, ovate, acute. Stipulas oval, obtuse, deciduous, interpetiolar. Peduncles axillary, 3 times shorter than the leaves, racemosely panicled: having the branches opposite, the lower ones the longest. Flowers small, sessile along the branches, bluish.

1 M. sarmentòsa (Aubl. guian. 1. p. 106. t. 41.?) ♄. S. Native of French Guiana, upon trees on the banks of rivers. Lam. ill. t. 66. f. 2. Cunninghàmia sarmentòsa, Willd. spec. 1. p. 615. Stipulas acute, ex Aubl., and the leaves tomentose beneath; but in the specimens examined the stipulas are obtuse, and the leaves are rather villous beneath, and at length glabrous. Perhaps there are two distinct species, Aublet's and Patris's.

Sarmentose Malanea. Shrub cl.

Cult. See *Pœdèria*, p. 561. for culture and propagation.

CXIII. ANTIRHŒ'A (from *αντι, anti*, against, and *ῥεω, reo*, to flow; the plant is used to stop hæmorrhage in Bourbon). Comm. mss. Juss. gen. p. 204. mem. mus. 6. p. 377. D. C. prod. 4. p. 459.—Malànea species, Lam. A. Rich.—Cunninghàmia species, Schreb.—Guettárda species, Sieb.
